
Advance and unedited reporting material on actions taken by States and regional fisheries management organizations and arrangements in response to paragraphs 113, 117 and 119 to 124 of General Assembly resolution 64/72 and paragraphs 121, 126, 129, 130 and 132 to 134 of General Assembly resolution 66/68 on sustainable fisheries, addressing the impacts of bottom fishing on vulnerable marine ecosystems and the long-term sustainability of deep-sea fish stocks¹ (English only)

Summary

The present report has been prepared pursuant to paragraph 164 of General Assembly resolution 69/109, requesting the Secretary-General, in cooperation with the Food and Agriculture Organization of the United Nations, to report to the General Assembly at its seventy-first session on the actions taken by States and regional fisheries management organizations and arrangements in response to paragraphs 113, 117 and 119 to 124 of resolution 64/72 and paragraphs 121, 126, 129, 130 and 132 to 134 of resolution 66/68, in order to facilitate the further review of the actions taken referred to in paragraph 162 of resolution 69/109.

The report is a follow-up to earlier reports prepared by the Secretary-General (A/64/305, A/61/154 and A/66/307). It should also be read in conjunction with earlier interim reports of the Secretary-General on the measures taken by States and regional fisheries management organizations and arrangements to implement resolution 61/105 (A/62/260, paras. 60-96, and A/63/128, paras. 63-78).

I. Introduction

1. The First Global Integrated Marine Assessment, or “first World Ocean Assessment” (WOA),² notes that, although no global assessment has been carried out on the extent of benthic impacts, the documented widespread extent of deep-water trawl fisheries in different regions and maritime zones has led to pervasive concern for the conservation of fragile benthic habitats. On seamounts where trawling has been discontinued, little regeneration is observed even after five to 10 years and recovery may require centuries to millennia.³ This highlights the need for continued action to protect vulnerable marine ecosystems (VMEs).

2. Within the framework of the United Nations Convention on the Law of the Sea and the Agreement for the Implementation of the Provisions of the United Nations Convention on the Law of the Sea of 10 December 1982 relating to the Conservation and Management of Straddling Fish Stocks and Highly Migratory Fish Stocks (“United Nations Fish Stocks Agreement”), a number of actions have been taken by States and regional fisheries management organizations and arrangements (RFMO/As), inter alia, to address the impacts of bottom fishing on VMEs and the long-term sustainability of deep-sea fish stocks.

3. The continuous need to achieve sustainable fisheries, as well as protect and manage marine ecosystems, has also been underlined in a number of important outcomes in the recent years, including, “The future we want”,⁴ the 2030 Agenda for Sustainable Development,⁵ including Sustainable Development Goal 14; and the recommendations of the resumed Review Conference on the United Nations Fish Stocks Agreement.⁶ Also of relevance are decisions of the parties to the Convention on Biological Diversity.⁷ Many of these outcomes include specific commitments by States to protect VMEs from destructive fishing practices and ensure long-term sustainability of deep-sea fish stocks.

4. The General Assembly considered the impacts of bottom fishing on VMEs and the long term sustainability of deep-sea fish stocks and called on States and RFMO/As to take a number of actions in that regard in 2006.⁸ Since then, it has conducted reviews of actions taken by States and regional fisheries management organizations and arrangements in response to its relevant resolutions on sustainable fisheries, in 2009 and 2011.

5. In resolution 69/109, the General Assembly recalled its decision in paragraph 137 of resolution 66/68 to conduct a further review of the actions taken by States and RFMO/As in response to paragraphs 113, 117 and 119 to 124 of

² The General Assembly welcomed the WOA with appreciation and approved its summary (A/70/112) in 2015. A/RES/70/235. For the complete text of the WOA, see <www.un.org/depts/los/global_reporting/WOA_RegProcess.htm>.

⁶ Outcomes of the resumed Review Conference in 2006, 2010 and 2016, A/CONF.210/2006/15, Annex; A/CONF.210/2010/7, Annex; and A/CONF.210/2016/5.

⁷ Decision IX/20. *Marine and coastal biodiversity*, UNEP/CBD/COP/DEC/IX/20; Decision X/2. *The Strategic Plan for Biodiversity 2011-2020 and the Aichi Biodiversity Targets*, UNEP/CBD/COP/DEC/X/2.

⁸ A/RES/61/105.

resolution 64/72 and paragraphs 121, 126, 129, 130 and 132 to 134 of resolution 66/68, with a view to ensuring effective implementation of the measures therein and to make further recommendations, where necessary, and recognized the value of preceding such a review with a two-day workshop as in 2011, and decided to conduct such a review in 2016. In resolution 70/75 of 8 December 2015, the Assembly requested the Secretary-General to convene the two-day workshop on 1 and 2 August 2016 in order to discuss implementation of the above-mentioned paragraphs of resolutions 64/72 and 66/68.

6. Following the adoption of resolution 69/109, requesting the Secretary-General to report to the General Assembly at its seventy-first session on the above-mentioned actions, the Secretary-General requested States and regional economic integration organizations and RFMO/As to submit detailed information. Information was also requested from the Food and Agriculture Organization of the United Nations (FAO).

7. In response, submissions were received from eleven States,⁹ the European Union, FAO,¹⁰ and eight RFMO/As.¹¹ The present report is based on the information therein provided, as well as information contained in the responses to the request circulated in connection with the preparation of the report of the Secretary-General to the resumed Review Conference on the United Nations Fish Stocks Agreement. The Secretary-General wishes to express his appreciation for these submissions.

II. Overview of the impacts of bottom fisheries on vulnerable marine ecosystems and the long-term sustainability of deep-sea fish stocks

8. The present section provides an update of the sections of previous reports of the Secretary-General on the actions taken to address the impacts of bottom fishing on VMEs and the long-term sustainability of deep-sea fish stocks. It should also be read in conjunction with WOA, which also provides detailed information on deep-sea ecosystems, including specific habitats that can constitute VMEs, such as cold water corals, hydrothermal vents and cold seeps, as well as on marine biological diversity and biological communities on seamounts and other submarine features potentially threatened by disturbance.¹²

⁹ Australia, Bulgaria, Canada, Chile, Iceland, Iraq, New Zealand, Norway, Oman, Philippines, United States of America.

¹⁰ The contribution of the FAO is summarized in section IV.

¹¹ CCAMLR, NAFO, NEAFC, NPFC and SEAFO. The International Commission for the Conservation of Atlantic Tunas, the North Atlantic Salmon Conservation Organization and the North Pacific Anadromous Fish Commission reported that they did not regulate bottom fisheries and/or did not have the mandate to do so. In addition, reference information was provided informally by GFCM.

¹² http://www.un.org/Depts/los/global_reporting/WOA_RegProcess.htm, in particular chapters 36F, 42, 45 and 51.

A. Vulnerable marine ecosystems: an updated review

9. Previous reports of the Secretary-General have detailed scientific advances in the understanding of habitats that may contain VMEs, including seamounts, hydrothermal vents, cold-water coral habitats and sponge grounds.¹³ The following section provides an updated review of these habitats, as well as additional information regarding other potential VMEs.¹⁴

1. Seamounts¹⁵

10. Over the last five years, there has been progress in understanding how seamount ecosystems are structured and function. While some seamounts do not contain VMEs, expansion of seamount exploration has identified VMEs in new regions as well as completely novel VMEs, such as the crinoid aggregations on the Admiralty Seamount.¹⁶

11. Past studies suggesting that seamount communities comprise a high proportion of endemic species remain largely unsupported.¹⁷ However, exploration of seamounts in more remote areas such as the Southern Ocean and South-West Indian Ocean have revealed novel communities or species.^{18,19,20} Seamount communities' high variability across regions, within regions and even between adjacent seamounts presents a significant management challenge for deep-sea fisheries.²¹

2. Canyons

12. Submarine canyons are incisions into the continental shelf and slope and act as conduits for sediment and other materials from continents into the deep-sea. Canyons can be localities of enhanced biomass and diversity of benthic and pelagic organisms including aggregations of large megafauna, such as cetaceans,²² and

¹³ As previously reported, the vulnerability of an ecosystem is related to the likelihood that one or more components (i.e., population, community or habitat) will experience substantial alteration owing to short-term or chronic disturbance, and the likelihood that it will recover, and in what time frame. The most vulnerable ecosystems are those that are both easily disturbed and very slow to recover, or may never recover.

¹⁴ Due to the scarcity of data regarding VMEs on the high seas, this section also extrapolates from scientific research conducted in areas within national jurisdiction.

VMEs, such as cold-water coral communities.^{23,24,25,26,27,28,29} Entire canyon systems may be regarded as VMEs and several have been protected from fishing within areas under national jurisdiction.

3. Chemosynthetic communities³⁰

13. Several island-like habitats in the deep-sea host biological communities that are based largely on chemosynthetic primary production including hydrothermal vents and cold seeps.

14. *Hydrothermal vents*.³¹ Hydrothermal vents generally occur below the depths of deep-sea fishing in extremely rugged terrain. The use of multibeam sonar to map mid-ocean ridges and deep-submergence technologies, such as remotely operated vehicles (ROVs), has led to increased understanding of the distribution of hydrothermal vents.

15. New vent observations, such as those at polar latitudes, have resulted in the discovery of many new species of vent-endemic fauna and an improved understanding of the regional organization of the vent fauna.³² Connectivity of populations is an important consideration in assessing the risks from human activities to vent ecosystems.

16. *Seeps*.³³ There is evidence that seeps within exclusive economic zones have been damaged by fishing (e.g. Hikurangi Margin, New Zealand;³⁴ Hecate Strait, Canada).³⁵ Although seeps occur mainly along continental margins within these zones, they are also found in the high seas. At present there is no understanding of the capacity of such ecosystems to recover from bottom-fishing impacts.

