

Distr.: General
13 October 2010

Original: English

**Committee of Experts on International Cooperation
in Tax Matters**

Sixth Session

Geneva, 18-22 October 2010

Item 3 (o) of the provisional agenda:

**Tax competition in corporate tax: use of tax
incentives in attracting foreign direct investment**

**SECRETARIAT NOTE ON AGENDA ITEM - USE OF TAX
INCENTIVES IN ATTRACTING FOREIGN DIRECT INVESTMENT**

Summary

For this agenda item, Stefan Van Parys of the University of Ghent, Belgium will present the findings of the annexed World Bank Group Policy Paper, which draws in part upon his research. María Amparo Grau Ruiz of the Complutense University of Madrid, Spain, who also has particular expertise in this area, will comment on the issues raised as well, especially for developing countries. An opportunity will be given for questions from the Committee and other participants.

Executive Summary

This paper analyzes how investment incentives may or may not be used to foster private investment, particularly in developing countries. What makes such incentives effective? How much should they cost? And how are they linked to policymaking and political economy? The assessment draws on existing literature as well as several case studies and surveys conducted for this paper.

Governments make extensive use of investment incentives in an effort to attract investments. Their effectiveness has been the subject of intense debate, and little consensus has emerged. Some experts have argued that there is little evidence such incentives are effective—a view that has guided considerable technical assistance recommending that governments curtail their use. Others have argued that investment incentives have contributed to the rapid economic growth of countries such as the Republic of Korea, Mauritius, and Singapore.

These disparate views are not surprising given that tax and nontax incentives are just one of the many factors that influence the success of investments. Countries typically pursue growth-related reforms using a combination of approaches, including macroeconomic policies, investment climate improvements, and industrial policy changes—including investment incentives. If such reforms have led to growth, it is difficult to attribute it solely to incentives. Although studies have tried to disentangle the effects of these reforms; most have been limited to OECD countries. Among other things, this paper aims to shed light on how incentives work in developing countries.

Every investment incentive policy has potential costs and benefits. The benefits arise from:

- Higher revenue from possibly increased investment.
- Social benefits—such as jobs, positive externalities, and signaling effects—from this increased investment.

The costs are due to:

- Revenue losses from investments that would have been made even without the incentives.
- Indirect costs such as economic distortions and administrative and leakage costs.

It is difficult to quantify these elements, but trying to do so provides a useful conceptual tool for policymakers analyzing the general framework for incentives as well as targeted incentives for anchor investments, export-oriented and mobile investments, extractive industries, and so on.

The investment climate is especially crucial for determining the effectiveness of incentives in attracting foreign direct investment (FDI). Although lowering effective tax rates helps boost FDI, the effect is eight times stronger for countries with good investment climates. This finding helps explain why incentives have encouraged investment in some countries yet failed in others. Legal guarantees for investors and simplified incentive regimes also have positive effects on investment. Evidence for other common interventions, such as tax holidays, tends to be less robust.

Surveys of investors in Jordan, Mozambique, Nicaragua, and Serbia find that most nonexporters do not rank investment incentives among their top reasons for investing. By contrast, exporters consider such incentives very important. Survey evidence also shows that some investors spent considerable time qualifying incentives, implying that these special benefits also impose costs. For these and other reasons—including political economy—the costs and benefits of investment incentives are rarely clear-cut for governments or recipients.

The paper reaches the following conclusions about investment incentives:

- On their own, such incentives have limited effects on investments. Countries must also dedicate themselves to improving their investment climates.
- If used, investment incentives should be used minimally—mainly to address market failures and generate multiplier effects.
- Incentives should be awarded with as little discretion and as much transparency as possible, using automatic legal criteria.
- To the extent possible, incentives should be linked to investment growth (that is, based on performance), and tax holidays should be avoided.
- Only the tax administration should administer tax incentives.
- Regional cooperation should be encouraged to prevent harmful tax competition between countries.
- Governments should regularly prepare tax expenditure statements to measure and monitor the costs of tax incentives. In addition, incentive policies should be reviewed periodically to assess their effectiveness in helping meet desired goals.

1. Introduction

Investment incentives are measurable economic advantages that governments provide to specific enterprises or groups of enterprises, with the goal of steering investment into favored sectors or regions or of influencing the character of such investments. These benefits can be fiscal (as with tax concessions) or non-fiscal (as with grants, loans, or rebates to support business development or enhance competitiveness).

Tax and nontax incentives have both been widely used to promote investment. Incentives—especially fiscal incentives—have been associated with higher investment in several countries, including Ireland, Mauritius, and Singapore. But while some governments vouch for the effectiveness of incentives, many others have failed to attract expected investments. Accordingly, considerable research has focused on the role incentives play in promoting investment and creating jobs.

Most of this research has occurred in developed countries; evidence from developing countries has largely been anecdotal. But there is proof that Incentives work for certain kinds of investments, in specific situations, and for specific sectors, such as export-oriented investments.

Finally, as practitioners and policymakers can attest, political economy exerts a powerful influence on incentives. Many incentives—especially generous ones—have persisted because of lobbying by special interests and politicians' need to curry favor. Yet little research has been done on how political economy affects incentive policy.

Investment incentives are constantly evolving, so gaining knowledge about them is a dynamic process. This paper breaks new ground in several areas. First, it consolidates recent research by the World Bank Group's Investment Climate Advisory Services on how a country's investment climate influences the effectiveness of incentives, particularly in developing countries. Though higher taxes reduce foreign direct investment (FDI), the size of that effect depends on the investment climate. Changes in tax rates have a much bigger effect on FDI in countries conducive to investment than they do elsewhere. Indeed, for countries ranked in the top half of the Bank Group's *Doing Business* indicators, changes in marginal effective tax rates had eight times more impact on FDI than for countries in the bottom half.

Second, the paper sheds light on the role that political economy plays in the popularity of incentives—and the related shortcomings. Incentives are sometimes used to dole out favors to investors, so investors who benefit from incentives resist attempts to eliminate them. This paper suggests a way to tackle such problems.

Third, the paper compiles good practices on managing and administering incentives in developing countries, drawing on government and private sector experiences.

Finally, the paper provides policymakers with a framework for analyzing the efficacy of investment incentives based on the sector and level of development involved, and suggests reforms for moving toward best practice.

Policy areas beyond this paper's scope

The policy recommendations in this paper are fairly broad and could be applied to investment incentives in general. However, some topics require detailed policy advice that is beyond the scope of this paper, including:

- *Investment incentives and broader goals for industrial policy.* Investment incentives can be used to pursue industrial policy goals such as diversifying investment, increasing local value added, and substituting for imports. But while this paper provides policy guidelines for investment incentives, it does not assess their effectiveness in achieving such goals.
- *Incentives and special economic zones (SEZs).* An attractive investment climate is important, and SEZs can provide such a climate. But this paper does not assess whether creating SEZs is preferable to developing institutions and improving the investment climate throughout a country.
- *Macro-Fiscal aspects of investment incentives.* Though this paper touches on aspects of the tax regime, it is not about fiscal policy. Governments may be willing to forgo tax revenue in the short term in hopes of boosting investment to support growth and tax revenue in the future, but the paper does not analyze the effectiveness of such policies.
- *Nontax incentives and spending policies.* This paper's guidance focuses on how to use tax incentives to promote investment. Some nontax factors, such as a good investment climate, are prerequisites for tax incentives to be effective. Other nontax factors—such as the ease of accessing land, starting a business, or exporting and importing—are also important for encouraging investment. While acknowledging the role of non-tax factors in encouraging investment and also in improving the effectiveness of tax incentives, the paper does not analyze the effectiveness of non-tax factors separately in encouraging investment.
- *Tax regime for mining.* This paper concludes that investment incentives are generally unnecessary for the mining sector because mining activities are location based and governments should collect the rents from such resources. But the tax regime for mining is highly specific and involves issues beyond the scope of this paper, such as taxation during the exploration period, carry-forward provisions and royalty rates, and the role of public-private partnerships in addressing environmental issues.

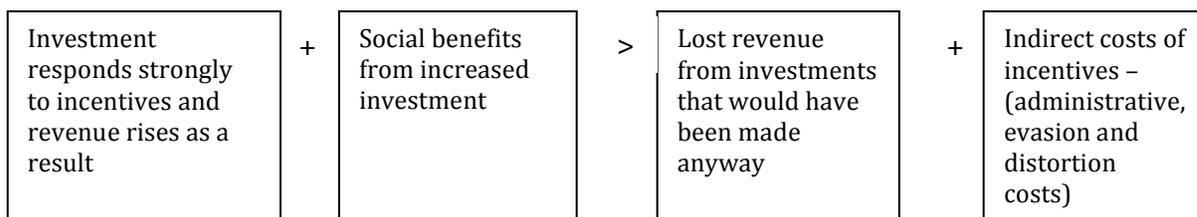

2. Framework for Analyzing Incentives

Incentive policies have varying costs and benefits for governments. Here tax incentives are defined as any deviations from the general tax system that are applied to certain kinds of investments to reduce their tax liability. Nontax incentives are direct expenditures and other efforts made by the authorities to lower the cost of investments.¹

When choosing policies for incentives, governments must balance their likely costs and potential benefits. (Appendix 1 provides a model for government decisionmaking.) Factors to consider include:

- Higher revenue from (possibly) increased investment.
- Social benefits—jobs, positive externalities, signaling effects—from increased investment.
- Revenue losses from investments that would have been made without the incentives.
- Indirect costs of incentives (such as administrative and leakage costs).

For tax incentives, an investment incentive is beneficial if:

In other words, lowering taxes for a specific sector can induce capital investment that increases revenue from the sector and generates social benefits—but it also reduces government revenue and imposes indirect costs on the economy. So this type of incentive policy is successful if the lost revenue and indirect costs are more than compensated for by higher revenue and social benefits from the additional investment.

Finally, the inequality defined above on the costs and benefits of the incentive policy is based purely on economic considerations. For political reasons, governments sometimes adopt incentive policies that do not satisfy this inequality. This issue is discussed in the section on political economy.

¹ Nontax incentives can be defined in different ways. Strictly speaking, they are expenditures such as grants for job creation and training. But they can also refer to all nontax aspects of encouraging investment, such as effective regulation, good access to land, and a healthy business environment. This paper uses the latter definition.

3. Do Incentives Matter for Investment? Econometric Evidence

Any policy on incentives should address whether it increases investment.² This can be inferred based on how investment in a country responds to the introduction of or changes to incentive policy, as measured by FDI and gross capital formation.

However, changes in incentive policy are generally made at the same time as other changes that affect investment behavior (such as macroeconomic restructuring). This simultaneity makes analysis challenging because it is difficult to attribute changes in investment to changes in incentives. But by carefully selecting the incentive reforms studied, it is possible to address some of these issues.

Another significant problem for econometric studies on investment in developing countries involves the measurement of investment. A lack of good data on investment in these countries makes it hard to estimate the effects of incentives in general and tax incentives in particular. Gross domestic capital formation is especially poorly measured, though FDI is measured better.³ The best data on investment come from firms, but such data are rare in developing countries. To mitigate this problem, several approaches have been used to determine whether incentives are effective in encouraging investments.

Conclusions from the literature

Hassett and Hubbard (2002) provide a good review of the literature on the effectiveness of tax policy (in general) and tax incentives (in particular) in promoting investment. They find that:

- Tax policy affects investment, with a 1.0 percent increase in the user cost of capital lowering investment by 0.5–1.0 percent (for an elasticity of -0.5 to -1.0).⁴ This analysis is based on microeconomic data from firms. Macroeconomic data, by contrast, provide little evidence that tax policy affects investment. But this conclusion is likely due to measurement errors in macroeconomic data, inter-asset reallocation of capital, and simultaneity, which make it difficult to draw causal links or make correct attributions using macroeconomic data.
- Taxes increase the user cost of capital, so any uniform reduction in that cost should encourage capital investment. But targeted incentives are unlikely to broadly reduce the cost of capital.
- Most investment incentives focus on investments in equipment, creating inter-asset distortions between types of capital. These distortions could outweigh the benefits of

² As indicated by the elasticity of capital investment to the tax rate, or the size of $\frac{\partial K}{\partial T}$ (see Appendix 1).

