<sup>11</sup> A high degree of parental control does not, however, necessarily lead to very early marriages; it is also compatible with marital postponement. See Judith Blake, "Parental control, delayed marriage, and population policy", in *Proceedings of the World Population Conference*, vol. II, *Fertility, Family Planning, Mortality* (United Nations publication, Sales No. 66.XIII.6), pp. 132-136.

<sup>12</sup> For an interesting discussion of the disruptiveness of the first birth as compared with additional births and the consequences of its timing to women's roles, see Harriet B. Presser, "The timing of the first birth: female roles and black fertility", *Milbank Memorial Fund Quarterly*, vol. 49, No. 3 (July 1971), pp. 329-362.

<sup>13</sup> Heavy domestic obligations were cited as major obstacles to enrolment of women in literacy classes in United Nations Educational, Scientific and Cultural Organization, "Equality of access of women to literacy", ED/MD/14, 31 August 1970.

<sup>14</sup> See H. V. Muhsam, "Education and demography", in

demographic point of view, the effect of education on reproductive behaviour is the more interesting aspect of the association. Indeed, the educational level of women appears to be one of the strongest factors affecting fertility, especially in high-fertility countries.

14. It may be, as some writers have suggested, that the number of years of formal schooling is simply the most visible and quantifiable element in a cluster of interdependent forces affecting fertility, and that it is not higher education *per se* but its association with such factors as openness to new ideas, higher levels of living, exposure to an urban environment and a greater range of options and interests outside the home that is responsible for the apparent influence of one on the other. Nevertheless, most studies show that the educational level of the wife is more strongly correlated with a couple's fertility than the educational level of the husband, suggesting that regardless of the way in which the causal mechanism works, investment in female education may have a greater impact on fertility than the same investment in schooling for men.

15. The relationship is not a simple one, however, nor is it inverse in all cases. The number of years of schooling a woman has received is, after all, only one factor among many influencing her reproductive behaviour; other biological, economic, social and cultural variables affecting fecundity, family size preferences and access to birth control may render it more or less functional. The question is in what way, and under what conditions, does a woman's education make a difference.

16. Higher education for women can work indirectly to reduce fertility in at least three ways, through: (a) delaying marriage and increasing the probability of non-marriage, thus reducing or eliminating the time span of exposure to the possibility of conception;<sup>15</sup> (b) reducing desired family size, by creating aspirations for a higher level of living for the couple and their children and by stimulating women's interest and involvement in activities outside the home, especially employment; and (c) exposing women to knowledge, attitudes and practices favourable to birth control, including a higher level of communication between husband and wife, enabling them to bring their actual reproduction in line with their desired family size.

17. In most developing countries, the education of women appears to have a very strong impact on family size; but where higher education is confined to a small *élite*, its impact on over-all birth rates is slight.<sup>16</sup> How-

International Union for the Scientific Study of Population (hereafter referred to as IUSSP), *International Population Conference, London, 1969* (Liège, 1971), vol. III, pp. 1867-1874.

<sup>15</sup> Assuming either a low probability of sexual contact outside of marriage and/or a high degree of birth control.

<sup>16</sup> For example, in a national sample survey of 3,200 currently married Turkish women under 45 years of age, conducted by the Hacettepe Institute of Population Studies in 1968, university graduates averaged 1.4 live-born children as compared to 2.0 for secondary-school graduates (12 years), 2.1 for elementary-school graduates (8 years), 2.8 for women with at least 5 years of primary school, 3.2 for women with

(Continued on next page)

ever, even the transition from illiteracy to literacy resulting from very low levels of schooling is shown to have some influence on family size in many areas, unlike the situation in industrialized countries where a significant reduction may not appear until much higher levels of schooling are reached, sometimes as high as college graduation.<sup>17</sup> Studies in many developing countries also show that women with secondary-school and higher education marry considerably later, are less likely to marry at all, desire smaller families and are far more likely to know about and practise "modern" effective contraception than are less educated or illiterate women.<sup>18</sup> Yet, the majority of women of reproductive age in a number of developing countries, and especially in rural areas, are illiterate and without effective options in this area. Indeed, cultural pressures towards high fertility in rural areas may be so strong as to obliterate the effect of six or eight years of schooling on reproduction entirely.<sup>19</sup>

18. Moreover, just as a high level of education may not motivate a woman to want a smaller family if her training does not lead to active participation in employment outside the home, female employment itself may not influence fertility significantly unless a woman's education has prepared her for something more than subsistence agricultural labour, unpaid work in a family enterprise, or other low-status, low-paying jobs. It is essential that special efforts be made in total development planning to ensure that women receive the kind of academic and vocational education that will prepare them to assume a full and equal role with men in all aspects of economic production, but especially in the modern sectors of agriculture, industry and services.

