Data integration for mapping  
and monitoring the SDGs

world  
pop

**FLOWMINDER.ORG**

Professor Andy Tatem

# Development goal denominators

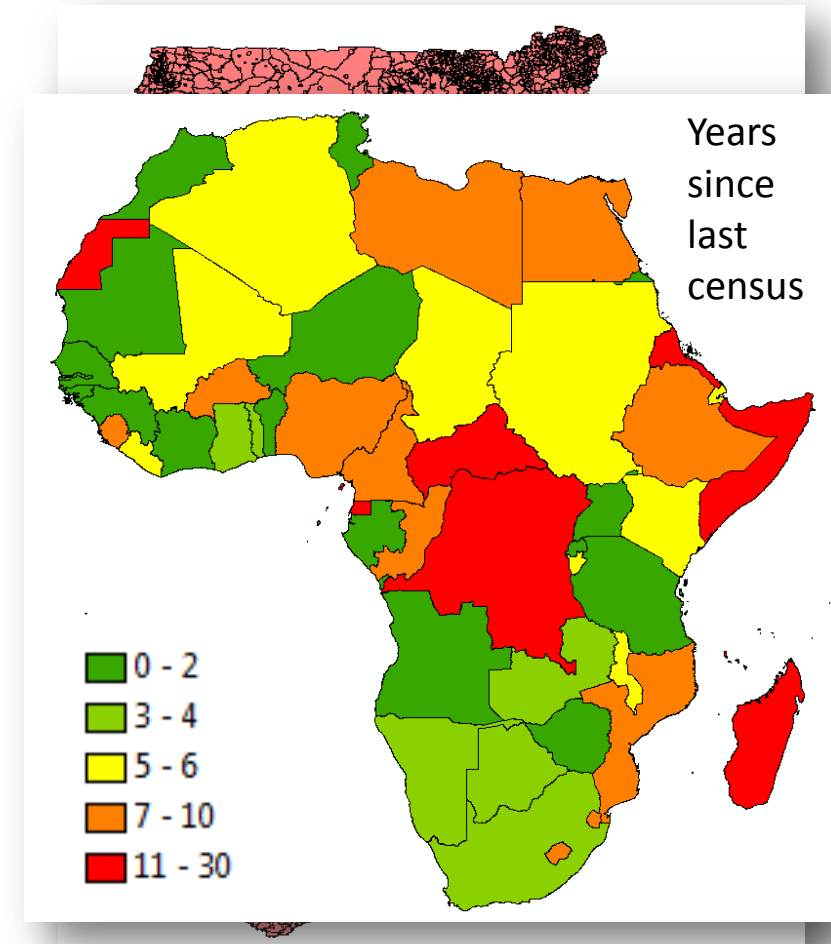

- All MDGs and SDGs are based on ensuring a certain percentage of the population has access to specific services or resources, or achieves a certain level of social, economic, or physical health.
- Improved understanding of *sub-national geographic variation and inequity* in health status, wealth, and access to resources within countries is increasingly recognized as central to meeting development goals.
- Requires a consistent, comparable and regularly updated understanding of not only how many people live in a country, but where the people are, and who they are.

# The challenge

- National census data will continue to be our most important datasource
- Provides denominators and numerators for all SDGs, and requisite subnational detail
- But, the 2015-2030 SDG period typically includes just one census datapoint
- And in some settings the situation is more challenging