4. Cold water coral ecosystems³⁶

17. *Cold-water coral reefs*. The last five years has seen a leap forward in understanding the distribution of cold-water coral reefs with new discoveries in many regions of the ocean, including along the continental margin of eastern South America.³⁷ Technological developments have been critical for the location of new cold-water coral reefs including the use of high resolution multibeam bathymetry, ROVs and towed cameras.²³ In the absence of observational data on the presence of VMEs, habitat suitability modelling is being used as a guide to where they may occur,³⁸ and can now be used in analysis of the risk of encounters of deep-sea bottom fisheries with VMEs.³⁹

18. Cold-water coral reefs in some areas are already under threat from a range of human activities, including fisheries and marine debris accumulation, including fishing gear and large pieces of plastic debris.⁴⁰

19. *Coral Carbonate mounds*. Such carbonate mounds⁴¹ are often associated with VMEs, including cold-water coral reefs and coral garden habitat.^{42,43}

20. *Coral gardens*. Such gardens are ecologically important because of their association with high biological diversity. Associates may occur within the coral garden habitat or be directly associated with the corals.^{24,44,45,46,47,48} Coral gardens can form an essential fish habitat for commercially important fish (e.g. Alaska,⁴⁶

Azores).⁴⁹ Functional relationships between coral gardens and commercial fish have been identified, such as observations of larvae sheltering in coral habitat or eggs being attached to corals.^{45,50}

21. Coral gardens are damaged by deep-sea bottom fishing^{51,52,53} and heavily fished areas may show evidence of significant reduction of populations.⁵⁴ Because of the high longevity (up to >4,000 years)⁵⁵ of some species of corals recovery potential is limited. Lost fishing gear has also been observed on coral garden habitats causing prolonged impacts associated with entanglement and mechanical damage.^{51,52,56}

5. Sponges⁵⁷

22. The distribution and taxonomy of sponges is poorly known and discoveries of new species and new sponge habitats continue. Sponges are fragile and are therefore vulnerable to damage from bottom-contact fishing.^{58,59,60} Some sponges, such as glass sponges, are highly vulnerable not just to bottom trawling but also to longlining or other forms of line fishing which may cut through the sponges and destroy them.^{59,61} They are also slow growing and their capacity to recover from

fishing or other impacts is limited.⁶² Habitat-forming sponges are therefore regarded as potential VMEs.

6. Other vulnerable marine ecosystems

23. Other organisms are associated with VMEs or form VMEs either by themselves or associated with other habitat-forming taxa.

24. Xenophyophores are giant protozoans that accrete inorganic material to form a complex test on the surface of the seabed. Xenophyophores are extremely fragile and easily destroyed by bottom-fishing gear.⁶³ Although xenophyophores can grow in rapid bursts,⁶⁴ it is unclear whether they rapidly recover. Syringamminidae are listed as an indicator species for the mud- and sand-emergent fauna VME.⁶⁵

25. Both stalked and un-stalked crinoids can form aggregations^{15,66} and may be used as habitat by small fish and other invertebrates.⁶⁵ These animals are extremely fragile and are long lived (>20 years) and the habitats they form are therefore classified as VMEs by at least one RFMO.⁶⁵ Crinoid VMEs have been identified in the areas covered by CCAMLR and NAFO.

26. Habitat-forming bryozoans are heavily-calcified species which extend for 5cm or more in three dimensions.⁶⁷ Habitat-forming bryozoans host a wide range of other invertebrate species and the diversity of associates at local to regional scales can reach hundreds of species.⁶⁶ In some cases, habitat-forming bryozoans can act as habitat for juvenile fish.⁶⁶ Bottom fishing is a significant threat to habitat-forming bryozoans.⁶⁶

27. Large sea squirts can occur in groups where they can form habitat for other species.⁶⁶ Although ascidians can grow relatively quickly⁶⁸ there is evidence that populations can decline as a result of fishing impacts (e.g. Bay of Fundy, Canada).⁶⁹

28. Tube-dwelling anemones of the order Ceriantharia occur in sediments and can form high density aggregations in the deep-sea.⁷⁰ Cerianthid anemones are known to

be damaged by bottom-contact fishing and given their relatively high longevity (11-20 years) they may be classified as VMEs.⁶⁹

29. Serpulids are polychaete worms that secrete calcareous tubes that can form habitat when they occur in tangled masses with or without association to coral frameworks. The impacts of bottom trawl fishing on these types of habitats are likely to be extremely large because of their fragility and thus they are classified as VMEs.⁷¹

30. High density aggregations of large erect hydroids, brittlestars (Ophiuroidea), barnacles, bivalve molluscs or brachiopods can form habitat on the seabed and are fragile organisms vulnerable to impacts from bottom fishing.^{65,72,73} In addition, deep-sea urchins, especially Cidaroida (pencil urchins) can occur in relatively high numbers in the deep-sea and can provide habitat for other species.^{74,75}

B. Deep-sea fish stocks

31. Previous reports of the Secretary-General have provided information on the characteristics of deep-sea fish stocks, including their vulnerability to overfishing.⁷⁶ There is no universally accepted definition of what constitutes a deep-sea commercial species⁷⁷ although generally they are identified as occurring below 200m – 500m depth.⁷⁸ There are significant correlations between depth and general life history traits. For example, rates of population increase drop with increasing depth, and maximum age and age at maturity increase with depth.^{79,80,81} Therefore, the proportion of species with a higher vulnerability to overfishing is positively correlated with depth.^{78,82,83}

32. Since 2011, there has been an increase in scientific knowledge regarding the characteristics and status of some deep-sea fish stocks.⁸⁴ However, the overall state of knowledge regarding deep-sea fish stocks remains limited.⁸⁵

C. Impacts of bottom fishing on vulnerable marine ecosystems and deep-sea fish stocks

33. Modern large-scale bottom fisheries were fostered by technological developments and distant-water industrial fishing. Gillnets, longlines, and both pelagic and bottom trawls have been the primary gears. Bottom trawls have had greatest impact, affecting both targeted and non-targeted species including associated benthic communities (see also para. 44). These fisheries have occurred in all oceans except the Arctic, although an increasing number of restrictions to such fishing activities are being imposed⁸⁶ (see also section III, *infra*).

34. The following section updates the information in previous Secretary-General's reports on the impacts of bottom fishing activities on VMEs and deep-sea fish stocks.⁸⁷

1. Vulnerable marine ecosystems

35. The impacts of bottom trawling in the deep-sea may include the scraping and ploughing of the seabed, killing of non-target species, destruction of habitat, resuspension of sediments potentially smothering fauna, and the dumping of processing wastes.⁷⁷ Many of these impacts also occur in shallow waters, but the fragility of deep-sea ecosystems and the extreme longevity and slow growth rates of many deep-sea species means that recovery may be much slower.⁷⁷ Observations of areas where fishing has ceased have shown no recovery of benthic VMEs (cold-water coral reef) in 5-10 years.^{88,89} Modelling of the recovery of sponges and corals from trawling in Alaska at relatively shallow depths (down to 300m) suggested recovery of 80 per cent of biomass after several decades.⁹⁰

36. The impacts of deep-sea trawling on soft substrata, such as sand or mud, has been less studied and publicized than on hard substrata, but can be significant. VME species, such as sponges and octocorals (e.g. sea pens), also occur on soft substrata and trawling has similar negative impacts on these organisms as in rocky habitats.⁹¹

So large are the physical and biological effects of trawling on deep-sea sediments that they may impact biogeochemical cycling at the local to regional scale.⁹²

37. In addition to deep-sea bottom trawling, bottom longlining is increasingly recognized as capable of damaging VMEs, particularly branching corals and sponges.^{46,60,93,94,95,96} Damage to VME species occurs from the weights used to hold lines to the seabed, lateral movement of longline sets during retrieval or as a result of currents at the seabed, and also through the hooking and entanglement of organisms.^{46,92,94} Whilst the level of impacts of individual longlines is small compared to bottom trawls, in the conditions of a high fishing intensity, where VMEs are present, they may represent a threat.^{46,92} Longlines can also be used in areas of complex rocky topography where trawling is not possible.⁹² These considerations may be particularly important where there is evidence of increased longline effort, for example, as a result of restrictions on other forms of fishing (e.g. gillnetting or bottom trawling).

38. The use of seabed imaging methods such as towed cameras and ROVs, indicates that high levels of lost fishing gear may also be found in VMEs. This is especially the case where such VMEs comprise or are located in complex seabed topography with hard substrata (e.g. seamounts, canyons).^{24,39,46,47,51,52,60,97,98} Lost gear has the potential to ghost fish, to continue damaging VME species through entanglement and/or abrasion and poses a significant risk to further fishing operations and scientific research.

2. Deep-sea fish stocks

39. The scale of bottom fisheries and their impacts on deep-sea fish stocks have been detailed in previous reports of the Secretary-General.⁹⁹ Overexploitation of deep-sea fish species has resulted in the depletion of some stocks for which targeted fishing has, in some cases, been prohibited (e.g. orange roughy in the North-East Atlantic).¹⁰⁰ Even where total allowable catches have been set, actual catches have

frequently exceeded these in some areas⁸⁰ and catch data can be poor, misreported or aggregated across species.

40. In addition to targeted species, populations of by-catch fish species have also been depleted by deep-sea fisheries.^{101,102,103} Moreover, the impact of deep-sea fisheries may extend beyond the footprint where fishing occurs.^{101,104}

41. For some deep-sea fish species, scientifically-based management is enabling sustainable fishing of target species. However, fisheries independent surveys, an important tool for monitoring abundance of target and non-target fish species, as well as broader aspects of the environment, are lacking for many regions.^{76,105}

42. New methods are being developed for stock assessment of target and by-catch deep-sea fish where data is poor or is only available from the fish catches.¹⁰⁶ They may be useful for a broader range of deep-sea fisheries especially where economic considerations mean that larger assessment programmes are unlikely to be viable.