#### RIGHTS PERTAINING TO EMPLOYMENT

19. International instruments declare that everyone has the right to work, to free choice of employment, to

fewer than 5 years and 4.2 for illiterates. However, university graduates were only 0.5 per cent of the sample, while two thirds were illiterate. Serim Temur, "Socio-economic determinants of differential fertility in Turkey", *The 2nd European Population Conference, Official Documents of the Conference*, Strasbourg, 1971 (London, Council of Europe, 1971), vol. III, pp. 131-139.

<sup>17</sup> Halvor Gille, "Summary review of fertility differentials in developed countries", in IUSSP, *International Population Conference, London, 1969* (Liège, 1971), vol. III, pp. 2011-2025. *The Second European Population Conference, Official Documents of the Conference*, Strasbourg, 1971 (London, Council of Europe, 1971), vol. III, pp. 131-139.

<sup>18</sup> See references in IUSSP, *International Population Conference, London, 1969*; *World Population Conference, 1965*, vols. I-IV (United Nations publications, Sales Nos. 66.XIII.5, 6, 7 and 8); *Proceedings of the Eighth International Conference of the International Planned Parenthood Federation, Santiago, Chile, 9-15 April 1967* (London, 1967); and KAP studies, among others.

<sup>19</sup> For example, J. M. Stycos and R. H. Weller found that in the rural areas of Turkey, neither female employment nor schooling was related to fertility, while in urban areas, fertility was differentiated quite clearly by schooling; see "Female working roles and fertility", *Demography*, vol. 4, No. 1 (1967), pp. 210-217. Finding similar situations in Latin America, Stycos suggested that a certain amount of urbanization may be necessary to "activate the effect of education on fertility", J. M. Stycos, *Human Fertility in Latin America* (Ithaca, N.Y., Cornell University Press, 1968), p. 269.

just and favourable conditions of work, to protection against unemployment, to fair remuneration and to equal pay for equal work, among other rights. Women, married or unmarried, are to have equal rights with men in this regard. In addition, in order to eliminate other forms of discrimination against women in employment, measures are to be taken to prevent their dismissal in the event of marriage or maternity, to provide paid maternity leave with the guarantee of returning to former employment, and to provide child care facilities and other necessary social services.<sup>20</sup>

20. In most countries, women are far from achieving equality in employment with men. General conditions of unemployment, underemployment and low wages, where they occur, adversely affect both men and women, of course. But women often find it particularly difficult to exercise their right to equal work and equal pay.

21. Conditions vary greatly from country to country according to culture, socio-economic structure and the level of development. In general, however, one finds that women are less likely to be gainfully employed outside the home than are men, although they may be engaged in equally heavy and unpaid domestic or agricultural labour.<sup>21</sup> They are also more frequently classified as unemployed and looking for work than are men in many countries. Female earnings often average only a fraction of male earnings even when other factors, such as type of work, education, training and experience, are taken into account. Almost everywhere one finds women in the paid labour force disproportionately concentrated in lower status, lower paying jobs. Most employers do not provide paid maternity leaves or guaranteed return to former employment after childbirth, as the Declaration on the Elimination of Discrimination proposes, and child-care facilities in most countries are inadequate to meet the needs of working parents.

22. Moreover, whereas rates of male gainful employment vary little from country to country, or through the normal working years in the life cycle, rates of female employment differ enormously between countries and within major subgroups of the population, usually follow well-defined patterns by age and

<sup>20</sup> See General Assembly resolution 217 A (III), articles 23 and 24; General Assembly resolution 2200 A (XXI), articles 7 and 10; General Assembly resolution 2263 (XXII), article 10; International Labour Organisation (ILO) Convention on Equal Remuneration, 1951; ILO Discrimination Convention, 1958.

<sup>21</sup> Among countries for which information is available, the percentage of females of all ages who were defined as "economically active" in censuses taken from 1960 to 1970 averaged approximately 26 per cent in Africa, 22 per cent in Asia, 18 per cent in the Americas, 16 per cent in Oceania, 45 per cent in the Union of Soviet Socialist Republics and 30 per cent in Europe. Moslem countries showed the lowest rates of female economic activity, frequently under 5 per cent, with a number of tropical African countries and the East European countries and the USSR showing the highest, at over 40 per cent. As a proportion of male economic activity rates, the female rates averaged 53 per cent in Africa, 43 per cent in Asia, 36 per cent in the Americas, 31 per cent in Oceania, 86 per cent in the USSR and 51 per cent in Europe. See International Labour Organisation, *Yearbook of Labour Statistics*, 1972, table 1; 1971, table 1.

generally fluctuate according to marital status and the number and spacing of children.<sup>22</sup>

23. In this section is a discussion of the relationship between variations in female employment and fertility. The major problem in analysing such a relationship derives from the difficulty of distinguishing cause and effect, as was the case for education. Does the opportunity or need to work actually influence women to have fewer children, or is it more often the case that women who have fewer children for a variety of reasons are free to take outside employment? The relative weight given to one factor over the other depends upon unique situations in every country, but it is possible to make a few generalizations.

