

Evaluation Methods and Results of EGAT's Labeling Programs

Napaporn Phumaraphand
Electricity Generating Authority of Thailand

Lessons Learned in Asia : Regional Symposium
on Energy Efficiency Standards and Labeling
29-31 May 2001, United Nation Conference Center (UNCC)
Bangkok, Thailand

Presentation Outline

- ❖ Program Summary
- ❖ Evaluation Approach
- ❖ Program Evaluation Results
- ❖ What was learned ?
- ❖ Next Steps

Program Summary

Objectives : To transform the market so that high efficiency refriger. or A/C are the norm in five years.
(since 1995 and 1996)

Major Market Barriers:

- ◆ Availability on EE models (A/C, Refriger)
- ◆ Customer Information on relative EE (A/C, Refriger)
- ◆ Price (A/C)

Strategies : Promote the use of efficient refriger. and A/C (label#4 and #5) over the standard ones (label#3) by obtaining voluntary agreements with manufacturers to affix labels in exchange for EGAT's promotion supports.

Program Summary-- Refrigerator Labeling

- ◆ Commenced in 1995 with focus on residential refrigerators.
- ◆ Negotiation with 5 local manufacturers to initiate voluntary labeling scheme for single-door models. (dominant market share)
- ◆ Large public campaign to raise consumer awareness and aggressively promote level 5 label.
- ◆ In 1998, labels have been made mandatory for single-door models and EGAT has expanded to include two-door models for voluntary labeling.
- ◆ Starting in Jan 2001, the efficiency level for each of the 5 ranking categories was increased by 20% .

Refrigerator Efficiency Levels

- Level 5 Annual electricity consumption is at least 25% below the mean consumption of tested refrigerators.
- Level 4 Annual electricity consumption is 10% to 25% less than the mean consumption of tested refrigerators.
- Level 3 Annual electricity consumption is within +/-10% of the mean consumption of tested refrigerators.
- Level 2 Annual electricity consumption is 10% to 25% more than the mean consumption of tested refrigerators.
- Level 1 Annual electricity consumption is at least 25% more than the mean consumption of tested refrigerators.

NEW

Rating Scale 1= low, 2=fair, 3=medium, 4=good, 5=very good

Rating of this appliance

"The label shows the efficiency of the electric appliance"

Type of appliance Refrigerator (NON-CFC)

Efficiency: volume/kWh

Electricity cost per year

Electricity consumption: kWh/year

EGAT Logo

EGAT

Program Summary-- Air Conditioner Labeling

- ◆ Commenced in 1996 with focus on room A/C (7,000-24,000 Btu/hr)
- ◆ Similar to refrigerator labeling but dealing with 55 manufacturers
- ◆ Product price differentials were significant, as a result;
 - ✧ interest free loan to customer
 - ✧ rebates to A/C retail shops
- ◆ Mandatory still not possible due to higher number of participating manufacturers.

A/C Efficiency Levels

Level 5	10.6	$< \setminus \text{EER}$	
Level 4	9.6	$< \setminus \text{EER}$	< 10.6
Level 3	8.6	$< \setminus \text{EER}$	< 9.6
Level 2	7.6	$< \setminus \text{EER}$	< 8.6
Level 1		EER	< 7.6

OLD

Rating for this appliance

“The label shows the efficiency of the electric appliance”