43. The continued targeting of species known to have a high vulnerability to overfishing,⁷⁸ and in geographic areas where scientific information is scant, remain a cause for concern (e.g. southern Indian Ocean)¹⁰⁷ as recovery of many overexploited stocks/populations of target and by-catch species has been slow.¹⁰²

3. Mitigation efforts

44. Improved impact assessments and area closures have had some success in reducing the impacts of bottom fishing on VMEs and deep-sea fish stocks. Technical modifications of fishing gear or changes in fishing practice have also been studied as a way to reduce impacts, but with limited success.⁷⁷

45. For example, in some cases, a switch from bottom trawl to mid-water trawl may be feasible as a way to lessen impacts, but though bottom contact from mid-water trawls is of lower intensity, it could still result in damage to VMEs.¹⁰⁸ Spatial

conservation measures whether through closure of areas where VMEs are present or by limiting the depth of fishing remain the most effective measures to conserve such ecosystems.

46. Implementation of encounter protocols presents a number of challenges.^{109,110} Problems associated with their implementation include: the absence of a rigorous process of VME identification; extremely high thresholds for VME indicator species not based on any form of scientific analysis, such as kernel density estimation (KDE);¹¹¹ and the specification that for corals the by-catch must be live.¹¹² Where move-on action is triggered, it is important that the move-on distance reflects the potential zone in which a VME may occur (e.g. anywhere along a trawl track or longline setting) and that the area is subject to rapid assessment and if necessary closure by the managing body.

III. Actions taken by States and regional fisheries management organizations and arrangements to address the impacts of bottom fisheries on vulnerable marine ecosystems and the long-term sustainability of deep-sea fish stocks

A. Actions taken by regional fisheries management organizations and arrangements with competence to regulate bottom fisheries¹¹³

47. The following section describes actions to give effect to the relevant paragraphs of resolutions 64/72 and 66/68 and address the impacts of bottom fishing on VMEs and the long-term sustainability of deep-sea fish stocks, taken by RFMO/As with the competence to regulate bottom fisheries: CCAMLR, GFCM, NAFO, NEAFC, NPFC, SEAFO, SIOFA, and SPRFMO.

48. Among the three new RFMO/As competent to manage bottom fisheries in areas beyond national jurisdiction, SPRFMO has adopted conservation and management measures (CMMs) to address the call of action by the General Assembly, while SIOFA and NPFC still need to do so. States that have participated

¹⁰⁹ Auster PJ, Gjerde K, Heupel E, et al. (2010) Definition and detection of vulnerable marine ecosystems on the high seas: problems with the Move-On Rule. ICES Journal of Marine Science. Doi:10.1093/icesjms/fsq074, 11pp.

¹¹⁰ Rogers AD, Gianni M (2010) The Implementation of UNGA Resolutions 61/105 and 64/72 in the Management of Deep-Sea Fisheries on the High Seas. Report prepared for the Deep-Sea Conservation Coalition, 97pp.

¹¹¹ Kenchington E, Murillo FJ, Lirette C, et al. (2014) Kernel density surface modelling as a means to identify significant concentrations of vulnerable marine ecosystem indicators. PLoS ONE 9(10): e109365.

¹¹² As cold-water coral reefs often largely comprise dead coral framework with a relatively small portion made up of live framework-building coral, specification that coral by-catch must be live is therefore likely to result in VMEs not being identified through the encounter protocol.

¹¹³ Information provided by the RFMO/As is supplemented by that provided by States and the European Union, as well as responses submitted by RFMO/As to the Voluntary questionnaire for States and RFMO/As for the report of the Secretary-General to the resumed Review Conference on the United Nations Fish Stocks Agreement (RRC Questionnaire). Where such supplemental information is utilized, the source is indicated in the footnotes.

in the negotiations to establish these three RFMO/As have adopted and implemented interim measures.

49. Following the entry into force of the Convention on the Conservation and Management of High Seas Fishery Resources in the South Pacific Ocean in 2012, SPRFMO reported that CMM 2.03 was adopted in 2013, to implement the 2008 FAO International Guidelines for the Management of Deep-Sea Fisheries in the High Seas (“the Guidelines”)¹¹⁴ and relevant General Assembly resolutions.¹¹⁵ It was succeeded by an almost identical measure, CMM 4.03, in 2016, which limits vessels flying the flag of a SPRFMO member or Cooperating non-Contracting Party (CNCp) to fishing within a specified fishing footprint, and prohibits SPRFMO members and CNCps from authorizing their flagged vessels to engage in any bottom fishing in the SPRFMO Convention Area unless they have prepared a bottom fishing impact assessment.¹¹⁶ Furthermore, SPRFMO CMM 1.02 (2013) prohibits the use of all deepwater gillnets in the Convention Area.¹¹⁷

50. Having entered into force in 2012, SIOFA recently agreed on its Rules of Procedure, and has yet to establish binding CMMs. Australia reported that it was preparing a CMM for the management of bottom fishing in the SIOFA Area seeking to implement the relevant General Assembly resolutions, and further noted that it would be considered by SIOFA’s Scientific Committee in March 2016 for proposal to the Meeting of the Parties to the Agreement in June 2016.

51. The Convention on the Conservation and Management of High Seas Fisheries Resources in the North Pacific Ocean, which established NPFC, entered into force in 2015. At the 13th meeting of the Scientific Working Group (SWG) in August 2015, NPFC reported that participants recognized the need to convert the VME and Marine Species interim and voluntary measures to formal NPFC measures in light of the coming into force of that Convention. The SWG recommended that the Commission, inter alia: approve continuation of all the current Interim Measures as the formal NPFC Interim Measures and continue all the Voluntary Measures; and direct the Scientific Committee to initiate the process for refinement of the formal NPFC Interim Measures and the Voluntary Measures to bring them up to formal CMMs.

1. Identifying vulnerable marine ecosystems on the basis of marine scientific research and other sources of information [paragraph 119(b) of resolution 64/72, and paragraphs 132 and 133 of resolution 66/68]

52. Several RFMOs reported having identified areas where VMEs occurred or were likely to occur, based on the result of marine scientific research and scientific and technical information obtained from other sources. In doing so, they carried out research programmes and/or elaborated on the definition of VMEs in the context of their regions.

¹¹⁴ FAO, *Report of the Technical Consultation on International Guidelines for the Management of Deep-Sea Fisheries in the High Seas, Rome, 4–8 February and 25–29 August 2008*, FAO Fisheries and Aquaculture Report No. 881 (FIEP/R881 (Tri)), appendix F.

¹¹⁵ SPRFMO response to Voluntary questionnaire for States and RFMO/As for the report of the Secretary-General to the resumed Review Conference on the United Nations Fish Stocks Agreement (RRC Questionnaire).

¹¹⁶ Australia.

¹¹⁷ New Zealand.

53. CCAMLR reported that its description of VMEs in its CM 22-06 included the habitats and communities identified in paragraph 80 of resolution 61/105 and paragraph 113 of resolution 64/72 and sponge fields. CCAMLR maintained a registry of VMEs in the Convention Area,¹¹⁸ which included their location and characteristics.¹¹⁹

54. NAFO reported that it had facilitated research on deep-sea species and ecosystems through the exchange of information and data in its scientific fora, coordination of funding of relevant research, and the analysis of Vessel Monitoring System (VMS) data by the secretariat. NAFO's NEREIDA project¹²⁰ represented a major multidisciplinary research effort on the sensitive habitats and fishing activities in the North West Atlantic, as well as an in-depth analysis of the impacts of fishing on VMEs.¹²¹

55. With regard to the use of research results, NAFO convened a series of scientific and fisheries management working groups since 2008, as well as a joint scientific-fisheries management group in 2014 and 2015.

56. NAFO also made efforts to ensure that the measures taken to promote sustainable fisheries and protection of ecosystems in the deep-sea were consistent with the Guidelines, including by reviewing species caught during research vessel surveys against the Guidelines for identifying VMEs and reassessing its bottom fishing activities.¹²²

57. In 2011, as a result of research vessel surveys in the NAFO Regulatory Area, three new groups (crinoids, erect bryozoans and large sea squirts) had emerged as potential indicators of VMEs, in addition to the coral and sponge taxa. Seamounts, canyon heads, spawning areas and knolls, listed as VME elements in the Guidelines, had also been identified. All of these new VME indicators and elements were mapped. The NAFO Coral, Sponge and Other Vulnerable Marine Ecosystem Indicator Identification Guide was published in 2015, to improve reporting related to the implementation of the ecosystem approach.

58. NEAFC reported that it did not conduct scientific work, but based its work on scientific advice from the International Council for the Exploration of the Sea (ICES), which undertook work on all the elements referred to in paragraph 133 of resolution 66/68. NEAFC and its Contracting Parties provided ICES with various data. On the basis of the best scientific information available, areas where VMEs occurred or were likely to occur were identified.

59. SEAFO reported that a research cruise by the *RV Dr Fridtjof Nansen* was conducted in 2015, to obtain more information on bathymetry, VME indicator organisms, fisheries resources and evidence of human footprint in the different study areas. The data collected during the research cruise indicated that corals in some knolls would be classified as coral gardens and/or reefs, and therefore as VMEs. SEAFO's definition of VMEs was derived from paragraphs 42 and 43 of the Guidelines. In 2014, SEAFO adopted Guidelines for scientific research conducted in the SEAFO Convention Area (SEAFO Research Guidelines), which differentiated exploratory fishing from scientific research.

¹¹⁹ United States.