24. A consideration is the impact of birth planning on female employment. Where cultural and structural conditions are conducive to female employment and where worker-mother roles are incompatible, one can point to the considerable advantages that women practising effective birth planning have over those who accept early and frequent childbearing as inevitable. Delaying marriage<sup>23</sup> and the first birth may enable women to complete their education and vocational training so that they are qualified for more highly skilled jobs or to establish themselves in a profession, if such options are otherwise open to them. Controlling the timing of births permits women to combine employment and childbearing in the least disruptive way. Keeping family size small frees women to work who might otherwise be overwhelmed by domestic responsibilities, especially in those countries where child-care assistance is scarce.<sup>24</sup> Lastly, having the last child early in the life cycle eases the burden on women working away from home and may encourage those who have stayed at home to re-enter the labour force.<sup>25</sup> Viewed in this

<sup>22</sup> See, for example, Nicole Dubrulle, "Communication sur l'emploi féminin en Europe", in *The Second European Population Conference, Strasbourg, 1966, Official Documents of the Conference*, vol. II, C 48; Tomas Frejka, "Demographic Aspects of women's employment", in IUSSP, *International Population Conference, London, 1969*, vol. III, pp. 1559-1571; and other articles in the same volume.

<sup>23</sup> Marriage itself, apart from childbearing, can reduce women's participation in the labour force to a large extent; see N. Dubrulle, *loc. cit.* In the province of Santiago, Chile, for example, although the participation rates of married women without children between the ages of 20 and 50 in 1960 (26.3 per cent) were considerably higher than those for married women with children, they were far lower than those for single women without children (68.8 per cent). See Juan Carlos Elizaga, "Demographic aspects of women's labour force in Latin America and Chile", in IUSSP, *International Population Conference, London, 1969*, vol. III, p. 1594.

<sup>24</sup> However, the effect of number of children on labour force participation often drops off after the third or fourth child; beyond that number further increases in family size may not significantly reduce the rates of mother's employment. See foot-note 23; J. C. Elizaga, *loc. cit.*, p. 1596; Jerzy Berent, "Some demographic aspects of female employment in Eastern Europe", in IUSSP, *International Population Conference, London, 1969*, vol. III, pp. 1580-1584.

<sup>25</sup> Stuart Garfinkle found in the United States of America that, for most women, the major proportion of work life occurs after a woman has raised her family and re-entered the labour force. A woman marrying at 20 years of age with one child had in 1960 a work life expectancy essentially of the same length (25 years) as a 35-year-old working woman

light, the exercise of the right to determine the number and spacing of children can have a direct impact on the woman's exercise of her economic rights. On the other hand, where opportunities for women in employment are few, or where women are discriminated against on the assumption that they are (or will be) married and have children and that they have less right to a job or an income than a man, an individual woman may not be able to improve her chances in the labour market at all by delaying, spacing or limiting her births.

25. The other side of the coin is this: to what extent might the full exercise of women's rights to equality with men in employment influence the number and spacing of their children? If a consistent causal effect were to be found, the implications for development strategies would be clear: ensuring women's right to equal work and equal pay should serve the purpose of reducing birth rates while simultaneously facilitating economic and social development. However, the relationship depends not upon the simple fact of gainful employment, but upon the sector of the economy in which the woman is employed, her occupation, income, work commitment, duration or continuity of employment, whether it is full or part-time; and on the availability of child care, among other factors.

26. Most research has focused on the concept of role incompatibility in attempting to explain variations in the strength of the association between female employment and fertility. The more mutually exclusive are the roles of worker and mother, the more likely it is that gainfully employed women will remain childless or have smaller families than non-employed women. Female employment should reduce fertility most effectively when birth planning is widely practised and when the roles of worker and mother are most incompatible, that is, when: (a) the place of work is away from the home, which may pose practical problems relating to child care; (b) the prevailing belief is that women should devote full time to their children, in which case the woman feels she must choose between work and children; and (c) the woman's employment provides her with significant social, psychological or economic rewards which she may be unwilling to forgo in order to have another child.

