

How exceptional is the pattern of fertility decline in sub-Saharan Africa?

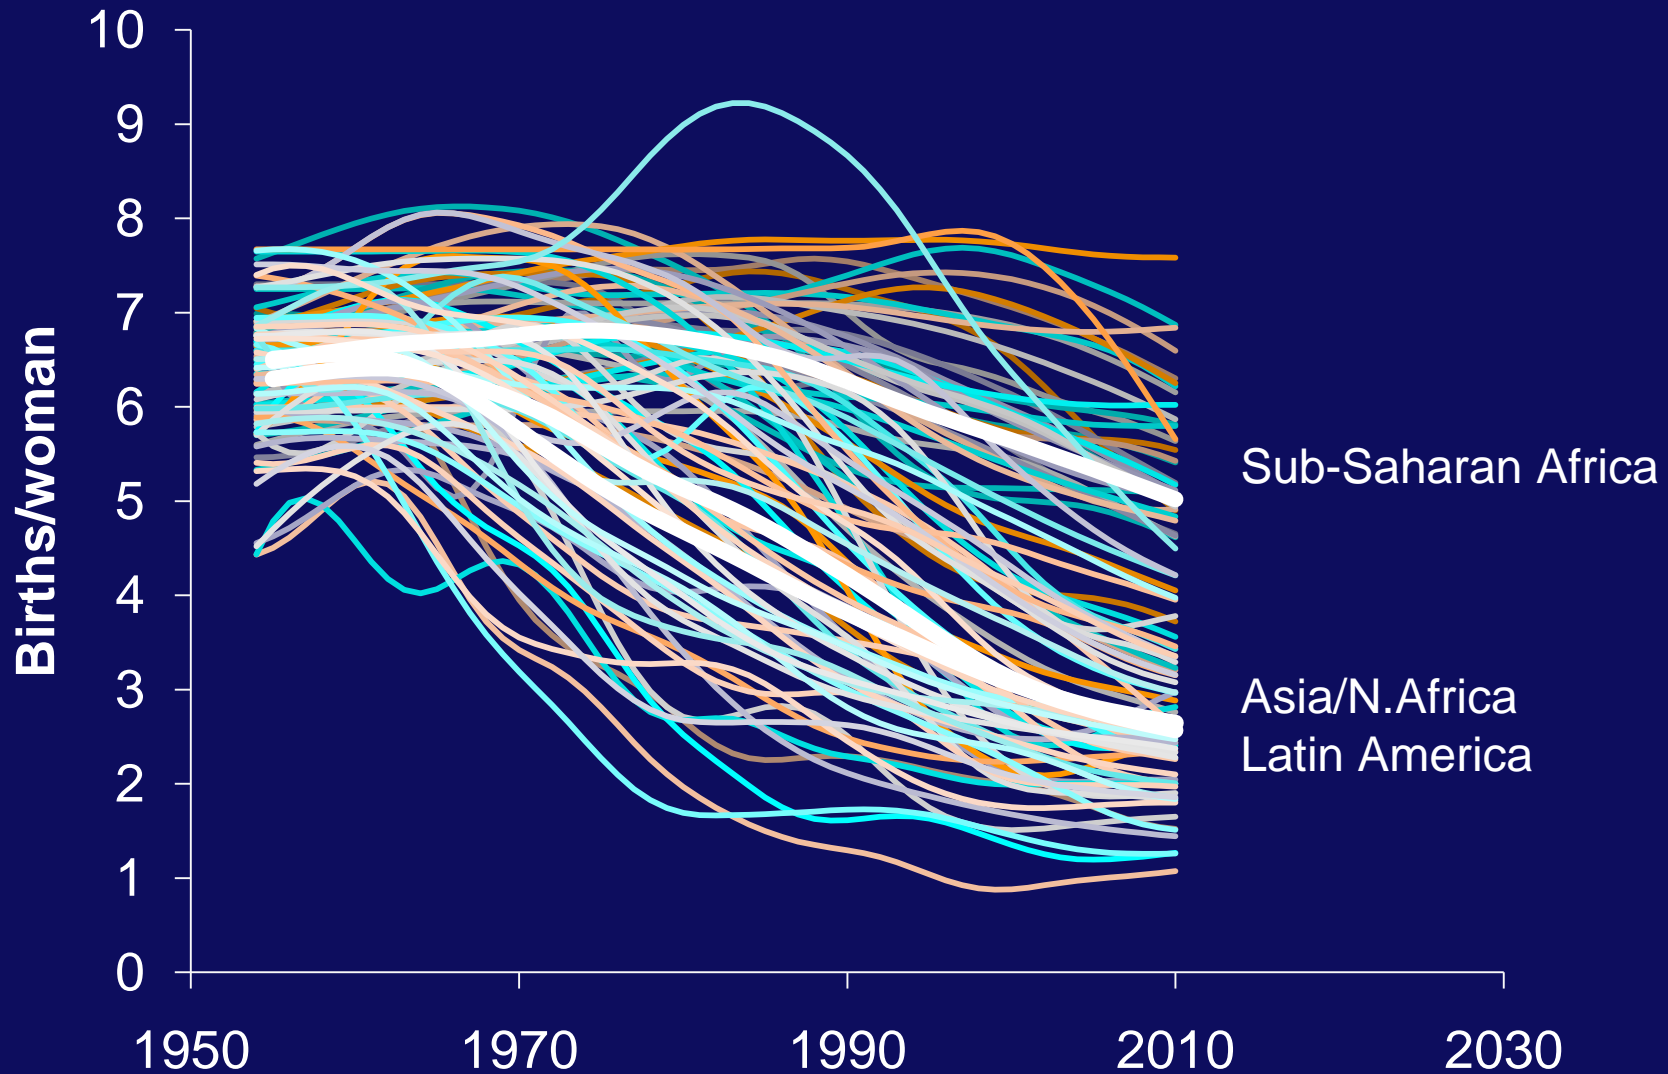

John Bongaarts

