1. Introduction

Canada signed the 1982 United Nations Convention on the Law of the Sea on the day it was opened for signature and ratified it on 7 November 2003. The Convention entered into force for Canada on 7 December 2003.

As reflected in article 77 of the Convention, the rights of a coastal state over its continental shelf exist *ipso facto* and *ab initio*. In this respect, the Convention mirrors Canada's long-standing position, based on international law and state practice, as well as Canadian legislation and practice regarding the exercise of its sovereign rights and jurisdiction over its continental shelf. The current definition of the continental shelf in Canadian legislation is found in section 17 of the *Oceans Act*, enacted in 1996. This definition refers to the seabed and subsoil that extend beyond the territorial sea of Canada throughout the natural prolongation of the land territory of Canada to the outer edge of the continental margin, determined in a manner under international law that results in the maximum extent of the continental shelf of Canada, or to 200 nautical miles (M) from the baselines from which the breadth of the territorial sea is measured where the outer edge of the continental margin does not extend to this distance.

This is a partial submission that fulfills the obligation of Canada pursuant to article 76(8) and article 4 of Annex II of the Convention to submit information on the limits of the continental shelf beyond 200 nautical miles from the baselines from which the breadth of the territorial sea is measured in respect of areas in the Atlantic Ocean. Information with respect to the limits of the continental shelf beyond 200 nautical miles in the Arctic Ocean will be submitted at a later date in accordance with article 4 of Annex II of the Convention read in conjunction with the decision of the eighteenth Meeting of States Parties to the Law of the Sea (SPLOS/183). Noting in particular article 77 of the Convention, Canada reserves the right to submit information in respect of other areas or portions of continental shelf.

This submission has been prepared as a joint effort of the Department of Foreign Affairs, Trade and Development, the Department of Natural Resources (Geological Survey of Canada) and the Department of Fisheries and Oceans (Canadian Hydrographic Service). The Geological Survey of Canada and the Canadian Hydrographic Service were responsible for collecting and interpreting data as well as preparing the submission from a technical and scientific standpoint. The Department of Foreign Affairs, Trade and Development was responsible for legal aspects of the submission and associated diplomatic work.

2. Notes

The depiction or use of the 200 M limit of another state should not be taken to signify acceptance or endorsement of its validity at international law.

All maps, charts and databases forming part of this submission were prepared by the government departments responsible for preparing such material and for certifying its quality and reliability.

3. Commission members who provided advice during the preparation of the submission

Mr. Harald Brekke, a member of the Commission from 1997-2012, and Dr. Richard Haworth, who was elected to the Commission in 2012, provided advice during the preparation of this submission.

4. Provisions of article 76 invoked in support of the submission

Canada has delineated its continental shelf in accordance with article 76 of the Convention. In particular, Canada invokes article 76(4), (5) and (6) in determining the location of the outer limits in this submission.

Canada has defined fixed points in accordance with the 1% sediment thickness formula in article 76(4)(a)(i) or on arcs 60 M from the foot of the continental slope as provided for in article 76(4)(a)(ii), as well as on the distance constraint (350 M) and the depth constraint (2500 m plus 100 M) provided for in article 76(5). In accordance with article 76(7), the outer limits of the continental shelf have been delineated by fixed points connected by straight lines not exceeding 60 M in length.

5. General description of the continental margin in the Atlantic Ocean

The partial submission is organized in three sections: the Labrador Sea, the Grand Banks and Nova Scotia. Each section treats a particular region in a comprehensive manner and can be reviewed separately if necessary.

In geological and geomorphological terms, the continental margin of Canada in the Atlantic Ocean extends continuously from offshore Nova Scotia in the south, along the Grand Banks to the northern tip of Labrador, although each of the three regions described below has unique characteristics. This continental margin comprises a number of seafloor

elevations and forms the submerged prolongation of the land mass of Canada.

The formation of the continental margin in the Atlantic Ocean was initiated by the break-up of the supercontinent Pangea and the subsequent seafloor spreading episode, which formed the North Atlantic Ocean and the Labrador Sea.

The rifting and continental break-up started in the Nova Scotia region in the Upper Triassic, leading to the separation from its conjugate margin of Morocco. The basement underlying the shelf is associated with the Appalachian Orogeny. Since the onset of seafloor spreading, large amounts of sediments have been deposited on the shelf and slope. However, the tectonic framework and early sedimentary environments are still evident. At least five Pleistocene glacial epochs are known to have resulted in glaciers crossing the shelf and delivering vast amounts of sediment to the slope. As a result, mass failure complexes at all scales are notable on the surface and in the subsurface and numerous canyons and channels dissect the slope resulting in sediment deposited on the lower slope and fed directly to the deep ocean floor.