¹²⁰ <http://www.nafo.int/science/nereida.html>.

¹²¹ Also reported by Canada and the European Union.

¹²² Also reported by Canada.

60. SPRFMO CMM 2.03 set out rules for identifying, on the basis of the best available scientific information, areas where VMEs were known or were likely to occur in the Convention Area, mapping these sites, and providing such data to the SPRFMO secretariat for circulation.¹²³ In SPRFMO, initial work related to the identification of areas where VMEs might occur, included the analysis of historical VME by-catch weights in bottom trawl operations to develop a definition of what taxa constituted evidence of VMEs, and to develop a move-on protocol based on threshold by-catch weights plus an index of biodiversity.¹²⁴ Research on deep-sea species, particularly orange roughy, was carried out under the auspices of the SPRFMO Scientific Committee Work Plan and research programme.¹²⁵

2. Adopting conservation and management measures to protect vulnerable marine ecosystems or closing areas to bottom fishing until such measures are in place [paragraph 132 of resolution 66/68]

(a) Assessing the impacts of bottom fisheries on vulnerable marine ecosystems [paragraph 119(a) of resolution 64/72; paragraphs 129(a)-(c) of resolution 66/68]

61. Several RFMOs maintained the possibility for bottom fisheries to take place in VMEs if they were assessed as not having SAIs on VMEs. To this end, several RFMOs established protocols for exploratory fisheries, which required those intending to conduct bottom fisheries to submit fisheries plans, preliminary assessments of impacts, and, if SAIs were likely, mitigation measures. They also provided for procedures for the examination and approval of proposals.

62. CCAMLR reported that CM 22-06 and CM 22-07 provided for an assessment process, undertaken by CCAMLR's Scientific Committee. It determines if proposed bottom fishing activities, taking into account, inter alia, the history of bottom fishing in the area proposed and a risk assessment, would contribute to SAIs on VMEs, and to ensure that, if it was determined that these activities would make such contributions, they were managed to prevent such impacts or were not authorized to proceed. CM 22-06 included a *pro forma* for submitting preliminary assessments of the potential for proposed bottom fishing activities to have SAIs on VMEs.

63. NEAFC reported that, since regular fisheries had been restricted to specific subareas where VMEs were unlikely to occur, any regular bottom fisheries that continued had been assessed as not being likely to have SAI on VMEs.¹²⁶ It prohibited regular fishing with bottom gear beyond existing fishing areas. Exploratory fishing beyond these areas could only be authorized if the risk of SAIs to VMEs was assessed to be minimized, after the proposing party submitted a letter of intent and a pre-assessment with specified content. The Permanent Committee on Management and Science would assess the proposal and advise the Commission whether it considered the activity to have SAIs on VMEs. The Committee had formulated procedures and standards for the consideration of such proposals. NEAFC also reported that the assessment called for in paragraph 83 (a) of resolution 61/105 had been conducted in NEAFC. In all three cases where proposals

¹²³ New Zealand.

¹²⁴ New Zealand.

¹²⁵ Australia.

¹²⁶ NEAFC reported that paragraph 129(a) of resolution 66/68 did not apply to it.

were made for exploratory bottom fisheries, the proposed activity was assessed as not having SAI on VMEs. However, the Commission did not allow the activities to commence, because the target species were a sedentary species subject to coastal State jurisdiction.

64. SEAFO reported that CM 30/15 addressed assessments associated with exploratory fisheries, requiring, inter alia: gathering of relevant data, which should preferably include data from sea-bed mapping programmes and/or other data relevant to the preliminary assessment of the risk of SAIs on VMEs; a Notice of Intent to undertake exploratory bottom fishing; and a preliminary assessment of the known and anticipated impacts of the proposed bottom fishing activity. The Scientific Committee would undertake an evaluation of the impact assessment, and provide advice to the Commission as to whether the proposed activity would have SAIs on VMEs and, if so, whether mitigation measures would prevent such impacts. On that basis, the Commission would either give or withhold its approval. Following exploratory bottom fishing, the SEAFO Commission would decide whether or not to authorize new bottom fishing activities based upon its results. Areas where such new bottom fishing activities were authorized would be defined as “existing bottom fishing areas”. In such cases, SEAFO would take into account the guidance provided by FAO in the framework of the Code of Conduct for Responsible Fisheries and any other internationally agreed standards, as appropriate.

65. It was reported that, since 2011, CCAMLR had strengthened and streamlined procedures for carrying out assessments to take into account cumulative impacts, refined the data requirements for CCAMLR members to improve the effectiveness of assessments and management measures, and recommended a review to determine whether current management measures were sufficient.¹²⁷

66. NAFO reported that it had adopted a cycle of advice, review and implementation of its management measures to ensure the ecosystem approach was always considered when fisheries management decisions were taken. NAFO’s “Roadmap for Developing an Ecosystem Approach to Fisheries for NAFO” served as a framework to assess and mitigate SAIs on any part of the ecosystem. In particular, since 2008, NAFO had established a process for reviewing its measures for the protection of VMEs, allowing refinement of its management measures on the basis of the most up-to-date scientific information. This ongoing review ensured that assessments were undertaken on a regular basis. Specifically, article 24 of its Conservation and Enforcement Measures (CEM) imposed the obligation on NAFO to review its VME measures before 2020.

67. Currently, NAFO was preparing for a reassessment of its bottom fishing activities to be presented at its annual meeting in 2016. It would take the necessary actions to protect VMEs following the reassessment, and conduct a reassessment of its bottom fishing activities every 5 years thereafter.

68. NEAFC reported that ICES updated the scientific advice to NEAFC on the basis of any new information, or new assessment of existing information. NEAFC then would take action, including closing new areas to bottom fishing and adjusting the borders of already closed areas. Furthermore, time-limits were in place on NEAFC’s area closures to ensure that they were revisited and reviewed regularly. Assessments of the occurrence of VMEs, and area closures based on them, were therefore regularly updated.

¹²⁷ New Zealand.

69. SEAFO reported that review procedures were included in its measures, and now also applied to existing bottom-fishing areas (CM30/15). Currently, the closed areas were closed to all types of fishing that were managed by SEAFO. However, with the approval of SEAFO, research activities would be permitted within the closed areas, and further information could lead to changes in adopted measures, including the closures.

70. SPRFMO requested its Scientific Committee to review and streamline the bottom fishing impact assessment standard agreed by the Scientific Working Group in 2011 to take account of the latest scientific information available. The measure was scheduled for review in 2017, taking into account the latest advice of the Scientific Committee.¹²⁸

(b) Closing areas containing vulnerable marine ecosystems to bottom fishing

71. Several RFMOs closed areas where VMEs occurred or were likely to occur. CCAMLR has implemented a set of regulations and guidelines to protect VMEs, particularly through CM 22-05 (2008) on restrictions on the use of bottom trawling gear in high-seas areas of the Convention Area.¹²⁹ Since 2011, CCAMLR closed further areas to bottom fishing based on the best scientific and technical information available.¹³⁰ CM 22-09, adopted in 2011, related to the protection of registered VMEs within areas open to bottom fishing, in which bottom fishing was prohibited in the defined areas set out in its Annex, except for scientific research activities agreed on by the Commission. It also adopted CM 22-07 (2013) on Interim measure for bottom fishing activities and CM 22-06 (2015) on bottom fishing in the Convention Area.¹³¹

72. GFCM reported that since 2006, it declared seven fisheries restricted areas (including three in 2016). Furthermore, in 2013, the Commission adopted resolution GFCM/37/2013/1 on area-based management of fisheries, including through the establishment of Fisheries Restricted Areas in the GFCM Convention area and in coordination with the United Nations Environment Programme (UNEP) Mediterranean Action Plan (MAP) initiatives on the establishment of Specially Protected Areas of Mediterranean Importance (SPAMIs).¹³² The Agreement for the Establishment of the General Fisheries Commission for the Mediterranean, amended in 2014, provided for the establishment of fisheries restricted areas for the protection of VMEs.

73. NAFO reported that since 2011 it continued to refine management measures to protect VMEs, including through closures of seamounts to bottom fishing at the 2015 Annual Meeting.¹³³ NAFO closed 380,000 km² to bottom fishing on seamounts and in other areas where these species were known or predicted to form significant concentrations.

74. The NAFO Scientific Council had noted that management through the closing of areas with significant concentrations of VME indicator species was the most effective measure for protecting VMEs in the NAFO Regulatory Area, and that the need to implement encounter protocols gradually became redundant as the

¹²⁸ United States.

¹²⁹ Norway.

¹³⁰ New Zealand.

¹³¹ Norway. There are currently no bottom trawl fisheries in the CCAMLR area, only long line fisheries, primarily for tooth fish, with bottom contact.

¹³² Instruments available here: <http://www.fao.org/3/a-ax392e.pdf>.

¹³³ United States.

locations of the benthic VMEs became increasingly well-defined, which avoided issues associated with the implementation of complex move-on rules.¹³⁴

75. NEAFC reported that areas where VMEs occurred or were likely to occur had been closed to bottom fishing. This included large precautionary area closures where no specific VMEs had been explicitly identified. Such closures included subareas within “existing bottom fishing areas” (see para. 82).

76. SEAFO reported that its Scientific Committee agreed to create a set of closures constituting a biogeographically representative selection of subareas likely to have VMEs. Due to limited information, the Scientific Committee applied the precautionary approach. Consequently, the Scientific Committee focused its analyses on seamounts and seamount complexes with summit depths shallower than 2000 m.

77. In 2006, SEAFO first closed 11 areas to bottom fishing. These closures were reviewed seven times within eight years, reflecting a progression of measures as knowledge of bottom fisheries, and of known or likely VMEs, increased. At present, 11 areas were closed to all gears and one area was closed to all gears except pots and longlines following the classification of corals in some knolls in that area as VMEs.