27. It is mainly in the industrialized countries that the relationship between female employment and fertility appears to be most clear when currently employed and non-employed women are compared, although historical studies have shown that major declines in the birth rate have often preceded the expansion of women's labour force participation. Women who are employed full-time tend to have smaller families (or to remain childless) more often than those who are employed part-time or not at all.<sup>26</sup> Those who have worked for a

who has completed her family. Stuart Garfinkle, "Work in the lives of women", in IUSSP, *International Population Conference, London, 1969*, vol. III, p. 1603.

<sup>26</sup> H. Gille, *loc. cit.*; "Family planning and social policy in Europe" (SOA/ESDP/1971/2), p. 14.

major part of their married lives have smaller families than those who worked for only short periods or sporadically.<sup>27</sup> Women in white-collar and professional occupations—occupations which require higher education and provide greater social and economic rewards—have smaller families than women in blue-collar and service occupations.<sup>28</sup> Women with a high degree of work commitment (for example, women who say they would continue to work even if their husbands made all the money they needed) are more likely to know about and practice modern and effective birth planning and to bear fewer children than those who work only from economic necessity.<sup>29</sup> In rural areas of industrialized countries, however, where agricultural labour is not so incompatible with raising a family, the relationship between female employment and fertility often disappears.<sup>30</sup>

28. In most developing countries, the employment-fertility relationship is less clear, although a distinction must be made between urban and rural areas and between the "modern" and "traditional" sectors of the society.

29. In rural areas, paid employment (where it exists) usually has little impact on fertility, in part because the value of large numbers of children often remains strong, and in part because the employment is likely to be of an agricultural, marketing or cottage industry type in which a woman may either keep her young children with her while she works or leave them with other family members.<sup>31</sup> The same reasoning holds true for women who are engaged in unpaid production.

30. In urban areas, on the other hand, woman's paid employment is more likely to be incompatible with raising a family if it takes her out of the home and if she has difficulty in finding ways to care for her children. She is also more likely to learn about birth control and have access to family planning services in urban than rural areas, although much depends upon the sector of the economy in which she works. For example, some studies in urban centres of developing countries have shown that women in the professions and in white-collar occupations are more favourably disposed towards the use of contraceptives and have fewer live births than skilled manual workers, who in turn have smaller families than women in sales, trade or the service sector.<sup>32</sup>

31. Generally speaking, however, the opportunities for labour force participation of women in non-agricultural sectors of the economies of developing countries have been extremely limited. As a number of writers have pointed out, the process of economic development is not a unilinear one leading inevitably to the greater integration of women in non-agricultural production.<sup>33</sup> The experience of many African countries and of India, for example, shows that rural-urban migrations accompanying development frequently deprive women of their formerly productive rôle in agriculture, handicrafts or marketing without offering a substitute rôle in the modern sector of the towns, where unemployment is usually high.<sup>34</sup> Under these marginal conditions one would not expect urban birth rates to decline rapidly. When the development effort is heavily capital-intensive rather than labour-intensive, women may find it particularly difficult to compete with men for mechanized, "male-typed" jobs. Some critics have suggested that an alternative form of development is preferable, one that is both labour-intensive,<sup>35</sup> and, in areas where disapproval of women working runs high, one that creates new fields of work for women that do not compete with male fields.<sup>36</sup> The work should be attractive to women and take them out of their homes if it is to have an effect on reproductive decisions.

#### RIGHTS PERTAINING TO MARRIAGE AND THE FAMILY

32. Perhaps no issue in the area of women's rights has been as sensitive or as controversial as the idea of equal rights of men and women "as to marriage, during marriage, and at its dissolution", although the principle is clearly stated in article 16 of the Universal Declaration of Human Rights. In many countries, equality within the family has not yet been recognized in civil law; and, upon marriage, women may be deprived of many civil rights, such as the independent ownership of property or the right to work without their husband's consent. But even in countries where legislation favours equal rights, traditional cultural patterns of male dominance in private life are slow to change.

33. Could the widespread practice of birth planning significantly alter the status of women as compared to

<sup>33</sup> See, for example, *Demographic Aspects of Manpower, Sex and Age Patterns in Economic Activities* (United Nations publication, Sales No. 61.XIII.4); Andrew Collver and Eleanor Langlois, "The female labour force in metropolitan areas: an international comparison", *Economic Development and Cultural Change*, vol. 10 (July 1962), pp. 363-385; Ester Boserup, *Woman's Role in Economic Development* (New York, St. Martin's Press, 1970).

men in private life? And how does a woman's educational or employment status affect her role in the family? Do laws and practices relating to the status of women at the time of marriage, during marriage and at its dissolution (through death, divorce, desertion, separation, annulment) influence reproductive behaviour in a way that can be isolated from the effects of other, related forces? The area is a rich and fascinating one to explore, for it is, of course, in the everyday interaction between the sexes that extraneous factors, such as education or employment, are translated into actual reproductive patterns through the medium of sexual expression and birth planning behaviour.