Population Council

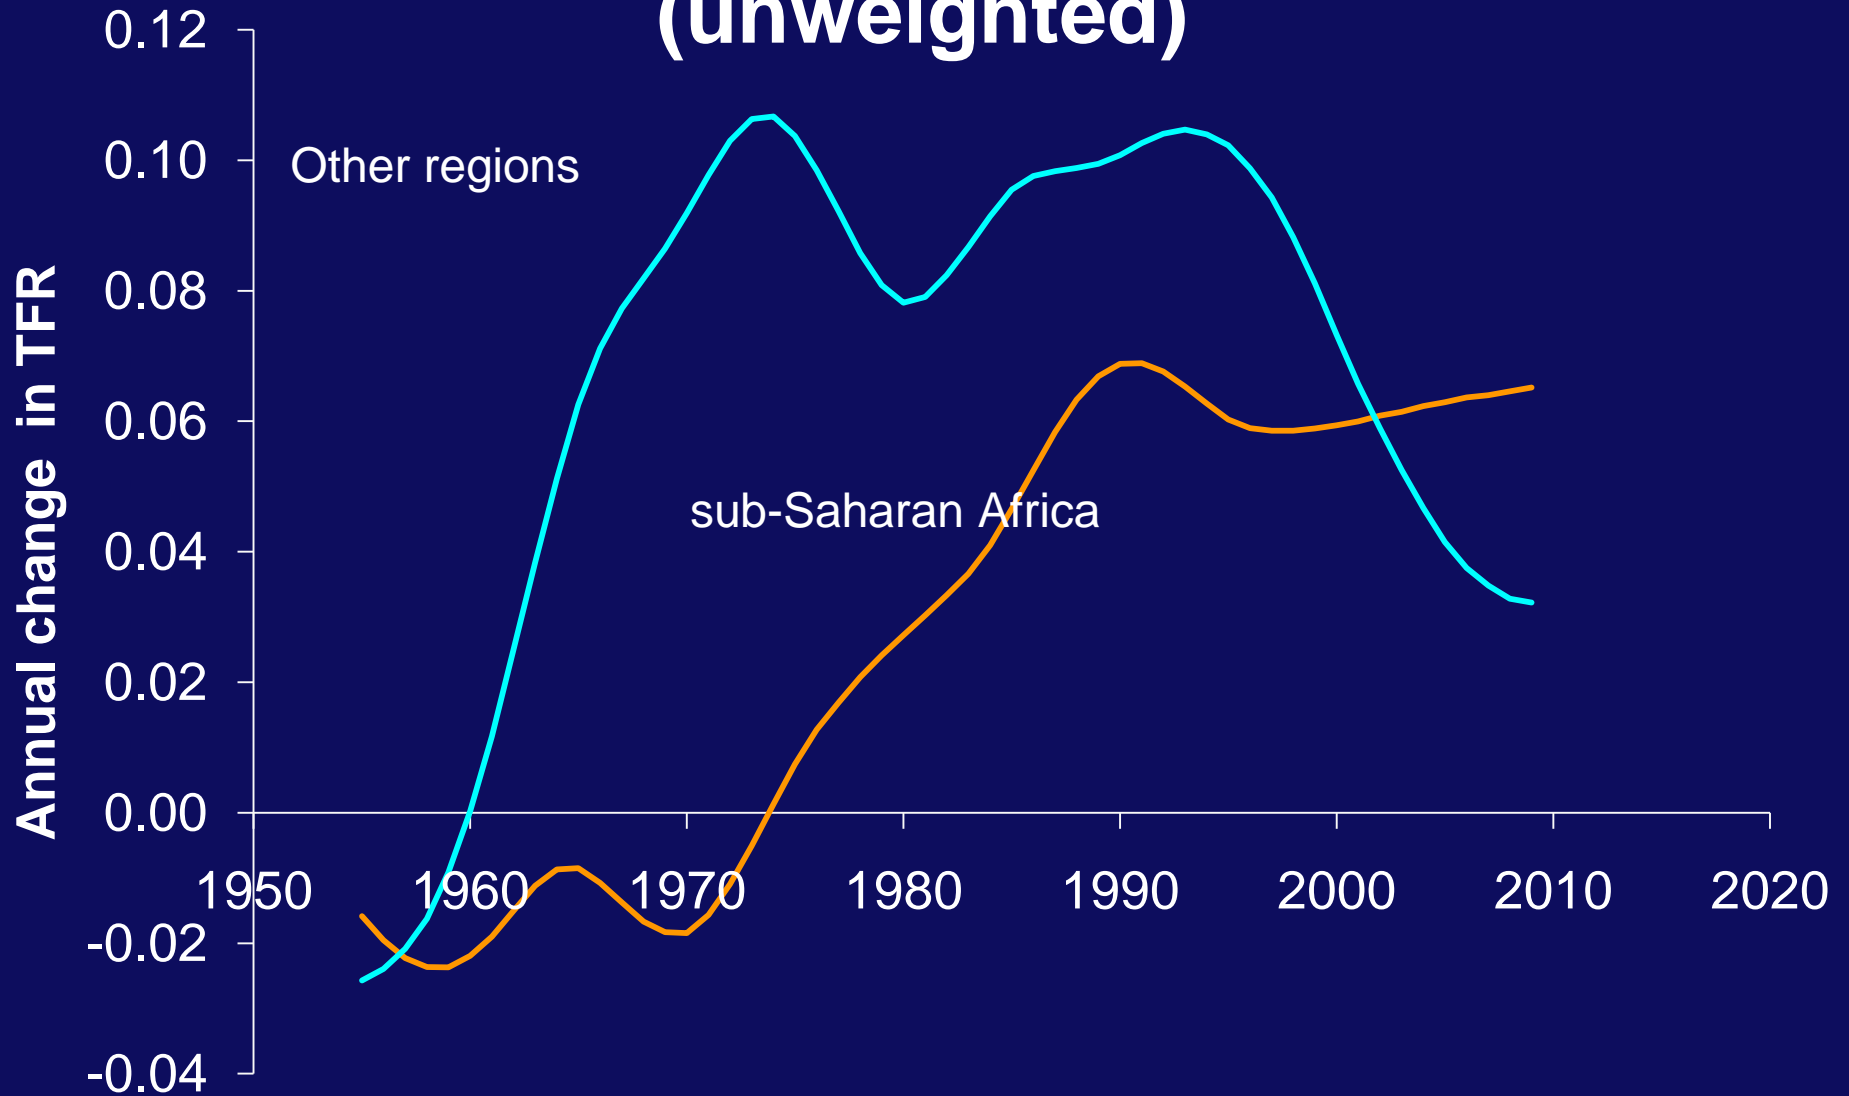

Outline

- **Background: fertility trends**
- **Transition patterns: onset and pace of decline**
- **Socio-economic determinants**
- **Policy options**

Trends in total fertility rate by country

Pace of fertility decline (unweighted)