78. SPRFMO CMM 2.03 required closing areas where VMEs were known to occur or likely to occur based on the best available scientific information, unless the SPRFMO Commission determined that such bottom fishing would not have SAIs on VMEs.¹³⁵

(c) Developing protocols for encounters with vulnerable marine ecosystems
[paragraph 119 (c) of resolution 64/72]

79. Several RFMOs established and implemented encounter protocols, including the definition of VME indicator species and thresholds, move-on rules, including reporting procedures, as well as temporary closures and subsequent procedures for deciding whether or not to reopen the area.

80. CCAMLR reported that encounters with potential VMEs during the course of bottom fishing were regulated under CM 22-07, which defined “Risk Area”, “VME Indicator Organism”, “VME Indicator Unit” and encounter parameters, and specified action required when indicator organisms were encountered. In this regard, the Scientific Committee recommended practices and mitigation measures, including the cessation of fishing activities, if needed, when evidence of a VME was encountered. CM 22-06 included guidelines specifying categories of information to be included in notifications to the CCAMLR secretariat by Contracting Parties when a VME was encountered.

81. To mitigate the likelihood of encounters outside of closed areas, NAFO reported it had established thresholds for significant encounters, on the basis of scientific assessments inside the fishing footprint and on adjacent continental slopes, at 7 kg per haul for sea pens, 60 kg for other live coral and 300 kg for sponges as catch per set. Catches in excess of these amounts triggered a “move-on rule”, requiring a vessel to move two nautical miles before recommencing fishing operations, and to inform their national administrations of the encounter, who then passed the information to the secretariat.

¹³⁴ Report of the Scientific Council, June 2013, SCS Doc. 13/17.

¹³⁵ New Zealand.

82. NEAFC reported that it had adopted a definition of what constituted an encounter with a possible VME, based on advice from ICES, with separate rules for trawling and longlining. It also had adopted an extensive list of VME indicator species. Where the vessel crew was not expected to have the expertise needed to identify individual species, threshold levels applied to the presence of any live coral or any live sponge. There were explicit rules on the process following such an encounter, including a temporary closure of the relevant area. For trawling, the area was a polygon of 2 nautical miles on either side of the track of the trawl. For other bottom fishing gears it was an area with a two nautical mile radius around the position that the evidence suggested was closest to the exact encounter location. The temporary closure applied to all Contracting Parties and was implemented until the Commission had acted on the advice from an assessment on whether the area had or was likely to have a VME.

83. SEAFO indicated that CM 30/15 contained a definition of an encounter as an incidental catch of a VME indicator species above threshold levels. The identification of indicator species was to be made on a case-by-case basis through assessment by the Scientific Committee. Furthermore, the CM contained protocols on the reporting of an encounter. The Scientific Committee compiled a provisional list of benthic invertebrate VME indicator species/groups, and the Commission adopted a coral and sponges guide to assist observers on board of vessels with the identification of VME indicator species.

84. CCAMLR, reflecting that the predominant bottom fishing method was benthic longlining, established thresholds based on volume, while NAFO, NEAFC and SEAFO had all established weight-based thresholds. For each of these RFMO/As, these thresholds were developed in coordination with the relevant scientific body. Both NAFO and NEAFC had re-evaluated their initial thresholds and lowered the thresholds for sponge fields and deep-sea corals. It was reported that encounters had been reported at CCAMLR, but none had been reported to date at NAFO and NEAFC. NAFO, NEAFC and SEAFO had only identified types of hard corals and sponge fields as indicator species.¹³⁶

85. Until its Scientific Committee had developed advice, SPRFMO required its members and CNCPs engaging in bottom fishing to establish threshold levels for encounters for VMEs for vessels flying their flag, taking into account paragraph 68 of the Guidelines. It also required vessels to either apply a “move-on” rule throughout the footprint whereby they needed to cease bottom fishing activities within five nautical miles of any site where evidence of a VME was encountered above threshold levels, or to fish according to a spatial management approach whereby the fishing footprint was divided, based on scientific advice, into areas open to bottom fishing, areas closed to bottom fishing and areas where vessels were required to cease bottom fishing activities within five nautical miles of any site where evidence of a VME was encountered above threshold levels. It further required reporting of encounters with VMEs to the secretariat.¹³⁷

86. Participants in the negotiations to establish NPFC have adopted interim measures (see also paras. 51 and 124), which include protocols for encounters with VMEs. Discussions regarding the adoption of an encounter protocol at GFCM began in 2016.

¹³⁶ United States of America.

¹³⁷ Australia, New Zealand.

3. Measures to ensure the long-term sustainability of deep-sea fish stocks and non-target species and the rebuilding of depleted stocks [paragraph 119(d) of resolution 64/72]

87. CCAMLR reported that it had developed CMs consistent with paragraph 119(d) of resolution 64/72. In particular, it highlighted CMs on: monitoring, control and surveillance (MCS); the regulation of mesh size; catch and effort reporting; prohibitions on directed fishing; measures for exploratory fisheries; and precautionary catch limits.

88. NAFO reported establishing management measures for fishing opportunities in line with its Precautionary Approach Framework, including catch and effort limitations, an Effort Allocation Scheme for Shrimp, product labelling requirements, catch monitoring and mandatory VMS, a Joint Inspection and Surveillance Scheme, an observer programme, port State control measures, and a NCP Scheme, with measures to combat illegal, unreported and unregulated (IUU) fishing.

89. NEAFC noted that ICES had developed an approach to providing quantitative scientific advice for data poor fish stocks. It also reported on a number of legally binding CMMs in place, consistent with the interim guidelines on management of deep-sea species, approved in 2014, and an interim categorization of deep-sea species, adopted in 2015. These included measures prohibiting fisheries directed at 21 deep-sea species and stipulating that the Contracting Parties should take measures to minimize by-catches of these species, as well as measures with explicit catch limits for two deep-sea fish stocks, and general measures that limit the overall fishing effort for all deep-sea fisheries. NEAFC also had a seasonal closure to protect known spawning aggregations of one deep sea species. It also implemented a system of MCS (see section III.A.6).

90. SEAFO reported that based on the best available scientific advice, the Commission had adopted two recommendations and several Conservation Measures relating to the conservation and management of deep-sea fish stocks and non-target species, including, since 2011, CM 25/12 on Reducing Incidental By-catch of Seabirds in the SEAFO Convention Area; CM 31/15 on Total Allowable Catches and related conditions for Patagonian Toothfish, Deep-Sea Red Crab, Alfonsino, Orange Roughy and Pelagic Armourhead for 2016 in the SEAFO Convention Area, and the System of Observation, Inspection, Compliance and Enforcement, which included an article on periodic reporting of catch and fishing effort by Contracting Parties (see section III.A.6 for more information on the System).

91. SPRFMO adopted CMM 2.03 in 2014, to, *inter alia*: limit bottom fishing catch in the Convention Area to a level that does not exceed the annual average over the period 1 January 2002 and 31 December 2006; and restrict bottom fishing to within the bottom fishing footprint (the spatial extent and distribution of historical bottom fishing over the period 1 January 2002 and 31 December 2006).¹³⁸ Under CMM 2.03, based on the Guidelines, scientific research and stock assessment were conducted by the SPRFMO Scientific Committee during its annual meeting to generate advice for the adoption of appropriate regulations by the Commission. This work included the development of reference points, sound fishery management strategies and rebuilding plans for declining stocks.¹³⁹

¹³⁸ New Zealand.

¹³⁹ SPRFMO response to RRC Questionnaire.

4. Establishing mechanisms to promote and enhance compliance with applicable measures [paragraph 129 (d) of resolution 66/68]

92. CCAMLR reported on its compliance CMs in place, a number which had come into force since 2011, including: Marking of fishing vessels and fishing gear (2014); Port inspections of fishing vessels carrying Antarctic marine living resources (2015); and Automated satellite-linked Vessel Monitoring Systems (2015). CCAMLR noted that in relation to resolution 66/68, paragraph 129(d), it adopted CM 10-10, CCAMLR Compliance Evaluation Procedure (2015), which served as a tool to assist monitoring the compliance of members with the decisions of the Commission.

93. GFCM established a number of measures related to MCS, including VMS requirements, as well as a regional scheme on port State measures to combat IUU fishing. GFCM, through its Compliance Committee, annually assessed compliance with obligations stemming from its measures vis-à-vis Contracting Parties, CNCPs and other relevant non-Contracting Parties.¹⁴⁰

94. NAFO's observer programme, outlined in article 30 of its CEM, required at least one independent and impartial observer, unless certain conditions were met, including the vessel having a VMS and an electronic observer and catch report system in place which had been tested by NAFO and Contracting Parties. Contracting Parties were required to ensure that their observers monitored compliance with the CEM, including by verifying logbook entries on composition of catch by species, quantities, live and processed weight, as well as recording gear type, mesh size, attachments, catch and effort data, coordinates, depth, time of gear on the bottom, catch composition, discards and retained undersized fish.

95. NEAFC reported that it implemented an extensive system of MCS, as set out in the NEAFC Scheme of Control and Enforcement, which is publicly available on its website.¹⁴¹ It included vessels' access monitoring, satellite-based VMS, regular catch reporting, at-sea inspections and port State measures. Following indications that the Contracting Parties may not have been monitoring their vessels sufficiently in real-time, the NEAFC secretariat reported that it had from early 2016 been actively monitoring the VMS in real-time for activities that indicated possible bottom fishing in areas where bottom fisheries were not authorized, with a view to immediately informing the flag State and requesting it to investigate the issue further. The flag State would then be required to report on the results of such investigations.