The continental margin in the Grand Banks region was primarily formed as a result of Upper Triassic to Lower Cretaceous rifting, followed by break-up, first from Iberia and then Europe. The complex rifting in this region followed different orientations and generated areas of stretched continental crust such as Orphan Basin and Flemish Pass, linking structural components like the seafloor elevations of Orphan Knoll, Flemish Cap and Newfoundland Ridge to the Grand Banks. The basement underlying the shelf is associated with the Appalachian Orogeny. Overprinting these structural features are the effects of numerous Quaternary glaciations, sea level transgression and regression and sculpting of the margin by bottom currents. Glaciers covered the Grand Banks during the Pleistocene and a number of shelf-crossing glacial troughs are evidence of ice streams delivering sediment directly to the slope. Strong bottom current activity generated large slope-plastered drift deposits on almost every segment of the continental margin in the Grand Banks region. The Northwest Atlantic Mid-Ocean Channel (NAMOC) circumscribes the Grand Banks. Turbidity current overspill deposits extend laterally from NAMOC to onlap the slope of the Grand Banks.

In the Lower Cretaceous, rifting started in the Labrador Sea segment of the continental margin. The subsequent seafloor spreading episode formed the Labrador Sea and separated Labrador from Greenland, which were both part of the North Atlantic Precambrian craton of Laurentia extending from Labrador through Greenland to northwest Europe. The shelf off Labrador is characterised by extended, seaward-flexed continental crust, featuring an irregular and complex erosional surface that developed on Precambrian cratonic basement.

The broad geomorphologic elements of the continental margin off Labrador are dictated by its underlying tectonic framework, but the modern surface is largely a result of Pleistocene glacial epochs. A number of shelf-crossing troughs are evidence of ice streams. These glacial epochs delivered vast volumes of sediment to the Labrador margin, particularly seaward of these ice-stream troughs. Much of this sediment flux was constrained through many channels and gullies on the slope. These slope channels trend perpendicular to the slope and turn southeastwards when they reach the basin floor to follow the overall dip of the basin. They ultimately coalesce with the NAMOC, which starts from Davis Strait in the north and trends towards the southeast in the central Labrador Sea basin.

6. Description of the outer limits of the continental shelf in the Atlantic Ocean

The outer limits of the continental shelf in the Atlantic Ocean are defined by 732 fixed points. Points are given a preface reflecting the region in which they are located but the numbering is continuous. For example, fixed point LS-ECS-047 in the Labrador Sea region is followed by GB-ECS-048 in the Grand Banks region. In all cases fixed points are joined by straight lines not exceeding 60 M in length, in accordance with article 76(7). All straight lines are geodesic lines.

Labrador Sea region

The outer limits of the continental shelf in the Labrador Sea region are defined by 47 fixed points (LS-ECS-001 through LS-ECS-047). These fixed points are either formula points established in accordance with article 76(4)(a) (i) or (ii), points on the distance or depth constraint lines established in accordance with article 76(5), or a point on

the intersection of the line delineating the outer edge of the continental margin and the 200 M limit of the Kingdom of Denmark.

In addition, since the outer edge of the continental margin extends into the 200 M zone of the Kingdom of Denmark, Canada has used a segment of that 200 M limit to define the outer limits of its continental shelf in this region. The establishment of the final outer limits of the continental shelf of Canada in this region will depend on delimitation with the Kingdom of Denmark.

Grand Banks region

The outer limits of the continental shelf in the Grand Banks region are defined by 450 fixed points (GB-ECS-048 through GB-ECS-497). These fixed points are either formula points established in accordance with article 76(4)(a)(ii) or points on the distance or depth constraint lines established in accordance with article 76(5).

Nova Scotia region

The outer limits of the continental shelf in the Nova Scotia region are defined by 235 fixed points (NS-ECS-498 to NS-ECS-732). The fixed points are either formula points established in accordance with article 76(4)(a)(i) or (ii), or points on the distance or depth constraint lines established in accordance with article 76(5). The southernmost fixed point in this region is placed at the intersection of the line delineating the outer edge of the continental margin and a provisional equidistance line with the United States of America computed by Canada that is used without prejudice to future delimitation. The establishment of the final outer limits of the continental shelf of Canada in this region will depend on delimitation with the United States of America.