³ See Gordon, David, and Ross Levine, 1988, "The Capital Flight Problem," International Finance Discussion Paper 320.

⁴ The user cost of capital is the cost of capital investment that incorporates all costs (such as interest and taxes) and incentives (such as investment allowances, investment tax credits, and accelerated depreciation).

such incentives, with the net result being that the incentives attract weaker investment. In Thailand, for example, firms that benefited from incentives had weaker financial ratios than those that did not.⁵

- Economic growth is higher in countries that invest more in equipment, mainly because workers learn better skills by operating different kinds of equipment. Thus equipment subsidies are good for growth because they generate positive externalities.
- Investment incentives do not work for many firms that face finance constraints and cannot grow to take advantage of tax incentives.
- Because the supply of capital goods is inelastic in the short run, some investment incentives might benefit suppliers of capital goods instead of investors.
- Low inflation—which is the result of factors other than a policy decision to award incentives—serves as a good investment subsidy.
- Temporary incentives can have larger short-run impact than permanent ones.

Tax rates affect FDI levels and locations

Though Hasset and Hubbard (2002) find that tax policy has little effect on investment when macroeconomic data are used, there is evidence that taxes affect the volume and location of FDI. Extensive research indicates that FDI is sensitive to taxation in host countries (Hines 1997). Such a wide body of literature exists on the topic that it was the subject of a meta study by De Mooij and Ederveen (2003).⁶ The authors' survey of the literature concluded that, on average, a 1 percentage point increase in the tax rate reduced FDI by 3.3 percent.

Though there is a wide range of elasticities, most studies find that higher tax rates (including effective average tax rates, effective marginal tax rates, and statutory tax rates) have a significant negative impact on FDI flows. But most of these studies involve investment in OECD countries. Of 47 econometric studies on FDI and taxation, just 5 include investments in developing countries.⁷ This is mainly due to the poor availability of firm-level data in developing countries.

Outbound FDI by firms offers another way of analyzing whether incentives are effective in attracting investment to developing countries. Such analysis is possible using firm-level data on outbound FDI that include investments in developing countries. For example, the U.S. Bureau of Economic Analysis (BEA) collects microdata on U.S. firms' outbound investments. In a study of FDI in 47 countries—including developing countries—drawing on the bureau's data, Grubert and Mutti (2000) study why investors decide to locate in certain

countries. They find that investments oriented toward domestic markets are less sensitive to changes in tax incentives, while export-oriented investments are more sensitive.⁸

Also using BEA data, Desai, Foley, and Hines (2006) conclude that U.S.-based multinational corporations in countries with a 10 percent higher indirect tax rate had 7.1 percent less assets (physical investments).⁹ Moreover, in countries with a 10 percent higher corporate income tax rate such corporations have 6.6 percent less assets. The advantage of this study is that more than half of the 55 countries with inbound investments were developing countries. But the results are not disaggregated by OECD and non-OECD countries.

There is a significant vacuum in the literature on econometric studies of the efficacy of investment incentives in developing countries. Although the literature concludes that tax rates matter a lot for FDI, this conclusion cannot be extended to non-OECD countries.

Recent work by the World Bank Group and International Monetary Fund

To address this shortcoming in the literature, the World Bank Group's Investment Climate Advisory Services undertook a series of econometric studies to determine how taxation affects FDI in developing countries. Investor surveys were also conducted to provide richer, disaggregated data. In addition, the International Monetary Fund (IMF) conducted a study on how corporate tax rates and tax incentives affected FDI in 40 Latin American, Caribbean, and African countries during 1985–2004.¹⁰

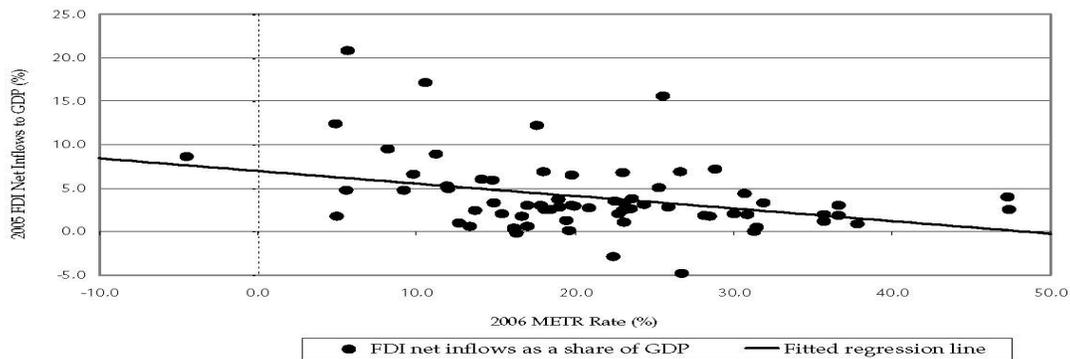

The studies had findings similar to those of the OECD studies: FDI is affected by tax rates, with a 10 percentage point increase in the corporate income tax rate lowering FDI by 0.45 percentage point of GDP. The studies also found that extending tax holidays by 10 years increases FDI by 1 percentage point of GDP. Still, these numbers are small relative to those for OECD countries. For example, Mintz and Tarasov (2008) measured how FDI responded to marginal effective tax rates (METRs) in 69 countries, including several developing ones. Figure 1 shows the relationship between FDI as a percentage of GDP and the METR. On average, a 10 percentage point drop in the METR causes FDI to rise by 3 percentage points of GDP.

⁸ However, the authors find that tax sensitivity is lower in high-income countries, which runs counter to the findings in this paper. See Grubert and Mutti. 2004. "Empirical Assymetries in Foreign Direct Investment and Taxation," *Journal of International Economics* 62: 337–58.

Figure 1. Higher FDI Is Linked to Lower Effective Tax Rates

Source: International Monetary Fund; calculations by Andrey Tarasov.

The investment climate affects the effectiveness of incentives

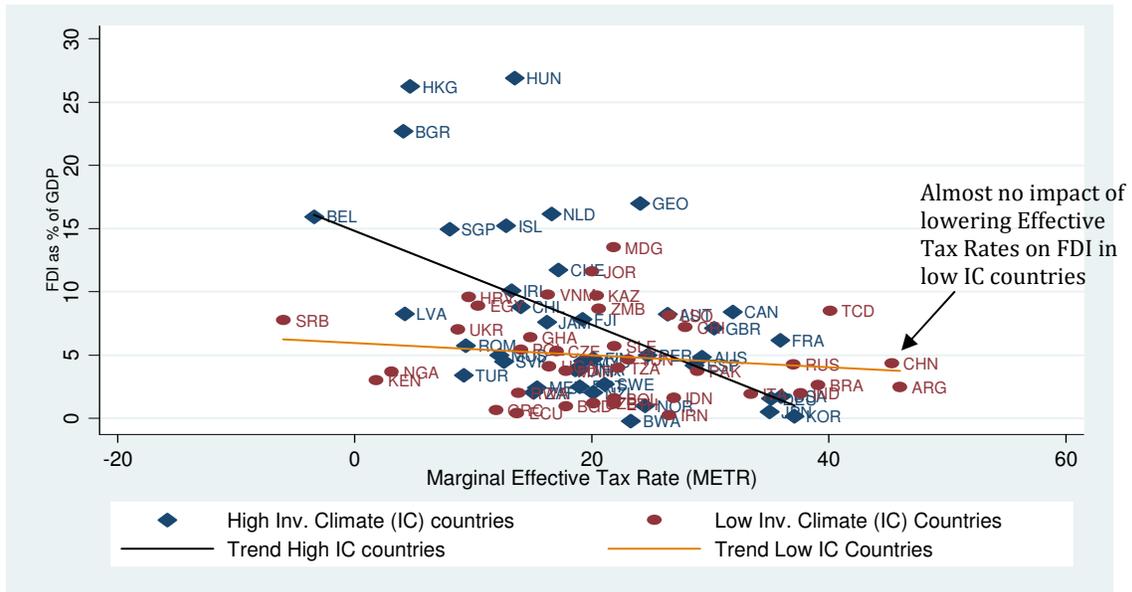

The balance of evidence suggests that, for many developing countries, fiscal incentives do not effectively counterbalance unattractive investment climate conditions such as poor infrastructure, macroeconomic instability, and weak governance and markets. Evidence from the econometric studies presented above suggests that tax incentives that affect investment in general and FDI in particular do not have nearly as much effect in developing countries as in developed ones. Based on such experiences, the OECD concluded that “a low tax burden cannot compensate for a generally weak or unattractive FDI environment.” And though Rolfe and White (1991) found that tax holidays had a small effect on FDI, they concluded that tax holidays and import duty exemptions were unlikely to attract FDI if no nontax factors were favorable. Morisset and Pirnia (2001) support this conclusion, stating that “incentives will generally neither make up for serious deficiencies in the investment environment nor generate the desired externalities.”¹¹

The Investment Climate Advisory pursued this line of research to show the econometric evidence behind it. Figure 2 shows that for countries with weak investment climates, a lower marginal effective tax rate (METR) has limited impact on FDI.¹² The average response is much more pronounced in countries with good investment climates. For example, having an METR of 20 percent instead of 40 percent raises FDI by 1 percent of GDP for countries ranked in the bottom half in terms of investment climate—while the same difference in METR has an effect eight times greater for countries in the top half. This finding implies that tax incentives are far less effective in weaker investment climates than in stronger ones.

¹² Countries were ranked on their investment climates using the World Bank Group’s *Doing Business* rankings for 2008.

Figure 2. Efficacy of Fiscal Incentives and Investment Climate

This observation was tested against the Global Competitiveness indicators, Index of Economic Freedom, and Heritage Foundation indicators of a good investment climate. Fiscal policy diverges across most of these indicators, suggesting that the investment climate is a critical precondition before fiscal policy can effectively encourage investment.

This is evidence that the effectiveness of incentives is linked to the environment where they are offered; in this case the quality of the investment climate is what matters. This is also a possible explanation for why some countries do much better when using fiscal policy to attract investment. Lower taxes do not compensate for a poor investment climate. To attract investment, countries should improve their investment climates. (See Appendix 3, section 3 for regression results; the interaction term of investment climate and effective tax rate is significant in several measures of investment climate.)

The investment climate influences the effectiveness of fiscal incentives in attracting investment through the role that public goods play in improving investment returns. Here the public goods are the components of the investment climate, such as infrastructure, rule of law, enforcement of contracts, and so on. The public goods are funded through a tax on capital, which in turn reduces the return on capital. But if the public goods make capital more productive, then an increase in taxation spent on them would have the opposite effect. On balance, the effect is ambiguous. However, when public goods and investment are highly complementary—as with the investment climate—then in countries with large endowments of such goods, a drop in taxes is much more effective at encouraging investment than in countries with smaller endowments.¹³

¹³ James, Sebastian, and Stefan Van Parys, 2009, "Investment Climate and the Effectiveness of Tax Incentives," World Bank Group.

To confirm this finding, the Investment Climate Advisory conducted three econometric studies and four surveys of investors in developing countries. These studies overwhelmingly conclude that the investment climate is more important than tax breaks or other nontax incentives. The surveys were conducted in Jordan, Nicaragua, and Serbia by the Investment Climate Advisory and in Mozambique by Nathan Associates for the U.S. Agency for International Development (USAID). The methodological model for all the surveys and an analysis of the Mozambique one are available in Bolnick (2009).¹⁴ All the surveys found that factors related to the investment climate—such as ease of import and export, availability of local suppliers, regulatory framework, adequate infrastructure, and the country’s geographic location—rated higher than incentives as a primary motivation for investment (Table 1).