# What do we have to help us?

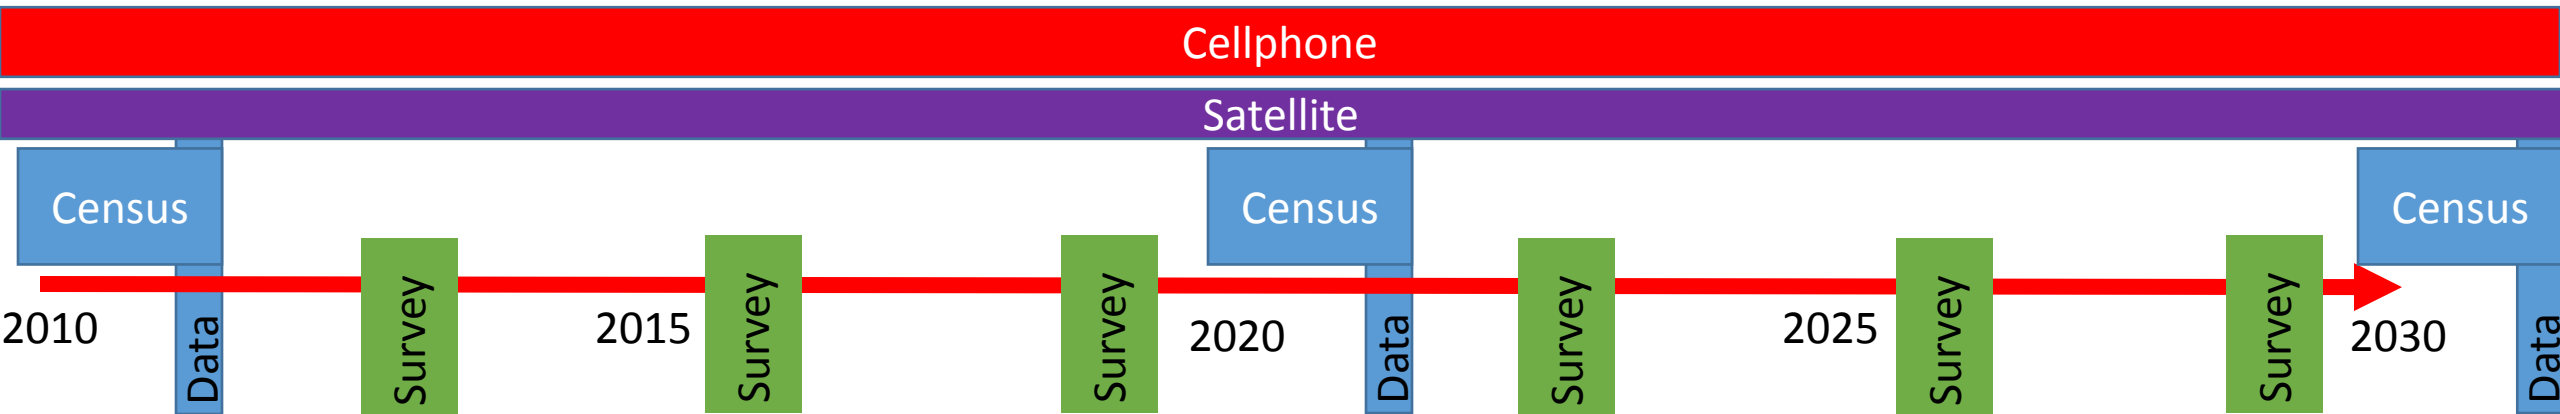

Geolocated  
household surveys

Satellite and GIS  
data

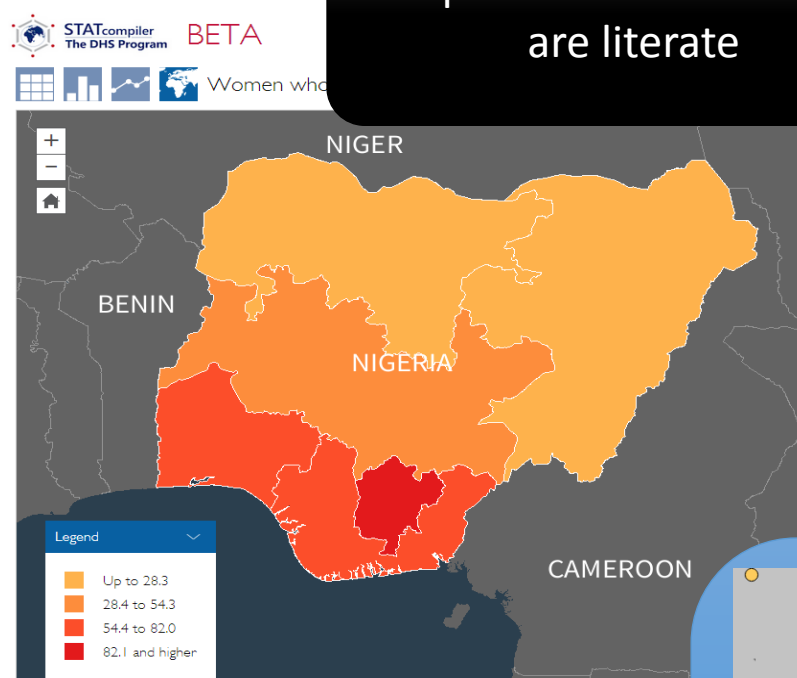

Cellphone data

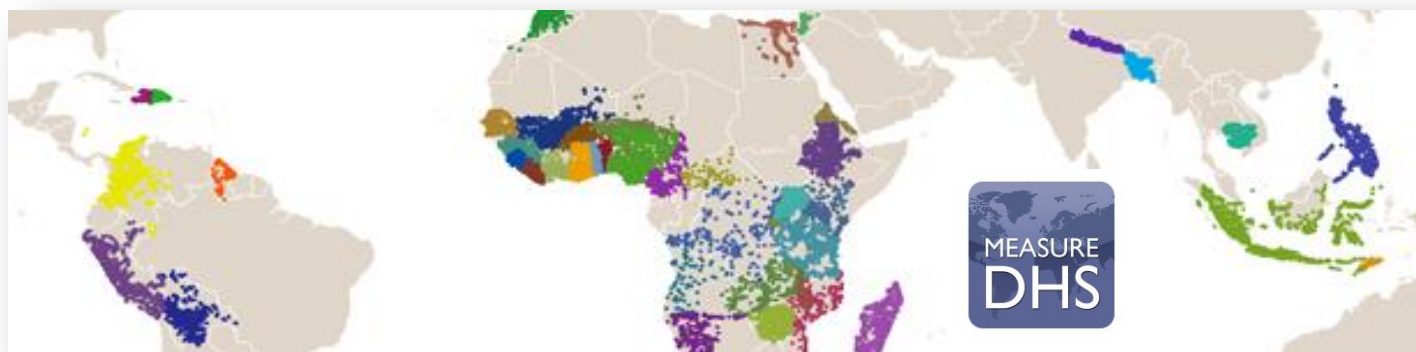

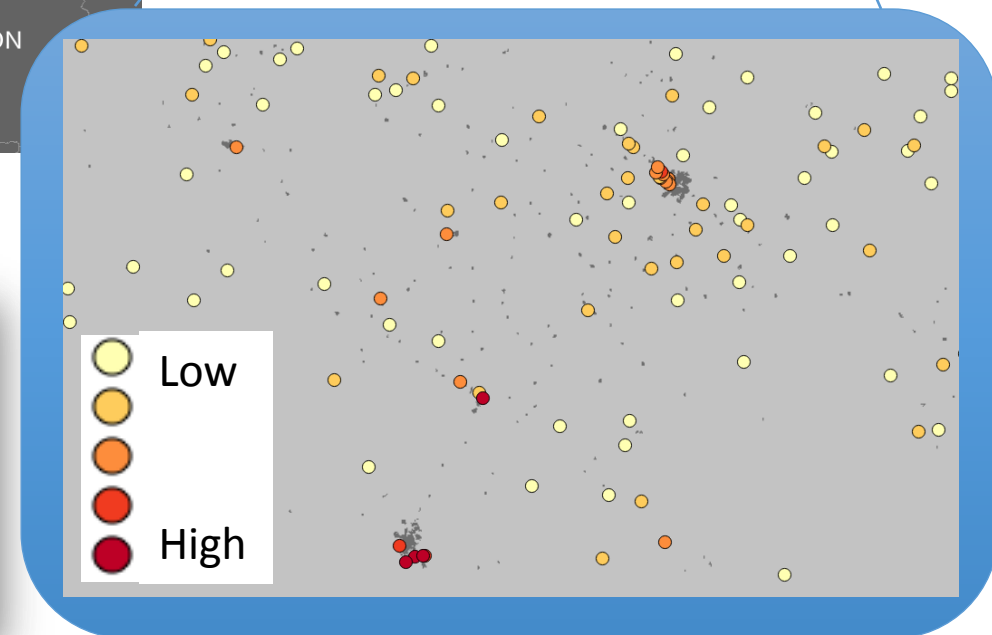

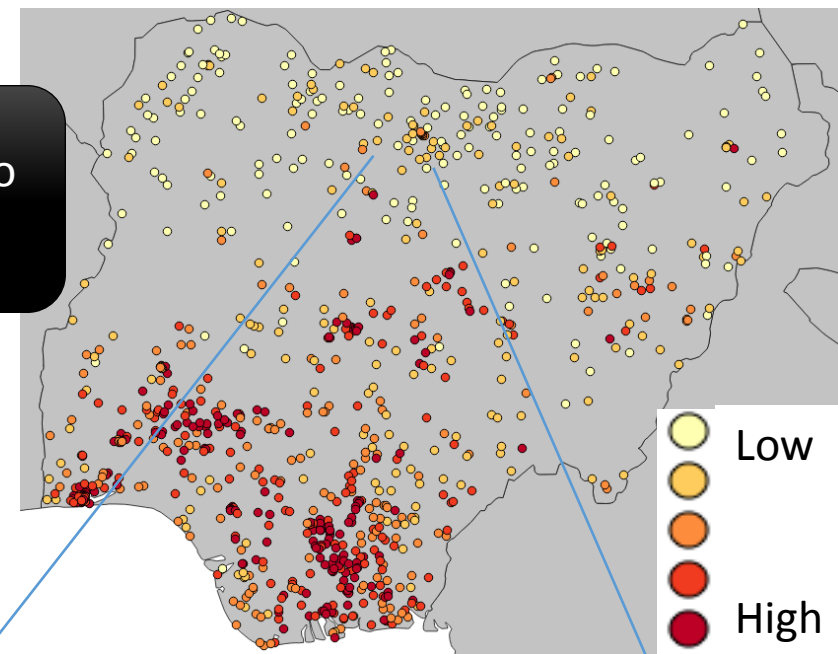

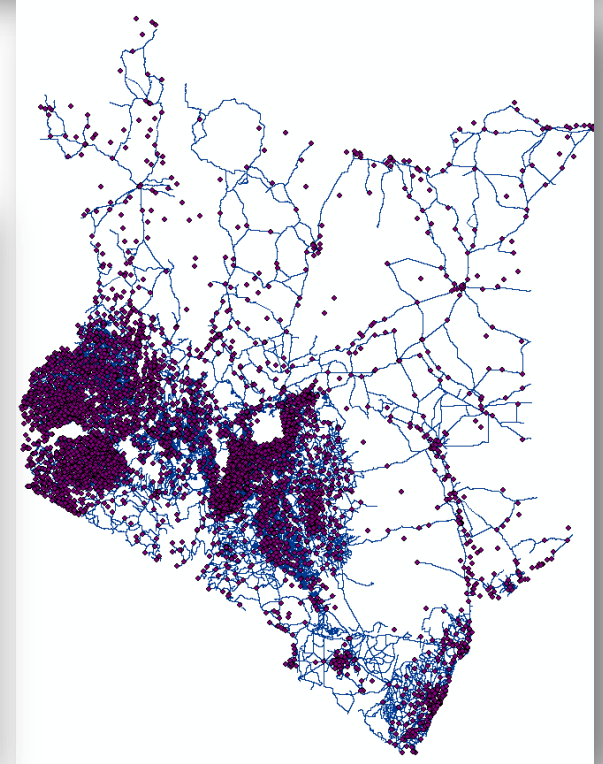

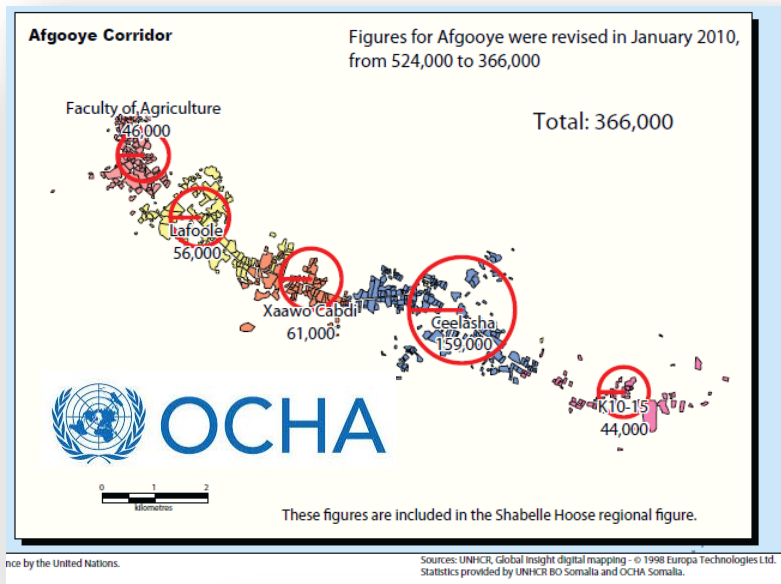

# Geolocated Surveys

Proportion of women who are literate

# Satellite and GIS o

# Cellphone call detail rec

## Cell Phone Ownership Surges in Africa

Adults who own a cell phone

Note: U.S. data from Pew Research Centers surveys.

Source: Spring 2014 Global Attitudes survey. Q68.

PEW RESEARCH CENTER

User makes a call from location X