7. Maritime Delimitation in the Atlantic Ocean

This partial submission is made, consistent with article 76(10) and article 9 of Annex II of the Convention, without prejudice to future delimitation.

Labrador Sea region

During the preparation of this submission, regular consultations between Canada and the Kingdom of Denmark revealed overlaps in their respective continental shelves in the Labrador Sea. Consequently, by an exchange of notes concluded on 15 March 2012, Canada and the Kingdom of Denmark reached an understanding that:

When one State transmits its submission regarding the outer limits of the continental shelf in the Labrador Sea to the Commission, the other State will promptly transmit a diplomatic note to the Secretary-General of the United Nations advising that it does not object to the consideration of the submission by the Commission and indicating that the recommendations made by the Commission in respect of the submission are without prejudice both to the consideration by the Commission of its own submission and to matters relating to the delimitation of boundaries between the two States. Each State will refer to this Arrangement in its submission and request the Commission to make recommendations on this basis.

Canada draws this exchange of notes to the attention of the Commission in respect of this submission and also advises, that in accordance with this exchange of notes, Canada filed a diplomatic note with the Secretary-General of the United Nations on 15 June 2012 with respect to the submission of the Kingdom of Denmark regarding the limits of the continental shelf beyond 200 M from the baselines from which the breadth of the territorial sea is measured in the areas south of Greenland.

Grand Banks region

No maritime delimitation issues arise in this region.

Nova Scotia region

During the preparation of this submission, regular consultations between Canada and the United States of America revealed overlaps in their respective continental shelves in the Nova Scotia region. Canada has been advised by the United States of America that it does not object to the consideration of Canada's submission without prejudice both to the delineation of its own shelf and to matters relating to delimitation between Canada and the United States of America.

The Commission will also be aware that on 8 May 2009, the French Republic submitted to the Secretary-General of the United Nations preliminary information in relation to St. Pierre and Miquelon. On 9 November 2009, Canada addressed a diplomatic note to the Secretary-General of the United Nations in which it rejected any claims by the French Republic to any maritime area, including any areas of continental shelf, beyond the area awarded to the French Republic by the Court of Arbitration in the Case concerning the Delimitation of Maritime Areas between Canada and the French Republic (10 June 1992). At that time, Canada also indicated it reserves the right to make additional comments in relation to the preliminary information or any other information, document or submission that the French Republic may subsequently file with the Secretary-General in relation to St. Pierre and Miquelon.

Legend for figures

Fixed points on the outer limits of the continental shelf of Canada

- Sediment thickness formula point
- 60 M formula point
- Point on the distance constraint (350 M)
- Point on the depth constraint (2500 m + 100 M)
- Point on the 200 M limit of Denmark (Greenland)
- Point on the computed provisional equidistance line between Canada and the United States
- ★ Point on the intersection of the 200 M limits of Canada and Denmark (Greenland)

Lines, limits and boundaries

- Straight line not exceeding 60 M
- Outer limits of the continental shelf of Canada
- Area of Canada's continental shelf beyond 200 M
- 200 M limit of Canada
- 200 M limit of an opposite or adjacent state
- 200 M limit of the United States/Limit of Canada's maritime zones with the United States
- Maritime boundary with an opposite or adjacent state
- Limit of Canada's maritime zones with an opposite or adjacent state
- Land boundary with the United States
- Maritime boundary with France (St. Pierre and Miquelon)
- Computed provisional equidistance line between Canada and the United States