Source: Investment Climate Advisory 2009.

Cross-country studies that examine the relationship between incentives and FDI are prone to omitted variable bias due to varying macroeconomic conditions, institutions, and endowments (such as mineral wealth). These issues are difficult to control for, and while time and country fixed effects take care of some of them, changes in macroeconomic conditions are harder to control for. One way to reduce such errors is to analyze similar countries or investors. Studies have found that incentives did not affect investment in West and Central Africa, while the opposite was true in the Eastern Caribbean (Box 1). The

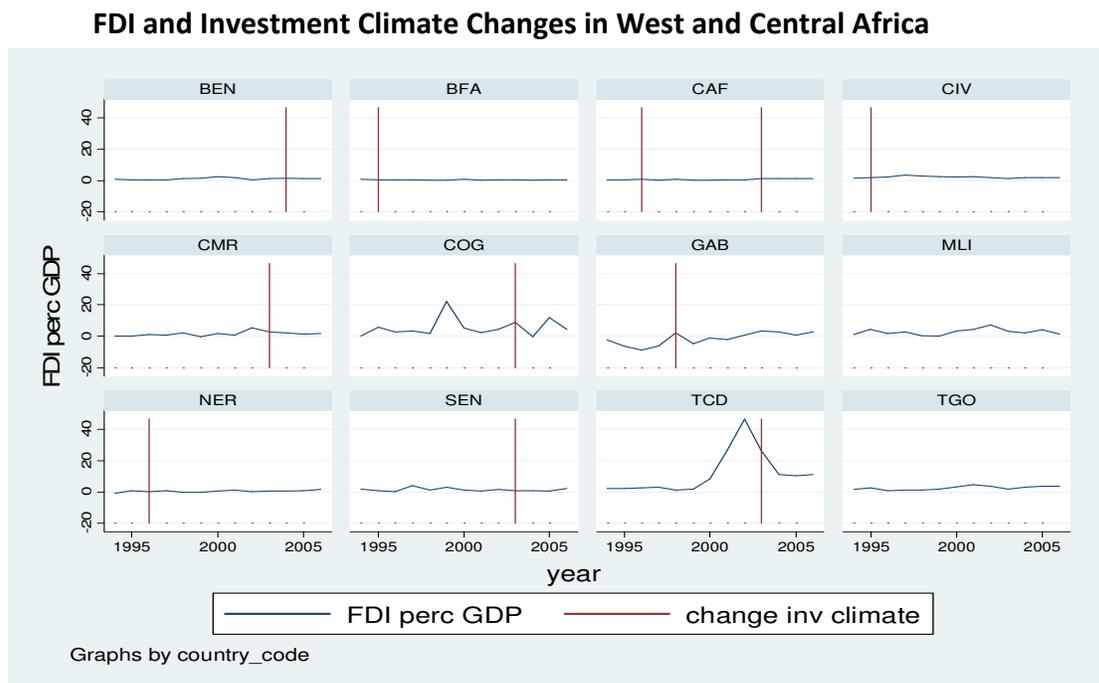

¹⁴ The Mozambique survey and analysis were conducted by Bruce Bolnick of Nathan Associates and was funded by USAID as part of the broader Investment Climate Advisory study. The survey report is available from the author on request.

difference in findings may be explained by the stronger investment climates in the Caribbean economies.

Box 1. Incentives and Investment in Africa and the Caribbean

Investment climate studies of the Economic Community of West African States (UEMOA), Economic Community of Central African States (CEMAC), and Organization of Eastern Caribbean States (OECS) have the advantage that all three are monetary unions located fairly contiguously and share similar institutions. Another advantage is that while the unions share the same monetary policy, they are free to set their own fiscal policy—giving researchers a unique opportunity to examine how differences in incentives affect FDI.

The figure below shows how differences in incentive policy affect FDI in the CFA franc zone, which consists of the six UEMOA countries and the six CEMAC countries. Because these countries are relatively homogeneous—sharing the same currency, speaking the same language (French), and geographically close to each other—they provide a rare basis for comparing investment and policies.

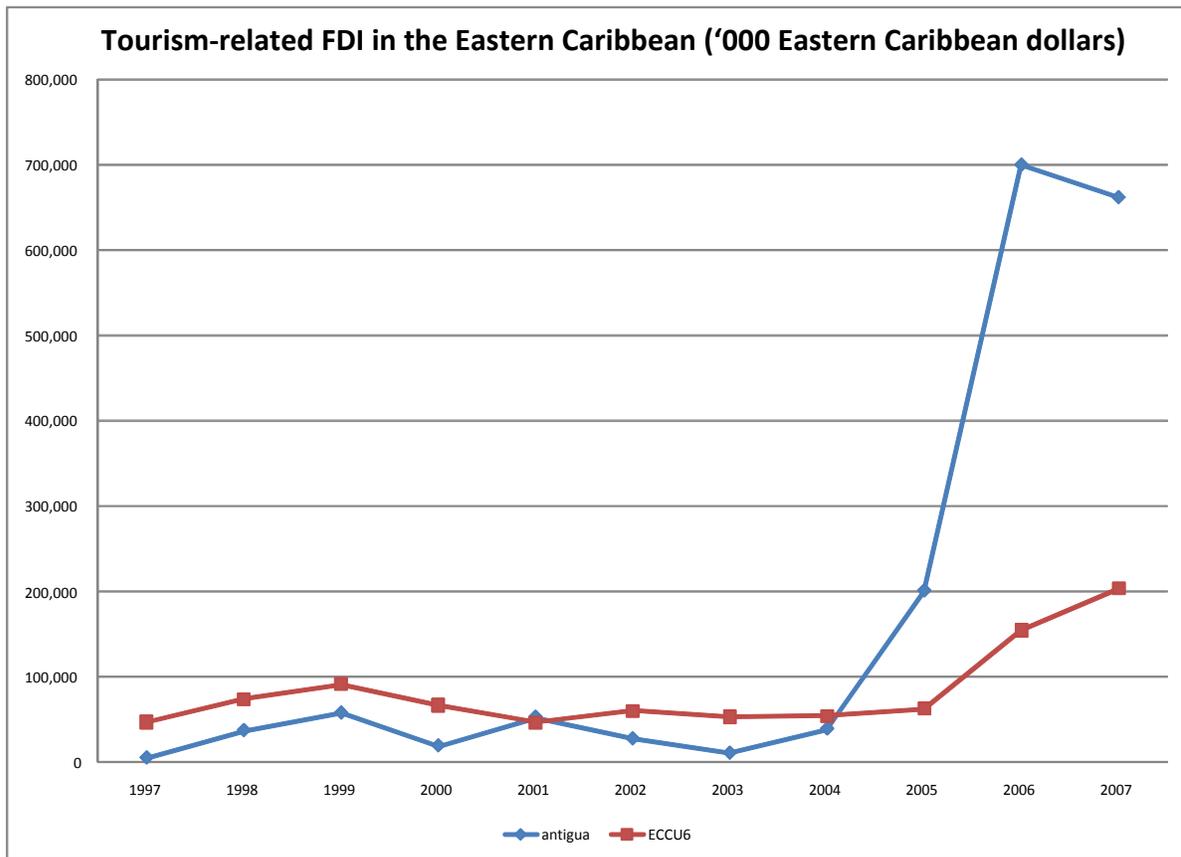

The CFA countries were studied to see how changes in their investment codes between 1994 and 2006 influenced FDI. The vertical lines in the figure denote the introduction of new investment codes, including investor-friendly changes such as tax incentives and legal protections. Providing more generous tax incentives did not have any effect on FDI, but reducing the number of incentive regimes and increasing the number of guarantees for investors raised it. In some cases granting tax exemptions to exporters increased FDI, though this finding was not robust (see Appendix 3, section 1).¹⁵

For the OECS countries, variations in incentives granted to the tourism sector were studied for their impact on related FDI. These countries are also fairly homogeneous, with most being former British colonies, sharing

¹⁵ James, Sebastian, and Stefan Van Parys, 2009 “Effectiveness of Incentives in UEMOA-CEMAC Countries,” World Bank, Washington, D.C.

the same currency and similar legal backgrounds and tourism endowments, and competing for the same (U.S. and European) tourists. Because their monetary policy is the same within the group—eliminating macroeconomic variations—it is easier to analyze changes that incentives had on FDI. During the period under study, 1997–2007, all the countries except Antigua kept their incentive regimes unchanged. Antigua initiated a major change to its incentives in 2003, extending the tax holiday for tourism companies from 5 to 25 years.

A difference-in-difference methodology was used to compare FDI in Antigua’s tourism sector before and after 2003. That difference was then compared to similar changes for the average of all the other countries. The figure below shows that tourism-related FDI in Antigua jumped relative to the other countries after 2003. This finding is significant under several specifications—including controlling for the cricket World Cup, which likely contributed to FDI. The extended tax holiday in Antigua is associated with a jump in tourism-related FDI of several times the average for the rest of the region.

Thus FDI had a completely different response to incentives in the OECS than in West and Central Africa. Though the OECS includes some countries poor enough to qualify for IDA grants, the investment climates in these countries are generally good. Moreover, these countries are known to be very open to business and have the advantage of being well placed for U.S. and European investments (see Appendix 3, section 2).

Policy implications

This section’s conclusions about how incentives affect FDI—and the related policy implications—are summarized in Table 2.

Table 2. Conclusions on Incentives and Investment—and Policy Implications*

Research	Conclusion	Policy implication
Mooij and Enderveen (2003), Desai, Foley, and Hines (2004)	Investments in developed countries respond strongly to incentives.	Investment incentives are likely to work in developed countries.
Klemm and Van Parys (2009)	Investments have responded to incentives in some developing countries, but the elasticity was smaller than in developed countries.	Incentives have a small impact on investments in developing countries.
Investment Climate Advisory research	Investments are not strongly influenced by lower tax rates in countries with weak investment climates.	Incentive policy should take into account the strength of a country's investment climate.
Grubert and Mutti (2003), Rolfe and White (1991), Wells (1986)	Export-oriented investments—especially mobile ones—are more sensitive to tax incentives.	Targeted incentives are a cost-effective way to foster such investments.
Hassett and Hubbard (2002)	Investment incentives create significant distortions by encouraging inefficient investments.	Attention should be paid to the efficiency costs of investment incentives.
	Low inflation is the best investment incentive.	A good macroeconomic environment works better than investment incentives.
	Temporary incentives have bigger short-run impact than permanent ones.	Incentives should be used only temporarily. Tax holidays, if used, should have an end date after which they are not available to anyone.

* Based on a selection of the literature discussed

4. Do Investment Incentives Matter to Investors?

An alternative to using econometric evidence to assess the importance of incentives for investment is to ask investors themselves whether incentives mattered when they decided to invest in a certain location. This approach has been popular because it provides nuanced information on the importance of incentives for different types of investors operating in different sectors.

Though this approach seems fairly straightforward, such surveys have problems. They run the risk of bias because any question to investors on whether incentives matter is likely to be answered yes. One way to avoid such bias is to ask investors to list and rank the reasons they invested in a country. If incentives were salient, investors would mention them. A second approach is to ask investors to rank an existing list of reasons. A third is the

“extreme test” devised by Guisinger and Associates (1985), which asks investors if they still would have invested if everything else were the same except that incentives were not provided.