Fertility transition patterns

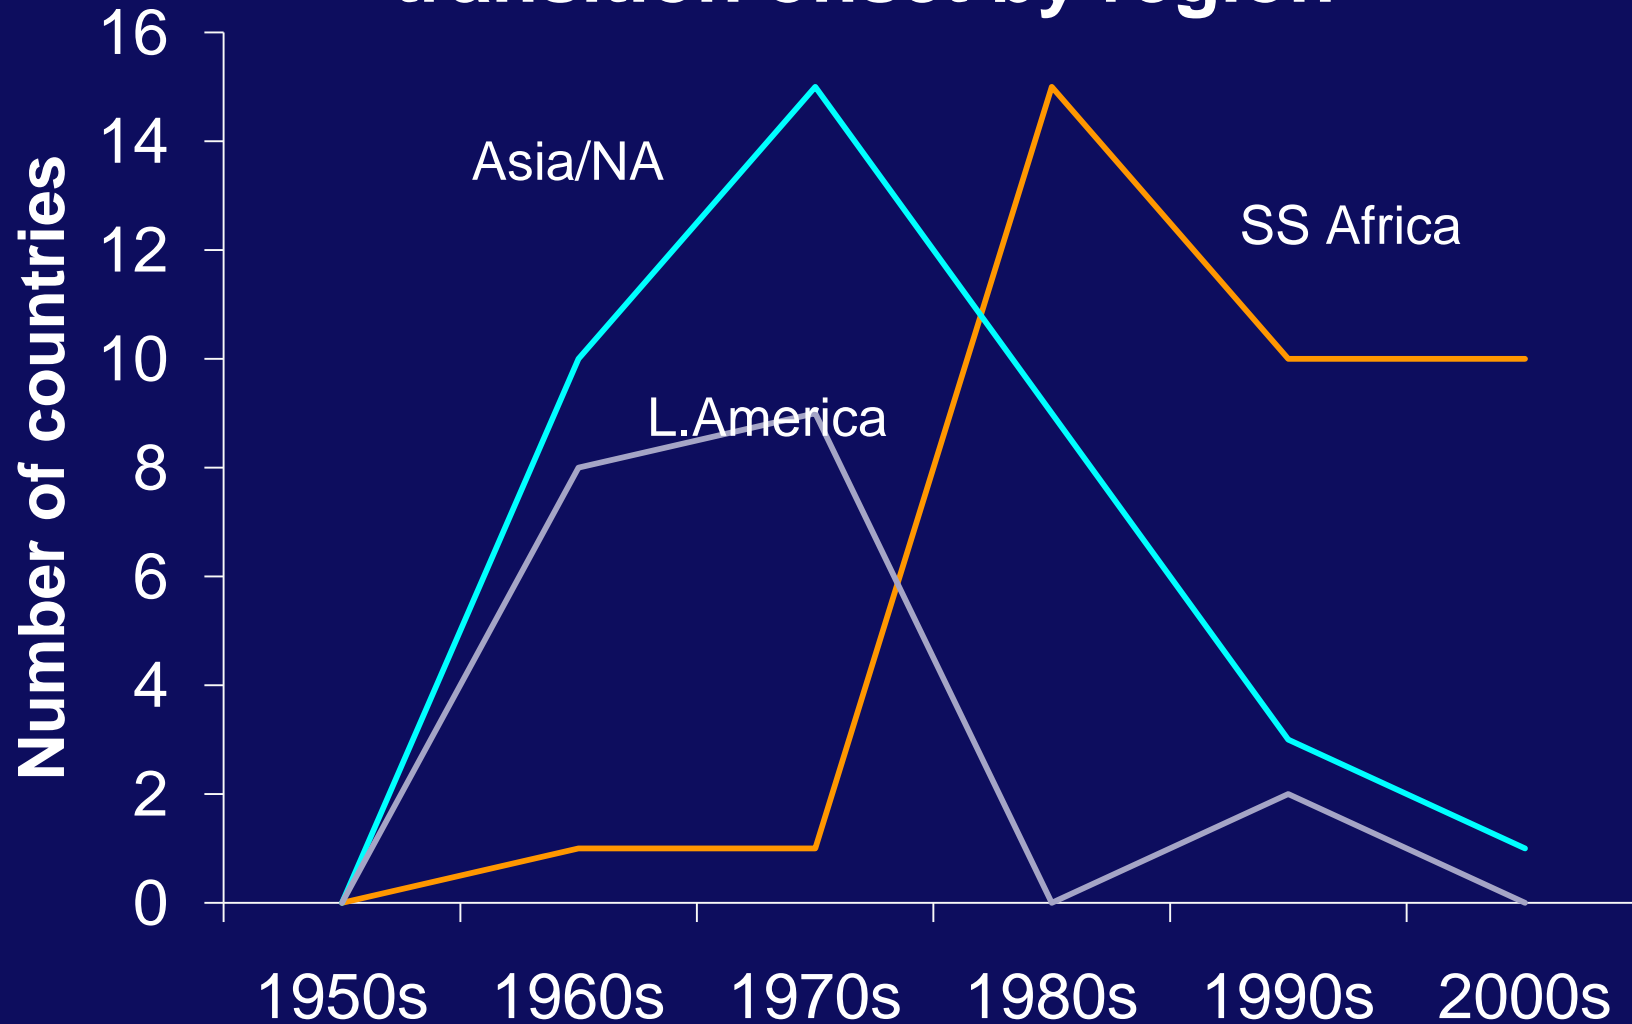

Fertility transition measures

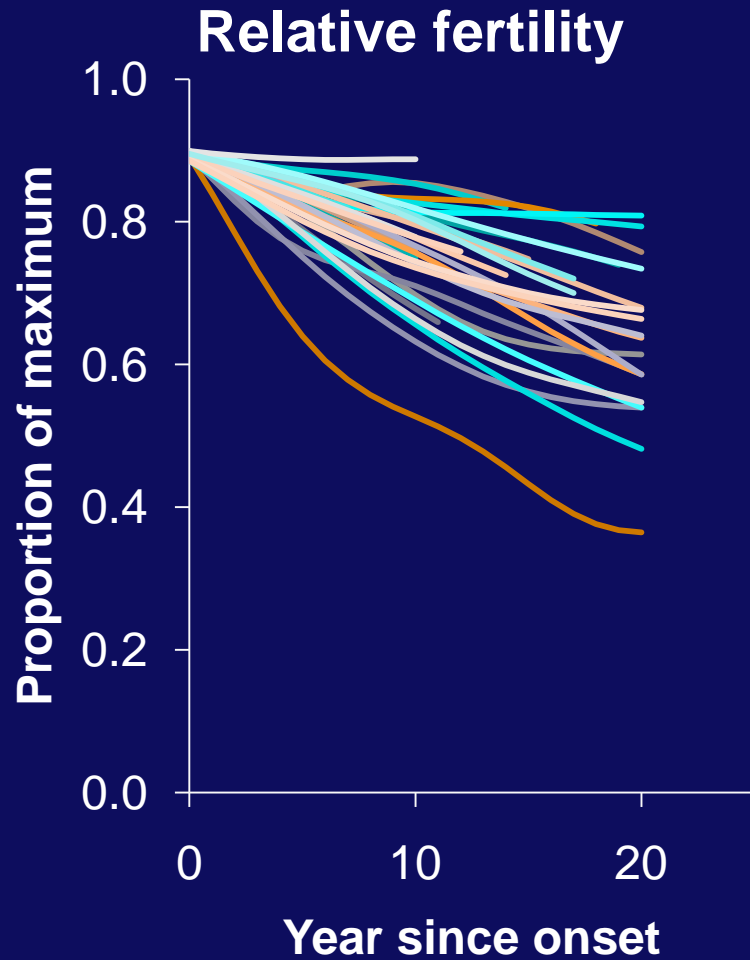

Pre-transitional fertility by region

	Sub-Saharan Africa (42)	Asia/ N.Africa (38)	Latin America (19)
TFR in 1955	6.5	6.4	6.5
Maximum TFR 1955-2010	7.1	6.7	6.6

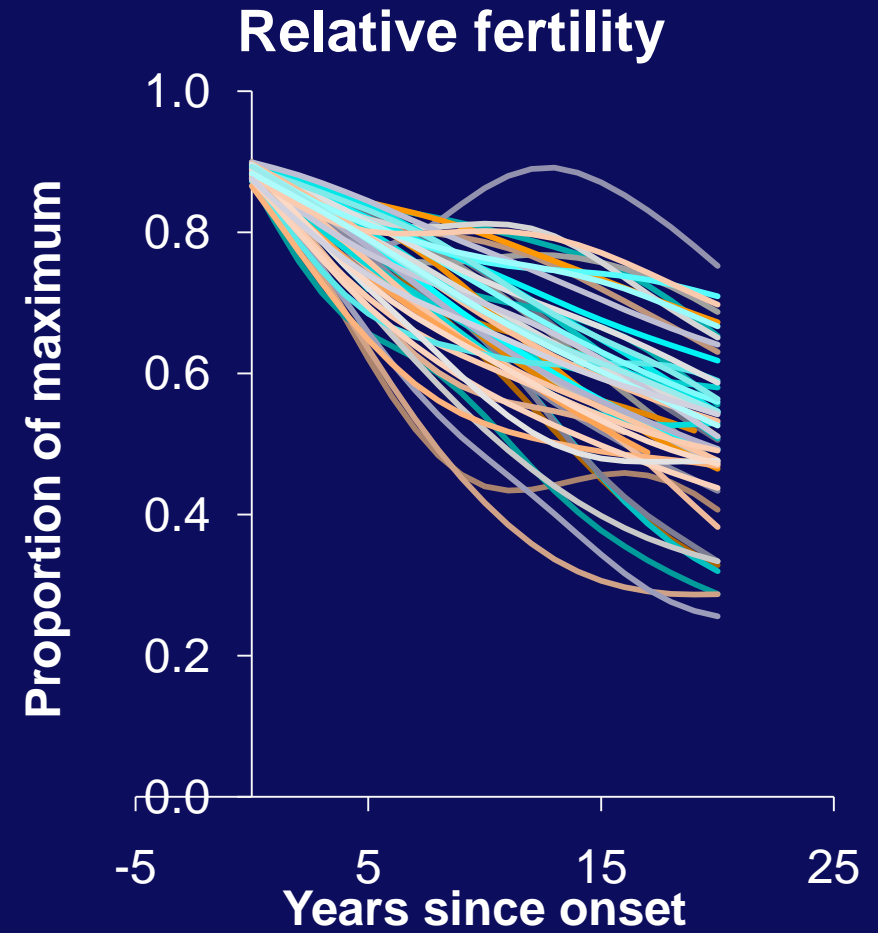

Distribution of countries by year of transition onset by region

Sub-Saharan Africa

Other regions

Average per cent decline in fertility from maximum

Year since onset of transition

	0	10	20
Sub-Saharan Africa	10	26	37
Other regions	10	31	48

a. Includes only countries observed for 20 years after onset

Sub-Saharan Africa is different:

- **Pre-transition: slightly higher TFR**
- **Onset: Two decades later than in other regions**
- **Pace: Slower**

Effects of socio-economic determinants:

- Probability of a newborn surviving to age 5
- Years of schooling among women aged 25 to 35
- GDP per capita, PPP 2005 \$US

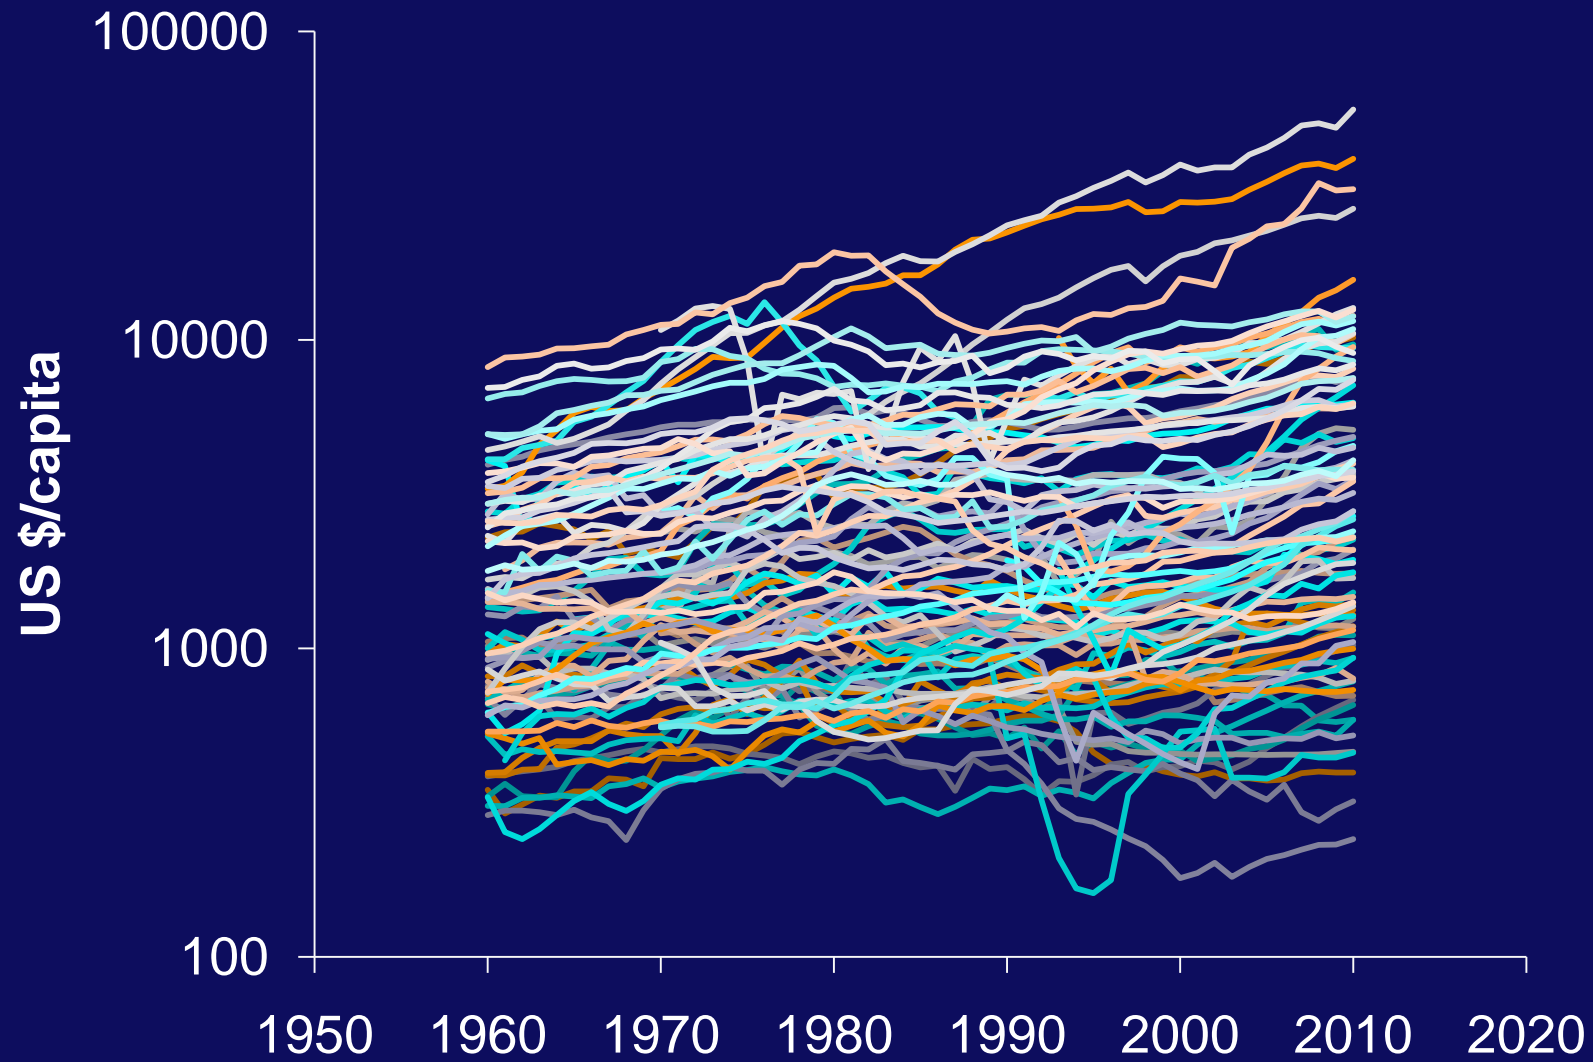

Effects of socioeconomic variables on the TFR in 2010

Variable	Effect	(SE)	p-value
Child survival (%)	-0.149	(0.033)	0.000
Schooling (years)	-0.0857	(0.0295)	0.005
GDP per cap. (PPP \$)	-0.287	(0.0969)	0.004
Sub-Saharan Africa	0.529	(0.229)	0.024
Intercept	20.2	(2.88)	0.000
No. of obs.	94		
R ²	0.84		