#### *Rights on entering marriage*

34. The United Nations has declared that child marriage and the betrothal of young girls before puberty is to be prohibited and that women shall have the same right as men to free choice of a spouse and to enter into marriage only with their free and full consent. The inheritance of widows is banned; minimum standards for age at marriage are to be set in every country at not less than 15 years, with all marriages being officially registered.<sup>37</sup>

35. Legal minimum ages for the first marriage of girls range from about 12 to 20 years, while actual averages range somewhat higher, from about 14 or 15 years to 24 or 25.<sup>38</sup> In setting a legal minimum age for marriage, most countries have legislated inequalities by setting a higher minimum for males than for females, although there is a trend towards greater equality in laws enacted in recent years. In general, the pattern in western industrialized countries over the past century has been one of delayed marriage and relatively high proportions of women remaining single throughout their childbearing years (from 5 to 20 per cent), while in developing countries, early and universal marriage for girls is more the rule.<sup>39</sup> However, there are important exceptions to this generalization, and, in recent years, the marriage patterns of many developing and industrialized countries appear to be converging towards an intermediate position.

36. Social pressures to marry girls off while they are very young remain strong in many regions, especially in Moslem countries, in India and in tribal African societies. An unmarried daughter past a certain age may be considered a disgrace to the family. Moreover, one generally finds that in countries where girls marry very early, the age gap between brides and grooms on entering

marriage may average as high as 10 to 12 years. Thus, the girl's already subordinate position at the time of her marriage is compounded by the additional advantages her husband has accrued with his age and "experience". Where women marry later, the difference in ages is usually much smaller. And in most countries, the average age at first marriage for women is higher, and the age gap between brides and grooms smaller, among educated and employed women and among those living in cities or towns.

37. What impact would the ability to space and limit births have on the timing of marriage and the exercise of the woman's rights at this crucial transition period in the life cycle? Having discussed the effect of birth planning on education and employment in the previous sections, an attempt is made here to consider only the direct, independent effect of birth planning on the timing or probability of marriage.

38. The essential contribution of birth control is, of course, the separation of sexual behaviour from reproduction. In examining the effect of contraception on the timing or probability of marriage, then, much depends upon the cultural *mores* of the particular society. Where pre-marital heterosexual relations are common, the ability to delay the first birth could serve to raise the average age at marriage and place women in a far better bargaining position over the choice of a spouse or of whether or not to marry at all, especially where a high proportion of early first marriages appear to be "caused" by an unplanned pregnancy.<sup>40</sup> It could also increase her chances of an eventual marriage in societies where out-of-wedlock births are common and yet where a woman without children has a better chance of finding a legal husband than a woman who has had children by another man.<sup>41</sup> If the early pregnancy is intended as a means to ensure marriage, however, as in societies where a woman's fecundity must be proved before she is acceptable as a bride, then there would be little motivation for birth planning at this stage in the life cycle.

39. Effective birth planning can also lower the average age at first marriage by making it possible for couples to marry early while postponing their childbearing. Much of the decline in the average age of brides in western countries in the past three decades may be attributed to this factor.<sup>42</sup>

40. Turning the question around, how much impact on family planning behaviour and fertility would one expect the abolition of child marriage or betrothal to have, or the exercise of the right to free choice of spouse

<sup>37</sup> See General Assembly resolution 217 A (III), article 16; resolution 2200 (XXI), annex, article 10; resolution 2263 (XXII), article 6; resolution 1763 (XVII), annex; and resolution 2018 (XX).

<sup>42</sup> See, for example, Gerd Skoe Lettenstrøm, "Fertility trends in Norway since the Second World War", in IUSSP, *International Population Conference, London, 1969*, vol. I, pp. 555-562.

or to marry only with free and full consent? And to what extent do the timing and number of marriages influence birth rates?

41. The second question is addressed first. Discounting for the moment the effect that a later age at marriage has on the woman's position within the marriage, one would expect variations in nuptiality to determine fertility patterns most strongly in societies in which birth control is not widely practised within marriage and in which the rate of out-of-wedlock births is very low. Thus, the decline of birth rates in Western Europe in the late nineteenth and early twentieth centuries can be attributed in good part to patterns of late marriage with relatively high proportions of women never marrying, while the early and universal marriage of girls in many developing countries, especially in parts of Asia and Africa, set the stage for high levels of fertility.

42. Where birth control within marriage is widely practised, the timing of marriage alone is less influential in determining completed family size. Differentials appearing early in the reproductive years as a response to marital postponement may disappear by the time childbearing is completed. Of course, if marriages are delayed in conjunction with higher education or non-agricultural female employment, family size may be kept small in an attempt to achieve a higher level of living for the couple and their existing children.