These tools make it possible to identify investors for whom incentives were critical to their investment. Based on that, the incentives given to other investors can be considered redundant. Table 3 shows redundancy ratios based on investor surveys in various countries. For example, a FIAS study on Thailand found that 81 percent of investments would have been made even without incentives. In Jordan, Mozambique, and Serbia 70 percent or more of investments would have been made anyway, so incentives were redundant. Overall, redundancy levels are quite high for investors.¹⁶ But as Table 4 shows for exporters, tax incentives are far more important. That table also shows responses for duty-free imports, most of which have redundancy ratios similar to those for tax incentives. The other remarkable aspect about investment incentives is that they did not affect the level of investment for most investors.

Returning to the model presented in section 2, one part of the costs of incentive policy is the loss of revenue from incentives given to investors who would have invested anyway. High redundancy ratios suggest that this loss is not trivial. Incentives are particularly redundant for investments oriented toward domestic markets and those based on natural resources—such as mining and tourism—unique to a country. Interestingly, the greatest salience for tax incentives is correlated with the footloose nature of the investment. Incentives mattered most in Nicaragua, which also had the highest percentage of investors who considered another location.

Thus surveys make it possible to understand the types of investors to whom incentives matter. Incentives are very important to exporters (those that are also mobile)—confirming Wells (1986), who notes that export-oriented firms operate in highly competitive markets with slim margins.¹⁷ They also tend to be highly mobile and have likely compared taxes across locations, because taxes are an important part of their cost structures.

There is a dichotomy between the importance of incentives as perceived by governments and investors. Robinson (1961) finds that in a survey of investors and government departments entrusted with encouraging investment, governments believed that incentives strongly influenced investment decisions. But for investors, access to domestic markets, a good investment climate, security and stability, skilled labor, and other factors ranked much higher than incentives (see Table 1). This dichotomy may be due to the fact that granting incentives is much easier for government officials than is providing a secure

¹⁶ Nicaragua is an exception, but 65 percent of the investors were exporters—40 percent of whom were garment exporters—and most had considered another location.

¹⁷ Wells, L. 1986. "Investment Incentives: An Unnecessary Debate." *The CTC Reporter* 22: 58–60.

and stable political environment, implementing economic reforms, or developing a skilled workforce.

Table 3. Salience of Incentives Based on Investor Surveys

Author	Focus of survey	Conclusion	Did incentives influence investment level? (share saying yes)
Investment Climate Advisory (FIAS)— investor motivation surveys	Jordan (2009)	Redundancy ratio for incentives (Would have invested even if Incentives were not provided)	70%
	Mozambique (2009)		78%
	Nicaragua (2009)		15% (51% for non-exporting firms outside free zones)
	Serbia (2009)		6%
FIAS ¹⁸	Vietnam (2004)		85%
FIAS	Thailand (1999)		81%
Guisinger and Associates (1985)	Investment incentives and performance requirements for export-oriented firms		33%
Reuber (1973) ¹⁹	FDI and market orientation		52% for export-oriented firms
Mckinsey— Multinational corporation investment in developing economies (2003)	Business process outsourcing (BPO) and automobile sectors in India (2003)	Incentives not among top 3 factors driving location decisions	
Fortune/Deloitte and Touche (1997)	Business location study	Taxes ranked 13 th of 26 factors in importance for investments	
G-30 (1984)	Study of 52 multinational corporations covering half of world's FDI stock	Incentives ranked 7 th in importance for investments

**Table 4. Importance of Tax Incentives to Investment Decisions
(share saying yes when asked if incentives were among the top five reasons to invest)**

Incentive	Mozambique (60)	Jordan (61)	Serbia (50)	Nicaragua (71)
Duty-free imports	27%	36%	16%	93%
Tax incentives	17%	38%	29%	76%
Considered another location?	12%	33%	30%	40%

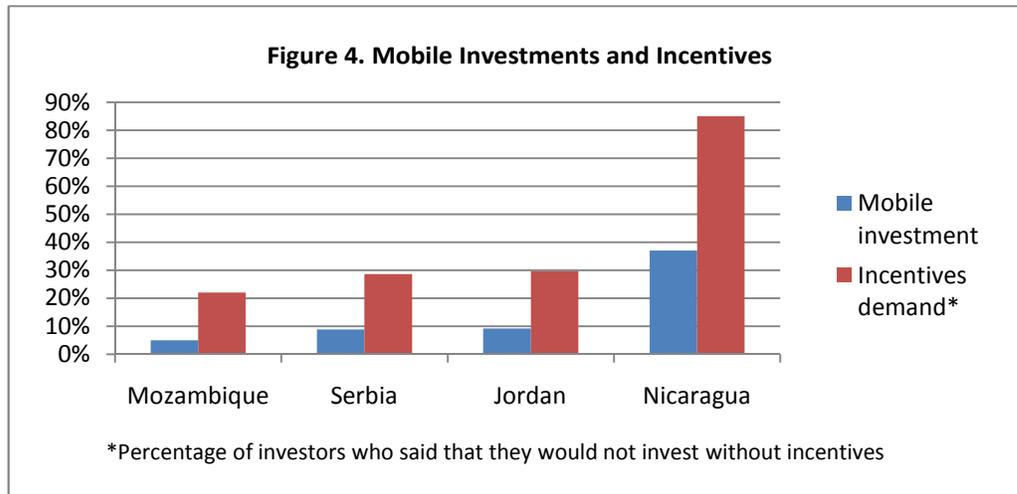

Sector orientation and incentives

The attractiveness of incentives varies among investors. Again, highly mobile investors are sensitive to incentives—especially tax incentives (Figure 4). But their investments provide few links to local economies. One highly mobile investment involves locating the head financial offices of multinational companies in tax havens or low-tax jurisdictions. Such investments, as opposed to operational headquarters, provide little local added value to host countries.²⁰ Exporters are also sensitive to incentives.

By contrast, investors oriented toward domestic markets are less sensitive to incentives (Figures 3). A larger share of investors oriented toward export markets would not have invested without incentives relative to investors oriented toward domestic markets.

²⁰ Easson, Alex, 2004, "Tax Incentives for Foreign Direct Investment," Kluwer Law International.

Firms operating from free zones are also more likely to export and to want incentives. In Nicaragua 98 percent of investors inside free zones would not have invested without incentives, compared with just 41 percent of those operating outside the zones.

WTO limitations on the use of export linked incentives

Export incentives are subject to WTO discipline as they are classified as export subsidies and affect terms of trade. They are expressly prohibited subsidies are prohibited by WTO. However there is a low income country exemption provided under article 27 in the standard countervailing measures agreement. They include,

- Least Developed Countries: 33 WTO members + 12 in accession
- Middle Income Countries: 18 WTO members with GNP/capita < \$1,000 (1990 US\$)
- Middle Income Countries: 23 WTO members with “grandfathered” programs (final phase out in 2015)

Policy implications

The analysis of investor surveys has three policy implications:

- To attract investment, governments should give top priority to improving their countries’ business climates.
- Targeted incentives should be provided to sectors where there is evidence that such incentives affect mobile investment. But these incentives should be linked to investment growth and job creation, both of which provide social benefits.
- Export incentives may run afoul of WTO guidelines.

5. When Incentives May Be Used?

“Tax incentives improve economic performance only if government officials are better able to decide the best types and means of production than are private investors.”

— — — Richard Bird

When assessing the utility of incentives, thought should be given to the circumstances under which governments should intervene in market operations. That is, when will private enterprises ensure that resources are used efficiently, and when should governments play a role? This section discusses examples of market failures. This is not to suggest that incentives should be offered to correct all such failures or anomalies, but rather that there are areas where governments may consider applying this policy framework to see if intervention is warranted.

Public goods

When considering approaches to stimulate certain economic activities or sectors or when establishing its policy to attract investment, a government should always ask what policy decision is likely to generate the most long-term economic activity or growth: spending a dollar directly on public goods and services or spending a dollar on incentives.

When the level of public goods is very low, the marginal benefit from an additional amount of public good is more than the marginal cost. Hence, it is optimal to invest in more public goods. On the other hand, an investment incentive could create private investment that in turn generates benefits for the economy. The goal is to compare the opportunity costs of public funds with the returns on funds used for investment incentives.

Consider the following examples:

- *Tourism*. In a country with weak road infrastructure, a dollar spent on roads leading to and from a tourist area is likely to create more economic activity than a dollar in tax concessions provided to a tourism company.
- *Manufacturing*. In a country with weak infrastructure and many unskilled workers, a dollar spent on roads, ports, telecommunications, or education is likely to attract more investment than a dollar in tax concessions provided to a manufacturing firm.²¹

Another consideration is that some public goods will not be supplied by the market or, if supplied, will be insufficient. In such cases thought should again be given to whether incentives can efficiently correct the undersupply.

²¹ Despite this, it is not uncommon for investment incentives to be given to mining companies. This could be partly due to political economy pressures.

Positive externalities

Economic activity often leads to positive externalities that governments want to support and encourage, perhaps through the use of incentives. Examples of such externalities include:

- Investments in technology—such as research and development or high-tech industries—that upgrade worker skills.
- Infrastructure projects that encourage business growth.
- Investments that create jobs in areas with high unemployment.
- Environmentally friendly technology.
- Anchor investments—that is, those that provide multiplier effects through signaling and by creating backward linkages into the local economy.

Such investments can have positive, often long-term spillover effects on the economy or environmental protection, making it easier to justify spending on incentives.

International tax competition

Tax competition creates a race to the bottom, with countries competing against each other to offer more generous incentives. There is evidence that tax competition is occurring between developing countries and is successful in attracting footloose investments (Klemm and VanParys 2009). Countries that attract such investments may suffer from the “winner’s curse”—having given up too much in exchange for investment. Moreover, while a country may win or lose a specific investment, in aggregate tax competition lowers revenues for all countries if investments would have been made in any case (a situation akin to the “prisoner’s dilemma”). Finally, footloose investments respond to tax incentives, yet often relocate to another tax-favored jurisdiction after tax incentives have been exhausted. Many investors also bargain with different governments to get the best incentive package, and governments generally acquiesce. For example:

- A highly mobile international textile company is looking for the lowest-cost country from which to export its goods. An incentive policy could provide tax concessions only for that company’s exports.
- Mining companies are not mobile because they need a country’s natural resources. So even though they export their product, they should not be given tax exemptions because they need to be in the country to access the natural resources.

Hence, when considering whether to “correct” market failures, governments should not get carried away when competing with neighboring countries. There is a strong role for

international bodies such as the IMF, World Bank, and OECD to provide coordination and avoid harmful tax competition so that all countries can gain.

While tax competition results in a race to the bottom, the clustering of investments provides advantages to investors, making them less sensitive to tax rates. In fact, this can result in a race to the top, with countries raising taxes to capture the rents arising from such agglomeration pressures. Though such pressures typically occur in developed countries, China's manufacturing cluster and India's software cluster are notable examples in the developing world.

Policy implications

To the extent possible, governments should:

- Use incentives to encourage the private sector to fund public goods or goods with a strong private good character (such as infrastructure).
- Limit use of incentives for activities unlikely to generate social benefits.
- Use resources saved by eliminating incentives for spending that the private sector is unwilling to cover.

6. Costs of Managing and Administering Incentives

As implied by the model from section 2, effective incentive policy requires reducing the nonrevenue costs of incentives.²² Ways to do so include reducing misuse of incentives, administering incentives effectively, and easing the compliance burden on investors who want to take advantage of incentives. Among other things, nonrevenue costs can involve:

- Distortions created by encouraging new investments that are detrimental to existing ones.
- Time and money spent by businesses lobbying the government for tax incentives.
- Time and money spent by businesses qualifying for and obtaining tax incentives.
- Revenue lost to illegal activity, such as from businesses that do not qualify for tax exemptions but falsify information to do so, or indirect revenue lost to businesses that do not qualify for tax incentives but illegally use tax-exempt entities to source goods.
- Additional costs for authorities responsible for administering tax incentives.

Though these nonrevenue costs are difficult to quantify, they may greatly exceed the financial costs of incentives. Thus they should be kept in mind when formulating incentive policy.