96. SEAFO reported on its System of Observation, Inspection, Compliance and Enforcement, which addressed control measures, monitoring of fisheries, at-sea inspections, VMS, a scientific observer programme, and port State control. It included a section on Measures to Promote Compliance, which included articles on Sightings and Identifications of Non-contracting Party Vessels and Listing of IUU Vessels. SEAFO had also concluded an agreement with CCAMLR, NAFO and NEAFC to jointly list IUU vessels.

97. SPRFMO's CMM 3.03 Compliance Monitoring Scheme set up a process to annually monitor compliance of its members and CNCPs with obligations arising

¹⁴⁰ GFCM response to RRC Questionnaire.

¹⁴¹ <http://www.neafc.org/scheme>.

under the Convention and CMMs adopted by the Commission, designed to: assess compliance by members and CNCs with their obligations under the Convention and CMMs; identify areas in which technical assistance or capacity-building may be needed to assist members and CNCs to achieve compliance; identify aspects of CMMs which may require improvement or amendment to facilitate or advance their implementation; and take action against non-compliance through preventive and remedial options, including possible responses that take into account the reasons for and degree of non-compliance.¹⁴²

B. Actions taken by States to regulate bottom fisheries

98. The following section describes the wide range of measures and actions reported by States¹⁴³ to give effect to resolutions 64/72 and 66/68 to address the impacts of bottom fisheries on VMEs and the long-term sustainability of deep-sea fish stocks.

99. At a general level, several respondents stressed the importance of the relevant resolutions of the General Assembly and the Guidelines in ensuring the long-term protection of VMEs and deep-sea species from the impacts of bottom fishing on the high seas. The United States noted that implementation of the commitments in resolutions 61/105, 64/72 and 66/68 continued to be uneven and more work in a number of areas was necessary to fulfil the goals and objectives set forth in those instruments.

1. Identifying vulnerable marine ecosystems on the basis of marine scientific research and other sources of information [paragraph 119 (a) of resolution 64/72, and paragraphs 132 and 133 of resolution 66/68]

100. Australia indicated that it was cooperating on research on deep-sea species as a target species in the SPRFMO area and was seeking to cooperate on further research relating to stock assessments in the SIOFA area.

101. In addition to the NEREIDA programme (see para. xxx), Canada participated in the European Union Blue Growth Horizon to research VMEs in the North Atlantic. Canada noted that it had undertaken annual stock surveys in the NAFO area and contributed to the stock assessments underpinning the science advice to the Fisheries Commission.

102. The European Union reported that it brought together data from visual surveys and multidisciplinary surveys of the seafloor to identify VMEs and inform the reassessment of the NAFO bottom fisheries. It also reported on Spain's programme of scientific mapping of the seabed in areas of the high seas where its bottom fisheries took place.

103. New Zealand reported on its contribution to the identification of VMEs in the CCAMLR area through information collected on its fishing vessels, including by observers, and information from its scientific research voyages to the Antarctic, as

¹⁴² SPRFMO response to RRC Questionnaire.

¹⁴³ Due to the low number of responses received by the Secretariat, this section does not purport to provide a comprehensive overview of actions taken by States. States that are members of RFMO/As may have taken additional action through such bodies and implemented the decisions of such bodies.

well as to the development of models to predict the distribution of VME indicator taxa.

104. Norway reported on the systematic mapping of the Norwegian sea floor since 2006, which facilitates the identification of VMEs and is used as a basis for fisheries management decision-making.¹⁴⁴

105. Oman reported that it did not possess a high seas fishing fleet, so it had not undertaken any research programmes, but it was working to integrate studies and the necessary tracing of marine resources in the marine environment.

106. The United States reported on a number of research projects to identify VMEs, including a multi-year collaboration to discover and characterize deep-sea coral habitats in the Gulf of Mexico and a multi-year deepwater mid-Atlantic canyons project to discover and characterize the seafloor communities that live in association with east coast submarine canyons. From 2009 through 2015, the United States had conducted three-year deep-sea research initiatives focused on mapping, modelling, and understanding the ecological functions of deep-sea coral and sponge ecosystems, which included cooperative surveys with Canada for VMEs in both the Pacific and Atlantic Oceans. It also recently began a three-year deep-sea research and exploration effort to increase the understanding of VMEs in the North and South Pacific. It developed a new deep-sea coral and sponge database, and collaborated with New Zealand to identify VMEs in the South Pacific.

2. Adopting conservation and management measures to protect vulnerable marine ecosystems or closing areas to bottom fishing until such measures are in place [paragraph 132 of resolution 66/68]

107. Several respondents reported on a wide range of measures to regulate bottom fishing vessels or close areas to bottom fishing, including through issuance of fishing permits, limits on the use of fishing gear, area-based management tools (ABMTs), and MCS mechanisms.

108. As part of its commitment to relevant interim measures, Australia noted that it had prepared an impact assessment for its bottom fishing activities in the SPRFMO and SIOFA Areas, which took into account individual, collective and cumulative impacts of fishing on VMEs and had been made publicly available. The assessments indicated that the risk of SAIs on VMEs from Australian vessels was low for demersal trawl and demersal auto-longline and negligible for mid-water trawl and drop-line. Australia reported that it may review its bottom fishing impact assessments if new information became available, or if fishing activity changed. Australia also reported on recent research within areas of national jurisdiction on the assessment of the vulnerability of benthic habitats to impacts by demersal gears that could be applied in areas beyond national jurisdiction in considering impacts of bottom fishing.

109. Canada reported that all high seas fishing by its vessels, as well as activities occurring in another State's waters, were subject to domestic licensing requirements, which required compliance with Canadian laws in all areas of the high seas, including areas where no RFMO existed. It applied an ecological risk assessment framework to help identify the level of ecological risk of fishing activity and its impacts on sensitive benthic areas in the marine environment, in particular cold-

¹⁴⁴ Norway.

water corals and sponges. Scientific assessments and research were peer-reviewed and made publicly available.

110. The European Union indicated that its member States could only issue special fishing permits for the use of bottom fishing gears on the high seas if specific conditions were met, including regarding prior impact assessments, unforeseen encounters with VMEs, area closures and an observer scheme. The use of bottom gears was prohibited in areas where no proper scientific assessment had been carried out and made available. The protection of sensitive and vulnerable habitats in areas beyond national jurisdiction was also promoted by the establishment of fishing protected areas.

111. The European Union established a specific access regime for fishing vessels engaged in deep-sea fisheries of the North-East Atlantic made up of four main components: capacity restriction, data collection, effort monitoring, and control. A proposal to update the regulation was currently being considered, which would represent a shift towards selective, science-based fishing for deep-sea species, incorporating the precautionary approach and ensuring minimal impact of fishing gears on vulnerable deep-sea ecosystems. The European Union also reported on a range of measures for managing deep-sea fisheries, including under its Common Fisheries Policy, such as restrictive fishing permits, reporting obligations and requirements for satellite tracking devices and scientific observers.

112. The European Union noted that, in application of its regulations, Spain had restricted fishing in the Southwest Atlantic to the area defined by the historical footprint of the fishery. Spain closed off nine areas with a total extent of 41,000 km², to bottom fishing by its fleet.

113. Iceland reported that vessels fishing outside areas of national jurisdiction were subject to its national legal regime aimed at fulfilling general obligations to protect living marine resources.

114. New Zealand noted its qualitative risk and impact assessment for its bottom trawl and bottom longline fishing operations in the SPRFMO Convention Area, as required by the relevant interim measures for bottom fisheries, which had been reviewed by the SPRFMO Scientific Working Group. The assessment was used as the basis for the development of a management approach for New Zealand bottom trawling operations in the SPRFMO Area.

115. In 2011, Norway adopted a regulation on bottom fishing in its exclusive economic zone, which addresses the requirements of General Assembly resolution 61/105, by inter alia establishing a footprint at depths above 1000 metres. It also adopted legislation to protect cold water coral reefs, under which 18 reefs have been given special protection. Since 1999, a general duty of care has been in place for Norwegian flagged vessels during fishing operations near known coral reefs both in areas under Norwegian fisheries jurisdiction and all other areas.

116. In addition to gear restrictions, Oman reported that its fishermen were required to declare equipment lost during fishing activities and to place markings on equipment during use, and that it prohibited the use of monofilament fishing nets on all its fishing fleet.

117. The Philippines ensured effective control over its distant-water fishing fleets by requiring strict compliance with the terms of fishing permits and by MCS mechanisms, such as observer coverage.

118. The United States reported that none of its vessels were authorized to conduct bottom fisheries in areas beyond national jurisdiction outside of RFMOs. Authorization to conduct bottom fishing on the high seas outside of RFMOs would only be granted upon completion of an assessment of impacts on the environment, including on VMEs. The United States was working to improve the monitoring of its fishing vessels on the high seas, including through adjustments to permitting and reporting procedures, requirements for installation and operation of enhanced mobile transceiver units for vessel monitoring, observer coverage, reporting of transshipments taking place on the high seas and protection of VMEs.

119. A number of respondents also reported on actions taken to prevent SAIs on VMEs within areas of national jurisdiction. Canada reported on a number of fishery closures to protect corals and/or sponges from fishery-related impacts. Iraq indicated that its fishing vessels did not use bottom trawl gear within the territorial sea. Oman prohibited all bottom fishing in its maritime zones in 2011. Chile reported it had prohibited all bottom fishing activities on all seamounts lying in its maritime zones which are indicative of VMEs, in an area of 68,065 square kilometres.

3. Measures to ensure the long-term sustainability of deep-sea fish stocks and non-target species, and the rebuilding of depleted stocks [paragraph 119(d) of resolution 64/72]

120. Several respondents reported on efforts to ensure the long-term sustainability of deep-sea fish stocks and non-target species and the rebuilding of depleted stock, including scientific research programmes, including in the context of their work through RFMO/As (see section III.A.3).