User travels to Y and makes a call

Call through tower

**Mobility:** Changing densities, flows, seasonal/permanent migration

**Social networks:** Number of contacts, calling patterns

**Consumption:** Credit purchase frequencies, top-up amounts

### Protecting confidentiality

- Aggregate summaries
- Regulator approval
- Raw data never leaves operator

**FLOWMINDER.ORG**

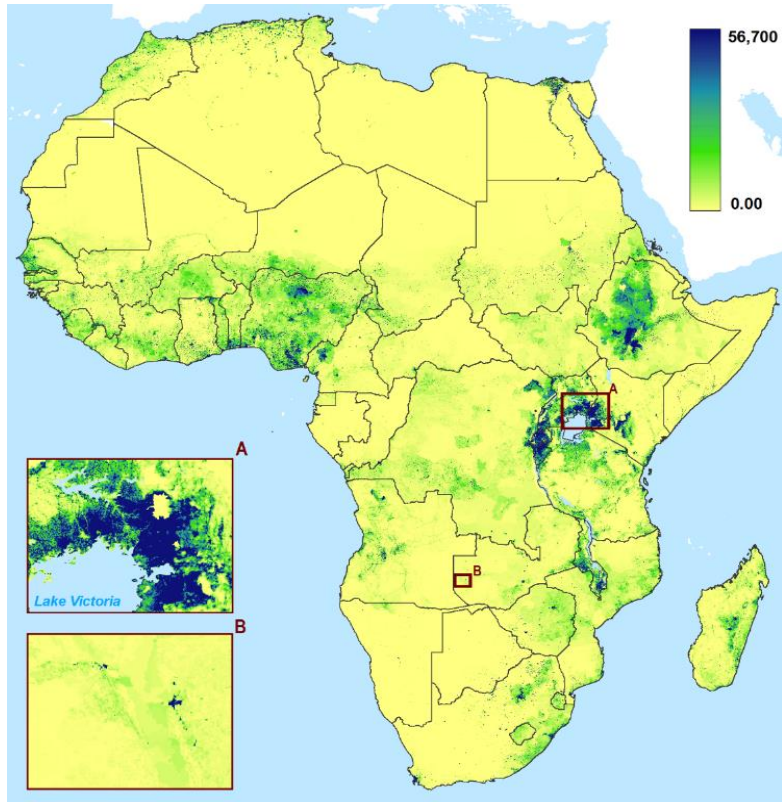

All SDGs are based on ensuring a certain percentage of the population has access to specific services or resources, or achieves a certain level of social, economic, or physical health  
**Need for accurate, subnational, ongoing data on denominators**

How can we get there with census data plus these newer datasets?