43. Where *de facto* marriages are frequent, as in parts of Latin America and the Caribbean, formal marriage patterns are also less likely to have a significant effect on fertility. A large proportion of the female population, while not legally married, enters into more or less permanent consensual unions or more casual "visiting" unions in which childbearing is nevertheless accepted, and begins early. The fruitlessness of trying to regulate birth rates through the medium of legislation raising the minimum age at marriage—if such were considered desirable—can clearly be seen in this case, as in cases where young girls continue to be betrothed or married before puberty in spite of legal prohibitions. At any rate, raising the minimum from 12 to 14 years, or from 14 to 16 may have no effect at all on the average age of the woman at the time of her first birth. Indian studies suggest that marriages would have to be pushed up over 19 or 20 years to have a significant demographic impact in that country.<sup>43</sup>

44. The loss of parental control over the arrangement of their children's marriages, in so far as such control is associated with early and universal marriage within an extended family system placing great importance on large numbers of children, should serve to delay marriage on the average and to increase the probability of non-marriage for some women, either voluntarily or involuntarily. Courtship, after all, takes

time, and an independently contracted marriage requires a degree of maturity not needed or desired of a young girl whose primary obligation is to obey the wishes of her husband and her elders. The free choice of a spouse—even with a considerable amount of parental guidance—also implies a degree of equality between husband and wife at the time of their marriage that may be essential to effective communication about family size desires and the practice of family planning.

#### *Rights during marriage*

45. According to United Nations instruments, men and women are to share equal rights and responsibilities within marriage, including equal rights and duties in matters relating to their children.<sup>44</sup> Evidence from surveys suggests that in practice, the greater are the resources that a woman brings into her marriage in relation to those of her husband (especially in regard to her education and outside paid employment or essential agricultural production), the more equal her voice is likely to be in the major decisions of the family.<sup>45</sup> Studies of married couples in predominantly urban areas in both industrialized and developing countries also indicate that the more equal or "non-traditional" is the division of labour (including decision-making) in the home, the more likely it is that couples will: (a) communicate with one another about sex, family size desires and birth planning; (b) report a high degree of sexual satisfaction; (c) express a desire for small families; and (d) carry out their family size desires effectively.<sup>46</sup>

46. Patterns of male dominance within the household, where they exist, are frequently found to be associated with strong double standards of sexual behaviour and with extreme resistance on the part of husbands to their wives learning about or using female methods of contraception. Resistance is apparently often founded in the belief that wives will no longer remain sexually faithful or generally submissive to their husbands if they know how to prevent pregnancies.<sup>47</sup> The implicit assumption here is that birth planning can indeed be a powerful means to greater independence for the woman in the family, at least under some conditions.

47. However, there are also those situations in which a woman's status is defined almost entirely by the number of children she bears, or by the number of her sons, so that the more fertile she is, the greater is her authority. Under these conditions, a woman who remained childless or who bore only one or two could well be the object of ridicule or pity. Family planning clinics in several countries of Africa, for example, have found that women are often more interested in learning about ways to increase their fertility than to decrease it.<sup>48</sup> In the context of such beliefs it would be detrimental to the status of the woman to practise contraception as long as no alternative rôles were possible under existing economic and social conditions. In so far as the spacing of births leads to a higher rate of infant survival, however, birth planning could increase family size and thus the woman's authority even within this pro-natalist context.

48. The crux of the argument in the relation between equality within marriage and fertility appears to be the issue of alternative rôles. When non-familial activities for women are highly valued and rewarded, wives' participation in these activities tends to bring a greater degree of equality into the marriage. Greater equality tends to create an interpersonal relationship more favourable to birth planning and lower fertility, while the resulting smaller family size itself permits a closer relationship between husband and wife and a greater degree of equality. But where non-familial alternatives are not available for women, that is, where the division of labour follows highly traditional lines and the individual woman has little autonomy, then frequent child-bearing is rewarded and encouraged. A woman's prestige in the eyes of her husband, her relatives and the community at large may depend solely upon the number of children she bears.

49. The rights and duties of parents as concerns their children (and the reciprocal rights and duties of children

II, *Fertility, Family Planning, Mortality* (United Nations publication, Sales No. 66.XIII.6), p. 143; Christian Council of Ghana, response to the United Nations questionnaire on the status of women and family planning.

with regard to their parents) may also play a crucial role in shaping reproductive decisions. It has become commonplace to assert that where children participate in economic or domestic production at an early age and carry obligations to support their parents in sickness and old age, the incentive for having large numbers of children is high. On the other hand, where children become primarily consumers of material resources rather than producers, the costs of a large family may override the benefits.