²² See Wells, Louis T., Nancy J. Allen, Jacques Morisset, and Neda Pirnia, 2001, "Using Tax Incentives to Compete for Foreign Investment—Are they Worth the Costs?" International Finance Corporation and World Bank, Foreign Investment Advisory Service (FIAS).

Distortions created by unduly favoring new investments

By definition, incentives for new investments place existing investments at a disadvantage. The goal of investment incentives is to create new investments or expand existing ones. But in their desire to attract new investors, policymakers may neglect existing investors. Much can be gained by addressing the issues facing existing investors in expanding their investments. Indeed, if existing investors are not taken care of, new investors will be less likely to invest.

Moreover, providing excessive investment incentives can erode the tax base by putting more pressure for revenue on the smaller base of existing investors—increasing their tax burdens and creating distortions. One response to such pressure is to evade taxes by posing as a new investor and benefiting from investment incentives. A common example is the abuse of tax holidays by investors who reorganize as new investors when their benefits expire.

Last but not least is the loss of business from existing investors who do not receive incentives to those who do.

Costs of obtaining tax incentives

The costs of obtaining tax incentives are not trivial when incentives are discretionary and investors must go through an approval process to qualify for them. This process can require considerable time and money from investors. Investment climate surveys in Jordan, Mozambique, Nicaragua, and Serbia have found that obtaining incentives delayed projects or raised costs for about a fifth of investors (Table 5). Some delays lasted more than a year. Anecdotal evidence suggests that some foreign businesses interested in investing in Mali did not because they never received information from the Ministry of Finance about their applications for incentives.

Some investment promotion agencies require that investors be approved before they can receive incentives. For example, the Gambia's investment promotion authority confers a special status on investors, who are then awarded special investment certificates that entitle them to benefit from incentive packages. The investment promotion authority also states that, "Apart from these specific incentive packages, others can be negotiated with the Agency depending on the strategic nature of the investment."²³

²³ http://www.gipfza.gm/Why_The_Gambia/Investment_Incentives.aspx (accessed 10 September 2009).

Table 5. Costs of obtaining Incentives

	Mozambique	Jordan	Serbia	Nicaragua
Did obtaining incentives delay project implementation?	22% said yes (10% by 1–3 months; 8% by 3–6 months) 78% said no	18% said yes (8% by 3–6 months; 2% by 18 months or more) 82% said no	2% said yes 98% said no	27% said yes (20% by 2–12 months; 1% by more than 12 months) 72% said no
Did obtaining incentives add to project costs?	27% said yes 72% said no	5% said yes 95% said no	20% said yes 80% said no	13% said yes 85% said no
What were the main additional costs?	18% said additional senior management time 15% said loss of business	Not an issue	12% said additional consulting fees 6% said additional senior management time	26% said additional senior management time 24% said legal fees 17% said loss of business

To the extent possible, qualification for incentives should be automatic, with investors receiving them if they satisfy the conditions required by tax and other laws. Investors’ costs increase if they are asked to go through an approval process. Moreover, most investment promotion agencies lack the capacity to administer incentives—especially tax incentives.

Revenue losses due to incentives

The moment a benefit is created for some taxpayers, it provides an opportunity for those who do not qualify to abuse the system. James (2007) describes how businesses that are not eligible for a lower tax rate try to look like those that are—even incurring costs to do so. Such fraud cannot be uncovered except through intrusive audits, and the resulting revenue leakage can be considerable.

For example, India’s central government provides area-based exemptions in industrially weak areas for direct and indirect taxes. In one instance, businesses set up front offices in Jammu and Kashmir, a state that qualified for area-based exemptions. But the businesses’ production occurred outside the state. Revenue losses in just two cases were equal to 4 percent of the spending on this incentive.

Transfer pricing—where taxpayers divert their profits or sales through an entity that qualifies for a tax incentive—is a popular way of misusing incentives (see Appendix 2). In India it was discovered that when companies had two units, one of which benefited from

tax incentives while the other did not, the profits of the unit that did not benefit were often much lower than the profits of the unit that did, indicating a diversion of profits to the tax-exempt entity (Box 2). The difference in profits occurred even when both units were in the same city and manufactured the same product.²⁴

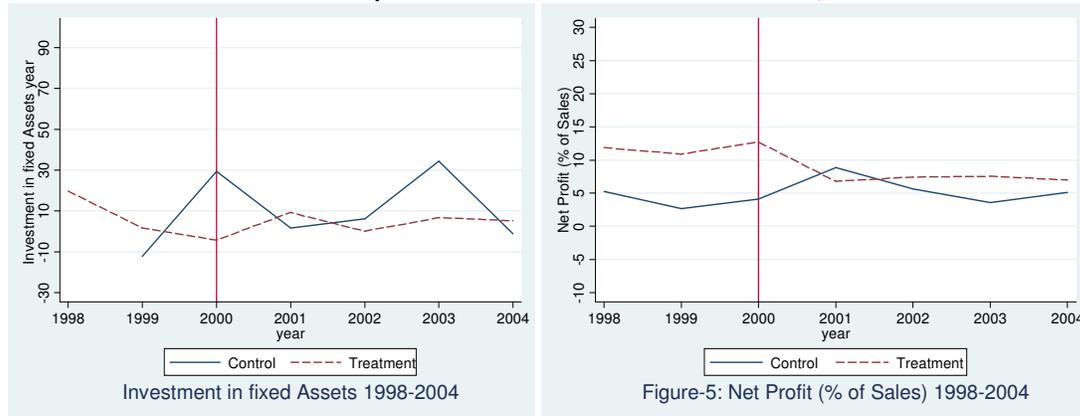

As noted, tax holidays often motivate firms to reorganize in order to extend their benefits. Another potential problem for tax authorities arises when existing investors not receiving tax holidays reorganize to receive benefits. This runs counter to the intended goal of encouraging new investment, with the added risk of shrinking the tax base.

Box 2. Incentives and Investment in India: The Role of Institutions

In 2000 the Indian government removed incentives being offered to exporters except those located in export processing zones or qualified as export-oriented units. Investment behavior quickly changed among firms that lost their incentives. To study these changes, firms from the zones and export-oriented units—which were quite similar—served as a control group. To make them comparable to other firms, only garment exporters from one Indian state (Tamil Nadu) were studied.

The figure on the left below shows how investments changed after 2000. Firms that lost their incentives maintained the same amount of investment despite higher tax rates. A similar trend occurred with the control group, indicating that investments were unaffected by the removal of incentives.

Investor Responses to Removal of Incentives in India, 1998–2004

That said, an interesting side story has implications for incentive policy. The right figure above shows how reported profits responded to the loss of incentives. Reported pre-tax profits dropped by half in the group that lost incentives despite almost no change in business parameters such as sales or export composition. But pre-tax profits did not fall because incentives disappeared: only the amount reported fell, as confirmed by tax audits. This implies that investors reacted to the loss of incentives by evading more taxes. In addition, it was found that among investors who owned two industrial units with one unit in the zone and the other outside, the pre-tax profits of units in the zone were far higher than those outside even when both units were manufacturing the same product in the same city. This point to a diversion of profits from taxed to tax-exempt units.

²⁴ James, Sebastian, 2007, “The Effect of Tax Rates on Declared Income: An Analysis of Indian Taxpayer Response to Changes in Income Tax Rates,” Ph.D. diss., Harvard University, Cambridge, Mass.

Costs of administering incentives

Any incentive policy requires constant monitoring to prevent leakage, imposing an additional burden on tax authorities. Excessive use of tax incentives complicates administration, facilitates evasion, and encourages corruption.²⁵ It also costs businesses time and money to comply with audit requirements. In some countries businesses forgo incentives because of the high indirect costs of obtaining them. For example, many Canadian firms gave up the tax incentive for research and development because the approval and audit processes were too costly.²⁶

Referring to the introduction of new tax holidays in India's special economic zones intended to encourage new investments, Raghuram Rajan, former chief economist of the IMF said that, "Of course the government says that only new investment will benefit, but who is to judge what new investment is? A poorly paid tax inspector?" He added that, "If you create perverse economic incentives and then rely on bureaucrats to stand in the way of businesses exploiting them, the outcome will be little more, and a lot less revenue, but much richer bureaucrats."²⁷

Policy implications

When incentives put pressure on an administration, impose additional costs on businesses, and create opportunities for rent seeking, policies are required to mitigate such problems. The following principles can help guide policymakers in such efforts.

- *Incentives should be granted automatically.* Eligibility for incentives provided by law should be based on clear criteria, not granted through special permission or certification by investment promotion agencies, ministries of trade, or other government agencies. This approach ensures prompt decision making and quick turnaround times for investors—essential to attracting and retaining investment.
- *Good policymaking and tax administration require that tax incentives be part of the tax code.* Governments should place tax incentives in the relevant tax code so that tax authorities can administer them. Some tax incentives are provided through different statutes, and in extreme cases through individual agreements with investors. Those approaches create confusion about which government body administers tax incentives. If relevant tax clauses cannot be moved to the tax law, they should at least be mirrored or copied there. Doing so unambiguously allows the tax administration to administer tax incentives and limit their abuse.

²⁶ Rao, S., and Andrew Sharpe, 2002, *Productivity issues in Canada*, University of Calgary Press.

²⁷ Rajan, Raghuram, 2006, *Finance and Development* (September).

- *Incentives require adequate monitoring and control mechanisms.* The tax administration should check that investors receiving tax incentives satisfy the requirements for them. To enable them to do so, it should be compulsory for tax returns, declarations, and relevant forms to be filed regularly as a precondition for tax benefits. Tax incentives should not be used as an excuse to avoid the compliance requirements of the tax administration. Moreover, strict information requirements (including the complete financial statements of related businesses) and regular audits must be imposed on firms seeking tax holidays.

7. Political Economy and Tax Incentives

“If one cannot simply eliminate tax incentives, I have elsewhere suggested three simple rules to reduce the damage that may be caused by poorly-designed and implemented incentives: keep them simple, keep records, and evaluate the result. Alas, very few developing countries have managed to follow even such basic rules as these: the political advantages of ambiguity seem always to outweigh the potential social gains from transparency.”

———Richard Bird²⁸

The preceding analysis of the costs and benefits of incentives is based purely on economic criteria. But governments’ behavior is not always driven by economic rationality, and political rather than economic considerations often tip the balance in favor of incentives. Incentives are popular with governments for a variety of reasons, including:

- They are a less visible way for governments to provide special benefits to certain businesses.
- They are easier to provide than infrastructure, labor skills, or other investment climate improvements.
- When ministries other than the ministry of finance are allowed to provide tax incentives, the incentives are misaligned. Other ministries tend to give more incentives than is optimal because they do not have to bear the burden of lower tax collections.
- Governments want to be seen as doing something active to attract investments. The easiest approach tends to be to give up revenue that they do not have.

Tax incentives, like any market intervention, are justified if they correct market inefficiencies or generate positive externalities. Though there is limited evidence that tax concessions work, they hold considerable appeal for politicians because discretionary tax incentives—especially in developing countries—generate political influence over policy options, provide a political gesture of action, and facilitate political and administrative corruption.

²⁸ Bird, Richard, 2008, “Tax Challenges Facing Developing Countries,” Institute for International Business Working Paper 9.

Discretionary tax incentives are popular with politicians²⁹

The tax complexity arising from tax incentives results from political tradeoffs—the product of elite bargaining within the political rules of the game. For example, through the fragmented power structures under Boris Yeltsin’s Russia in the 1990s, politically powerful elites secured exemptions through tax expenditures (incentives, concessions, holidays, exemptions) estimated to equal more than two-thirds of taxes collected for the federal budget (Easter 2008).