121. Canada reported on guidelines for the development of rebuilding plans for severely depleted fish stocks to ensure that such plans were developed in a nationally coherent manner, consistent with the precautionary approach. New Zealand indicated that it was using a predictive habitat model to develop estimates of potential orange roughy biomass in the SPRFMO area as a basis for making recommendations on likely sustainable orange roughy catches.

122. The European Union reported on measures which provided for fixing and allocation of fishing opportunities, prohibition of discards and landing obligations, establishment of protected areas, collection of scientific data. It also noted its general legislative frameworks for the protection of VMEs and marine biodiversity, policies to reduce impacts of economic activities on the marine environment, participation in regional seas conventions that provided for international cooperation on marine ecosystem protection, and financial support and investment in measures that contributed to the protection of VMEs and to restore marine biodiversity and ecosystems.

4. Establishing new regional fisheries management organizations or arrangements and prohibiting bottom fishing activities where no regional fisheries management organization or arrangement exists [paragraphs 120 and 124 of resolution 64/72]

123. Since the report of the Secretary-General to the General Assembly in 2011,¹⁴⁵ three new RFMO/As have been established, namely SIOFA and SPRFMO in 2012 and NPFC in 2015 (see paras. 48-51). In addition, the Declaration Concerning the Prevention of Unregulated High Seas Fishing in the Central Arctic Ocean was signed by all five Arctic Ocean coastal States in 2015. It expresses an intention to implement certain interim measures, acknowledges the interest of other States in preventing unregulated high seas fisheries and envisions a broader process to develop measures that would include commitments by all interested States. Canada reported that the relevant coastal States were working to develop measures consistent with the Declaration.

124. Australia reported that, since SIOFA had not established binding CMMs, it managed fishing vessels operating in the SIOFA regulatory area consistent with the Guidelines and under conditions similar to those applicable to vessels operating in the SPRFMO area. It was working with SIOFA parties towards a spatial management approach. Australia monitored the total catch taken from bottom fishing in the SIOFA regulatory area against the average annual catch level between 1999 and 2009.

125. The United States noted that participants in the negotiations of the NPFC developed interim measures, including those applicable to the North Eastern Pacific Ocean in 2011, for use in the identification and assessment of marine species and VMEs and a protocol for exploratory fisheries and were beginning to cooperate to ensure the long-term and sustainable use of fisheries in the convention area.

126. Several States reported that their vessels were not authorized to conduct bottom fisheries in areas beyond national jurisdiction or did not fish outside areas regulated by RFMO/As (Bulgaria, Canada, Iraq, Philippines, Oman, New Zealand, United States) (see paras. 115 and 117). Bulgaria reported that fishing vessels in its register were not engaged in deep-sea fisheries in areas beyond national jurisdiction, Canada noted that fishing by its vessels in areas beyond national jurisdiction occurred almost exclusively in the convention areas of RFMO/As. Oman indicated that any future authorization to conduct bottom fishing in areas beyond national jurisdiction would be granted in accordance with the Guidelines. Iraq reported that it had no ships fishing in the high seas. The Philippines noted that its vessels were not currently engaged in bottom fishing on the high seas.

5. Implementing measures adopted by regional fisheries management organizations or arrangements

127. Several States reported on their actions to support the adoption and implementation of CMMs in RFMO/As to which they belonged, to regulate bottom fishing and protect VMEs from the impact of bottom fishing activities, pursuant to relevant resolutions of the General Assembly (Australia, Canada, European Union, Iceland, New Zealand, Norway, Philippines, United States). A number of States reported on actions taken at the national level to implement CMMs adopted in

¹⁴⁵ See A/66/307.

RFMO/As to address the impacts of bottom fishing on VMEs, including through encounter protocols (Australia, New Zealand), licensing systems (Australia, Canada, Iceland, New Zealand, Philippines), catch limits (New Zealand), MCS mechanisms (Canada, New Zealand), and impact assessments (Australia, New Zealand, Oman).

128. Some States have also adopted MCS measures, New Zealand noted that it undertook pre- and post-trip inspections of vessels heading into the CCAMLR area, as well as aerial and surface patrolling and reported all sightings of illegal activities to the CCAMLR secretariat. The Philippines integrated into its newly amended fisheries code a penal provision for violation of CMMs enacted by the RFMO/As or through international or regional agreements relative to fishing in high seas convention areas.

C. Actions taken by States and competent regional fisheries management organizations and arrangements in cooperating to undertake marine scientific research, collect and exchange scientific and technical data and information and develop or strengthen data-collection standards, procedures and protocols and research programmes

1. Exchanging best practices and developing regional standards [paragraph 122 (a) of resolution 64/72]

129. The European Union reported that its member States provided their respective survey data to ICES. In that regard, data as well as best practices were made available to the RFMOs to which the European Union was a party.

130. NEAFC reported that ICES conducted extensive work relating to developing scientific best practices and standards.

131. NAFO noted that it participated in regular exchanges and international fora, mediated through FAO or bilaterally with other RFMOs, to develop and implement best practices.

132. SEAFO reported on its active role in promoting and setting standards, as well as enhancing the exchange of best practices, by participating in various forums. For instance, SEAFO co-authored a chapter of a publication by FAO to review best practices by RFMO in deep fisheries.

2. Making assessments and adopted measures publicly available [paragraph 122 (b) of resolution 64/72, and paragraph 130 of resolution 66/68]

133. Generally, RFMOs with competence to regulate bottom fisheries reported that they maintained websites that detailed and publicized conservation measures that had been adopted by their contracting parties.

134. In addition, several States reported on the publication of assessments or measures by RFMOs. Examples were provided by Australia and New Zealand. Australia noted that an impact assessment for its bottom fishing activities in the SPRFMO and SIOFA Areas prepared in 2011 had been made publicly available (see para. 106). New Zealand indicated that SPRFMO and CCAMLR impact assessments were publicly available on their respective websites.

135. NAFO reported that all assessments of the extent of VMEs in its Regulatory Area and the assessments of any impacts of fishing activity on them were publicly available on its website and in the FAO VME Database. While details of exploratory fishery activities were considered confidential, summaries of the discussion on impacts of such activities could also be found in NAFO Scientific Council Reports.

136. NEAFC reported that information made publicly available in its website included reports on all of its meetings, including those where assessments were acted on; and various legally binding CMMs relating to deep-sea species and the protection of VMEs.

137. SEAFO reported that the impact assessments provided by Contracting Parties were evaluated by its Scientific Committee and published in the annual SEAFO Scientific Reports together with assessments conducted by SEAFO scientists, and made available on the SEAFO webpage. Catch data was also submitted to FAO annually.

3. Submission by flag States of lists of authorized vessels and relevant adopted measures to FAO [paragraph 122 (c) of resolution 64/72]

138. Australia reported that it provided all data required by RFMO/As to which it was a party, and also provided data to FAO, when requested. New Zealand indicated that it had provided a list to FAO of New Zealand flagged vessels that had approval to fish on the high seas using bottom fishing methods.

139. The United States stated that, as vessels flying its flag were not authorized to conduct bottom fisheries in areas beyond national jurisdiction outside of RFMOs, it did not maintain a list of such vessels.

4. Sharing information on vessels engaged in bottom fishing where the flag State responsible cannot be determined [paragraph 122 (d) of resolution 64/72]

140. NEAFC reported that any vessel identified as engaging in or supporting fishing activities in the NEAFC area that was not flying the flag of a Contracting Party was placed on the list of suspected IUU vessels (IUU 'A list') and, if the vessel was confirmed as having engaged in or supported IUU fisheries, it was placed on the list of confirmed IUU vessels (IUU 'B list'), which was shared with other RFMOs and made publicly available on the NEAFC website. NAFO reported that it maintained a list of vessels linked to IUU fishing on its website, and exchanged details of these with other RFMOs (for additional information on mechanisms to enhance and promote compliance with applicable measures, see section III.A.6).

5. Developing or strengthening of data-collection standards, procedures and protocols and research programmes [paragraph 123 of resolution 64/72]

141. In addition to the publication of the NAFO Coral, Sponge and Other Vulnerable Marine Ecosystem Indicator Identification Guide (see para. 57), NAFO indicated that it had adopted measures requiring all catches of VME indicator species to be recorded at the lowest taxonomic level possible by observers, and to facilitate this, the secretariat had forwarded to FAO a list of VME indicator species which currently lacked ASFIS codes for inclusion in the 2016 FAO species list.

142. NEAFC reported that its comprehensive Recommendation on the protection of VMEs included annexes on a "VME Data Collection Protocol", the "Assessment of Exploratory Bottom Fishing Activities" and on "VME Indicator Species".

143. SEAFO reported that its Commission had adopted data collection protocols, developed by its Scientific Committee, which ensured that a representative part of all

catches were sampled, Its Marine Research guidelines, available on the SEAFO webpage, were developed to ensure that high-quality science would be conducted freely and to the benefit of all, in a manner which did not cause SAIs on the marine ecosystems and organisms, including fisheries resources.

D. Recognition of special circumstances and requirements of developing States¹⁴⁶

144. The special requirements of developing States were recognized in the constitutive instruments of several RFMO/As, including: SEAFO, GFCM, SPRFMO and SIOFA. Some States and RFMO/As reported that they had recognized the special circumstances and requirements by engaging in capacity-building and assisting developing States.

145. The United States reported that its National Ocean Atmospheric Administration was a partner in the Global Environment Facility's "Global Sustainable Fisheries Management and Biodiversity Conservation in the Areas Beyond National Jurisdiction" programme which, inter alia, provided assistance to developing countries to implement the Guidelines. It also developed the Field Sampling Guide on Corals in English, Korean, and Japanese, that can be used by scientific observers operating over Emperor Seamounts. New Zealand assisted Pacific small island developing States by supporting the sustainable management of offshore fisheries, with focus areas of cooperation including fisheries management frameworks at a national, regional, and sub-regional level, and the implementation of successful fisheries surveillance and enforcement regimes.