50. The question is less frequently asked about the effect of the division of parental rights and responsibilities on family size decisions. Speculation on the differences between husbands and wives in their desire for additional children sometimes focuses on the assumption that because women tend to carry the major responsibility for day-to-day care of children while men are removed from the immediate burdens of child care, the motivation to keep the family small should be stronger among women. But this is not always the case. Alternative hypotheses suggest that men, being more closely associated with the financial responsibilities of children and more exposed to "modern" ideas outside the home, should be more intensely motivated to limit family size. The true answer must rest in the unique cultural and structural conditions of each society which determine the division of labour between the spouses and the perceived costs and benefits to each spouse of additional children. It must also rest with the nature of parental rights and responsibilities when the marriage dissolves, either through death, divorce or desertion.

51. The foregoing discussion has centred on the nature of informal equality between the spouses. It is not possible to examine here the relationship between the number and spacing of children and the exercise of a woman's specifically legal rights and obligations within the family because there is little systematic data in this area. How does the denial of certain of her civil rights, such as the right to own, inherit or bequeath property, for example, affect her desired family size? Where only male children inherit property, does fertility increase until a desired number of sons are born? Is a woman who bears no children or who bears only one or two, or only daughters, disadvantaged under some legal systems more than others?

52. Nor has the discussion explored the relationship between fertility and equal rights within different kinds of marital unions—nuclear families as compared with extended families, monogamous as compared with polygamous unions, legal marriages as compared with consensual or more casual visiting unions. Evidence concerning the effect of these differences in family structure on fertility is inconclusive and needs to be more precisely specified,<sup>49</sup> along with the legal and

<sup>49</sup> Couples in nuclear families do not necessarily bear fewer children on average than those in extended families in the same social setting, where one would expect child-rearing to be easier; see Moni Nag, "Socio-cultural patterns, family cycle and fertility", *Population Debate*, vol. II, part six, paras. 83-86.

(Continued on next page)

*de facto* rights that a woman has within each type of union.

### *Rights on the dissolution of marriage*

53. The International Covenant on Civil and Political Rights and the Declaration on the Elimination of Discrimination Against Women call for the equal rights of the spouses at the time of marital dissolution, either through death, separation, annulment or divorce. Provision is to be made for the necessary protection of children at the time of marital dissolution. In assessing the rights and responsibilities of parents the interests of the children are to remain paramount.<sup>50</sup>

54. The United Nations has not addressed the question whether couples have a basic right to terminate an unhappy marriage. Its instruments do declare that whatever the degree of restrictiveness a State imposes with regard to divorce, the grounds for dissolving a marriage and the rights and obligations following its dissolution should be the same for men and women.

55. How might the practice of birth planning affect a woman's rights at the time of divorce, or the probability of the divorce itself? In industrialized countries with liberal divorce laws, one would expect that remaining childless, or having only one or two children, would place women in a more advantaged position because they would feel less compelled to remain in an unsatisfactory marriage and more able to manage independently. Of course, much depends upon their options outside the home. Some studies show that women who are gainfully employed have a higher probability of divorcing than do housewives,<sup>51</sup> and it is known that divorce tends to be more frequent among couples with no children, or with small families, even when unequal durations of marriage are taken into account. Under these conditions, birth planning should enable women more easily to exercise their equal rights at the time of divorce.

56. On the other hand, in societies where the husband has unilateral power to divorce his wife and take another, where the wife has no such power and where her options outside the home are few, the fear of repudiation can motivate women to have many

children as a form of protective "insurance".<sup>52</sup> Thus, where sterility or the absence of sons is frequently used to justify divorce, the woman with the most children may feel the safest in her marriage—a marriage she depends upon for her survival. Eliminating the husband's power to divorce his wife at will could lighten the pressure on a wife to reproduce so abundantly.

57. The impact on fertility of marital dissolution either through divorce, annulment, desertion, separation or death depends, to a large extent, upon patterns of remarriage and upon the length of reproductive time a woman "loses" between sexual unions. Where death rates are high, women may lose up to eight or ten years, on average, due to the early death either of herself or her husband.<sup>53</sup> If the remarriage of widows is forbidden, as it was in Hindu tradition among the higher castes, fertility is inevitably depressed; if widows are inherited, fertility may not be reduced at all. The impact of divorce, annulment or separation also depends upon the probabilities of the woman's remarriage or her entry into another type of sexual union.

58. It is difficult, with existing evidence, to evaluate precisely the relationship between reproductive behaviour and women's rights at the time of marital dissolution as to property, support, custody over children, remarriage, etc. But such factors may play an influential role in shaping family size desires and decisions.