Policymakers should be cautioned against introducing incentives that could notionally result in two investors in the same sector or two similar enterprises receiving entirely different incentive packages. Beyond the risk of enabling corruption, such a regime runs contrary to internationally accepted principles and will likely destroy any confidence that investors should have in government authorities to create an enabling business environment.

Tax incentives have unknown costs

Tax expenditures hold special political appeal because their costs are usually unknown, interference from other “veto players” (such as legislatures) is limited or nonexistent, and revenues losses are dispersed over the long term—while the political benefits, especially from discretionary regimes, are immediate and offer opportunities for corruption, on which political stability (Khan 2006) and personal greed depend. Thus tax incentives and the corruption around them offer what North and others (2007) describe as “the universal problem of violence and disorder.” They do so by providing powerful individuals and groups with incentives to cooperate with rather than fight the coalition in power.³⁰

Tax expenditure budgeting is a useful tool for shedding light on the cost of incentives. Developing countries are increasingly using this tool, with India, Morocco, South Africa, and Uganda as recent examples. Investment Climate Advisory studies in Rwanda and Sierra Leone have found that more than one-third of tax revenues were given up as incentives—revenues that were badly needed to deliver basic public goods such as health care and education, prolonging both countries’ dependence on aid.

²⁹ Major part of this section and the next two are drawn from Everett-Phillips, Max, 2009, part of chapter 7 in *Handbook of Tax Simplification*, World Bank Group, Investment Climate Advisory Services.

³⁰ North, Douglass C., John Joseph Wallis, Steven B. Webb, and Barry R. Weingast, 2007, "Limited Access Orders in the Developing World: A New Approach to the Problems of Development," Policy Research Working Paper 4359, World Bank.

Tax incentives can work if governance is good

Tax incentives have worked in the context of effective governance. East Asian governments were able to offer successful nondiscretionary incentives that attracted private investors and promoted exports and technological adaptation and innovation (Choi and Kwack 1990). The type of political regime influences tax incentive policy. Countries with better governance offer lower tax incentives, with a stronger effect in more democratic countries (Li 2006). In environments with weaker governance, lacking the political incentive to deliver economic growth to legitimize the state, it can be difficult for political processes to select the right projects to support.

At the same time, tax incentives may shift investment to certain industries or political priority areas because of redistributive concerns (for example, incentives for investment in poor areas), positive spillovers (for example, incentives for high-tech industries that transfer technology to the rest of the economy), or for economic diversification. But in all cases it remains problematic for political processes to correctly identify such spillovers without the politically driven “action learning” that underpinned the East Asian miracle.

Bargaining for incentives—the role of tax competition

Demands for incentives are also driven by the private sector. For export-oriented investors, lowering costs is critical to being competitive. Surveys of non-export-oriented investors have confirmed that while incentives were not an important factor in their decisions to invest, they would ask for them anyway because incentives improved their bottom lines. A survey of U.S. investors concluded that those who considered tax exemptions did so only marginally (Aharoni 1966). In fact, one concluded that, “Tax exemption is like a dessert; it is good to have, but it does not help very much if the meal is not there.”

Given that governments tend to buckle under pressure, many investors have played one country against another in seeking generous incentives, with the “winning” country invariably overplaying its hand and ending up the loser. In 2001 Ramatex, a Malaysia-based textile manufacturer, negotiated with the governments of Botswana, Madagascar, and South Africa, then decided to invest in Namibia, which offered a 20-year tax holiday, subsidized water and electricity, a 99-year tax exemption on land use, and R 60 million (\$1 = R 8.12) to prepare the site (including setting up electricity, water, and sewage infrastructure). In fact, Namibia actively competed against South Africa, which offered a six-year tax holiday and subsidized land. But a year after production started, the Namibian government was having serious doubts about whether Ramatex would honor its promise of creating jobs.³¹ The factory closed in 2008 amid complaints of worker mistreatment and groundwater pollution, along with claims that the company had used Namibia only as a transshipment point.

³¹ James, Sebastian (2003); see also Bolnick (2004).

Wells and others (2001) discuss a large multinational corporation planning to set up an export-oriented electronics plant and bargaining with the Indonesian and Malaysian governments for generous tax benefits. In the end Malaysia “won” the contest, but the company then revealed that it had never intended to locate in Indonesia. Yet by playing one government against the other, it got a good deal.

Tax competition creates a race to the bottom and is a classic coordination problem among countries. As an international public good, tax competition should be managed through international or regional agreements so that governments do not end up losing. The European Union offers a good model to emulate in this regard.

Incentives create a community that depends on them

In many countries incentives have stayed on the books long after the period they were intended for and well after their benefits no longer exist. Incentives create a community of businesses that depend on and lobby for them even after using up their benefits for the initial period they were granted. As Richard Bird has noted, “Once created, concessions usually prove hard to remove and tend to be enlarged at the initiative of taxpayers who lobby for more concessions or simply redefine existing concessions in unforeseen and presumably undesired ways. Get rid of them.” Once incentives are granted, it is extremely difficult to wean businesses away from them without expending a huge amount of political capital.

Policy implications

Tackling the persistence of incentives arising from political economy is extremely challenging. But certain methods can alleviate the problems, making it difficult for political elites to grant special favors and for special interests to receive them:

- *Incentives should be granted transparently, through legislation.* Incentives are more transparent and less subject to abuse when provided by law and approved by the legislature. This is particularly relevant because budgetary processes are usually subject to parliamentary oversight—and because tax incentives have budgetary consequences, they should be provided in a similar way. Doing so ensures that incentives are granted according to uniform, predetermined criteria available to the public. Incentives can be granted by the executive as political favors when transparency and public awareness are limited and checks and balances are lacking.
- *Discretion should be limited.* Discretionary incentives are one of the main reasons political economy problems are aggravated. Automatic eligibility for incentives based on law and clear criteria allows investors to know well in advance their eligibility for any incentive and reduces opportunities for corruption.
- *Costs should be clear.* Improving transparency about the cost of incentives goes a long way in pushing government toward sound incentive policy. Because the revenue costs

of incentives are not obvious, governments tend to face limited scrutiny when granting them, unlike when making direct expenditures. Just as with the expenditure budget, it is best practice to budget the amount of revenue forgone and reveal it to the public. This approach requires that the ministry of finance project the likely amount of tax revenue to be forgone through tax expenditures in its budget projections. Doing so increases public discussion on the costs and benefits of incentives. Recent tax expenditure calculations for Rwanda and Sierra Leone have made both governments take notice after having revealed that more than a third of revenues were given up as incentives.

- *Action should be coordinated among neighboring countries.* Avoidance of tax competition is a useful goal at the regional level because it improves outcomes for all the governments involved.

8. Options for Incentive Policy

This section provides policymakers with advice on an optimal approach to providing incentives, including policy, administration, and needed reforms.

Best policy option for tax incentives

A good tax system ensures predictable revenue for government, is stable, and minimizes distortions in investment decisions. There is broad consensus that a reasonable, uniform tax rate on a broad base of taxpayers is sound policy. Paradoxically, that approach rules out all tax incentives.

However, some experts have argued that governments should have less neutral policies because not all investments are the same and some incentives may be needed.³² Silvani and Baer (1997) note that in many developing countries a tax system with few taxes, a limited number of rates for each tax, limited exemptions, and a broad base has proven much easier to administer and resulted in higher compliance than a complex tax system. Wallschutzky (1989) suggests that an ideal tax system should keep tax laws as simple as possible, aim for a global tax with few exemptions, credits, rebates, or deductions, not try to achieve too many social and economic goals, and be continually monitored.

Having few exemptions limits the need to verify case-by-case compliance with the conditions under which exemptions are granted. Tax administration costs increase and tax administration becomes complex if the tax system is used to achieve nonrevenue goals. In addition to creating a narrower base, reducing equity, and imposing price distortions, differential treatment greatly increases information requirements for the tax

³² Ibid footnote 11. Page 85-86.

administration, provides opportunities for misreporting, and complicates tax compliance requirements. Tax concessions for nonrevenue objectives should be used very selectively and only after comparing their effectiveness with alternative expenditure, subsidy, or regulatory instruments that can potentially achieve the same goals.

Broad tax bases can be justified by the indirect savings due to reduced opportunities for noncompliance.³³ Allowing little exclusion from the tax base makes reduces the scope for tax evasion whereby the tax evader incorrectly claims tax exemptions. Furthermore, for a given revenue requirement, tax rates can usually be lower than with a narrow base.

Figure 5 provides basic guidance for policymakers seeking to move toward the best approach for tax incentives. Most countries fit somewhere in the middle in administering these incentives, so more detailed guidance about reforms is given below.

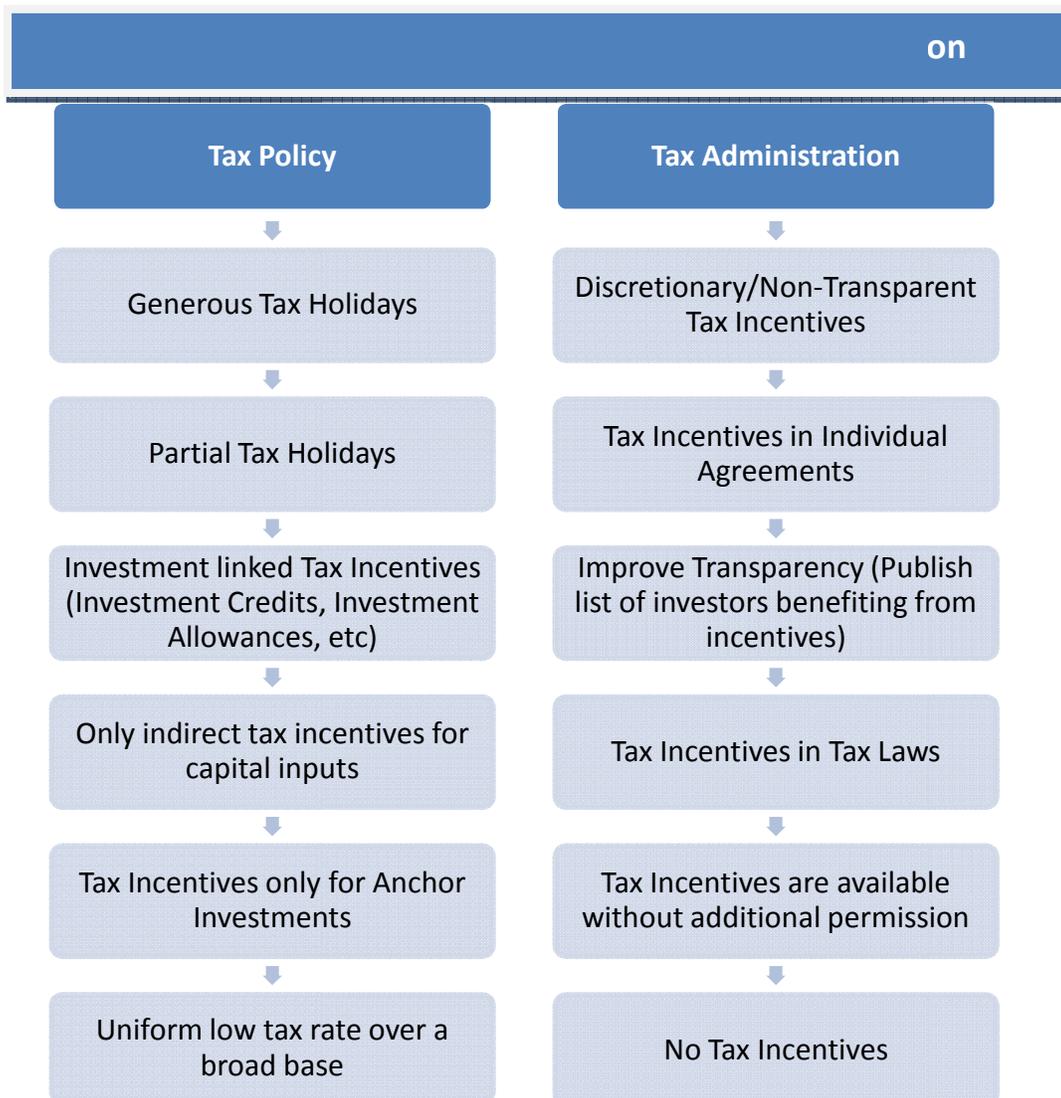

Reform Path for Tax Incentives Reform

Provide immediate relief to investors

In the short term and for various reasons—including political—governments face pressure to act quickly to show that they are working to increase investment and generate jobs. Reform policies can give immediate relief to investors without providing overly generous tax incentives. Such policies include:

- Setting time limits on incentives, sending a signal to potential investors that there is a limited window for benefits.
- Fostering investment in plants and machinery by reducing the cost of capital. Although this effort has a revenue cost, it goes a long way in encouraging investment.
- Making incentives available automatically, signaling to investors that government is making the investment process friendlier.
- Publicly announcing investors who benefit from incentives—helping to increase transparency and providing political backup.
- Pursuing a time-bound plan to reduce barriers to investment.