Type of appliance Aircon

Size X btu/hour

Produce name, model

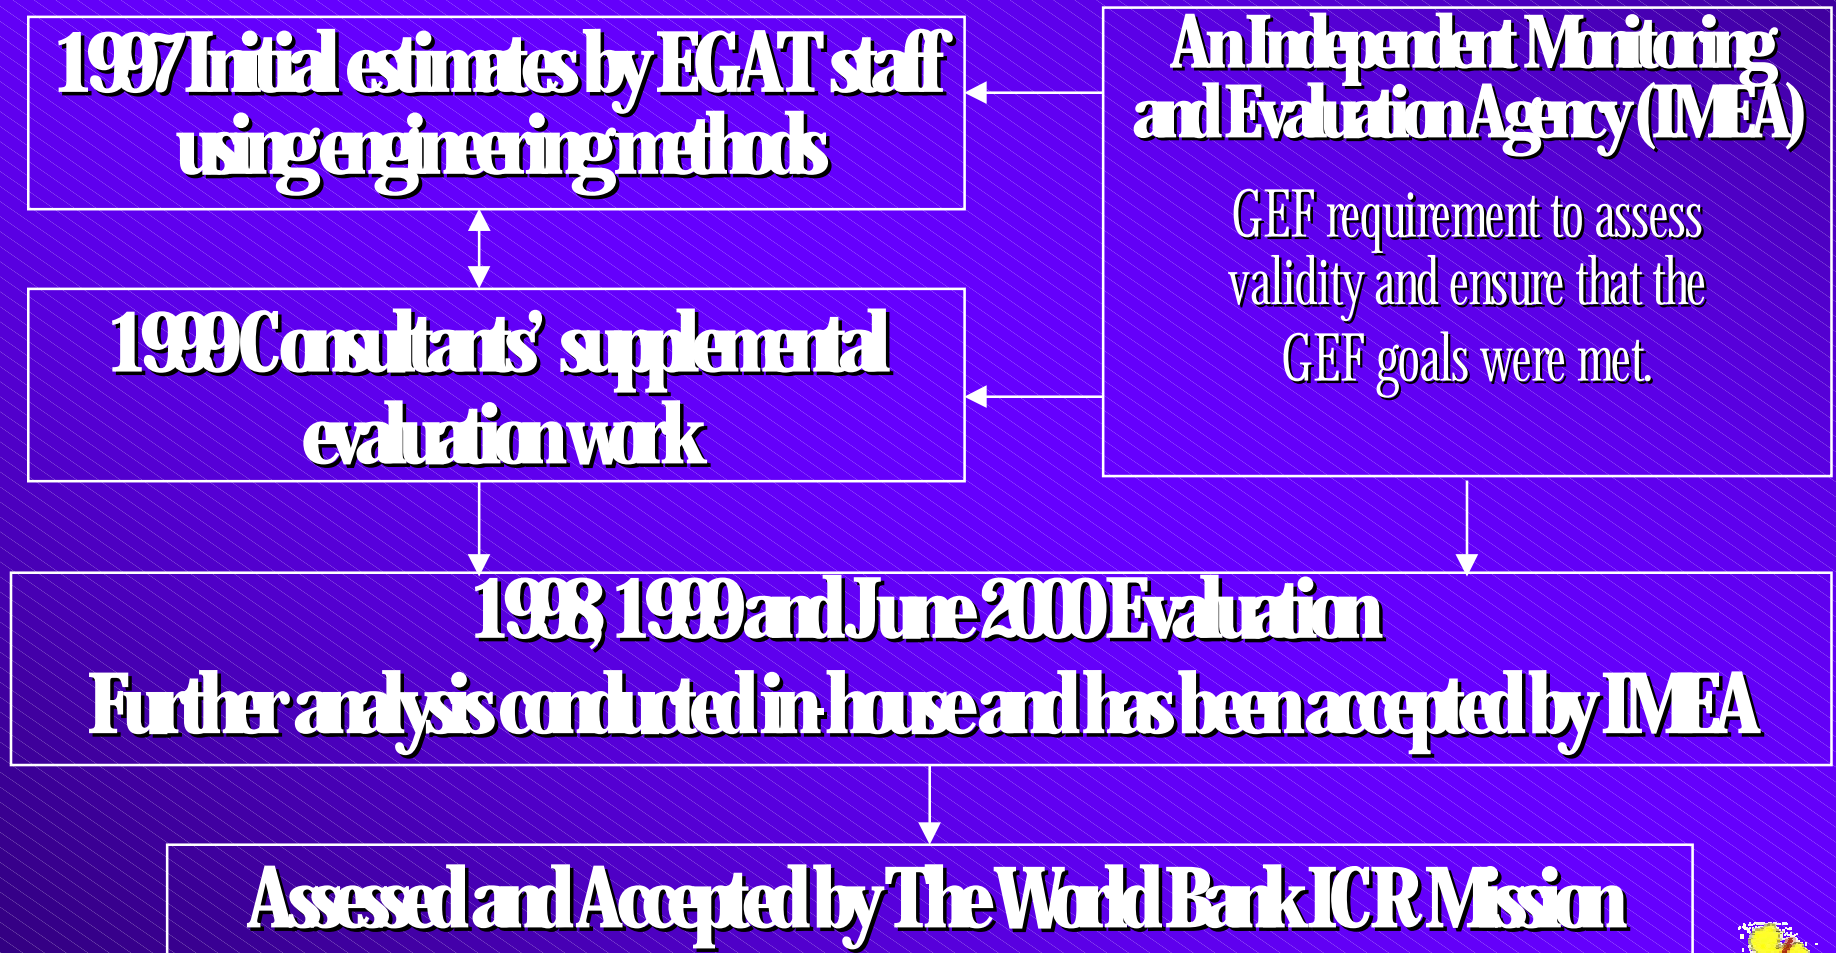

EER btu/watt

Electricity price baht/year

Electricity use units/year

Logos from EGAT, MEA, PEA
“we can work together and save energy”