146. In 2009 CCAMLR emphasized the importance of fair burden sharing, having better data sharing, enhancing participation in working groups, exchanging scientists and readers/manuals. It established a Scientific Committee scholarship, using funds donated by Norway.¹⁴⁷ SPRFMO maintained a budget for developing States to attend SPRFMO meetings.¹⁴⁸

147. NAFO's Development Internship Program provided training for citizens of developing States.¹⁴⁹

148. NEAFC engaged in projects focused on working with developing States and capacity-building. SEAFO established the Special Requirements Fund in 2009 to financially support initiatives in developing States. SEAFO also sponsored two observer training workshops and several capacity-building opportunities arose during the research cruise referred to in para. 59.

IV. Activities of the Food and Agriculture Organization of the United Nations to promote the regulation of bottom fisheries and the protection of vulnerable marine ecosystems

¹⁴⁶ Paragraph 121 of General Assembly resolution 64/72 and paragraph 134 of resolution 66/88.

¹⁴⁹ <http://www.nafo.int/publications/PAR-2011.pdf>

149. FAO reported on a number of actions taken to assist the implementation of the relevant provisions of General Assembly resolutions 64/72 and 66/68, including paragraphs 135 and 136 of resolution 66/68.

150. FAO continued its work to assist in the implementation of the Guidelines. FAO's deep-sea fisheries programme was implemented through targeted contributions and through projects supported by various donors.¹⁵⁰ In 2014, the project "Sustainable Fisheries Management and Biodiversity Conservation of Deep-sea Ecosystems in the Areas Beyond National Jurisdiction" (ABNJ Deep Seas Project) was launched to contribute to strengthening international policy and legal frameworks; supporting planning and management in deep-sea fisheries; and reducing impacts on VMEs. FAO is also a partner in SponGES: "Deep-sea Sponge Grounds Ecosystems of the North Atlantic" project.

151. With regard to the 2015 research cruise with the *R/V Dr Fridtjof Nansen* in the Convention Area of SEAFO (see para. 59), follow-up activities include capacity development activities to further analysis of the reference collection and publication of the results. FAO also conducted a Trans-Indian Ocean Survey from Indonesia to South Africa. It organized and/or supported a series of four regional multi-stakeholder workshops to facilitate information-sharing and discussions on issues related to VMEs. In the Caribbean, the workshop led to the identification of VMEs by the Western Central Atlantic Fishery Commission (WECAFC). One additional regional workshop (in the Central Eastern Atlantic) is planned for 2016. Furthermore, a multi-stakeholder workshop was held in May 2015 in collaboration with the Norwegian Institute of Marine Research to facilitate the sharing of best practices and effective solutions on VME encounter protocols and impact assessments.

152. Regional training workshops on the "Identification of Deep-sea Cartilaginous fishes of Indian Ocean and the Southern Atlantic Ocean" were held in 2014 and in 2015, respectively, to improve the capabilities of scientists from the region in the identification of these species. After consultations with relevant stakeholders, FAO finalized species guides and catalogues of the deep-sea cartilaginous fishes of the Indian Ocean and the South East Atlantic, for use on board vessels by observers, scientists, and non-scientific personnel. The development of similar tools had been initiated for the South Eastern Pacific Region and would be finalized in 2016.

153. A manual on collection of biological data on deep-sea species is to be published in 2016. In addition, an electronic application (SmartForms) for reporting onboard observations related to VMEs and biodiversity reporting from deep-sea fisheries vessels is currently being developed by FAO and an interested group of RFMOs.

154. Work has been initiated to update and expand the *Worldwide Review of Bottom Fisheries in the High Seas* (FAO, 2009) by addressing information gaps identified in the last review, describing progress made on the monitoring of data-poor deep-sea stocks, and benefiting from updated stock assessment for key species. A global review of Alfonsino, their fisheries, biology, and management is available¹⁵¹ and a similar review of the biology and assessment of orange roughy is underway. FAO is also working to analyze existing policy and legal frameworks for addressing biodiversity in sustainable fisheries in the ABNJ Deep Seas, and develop practical tools to improve their implementation.. The information reported to FAO in relation to General Assembly resolution 61/105 was made

¹⁵⁰ <http://www.fao.org/fishery/topic/16160/en>

¹⁵¹ <http://www.fao.org/publications/card/en/c/d1c00ca0-7215-4386-8460-fbfb8038d06/>.

publicly available through FAO's website. Capacity development has been incorporated at various levels in FAO's activities supporting implementation of the Guidelines. This includes the use of species identification tools, on the job training during research surveys, and training to analyze research information; as well as capacity-development in relation to all elements of the Guidelines.

155. *Establishing a global database of information on vulnerable marine ecosystems in areas beyond national jurisdiction.* The VME Portal and DataBase was launched in December 2014. It serves as an information sharing-platform as well as awareness-building tool to promote transparency and accessibility of work that has been done in relation to VMEs to the general public. Furthermore, FAO reported that a review on "Vulnerable Marine Ecosystems: Processes and Practices in the High-Seas" was close to being finalized. The main chapters described actions taken in regions covered by RFMO/As and regions where there were no regional management bodies. Domestic measures applied by States to their flagged high seas fishing vessels were only included when particularly relevant such as in areas where there were no current regional measures from a regional body.

V. Concluding remarks

156. In the past five years, steady progress has been made in understanding, inter alia, characteristics of different types of possible VMEs and the diverse impacts of different bottom fishing gears, as well as the characteristics and status of some deep-sea fish stocks, although the overall state of knowledge remains limited. To address the issue of insufficient data, new methods are being developed for stock assessment of deep-sea fish where data is poor or is only available from the fish catches. In the absence of observational data on the presence of VMEs, habitat suitability modelling is being used as a guide to VMEs, and can now be used in analysis of the risk of encounters of bottom fisheries with VMEs. While bottom trawls have had greatest impact, bottom longlining is increasingly recognized as capable of damaging VMEs, among other bottom fishing gears. Technical modifications of fishing gear or changes in fishing practices have been implemented as a way to reduce impacts with limited success.

157. Significant progress has been made in terms of the establishment of new RFMO/As since 2011. Based on the responses received from RFMO/As and several States, there has also been good progress in the identification of VME indicator species by a number of RFMO/As and States, through the conduct of research programmes and/or the elaboration of the definition of VMEs in the context of their regions. In some RFMO/As where progress has been limited, individual members within these RFMO/As have undertaken work to identify VME indicator species and/or their distribution.

158. RFMO/As have adopted a number of CMMs relating to VME protection, including regarding the conduct of bottom fisheries if they are assessed as not having SAIs on VMEs, the submission of preliminary assessments of impacts, and mitigation measures. However, information on the conduct of assessments in relation to cumulative impacts appears limited except for some RFMO/As. In addition, the requirement of impact assessments in some RFMO/As appears to provide insufficient protection within the existing fishing footprints. Flag States

have adopted measures to regulate bottom fishing by vessels flying their flag, including for areas where there is no RFMO/A competent to regulate bottom fisheries. Such measures range from prohibitions of fishing to the granting of licences after impact assessments.

159. Several RFMO/As have closed areas where VMEs occur or are likely to occur. In areas where there is no RFMO/A, some States have closed certain areas with VMEs to bottom fisheries by vessels flying their flag. Some RFMO/As have reviewed and updated such closures in light of new information regarding VMEs and deep-sea fish stocks. Other RFMO/As could consider similar actions.

160. Several RFMO/As established and implemented encounter protocols, including the thresholds levels for VME indicator species, the move-on rules, as well as temporary or permanent closures. While conservative threshold values established by some RFMO/As would enable the full implementation of the relevant paragraphs of the resolutions, thresholds set by other RFMO/As are too high to provide effective protection for VMEs. In addition, the requirement of “live” by-catch species by some RFMO/As may prevent them from taking timely action based on the identification of VMEs. Some RFMO/As had only identified types of hard corals and sponge fields as indicator species. Members of some RFMO/As have yet to agree on thresholds for encounter protocols. Furthermore, difficulties associated with the implementation of encounter protocols, including the move-on rules, remain. All in all, whether or not existing encounter protocols, including threshold levels, are providing sufficient protection for VMEs should be further investigated.

161. A number of RFMO/As have adopted CMMs to ensure the long-term sustainability of deep-sea fish stocks, including catch and effort reporting, gear restrictions, measures for exploratory fisheries, precautionary catch limits and prohibitions on directed fishing. Some RFMO/As have yet to adopt a full range of measures, for example setting catch/effort limits.

162. In addition to the measures outlined above, a number of other actions addressing other parts of the relevant resolutions have been adopted by RFMO/As and States, including: cooperation to undertake marine scientific research, collection and exchange of scientific and technical data and information and development or strengthening of data-collection standards, procedures and protocols and research programmes, and capacity-building activities for developing States. In regard to the last issue, a limited number of States reported on their capacity-building activities for managing bottom fisheries specifically. Developing States will need effective assistance in this regard.

163. Overall, while a number of actions have been taken, implementation of the resolutions on a global scale continues to be uneven and further efforts are needed. Unless timely actions are taken by all the stakeholders concerned, overfishing of deep-sea species is likely to continue to occur and some VMEs will not be adequately protected from SAIs. If fully implemented, however, resolutions 64/72 and 66/68, as well as the Guidelines, continue to provide a good basis for protecting VMEs from SAIs due to bottom fishing and to ensure the long-term sustainability of deep-sea fish stocks.