# Census data disaggregation

Integration with satellite/GIS data related to human population distribution patterns to disaggregate counts to regular grids

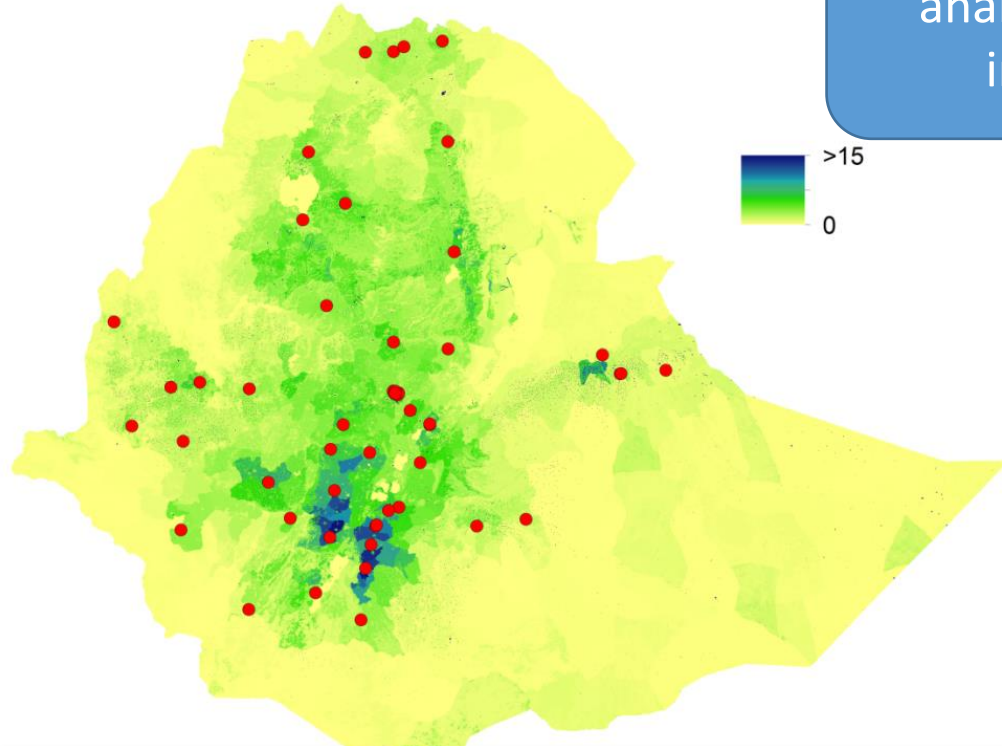

Women of childbearing age per 1x1km 2015

# Benefits of 'gridded' demographic data

Grids: flexibility in analysis and data integration

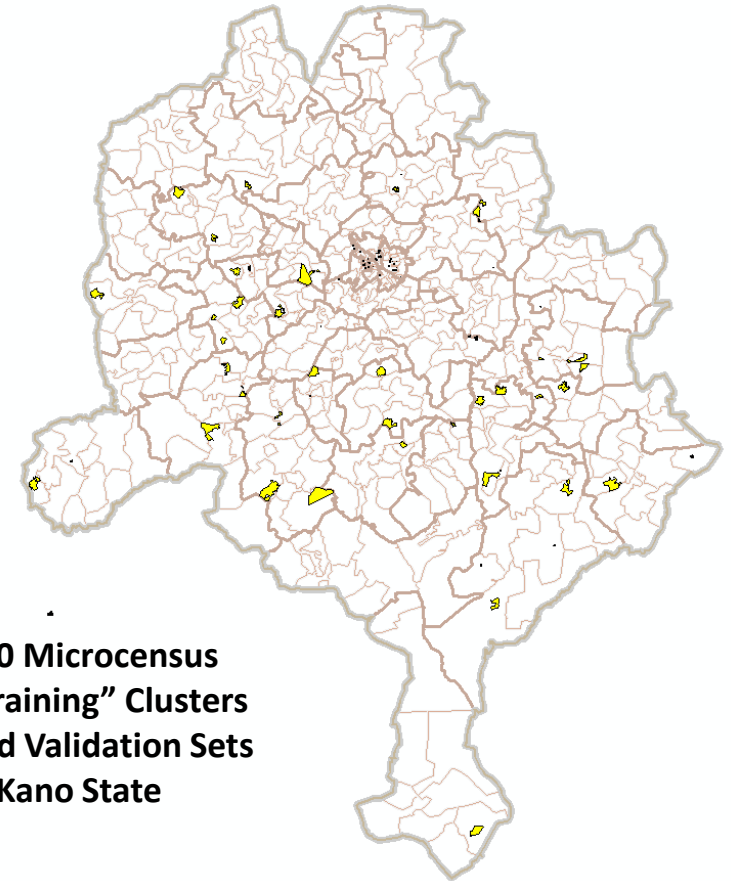

# Bottom-up population mapping

Mapping buildings and settlements from satellite  
imagery

150 Microcensus  
"Training" Clusters  
and Validation Sets  
in Kano State

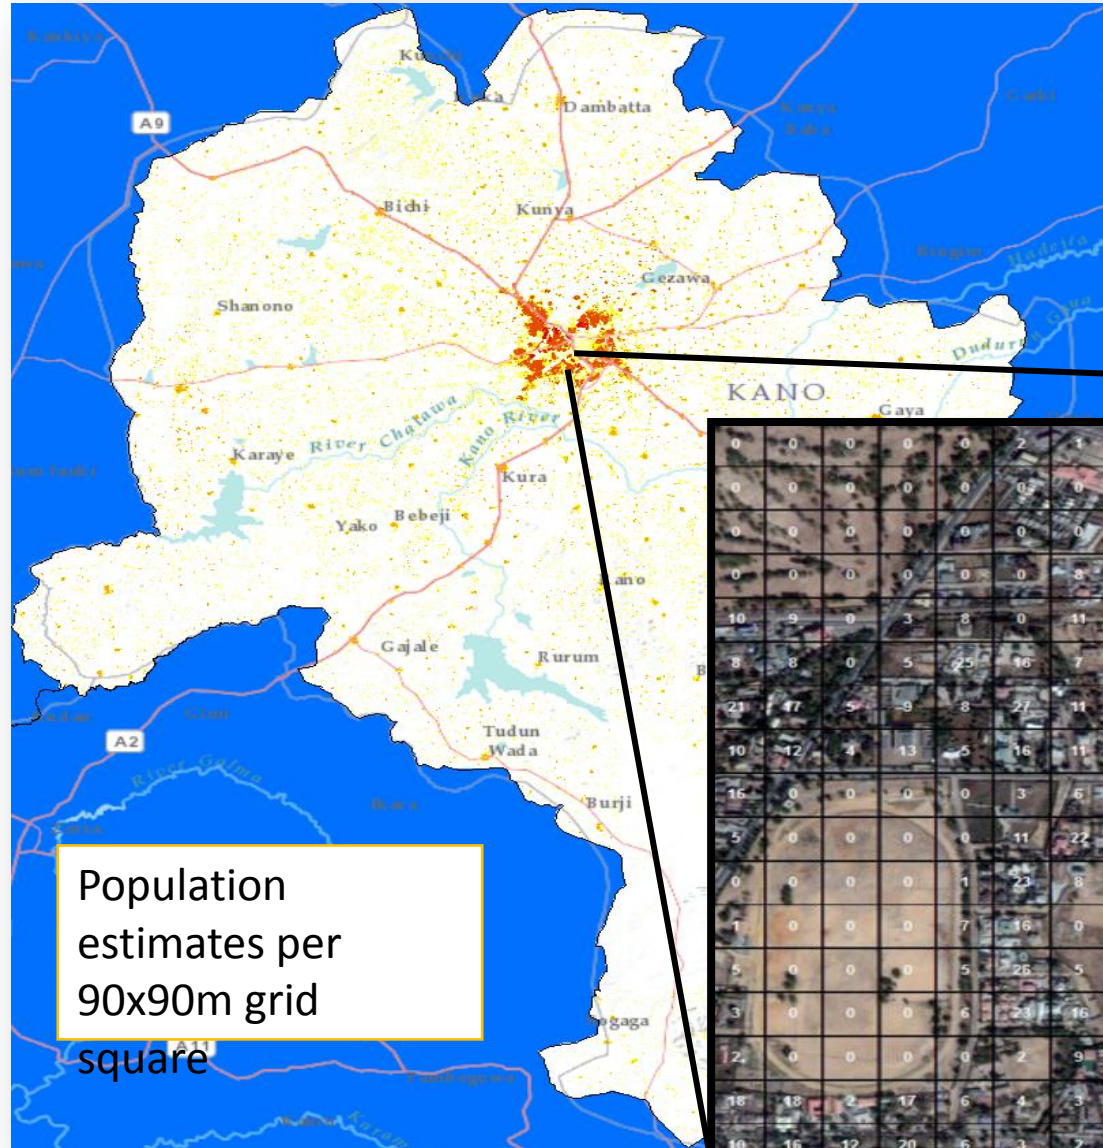

BIL

National Laboratory

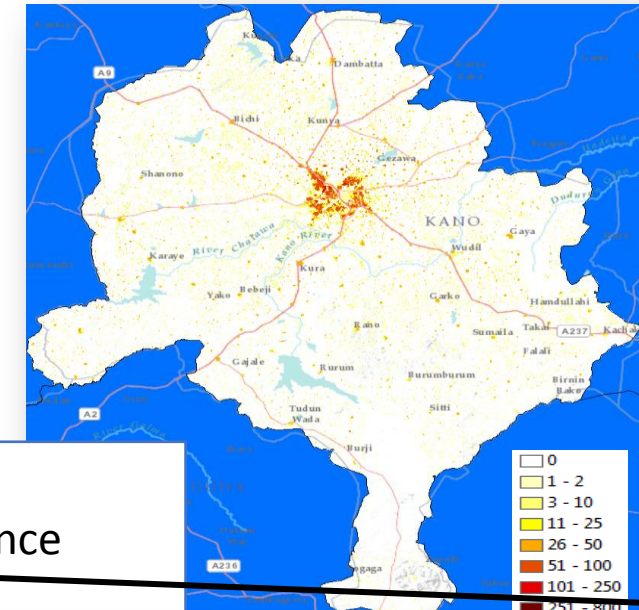

# Kano State, Nigeria

Lower confidence interval

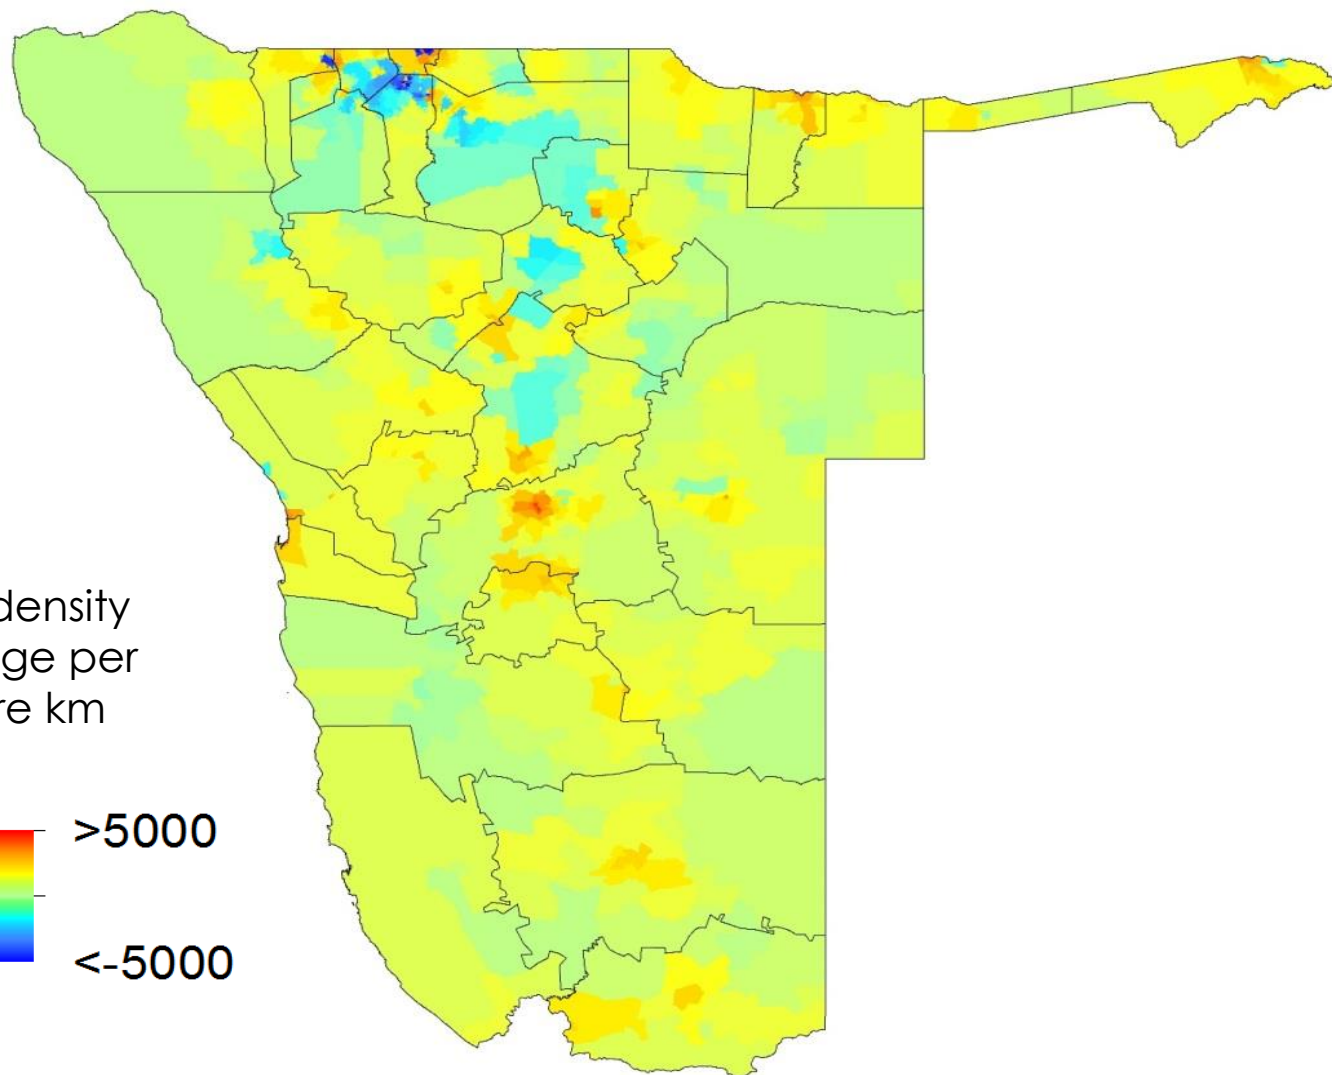

Populations don't stay still....

Pop density

# Measuring migration

# Measuring targets: Population characteristics and coverages

## SDG targets

- 1.1. Eradicate extreme poverty for all people everywhere -measured as people living on less than \$1.25 a day

- 2.2. End all forms of malnutrition, including the internationally agreed targets on stunting and wasting in children under 5 years of age

- 3.7. Ensure universal access to sexual and reproductive health-care services

- 4.6. Ensure that all youth and a substantial proportion of adults, both men and women, achieve literacy

- 6.2. Achieve access to adequate and equitable sanitation and hygiene for all

## What can we use?

# Spatial data integration

- Population characteristics measured in household surveys can be strongly related to features we can measure everywhere
- We can use these relationships to predict characteristics into unsampled locations using metrics from census, satellite and cellphone data to create maps of SDG-relevant indicators
- Importance of validation and the measurement and mapping of uncertainty