EGAT's Program Evaluation Framework

Evaluation Objective

- ❖ To quantitatively and qualitatively assess two EGAT's labeling programs in terms of energy and environmental impacts
- ❖ Program Goals

	<i>MW</i>	<i>GWh</i>	<i>CO₂ reduction</i>
Refrigerator	27	185	not specified
Air Conditioner	22	117	not specified

Evaluation Methods- Engineering Estimates

❖ Engineering Algorithms Share Similar Features

GWh savings = Number of units * saving per unit *
hours of operation * (1-free rider rate)

Peak MW Reduction = Number of units * saving per unit *
coincident peak factor * (1-free rider rate)

❖ EGAT's spreadsheet monthly report since 1997 provided quantitative estimates of program impacts based on assumptions and program data tracking

Engineering Estimates Monthly Report

Comparison of Savings Target and Achieved to Date as of June 2000

Based on Afternoon Peak (2:00 p.m.)

PROGRAM	Launch Date	Savings Target (1998)		Achieved To Date		Percent Achieved		CO ₂ Reduction (Tons)
		MW	GWh	MW	GWh	MW	GWh	
Lighting	Sept. 1993	139	759	628.84	2,373.85	452%	313%	1,771,157
Refrigerator	Sept. 1994	27	186	72.96	532.63	270%	286%	397,401
Air Conditioner	Sept. 1995	22	117	44.66	679.28	203%	581%	506,818
Motor	Dec. 1996	30	225	0.21	1.23	1%	1%	918
Commercial Building	Oct. 1995	20	140	8.20	23.50	41%	17%	17,530
TOTAL		238	1,427	755	3,610	317%	253%	2,693,824

Note : 1. Cost Effectiveness of DSM Program

• Estimated Total DSM Expenditures to Date	=	1,814.50	million Baht
• Cost of Peak Demand Saving	=	2,403.69	Baht/kW
• Cost of Energy Saving	=	0.5026	Baht/kWh

2. Lighting Program

	MW	GWh
• Fluorescent Tube	627.55	2,279.96
• CFL	-	2,279.69
• Low-Loss Ballast	1.29	5.78
• HPSV Street Light	-	16.48

3. Commercial Bldg. Program

	MW	GWh
• Fluorescent Tubes & Reflectors	1.14	3.47
• CFL	6.58	20.03
• Thermal Energy Storage at EGAT	0.48	-

Calibration of Engineering Estimates 1

❖ Surveys, Interviews, and Metering Study by Consulting firms

	Refrigerator	A/C
◆ Survey Samples		
participant	247	216
non-participant	229	209
◆ Metered Samples (Hours of Operation)		
participant	75	64
non-participant	52	65
◆ No. of manufacturers interviewed	10	32
◆ Mail questionnaires sent to distributors	-	170
◆ In-person interviews with EGAT DSMO Staff		

Calibration of Engineering Estimates 2

❖ Adjustments due to IMEA comments and spot-metered data

Refrigerator Baseline

Before IMEA's comment
1994) 485 kWh/year/unit

average value of efficiency tested before program (Nov.

After IMEA's comment
kWh/year/unit

market average efficiency in Jan. 1995 i.e. 435

A/C Baseline

	IMEA Baseline EER	EGAT Baseline EER
Non-residential	8.0	7.6
Residential	8.3	7.6
Total	82	76

Calibration of Engineering Estimates 3

❖ Adjustments due to EGAT's internal analysis and data

Refrigerator • Coincident peak factor based on maximum kW metered values (not average values).

- Adjusted new with-load consumption factor.

A/C

- Coincident peak factor based on maximum kW metered values (not average values).
- Separate A/C sales to residential sector (80%) and non-residential sector (20%) based on in-house telephone survey.