³³ FIAS. 2009. *Handbook of Tax Simplification*, (ed. Sebastian S. James). Chapter 5. World Bank Group.

Move away from tax holidays

Tax holidays partly or completely exempt income from taxation for a specified number of years. This is a popular but ineffective incentive because:

- Tax holidays are a blanket benefit unrelated to the amount of capital invested or its growth during the holiday. An alternative is to set minimum capital investment requirements to receive a tax holiday.
- Firms have an incentive to close and sell their businesses at the end of the tax holiday—only to reopen as a “new” investment, thus gaining an indefinite tax holiday.
- If FDI operates under double taxation agreements, tax holidays simply transfer tax revenues from the country receiving the investments to the investing home country.
- Tax holidays enable firms to funnel profits, using transfer pricing, from an existing profitable company through the “tax holiday” company and so avoid paying taxes on either.

- Most capital-intensive investments do not yield a profit until several years after operations start. Thus tax holidays for a “start up” period of five years are ineffective. Indeed, tax liabilities often kick in just about when a business starts to make a profit.

Thus tax holidays are a very blunt investment incentive. Other incentives could provide benefits to taxpayers while encouraging investment. Such incentives, known as investment-linked or performance-based incentives, include:

- *Investment tax credit*—deducting a fixed percentage of an investment from tax liability. Rules differ about credits in excess of tax liability and include the possibility that they will be lost, carried forward, or refunded.
- *Investment allowance*—deducting a fixed percentage of an investment from taxable profit (in addition to depreciation). The value of the allowance is the product of the allowance and the tax rate. So, unlike a tax credit, its value will vary across firms unless there is a single tax rate. Moreover, the value is affected by changes to the tax rate, with a tax cut reducing it.
- *Accelerated depreciation*—allowing depreciation at a faster schedule than is available for the rest of the economy. This can be done in many ways, including through higher first-year depreciation allowances or increased depreciation rates. In nominal terms tax payments are unaffected, but their net present value falls and the liquidity of firms increases.

The tax benefits of tax holidays could be converted to an equivalent investment-linked incentive or a flat corporate tax rate. Mintz and Tsiopoulos (1992) provide examples of moving from a tax holiday regime to one with a low flat tax rate. By properly calibrating the rates, such a conversion protects incentives for investors while eliminating the disadvantages of tax holidays.

Moving from one incentive structure to another while reducing the tax burden has implications for revenue. Bolnick (2004) uses the ratio of the revenue loss to the METR gain to compare the cost-effectiveness of different incentives. As Table 6 shows, an investment tax credit provides the most (incentive) bang for the (revenue) buck. Though lowering tax rates provides a strong incentive for investment, making them too low is quite costly for revenue. As a result, any reform path that moves a country toward the best option should balance the competing objectives of attracting investment and protecting the revenue base. It should be noted that Table 6 does not reflect the additional investment that may occur when tax rates are lowered. But if the redundancy ratios are anywhere near those in Table 3, the revenue gain from investments that respond to incentives will likely be outweighed by the loss from investments that would have come in anyway.

Table 6. Cost-effectiveness of Various Tax Incentives³⁴

Relative Cost-effectiveness Ratios for Various Tax Incentives ^a		Scenarios			
		1 0% debt; greenfield project ^c	2 50% debt; greenfield project ^c	3 0% debt; 100% plant & equipment	4 50% debt; 100% plant & equipment
METR for benchmark tax regime ^b		57.0%	52.6%	59.0%	56.0%
1	Benchmark + Tax rate = 30% ^d	1.01	1.00	1.02	0.98
2	Benchmark + Tax rate = 15% ^d	0.99	0.92	0.98	0.90
3	Benchmark + Tax Holiday of 5 years	1.07	1.12	1.05	1.07
4	Benchmark + Tax Holiday of 10 years	0.96	0.88	0.95	0.85
5	Benchmark + Double Declining Balance	1.03	1.30	1.03	1.21
6	Benchmark + 20% ITC (no adjustment to basis) ^e	1.43	1.72	1.51	1.81
7	Benchmark + 50% IA (adjustment to basis) ^e	1.06	1.30	1.04	1.21
8	Benchmark + 50% IA (no adjustment to basis) ^e	1.05	1.07	1.03	0.96
9	Benchmark + Dividend Tax = 0%	1.02	1.07	1.02	1.05
10	Benchmark + Capital Gains Tax = 0%	1.00	0.81	1.01	0.84
11	Benchmark + Import duty on capital goods = 0%	1.03	1.22	1.03	1.21

Notes:

^aRelative cost effectiveness (RCE) = percentage decline in METR/percentage decline in PV Tax. When RCE > 1, then the incentive effect (% reduction in METR) exceeds the direct revenue effect (% foregone revenue, in present value terms).

^bBenchmark case: 35% company tax and capital gains tax; declining balance depreciation at rates of 5%, 15%, 25% for buildings, plant & equipment, and vehicles, respectively; 15% dividend withholding tax; unlimited loss carry-forward, but no loss offset; 10% inflation, 25%; nominal interest rate (to accentuate debt effect), without indexing; 10% duty on imported capital goods; sale of company after 10 years.

^cGreenfield project = 10% land, 40% building; 40% plant & equipment; 10% vehicles

^dCapital Gains Rate also adjusted to equal to the tax rate

^eITC = investment tax credit; IA = initial allowance

Reform administration of tax incentives

Several bad practices involving the administration of tax incentives should be avoided. Some countries award incentives on a case-to-case basis or give investment certificates to “approved” investors that allow them to claim incentives. Moreover, these actions are hidden from the public. Such discretionary, nontransparent practices are prone to abuse and may not lead to the desired outcomes for government. Some countries also provide special investment incentives by executive decree. Even when such decrees are given by the highest authority, such as the president, this approach lacks proper checks and balances.

Even when tax incentives are awarded based on the law, there is a danger that incentives will proliferate if they are provided by sector ministries. Because these ministries are not

³⁴ Bolnick (2004).

responsible for collecting taxes, they do not bear the costs of the incentives they award. The best approach is to grant incentives according to tax laws that offer as little discretion as possible.

Finally, when Incentives are provided it is essential that:

- They be based on rules and not be open-ended (with strict time limits).
- Benefiting investors file tax returns and face audits.
- Governments produce tax expenditure statements so that the cost of incentives is transparent.
- Incentives be reviewed occasionally for their efficacy.

Policy for anchor investments

The model outlined in section 2 is useful for policymakers analyzing whether directing incentives toward certain investments has a positive net impact on the economy. This tool can also be used to analyze the cost-effectiveness of incentives for anchor investments.

Anchor investments are large enough to have significant backward linkages for the local economy, and are often made by highly reputable firms that jumpstart investment in several areas. Accordingly, governments often woo such investors with incentive packages. First, however, some basic questions should be answered:

- Will the investment generate additional tax revenue?
- Does the anchor investment provide positive externalities (such as signaling future investors and creating linkages to the economy)?
- Would the investment come in anyway? Does the country have any special advantages that are important to the investor?
- Would the investment incentive put existing investments at a disadvantage? Does it cause a leakage in tax revenue? Does it undermine the investment environment by encouraging other investors to ask for similar incentives ?

The most important question is whether the investment will generate the promised positive externalities. Around the world, several large investments have had limited direct impacts on local economies.³⁵

Tailor incentives to country conditions

Table 7 summarizes desirable short- and long-term incentive policies for countries facing a variety of conditions.

³⁵ MOZAL, a \$2.2 billion aluminum smelter in Mozambique, is a classic example. Despite its massive size, there have been complaints about low job creation and limited backward linkages to the local economy. Moreover, the project benefited from generous tax incentives and contributes little tax revenue (see <http://www.irinnews.org/Report.aspx?ReportId=75790>). Still, MOZAL helped signal that Mozambique is a good place to do business, and has been followed by several other large investments.

Table 7: Incentive Policies under Various Country Scenarios

Country Scenario	Short term policy	Long term policy
Countries with very weak investment climate	Investment incentives are ineffective and therefore lead to waste of tax revenues. Tax revenues instead should be used to create public goods. Reforms should also be introduced to clean up its tax system.	Country should work to reduce barriers to investment and focus on simplifying investment process widely.
Countries facing tax competition	Incentives may be used to ensure that the country is not at a disadvantage to its neighbors.	Such countries should work on regional pacts to stop harmful tax competition. Countries should work on marketing the more substantive differentiations eg. labor, skills, infrastructure, etc.
Countries planning to diversify their economy	Countries may use incentives that are linked to investment growth (investment allowance, accelerated depreciation, etc.) but only for a limited period based on clear prioritization of sectors in line with FDI competitiveness	Broader industrial policy strategies have to be followed, including a focus on sector targeting and promotion for investment
Countries possessing unique advantages (natural beauty, natural resources)	General Investment incentives to attract investments that exploit such advantages wastes revenue, unless they kick start investment ³⁶	Barriers should be lowered for designed to exploit its natural resource, access to land, and so on.

Gauging the cost-effectiveness of investment incentive policies

A popular metric for measuring the cost-effectiveness of investment incentive policies is to calculate the dollar cost of the jobs they create, based on total tax expenditure. Though not an entirely accurate measure, this approach provides a ballpark figure that can help policymakers decide if the incentive was worthwhile.

For example, a 2008 Investment climate advisory study found that the Yemeni government spent about \$6,000 each year for 8,000 jobs that investment incentives helped create—more than six times the country’s per capita income. In Thailand a 1999 FIAS study found that investment incentives each year cost the government about 16 times the average annual wage of an industrial worker.

³⁶ While such a strategy was effective in the case of Antigua, it is possible that it took investment away from its neighbors through tax competition could be one factor. As a result, while Antigua gained, it is likely that this was at the cost of its neighbors.

9. Conclusion

Whatever incentives a government decides to offer and however it structures them, every effort should be made to ensure that incentives are:

- *Affordable*—forgone income should not severely undermine government revenue streams.
- *Targeted*—targets for incentives should be based on research to confirm that they will benefit the country in ways that would not have been possible if there were no incentives, thereby reducing revenue costs.
- *Simple*—incentive administration should permit easy accessibility and determination of eligibility.
- *Reviewed periodically*—investment incentives should be regularly reviewed to determine their relevance and economic benefit relative to their budgetary and other costs, including long-term impacts on resource allocation.

Providing incentives can create risks that might have implications for the investment climate and overall fiscal compliance. It also encourages lobbying and rent seeking. Increasing transparency on the costs and benefits of tax incentives would, in the long run, help frame future policy. Providing a level playing field to all businesses through a broadly based, low, uniform tax rate has been the best investment incentive in many countries.