-Increasing distance from major roads = increasing poverty

-Increasing urbanicity = decreasing poverty

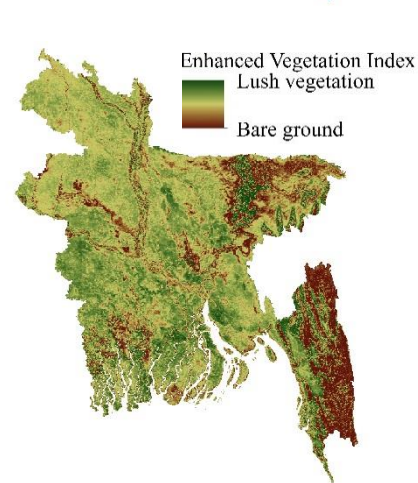

-Wider social network = lower poverty

-Large, regular credit top up = lower poverty

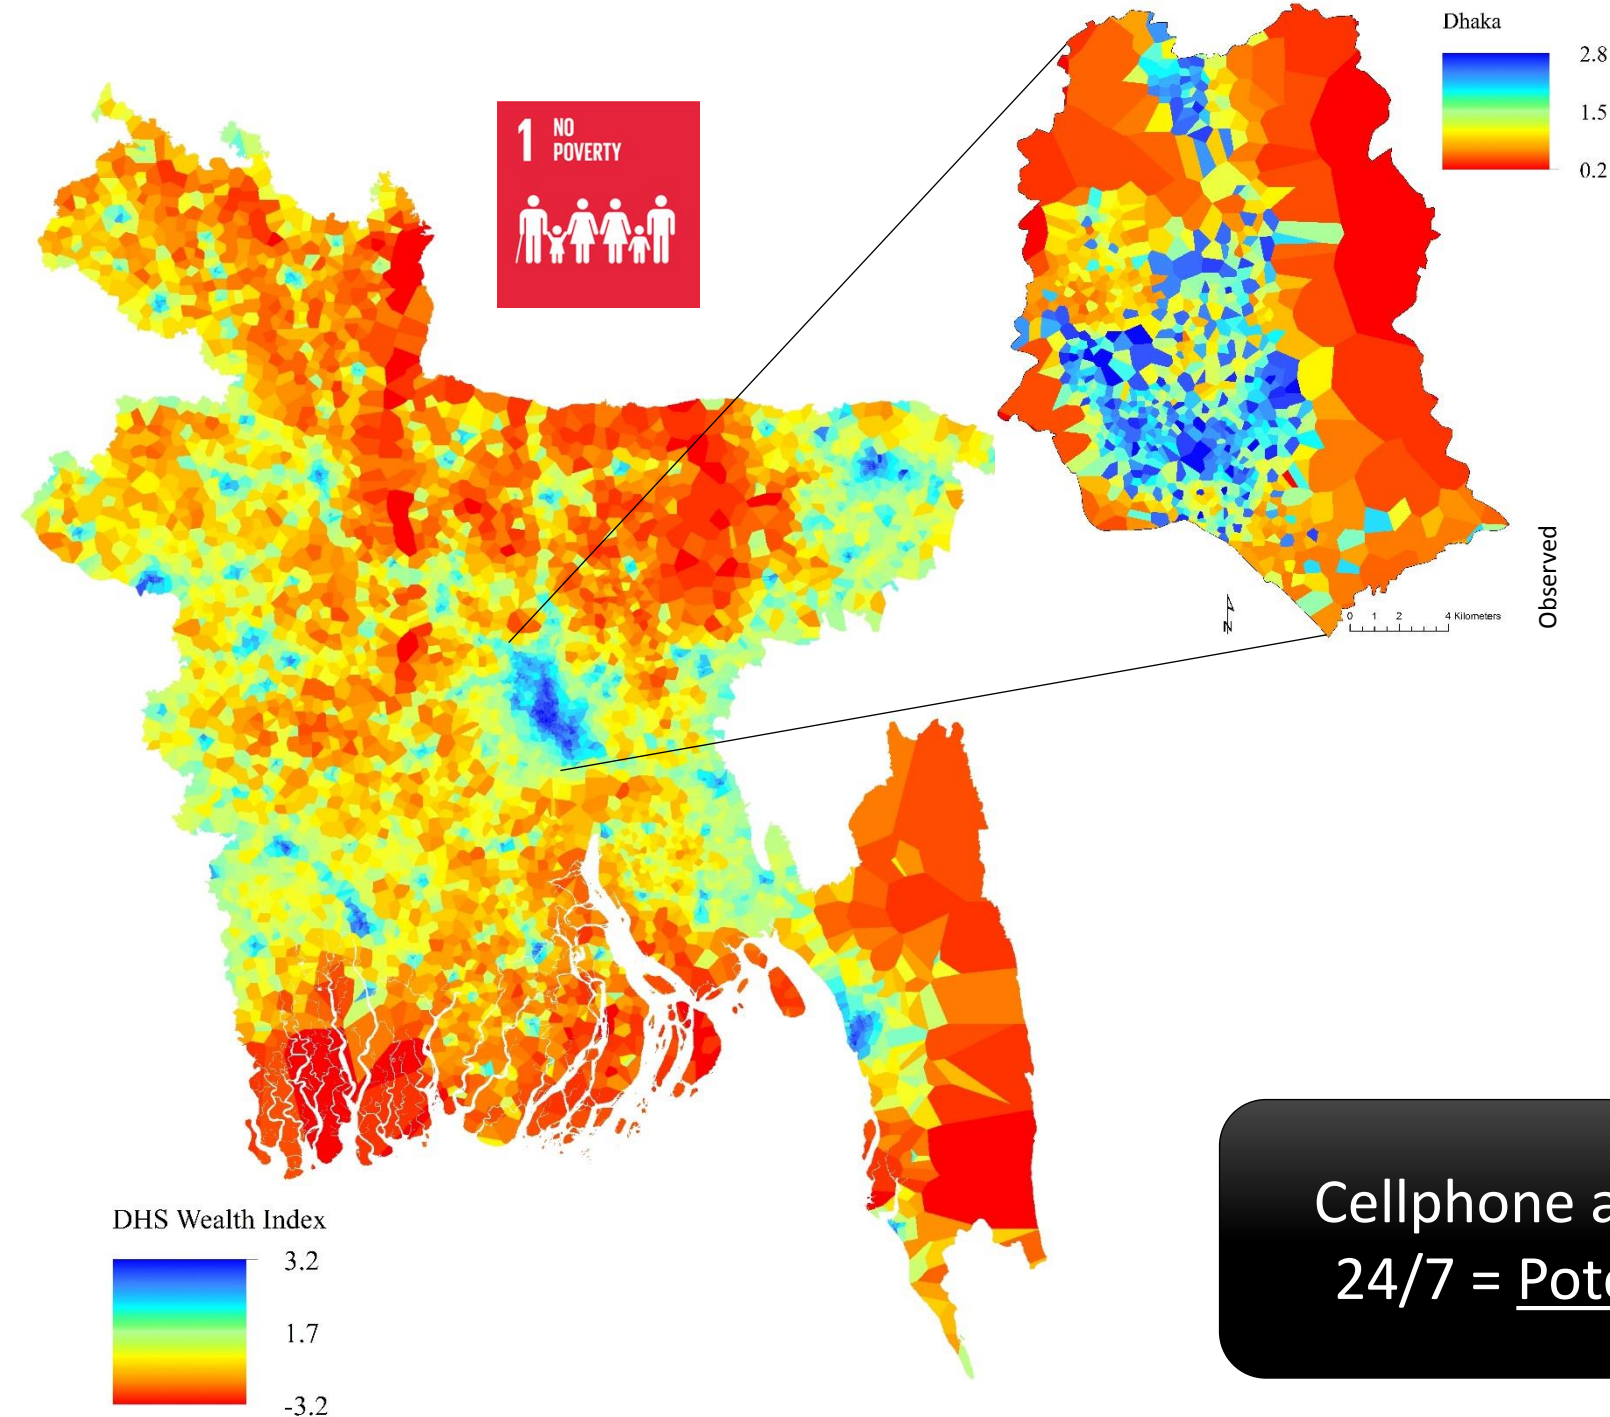

# Improving mapping of socioeconomic indicators

GPS-located survey cluster data

## Example output: Bangladesh wealth index

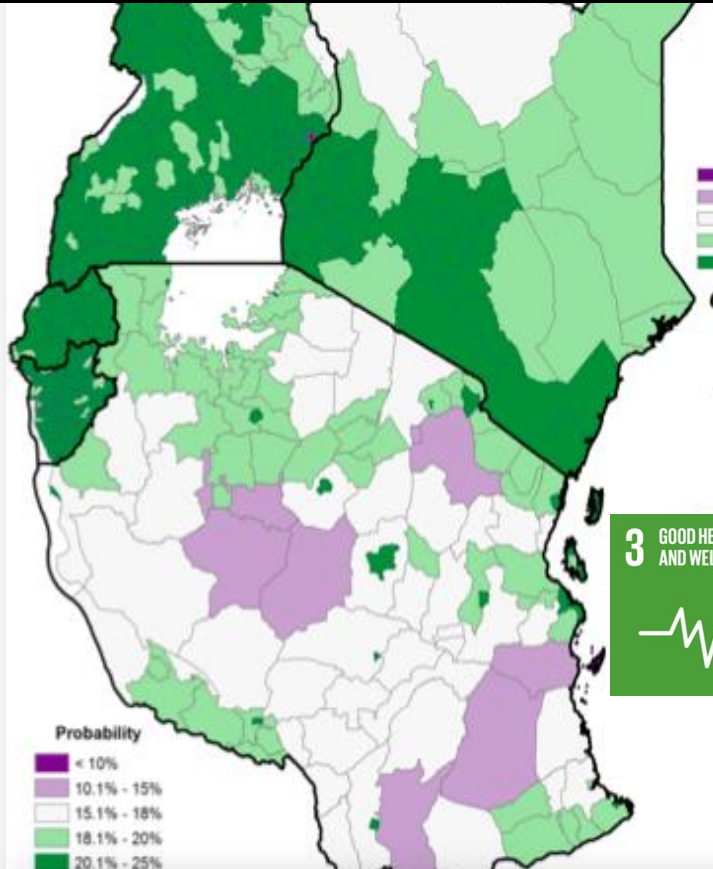

Cellphone and satellite data are collected  
24/7 = Potential for ongoing monitoring