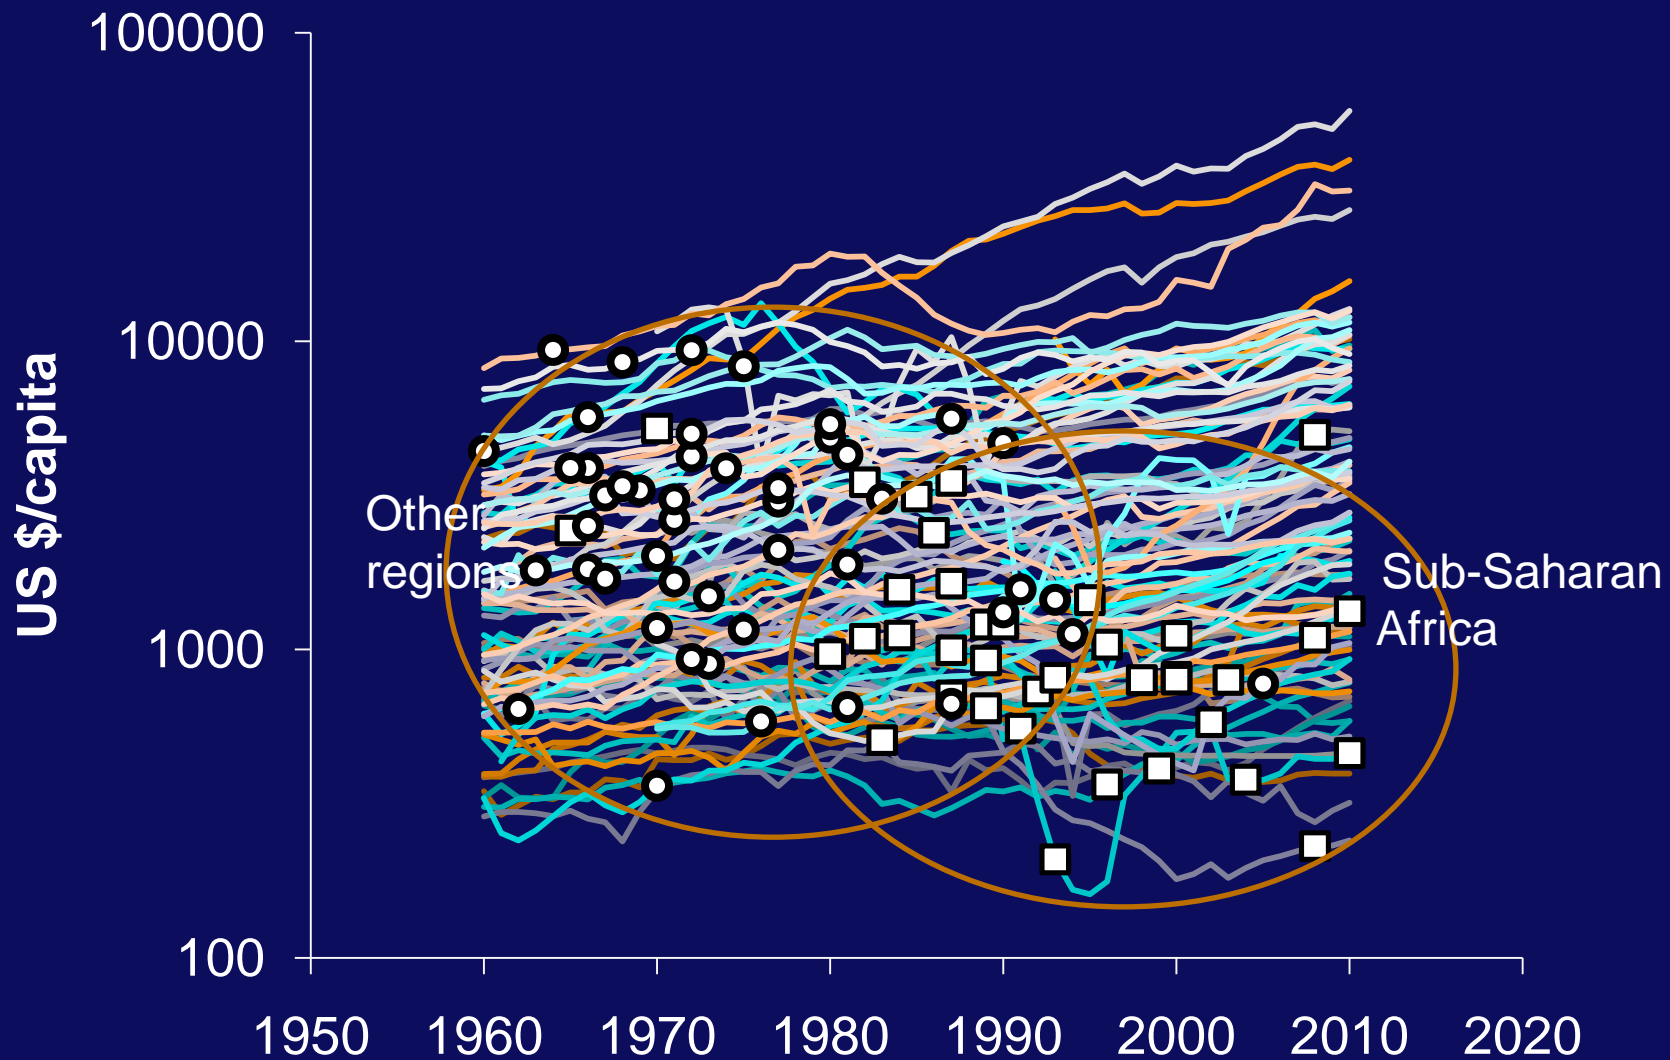

Pre-transition regression:

- No effects of socio-economic variables
- Significant dummy variable for sub-Saharan Africa (+0.32)

Trends in GDP/cap

Trends in GDP/cap and year of transition onset

Effects of socioeconomic variables at onset on the year of transition onset (bi-variate OLS)

Variable	Effect	(SE)	p-value
Child survival (%)	-0.77	(0.26)	0.003
Schooling (years)	-1.80	(0.87)	0.043
GDP per capita (log)	-18.12	(3.12)	0.000

Averages for socioeconomic indicators at onset

	Onset year	Percent survival to age 5	Years of schooling women aged 25 to 35	GDP per capita
Sub-Saharan Africa	1992	84.5	3.0	1359
Other regions	1975	87.7	3.4	3119

Pace during first decade of the transition

	TFR	Child survival %	Years schooling	GDP per capita \$
Sub-Saharan Africa	-0.96	2.9	1.2	149
Other regions	-1.47	3.8	1.6	513

Regressions of PACE of socio-economic variables on PACE of TFR

- No significant effect of survival and GDP/cap
- Significant effect for years of schooling and dummy for SSAfrica

Effects of LEVEL of socioeconomic variables on TFR pace in the first decade of the transition.

Variable	Effect	(SE)	p-value
Child survival (%)	-0.086	(0.014)	0.000
Schooling (years)	-0.072	(0.032)	0.029
GDP per capita (log)	-0.605	(0.180)	0.003

Sub-Saharan Africa is different:

- **Pre-transition: slightly higher**
- **Onset: Late in time due to later development
But early relative to development level**
- **Pace: Slower due to early onset and slower rate of development. Pace is faster in first decade after onset than in second decade**

Policy options:

- **Family planning programs to reduce unplanned pregnancies**
- **Investments in human capital (e.g. girls education)**

Rwanda: Trends in fertility and contraceptive use
