Despite extraordinary economic growth and widespread improvements in well-being over recent decades, inequality remains high within and across countries.

Today, powerful economic, social and environmental forces are affecting inequality. The World Social Report 2020 examines the impact of four such global trends: technological innovation, climate change, urbanization and international migration.

Rising inequality is not inevitable, according to the report. National policies and institutions can help ensure that the benefits of these global trends are broadly shared and their negative effects do not fall disproportionately on those who lack the resources to cope and recover.

How these trends are addressed will largely determine the shape of our common future.