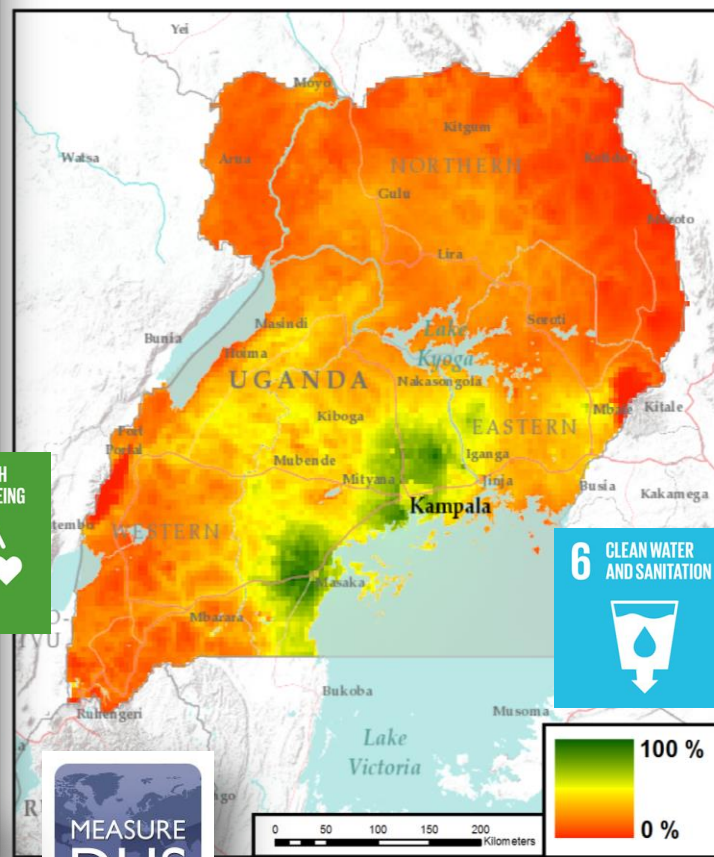

# Mapping SDG indicators

data2x  
partnering for a  
gender data revolution

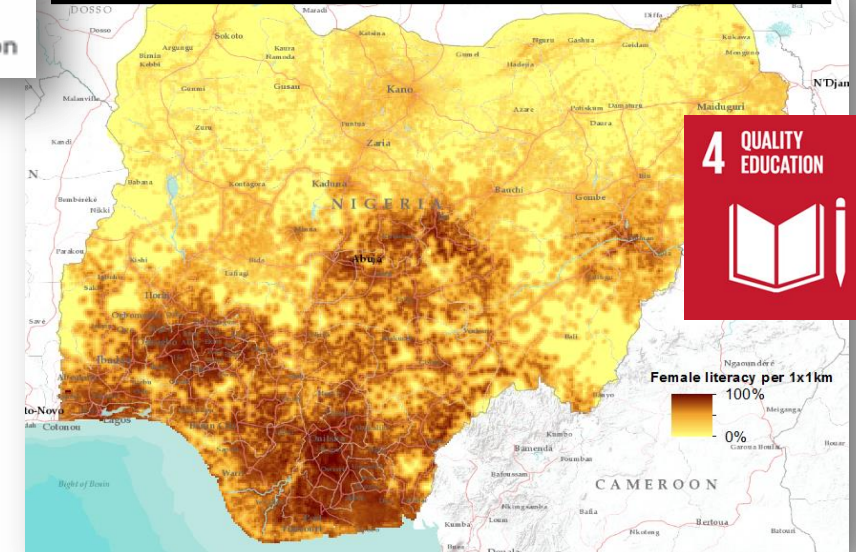

Probability of receiving postnatal  
care within 48 hours of delivery  
per district

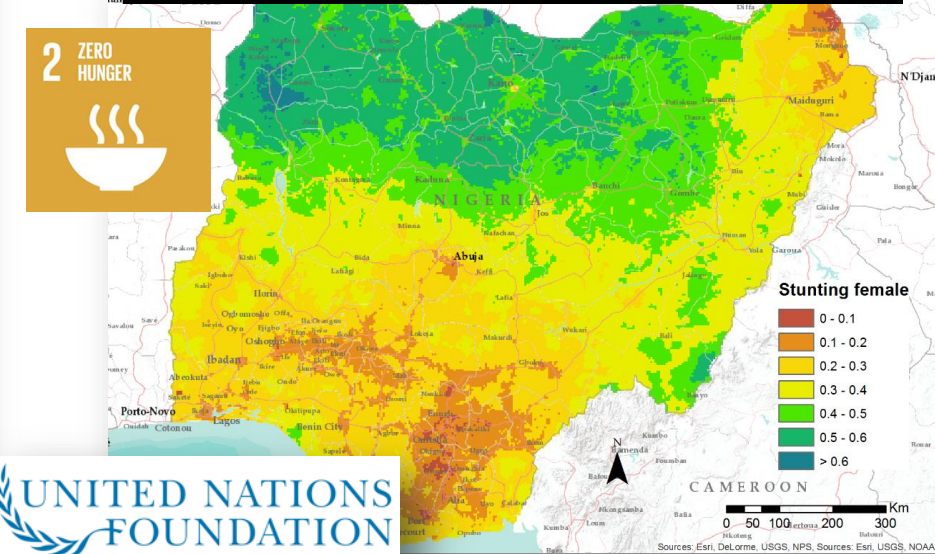

Percentage of population with access  
to sanitation per 1x1km grid cell

Percentage of women who are  
literate per 1x1km grid cell

Percentage of girls who are stunted  
per 1x1km grid cell

Open Health Initiative

# Measuring targets: Resilience and risk reduction

## SDG targets

- 3.d. Strengthen the capacity for early warning, risk reduction and management of national and global health risks

- 9.a. Facilitate sustainable and resilient infrastructure development in developing countries

- 11.b. Adaptation to climate change, resilience to disasters, holistic disaster risk management at all levels

- 13.1. Strengthen resilience and adaptive capacity to climate-related hazards and natural disasters in all countries