Final Analysis and Formally Reported Results (Calibration of Engineering Estimates 3)

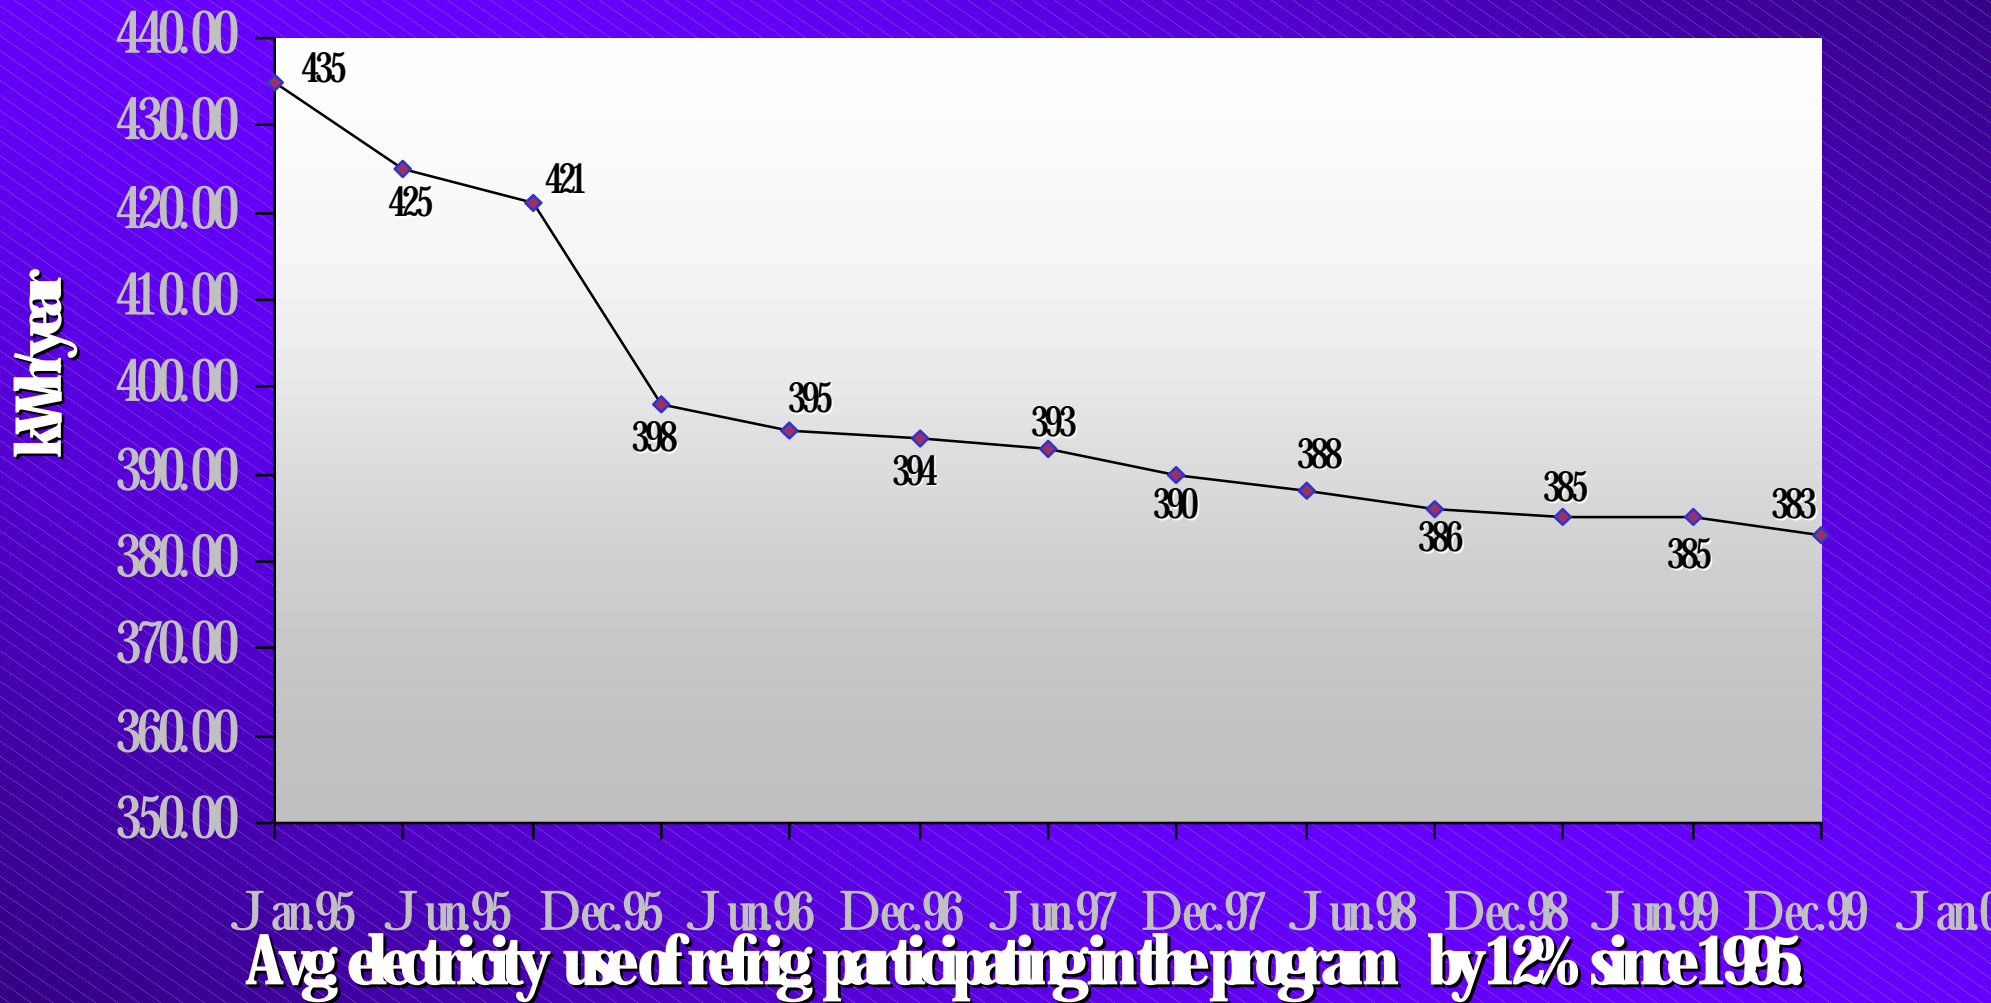

As of June 2000	Refrigerator	A/C
◆ Peak Demand Reduction (MW)	84	84
◆ Energy Savings (GWh)	849	318
◆ CO ₂ Reduction (Tons)	627,365	235,314
◆ Benefit-Cost Ratio		
Participant Test	6.5	1.6
Utility Test	17.5	14.5
Total Resource Cost Test	1.6	1.1

Market & Process Evaluation

Refrigerator (single door models)

- ◆ High consumer awareness
- ◆ 100% Market impacts for single-door models of total mkt) (~80%)
- ◆ Consumers & manufacturers satisfied
- ◆ Improvements recommended
 - ▶ Testing speed and accuracy
 - ▶ Update labeling scheme
 - ▶ Target promotions to sales people

Average Electricity Consumption of Refrigerator in Program

Market & Process Evaluation

Air Conditioner

- ◆ High consumer awareness
- ◆ Manufacturers and consumers satisfied
- ◆ Retailers (Green Shops) were less satisfied due to inadequate market support by EGAT
- ◆ Market impacts from 19% (1996) to 38% (1998)
- ◆ Improvements recommended
 - ▶ Testing speed and capacity
 - ▶ Simplify loan program
 - ▶ Make labeling mandatory

Average EER of Air Conditioner in Program

Avg EER of A/C participating in the program ↑ by 2% since 1996

Overall Program Impacts

- ◆ Capability building for program implementation & evaluation
- ◆ Domestic manufacturer awareness and capability to produce higher efficiency appliances