Appendix-1. A Simple Model of Incentives

Government utility sets the tax rate (T) to maximize its utility given by

$$U = R(T) + S(K) - C(T-\hat{T}, I) \tag{1}$$

Where $R(T)$: This is the Revenue accruing to government is assumed to be a tax on capital given by the expression $R(T) = T \times K$. However, in the case of a the tax favored sector taxed at a lower rate \hat{T} , the capital base could be disaggregated into $K_1 + K_2(T, \hat{T}) + K_3(T)$, where K_1 is the capital that would be invested in the tax favored sector anyway, $K_2(T, \hat{T})$ is that capital in the tax favored sector that responds to tax incentive and, $K_3(T)$, is the capital investment into the regular sector;

$S(K(T))$: This is the social benefit arising from investment in the tax favored sector which is an increasing function of invested capital $K(T)$, which itself is a function of the tax rate. The social benefit may be defined as the benefit that goes beyond the investment (e.g. positive externalities, or investments that have public good characteristics such as infrastructure), and;

$C(T-\hat{T}, I)$: This is the indirect cost of incentives. A special benefit to certain sectors imposes an additional cost on the economy (including distortions and administrative costs). This cost increases with the tax differential between the regular and tax favored sector ($T-\hat{T}$) due to economic distortions (Hassett and Hubbard 2002) and increased evasion (James 2007). The cost also decreases with the investment climate (I) or strength of the institutions. For example, if the tax administration is efficient, there is less leakage due to misuse of the incentives thereby less costs³⁷.

Additional explanation of the terms:

$R(T)$, the revenue accruing to government, is assumed to be a tax on capital given by the expression $R(T) = T \times K$. But in the case of a the tax-favored sector taxed at a lower rate \hat{T} , the capital base could be disaggregated into $K_1 + K_2(T, \hat{T}) + K_3(T)$, where K_1 is the capital that would be invested in the tax-favored sector anyway, $K_2(T, \hat{T})$ is the capital in the tax-favored sector that responds to the tax incentive, and, $K_3(T)$ is the capital investment in the regular sector. Hence, by definition $K_2(T, T) = 0$. That is, when there is no tax-preferred status, this part of the capital is zero.

$$K_2(T, T) = 0 \tag{2}$$

Hence,

³⁷ See James(2007), Tax Policy, Tax Compliance and Optimal Tax bases, Phd. Thesis. Harvard University.

$$R_1(T) = T \times (K_1 + K_2(T, \hat{T}) + K_3(T)).$$

$C(T-\hat{T}, I)$ is any special benefit to a certain sector that imposes an additional cost on the economy (including distortions and administrative costs) and increases with the tax differential between the regular and tax-favored sectors ($T - \hat{T}$). The cost also decreases with the investment climate (I) or strength of institutions. This implies that as the investment climate improves, the costs of administering incentives fall. James (2007) describes how firms use differential taxation to evade taxes through a lower-taxed sector, which is one of the costs of tax incentives,³⁸ and how this relates to the strength of institutions. As in equation 2, $C(0, I) = 0$, which implies that there is no indirect cost of administering incentives when no incentives are provided.

As a result, when incentives are provided, equation 1 can now be written as:

$$U = T \times (K_1 + K_2(T, \hat{T}) + K_3(T)) + S(K(T)) - C(T-\hat{T}, I) \quad (3)$$

When incentives are not given out (that is, $\hat{T} = T$),

$$U = T \times (K_1 + K_2(T, T) + K_3(T)) + S(K(T)) - C(0, I) \quad (4)$$

Government now lowers the tax rate for the tax-favored sector from T to $\hat{T} = T - \Delta T$ to maximize the utility given by equation 1 without changing the rate for the regular economy. Because this change only applies to the tax-favored sector, $K_3(T)$ remains unchanged. Hence equation 3 could be written as:

$$U + \Delta U = (T - \Delta T) \times (K_1) + (T - \Delta T) \times (K_2 + \Delta K_2) + T \times K_3(T) + S(K(T - \Delta T)) - C(\Delta T, I) \quad (5)$$

Where $\Delta K_2 = \Delta T \times \frac{\partial K}{\partial \hat{T}}$ is the increase in capital investment in the tax-favored sector because of the incentive. This is critically dependent on the size of $\frac{\partial K}{\partial \hat{T}}$.

As a result, the impact of a small decrease in tax ΔT on the utility of the government is given by subtracting the equation 4 from equation 5. After dropping the second order terms and noting equation 2, this is given by:³⁹

³⁸ James, Sebastian, 2007, "Tax Policy, Tax Compliance, and Optimal Tax Bases," Ph.D. thesis (Essay #1), Harvard University, Cambridge, Mass.

³⁹ $(T - \Delta T) \times K_2(T, T - \Delta T)$, on simplification becomes $(T - \Delta T) \times (K_2(T, T) + \Delta T \times \frac{\partial K}{\partial \hat{T}})$, calling $\Delta T \times \frac{\partial K}{\partial \hat{T}}$ as ΔK_2 , we get $(T - \Delta T) \times (K_2(T, T) + \Delta K_2)$, on further simplification, $T \times K_2(T, T) + T \times \Delta K_2 - \Delta T \times (K_2(T, T) - \Delta T \times \Delta K_2)$.

$$-\Delta T \times K_1 + T \times \Delta T \times \frac{\partial K}{\partial \tau} + S'(K) \times \Delta T \times \frac{\partial K}{\partial \tau} - \Delta T \times C_1$$

Where C_1 is the partial derivative of the cost function with respect to the first argument. Hence a unit decrease in tax for the tax favored sector would increase utility provided that

$$T \times \frac{\partial K}{\partial \tau} + S'(K) \times \frac{\partial K}{\partial \tau} > K_1 + C_1 \tag{6}$$

Equation 6 is the classic problem of the government. Each of its terms can be explained as follows:

$T \times \frac{\partial K}{\partial \tau}$ is the Laffer curve effect that operates on the premise that lower taxes encourage investment and so increase revenue. This depends on the size of $\frac{\partial K}{\partial \tau}$. If capital does not vary a lot with lower tax rates, it implies that lowering taxes does not result in much additional revenue. In the extreme case, $\frac{\partial K}{\partial \tau} = 0$, which implies that any lower taxes result in a loss of revenue for government.

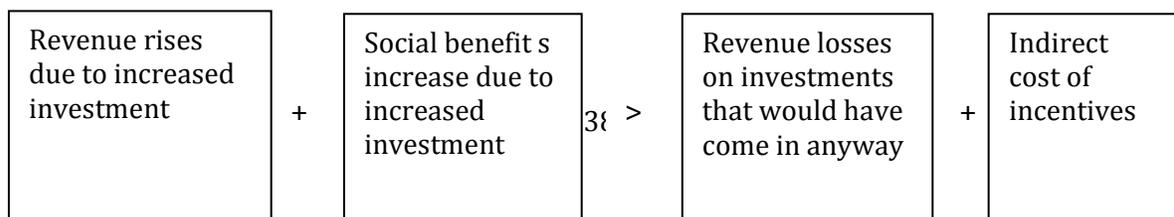

$S'(K) \times \frac{\partial K}{\partial \tau}$ is the social benefit arising from additional capital investment. The social benefit is proportional to the additional capital investment induced by the lower taxes as well as how responsive the social benefit is relative to capital investment.

K_1 is the loss of revenue arising from lower taxes on investment in the tax-favored sector that would have come in anyway. If $K_1 = 0$, this implies that the investment would come in only because of the tax incentive. As a result there is no revenue loss from the incentive.

C_1 : is the function denoting the indirect cost of incentives.

Government now lowers the tax rate only for the tax favored sector, which results in an increase in revenue from investments that were positively influenced by the tax change, social benefits from this increased investment, revenue loss from investments that would have come in anyway, and indirect costs of the incentives.

In summary, an incentive policy is successful if:

Policy implications

Expression	Explanation	Policy implication
$\frac{\partial K}{\partial \hat{T}}$ is small	Investment is not responding to incentives	Limited economic benefit of incentives
$S'(K)$ is high	Investment provides high social benefits	Incentives in these sectors are good for the economy
K_1 is high	A lot of Investment would have come despite the incentives	Revenue loss for government
C_1 is high	Incentives have high indirect costs	Reduces the economic benefits of Incentives due to administrative and leakage costs

As a result, lowering taxes for a tax-preferred sector decreases revenue and imposes indirect costs on the economy. But it also increases capital investment that in turn increases revenue from the sector and generates social benefits.

As a result an incentive policy is successful if the decrease in revenue (and additional costs) is more than made up for by the increased investment and social benefits that the additional investment provides.

If $\frac{\partial K}{\partial \hat{T}}$ is zero or very small, equation 6 is unlikely to be satisfied. Hence any tax decrease to a tax-favored sector is a net loss to the welfare of the economy.

If $\frac{\partial K}{\partial \hat{T}}$ is positive, it remains to be seen if equation 6 is positive. It may be true that for various reasons $\frac{\partial K}{\partial \hat{T}}$ is so small and the indirect cost $C(I)$ is so large that incentives are a net loss to the economy.

As a result the success of any tax incentive policy hinges on the dependence of investment on tax rates, which depends on the conditions favorable to investment, the social benefits that any additional investment generates, and the indirect costs of the incentive policy.

For an incentive policy to be successful, three factors must be satisfied:

- Investment is highly dependent on tax rates, with lower taxes resulting in significant additional investment.
- Investment generates many social benefits.
- The incentive policy has low indirect costs.

Adjusting the model for Investment climate

As discussed, the crucial factor for effective incentives is the dependence of capital investment on the tax rate, or the magnitude of $\frac{\partial K}{\partial \tau}$. Based on econometric evidence, capital investment and its elasticity relative to tax rates depend on the investment climate.

This implies that when an investment climate improves, capital could be used more efficiently. As a result more is invested. Second, is more effective when the investment climate is more conducive. This implies that $\frac{\partial K}{\partial \tau}$ can be written as $\frac{\partial K}{\partial \tau} = -F(I)$, and $F(0)=0$, $F(I) \geq 0$, and $F'(I) > 0$, so that as the tax rate decreases, capital investment decreases, but that increase depends on the strength of the investment climate. When the investment climate is bad ($I = 0$), no amount of tax change affects the investment level.

Appendix-2. Types of Tax Incentives

Definitions of Typical Tax Incentives⁴⁰

Tax holidays: Temporary exemption of a new firm or investment from certain specified taxes, typically at least corporate income tax. Sometimes administrative requirements are also waived, notably the need to file tax returns. Partial tax holidays offer reduced obligations rather than full exemption.

Special zones: Geographically limited areas in which qualified firms can locate and thus benefit from exemption of varying scope of taxes and/or administrative requirements. Zones are often aimed at exporters and located close to a port. In some countries, however, qualifying companies can be declared “zones” irrespective of their location.

Investment tax credit: Deduction of a certain fraction of an investment from the tax liability. Rules differ regarding excess credits (credits in excess of tax liability) and include the possibility that they may be lost, carried forward or refunded.

Investment allowance: Deduction of a certain fraction of an investment from taxable profits (in addition to depreciation). The value of an allowance is the product of the allowance and the tax rate. Unlike a tax credit, its value will thus vary across firms unless there is a single tax rate. Moreover, the value is affected by changes to the tax rate, with a tax cut reducing it.

Accelerated depreciation: Depreciation at a faster schedule than available for the rest of the economy. This can be implemented in many different ways, including a higher first year depreciation allowances, or increased depreciation rates. Tax payments in nominal terms are unaffected, but their net present value is reduced and the liquidity of firms is improved.

Reduced tax rates: Reduction in a tax rate, typically the corporate income tax rate.

Exemptions from various taxes: Exemption from certain taxes, often those collected at the border such as tariffs, excises and VAT on imported inputs.

Financing incentives: Reductions in tax rates applying to providers of funds, e.g., reduced withholding taxes on dividends.