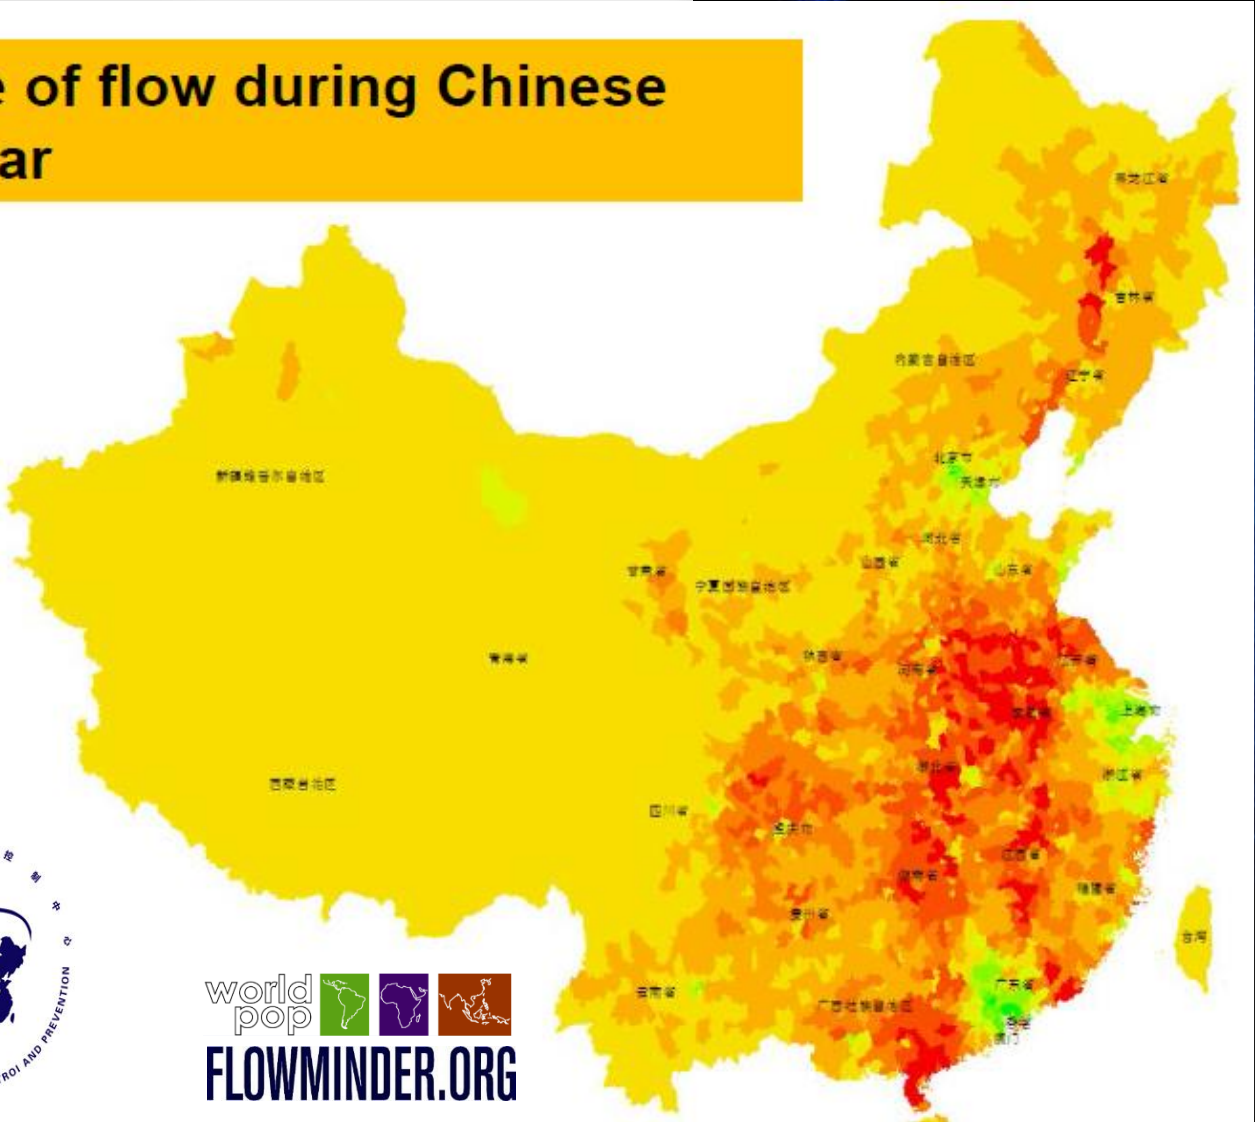

**What can we use?**

# Mapping population movement

## Change of flow during Chinese New Year

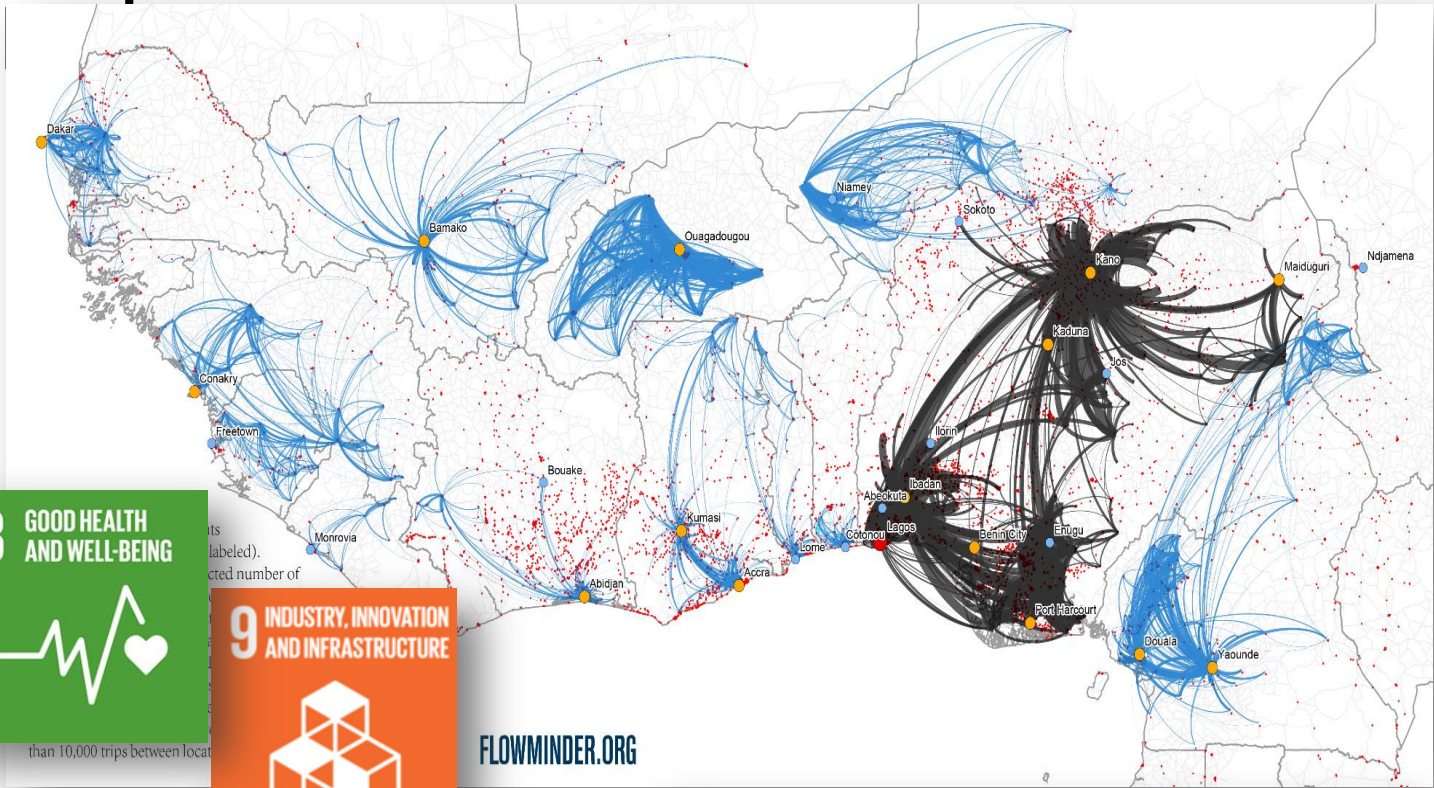

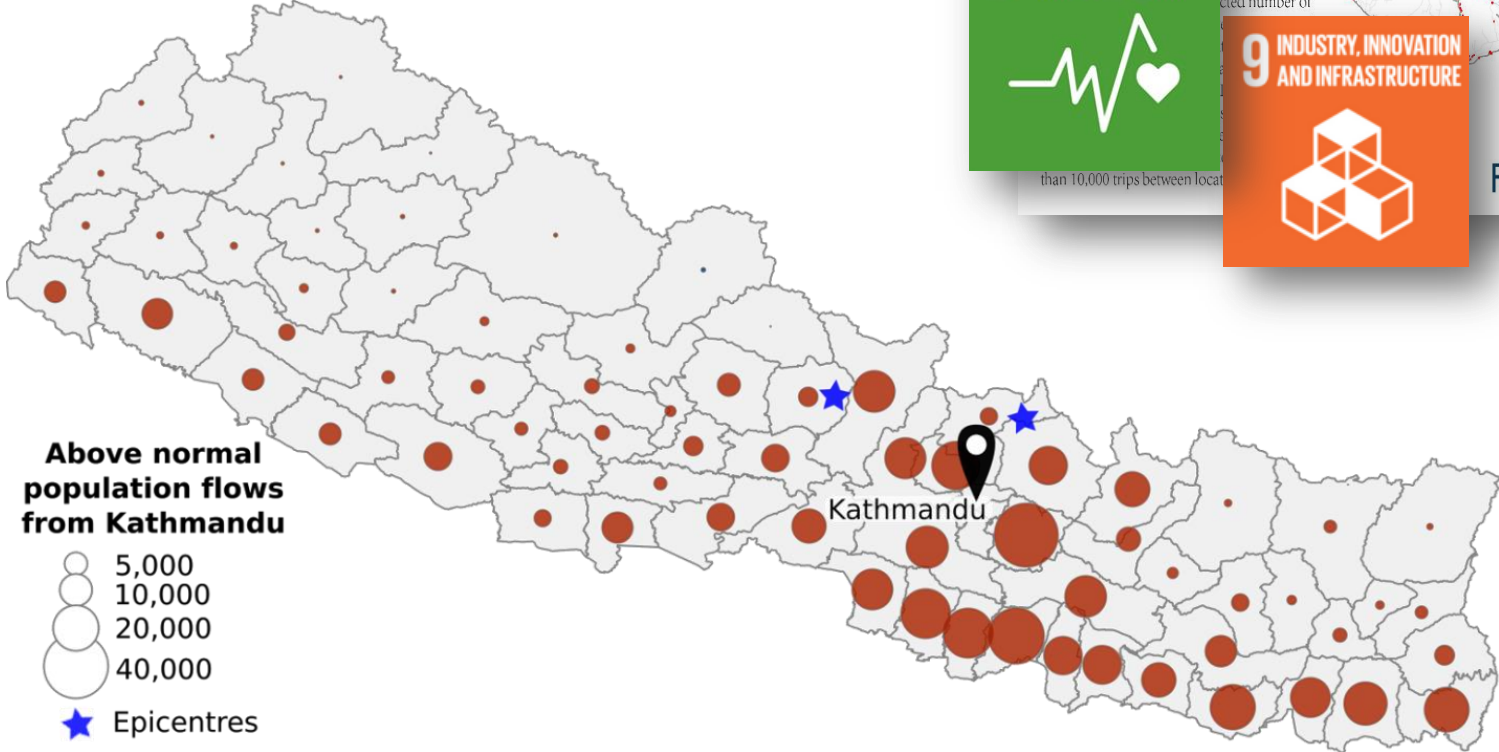

world pop  
FLOWMINDER.ORG

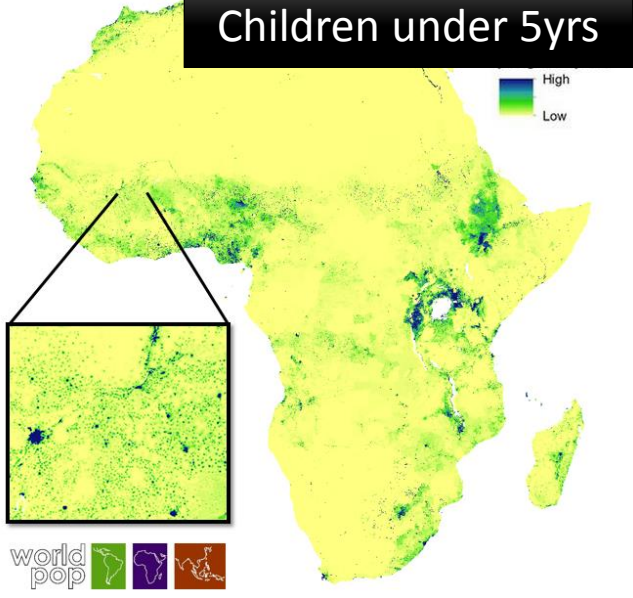

# Mapping connect and displacement

# Datasets, methods already in use operationally

Children under 5yrs

## EAST ASIA'S CHANGING URBAN LANDSCAPE

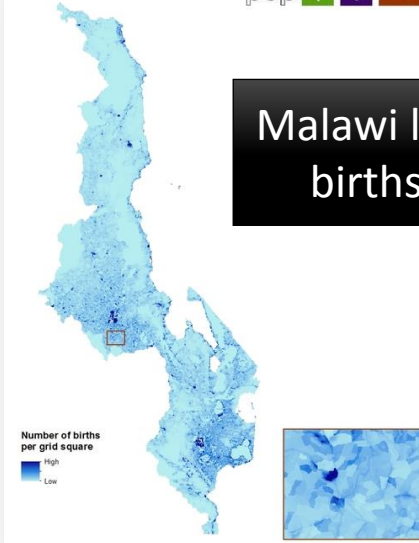

Measuring a Decade of Spatial Growth

Malawi

Malawi live births

## THE STATE OF THE WORLD'S MIDWIFERY 2014

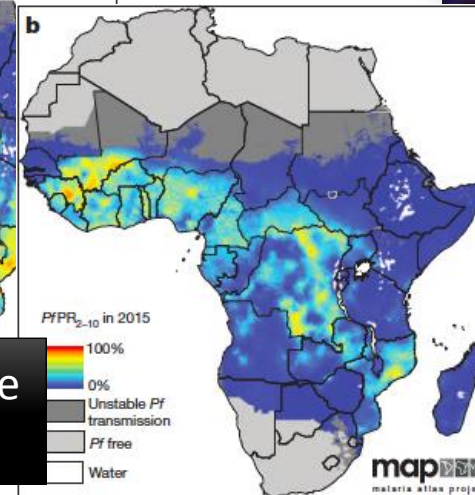

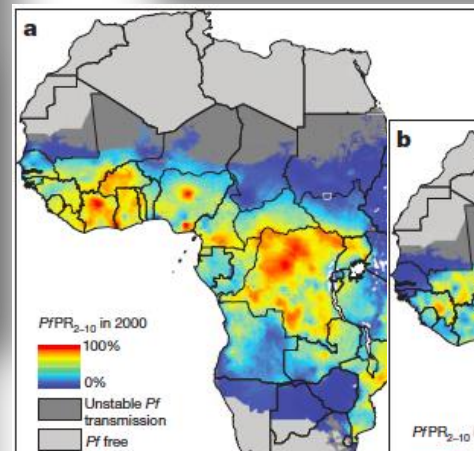

### A UNIVERSAL PATHWAY.

Syria population distribution

## WORLD MALARIA REPORT 2014

Malaria prevalence 2000-15

## 2015 LIBYA HUMANITARIAN NEEDS OVERVIEW

SEPTEMBER 2015

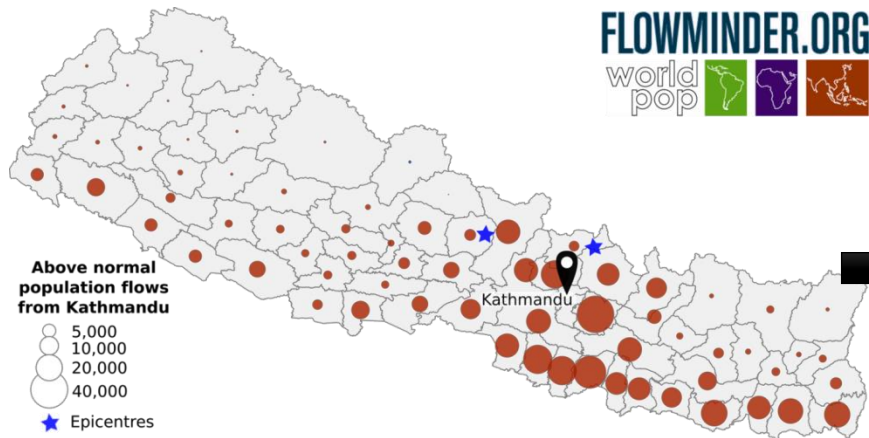