- ◆ Local testing capability improvement at TISI and MEA
- ◆ Introduction of Mandatory Energy Efficiency Standards by NEPO for six key end-uses by 2004 (Refrig., A/C, Electric Motors, Ballast, Fluorescent Lamps, Compact Fluorescents)

What was learned?

Implementation

- ◆ Program delivery is more effective for markets with few manufacturers and less price differentials.
- ◆ Efficiency and availability of testing facilities are important factors for effective delivery and continuity in operation.
- ◆ Voluntary labeling should be firstly introduced before extending to mandatory status of MEPS.

What was learned?

Evaluation

- ◆ Reliable pre- and post- program data such as baseline efficiency, market data, and end-use profiles are crucial to enable evaluators to correctly measure program impacts.
- ◆ Process evaluation is needed during early implementation to provide sufficient feedback to improve program delivery and program design.

DSM Five year Plan & Labeling Programs

◆ Peak Demand and Energy Reductions Expected By Program (2001-2005)

Program	Peak Demand Reductions (MW)	Energy Saving (GWh)	B/C Ratios (TRC)
Refrigerator	108	1,095	1.78
Air Conditioner	102	388	1.26
CFL	30	173	1.11
Ballast	3	18	0.95
HEM	56	380	1.38
Total	299	2,054	1.43

◆ Labeling Programs primarily focus on residential sector and account for about 57% and 93% of total DSM peak demand & energy reductions target.