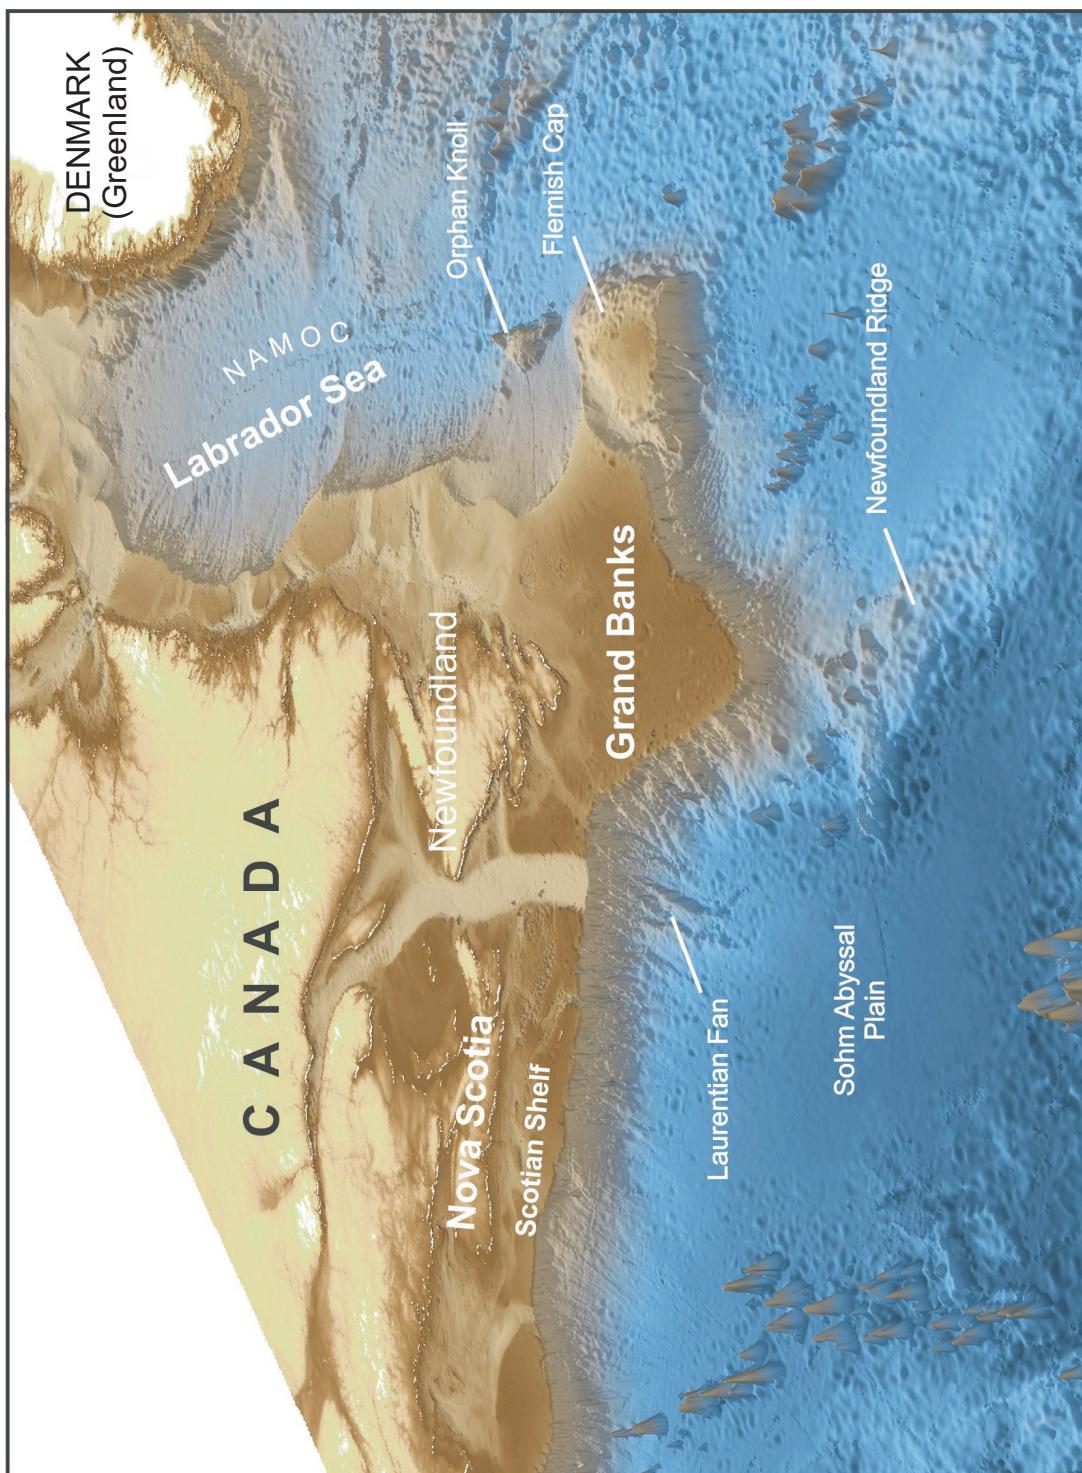

Figure 1. Perspective view of the continental margin in the North Atlantic Ocean looking from the south towards the north. NAMOC is the Northwest Atlantic Mid-Ocean Channel. The rendered image is derived from the GEBCO_08 gridded bathymetric data set. GEBCO is the General Bathymetric Chart of the Oceans. Vertical exaggeration is 20x. To provide a scale perspective, the shelf edge from offshore western Nova Scotia to the northern tip of Labrador is 7700 kilometres in length.