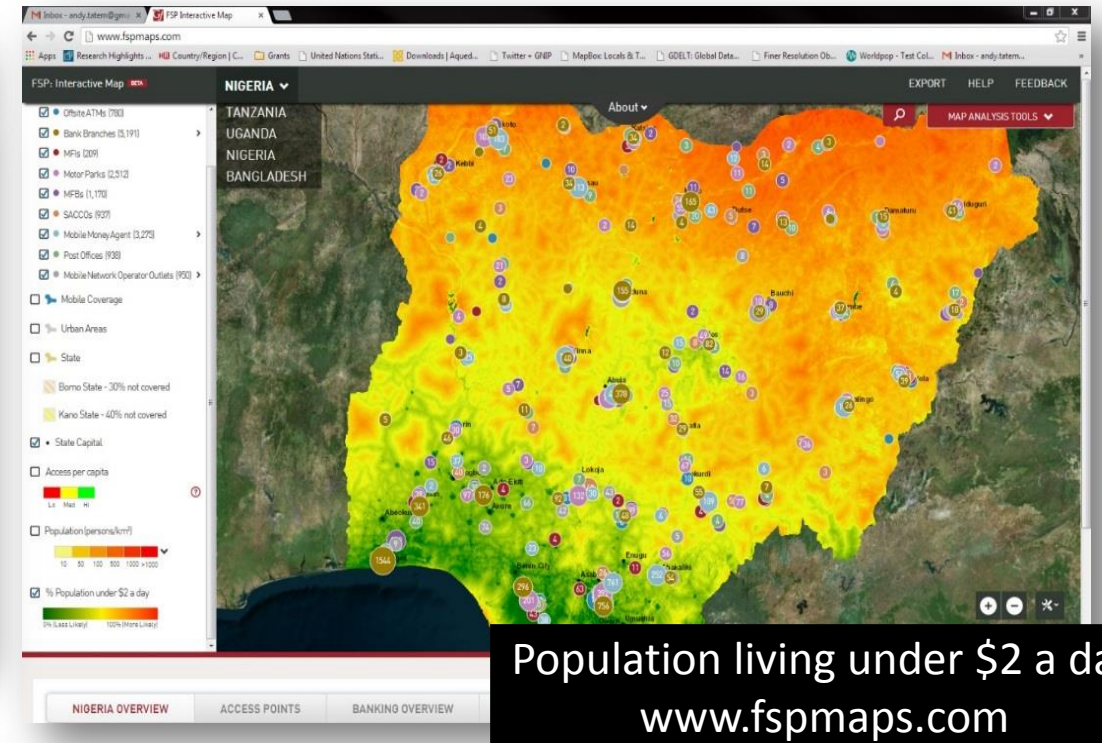

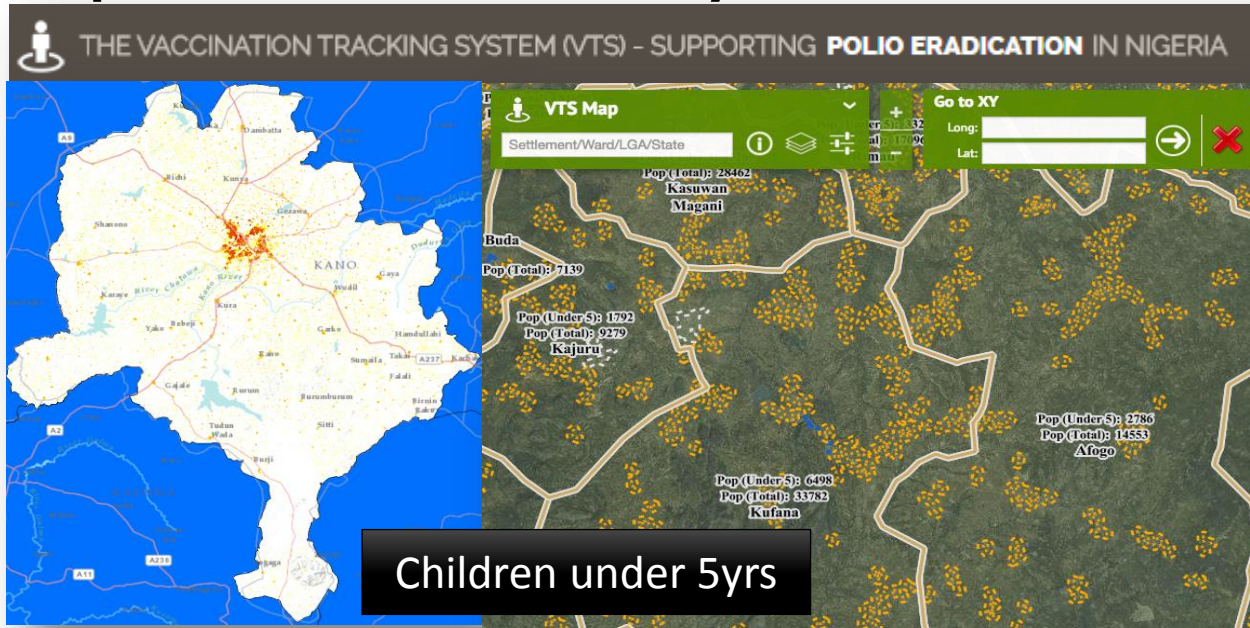

## Achieving the Malaria MDG Target

Reversing the Incidence of Malaria 2000-2015

# Datasets, methods already in use operationally

Landslides and displacement in earthquake affected areas  
Bi-weekly update  
27 July 2015

# Summary

- In producing estimates for different geographical scales and time periods, the integration of multiple types of data to complement traditional sources is often required
- Novel datasets (e.g. phones, satellite) are prone to biases, but each has advantages over census data in terms of the frequency of measurement and spatial precision
- Methods to account for biases, reporting uncertainties and providing clear metadata/documentation to inform users are all important
- ***Great potential in complementing traditional sources to build strong demographic databases for measuring progress towards the SDGs***