### PARTICIPATION OF WOMEN IN PUBLIC LIFE AND DECISION-MAKING

59. The United Nations has declared the right of women to participate in public life and political decision-making on equal terms with men, specifically the right to vote in all elections, to be eligible for all publicly elected bodies, to hold public office and to exercise all public functions.<sup>54</sup> Women have won the right to vote in all but a handful of countries; but in most countries—even those which guarantee equality in the law—women are poorly represented at the upper levels of decision-making in Government offices or elective bodies. Their greatest successes have occurred in countries where the Government actively promotes equality between men and women in public life, thus overcoming some of the traditional resistance to the idea of placing women in leadership positions. Elsewhere, the story is not so encouraging. Many countries point to the one or two women in conspicuously high positions while ignoring the weight of evidence on the extreme under-representation of women as a major population group.

<sup>52</sup> Aziza Hussein, "Recent development in the UAR", paper presented at the 50th Anniversary Conference, Planned Parenthood-World Population, October 1966; responses of Egypt and Indonesia to United Nations questionnaire on the Status of Women and Family Planning.

<sup>53</sup> S. N. Agarwala, "Social and cultural factors affecting fertility in India", in *Proceedings, Seventh Conference of the IPPF, Singapore, 1963*, p. 102.

<sup>54</sup> See General Assembly resolution 217 A (III), article 21; resolution 640 (VII), annex; resolution 2200 (XXI), article 3, and resolution 2263 (XXII), article 4.

Individual women in monogamous unions may bear more children than women in polygamous unions, where long taboos on sexual intercourse can more easily be observed during lactation, yet polygamy can increase the over-all birth rate by ensuring that all women shall marry, marry young, and remarry quickly; A. Romaniuk, "Fertility trends in Africa", in *IUSSP, International Population Conference, London, 1969*, vol. I, pp. 739-747. Women in consensual or "visiting" unions may have their first sexual experiences and begin to be spaced at wider intervals and lead to lower completed family size than among married women; see G. W. Roberts, "Fertility in some Caribbean countries", in *IUSSP, International Population Conference, London, 1969*, vol. I, p. 702; see also Judith Blake, *Family Structure in Jamaica, loc. cit.*

<sup>50</sup> See General Assembly resolution 2263 (XXII), and resolution 2200 (XXI), annex, article 23.

<sup>51</sup> For example, H. Hansluwka, "Divorces in Austria", in *IUSSP, International Population Conference, London, 1969*, vol. III, p. 1837.

60. The participation of women in public life can have the same effect on fertility as other forms of employment. Women with reduced domestic responsibilities are more free to involve themselves in community or national activities, while women whose political involvement takes them out of the home and into a world of wider interests and rewards may desire and have smaller families. But beyond this direct association between public life and reproduction among women who are themselves active participants, an expanded engagement of women in public affairs may have a far broader—though less direct and more difficult to measure—impact on fertility patterns by producing highly visible models of women who are active, competent leaders and decision-makers. Such women can be a powerful force towards changing attitudes concerning female roles and responsibilities. Even the simple act of voting itself may encourage women to have greater confidence in their own capacity for independent thought and action, a confidence that could carry over into the more private activities of sex and childbearing.

61. Of course, the participation of women in political areas specifically devoted to improving the status of women, promoting equality between the sexes or expanding birth-planning information and services can have a tremendous impact on the questions discussed above. Women are becoming increasingly active in a number of countries as policy-makers in their own organizations, highly vocal social critics and skilled pressure groups in the political arena.

62. In the field of development planning and population policies, where women have been severely under-represented in the past, many are beginning to take note of the overwhelmingly masculine character of research institutes and decision-making bodies. They are demanding that women play a larger role in determining and evaluating policies that affect their lives so intimately. In the long run, the direction of development planning and population research, along with the priorities for action, may shift considerably as the relationships between social and economic structures, equal rights for men and women, and demographic behaviour are more fully understood, and as women share equally with men in leadership positions.

#### THE STATUS OF WOMEN AND DEMOGRAPHIC CHANGES

63. At a time when the attention of the world is focused on the dynamics of human population growth, structure and geographical distribution, one of the most burning issues is the way in which current and projected population trends have affected, and are likely to affect, the exercise of fundamental human rights and freedoms. Within this general area of concern, questions are being asked about the differential impact of population processes on human rights as experienced by major sub-groups in society, such as racial or ethnic minorities, religious groups, children, working people and the aged. This paper is concerned with the determinants and consequences of population trends as they are affected by,

and, in turn, affect the degree of equality between men and women. Is it possible to isolate particular aspects of population processes in order to identify their general influence on women's status now and in the future? More specifically, how is the position of women in the family, in education, in employment, and in public life shaped under different conditions of population growth, structure and distribution? What demographic conditions appear to facilitate equality between the sexes and what conditions appear to hinder it?

64. It is easy to point to examples of countries with very rapid rates of population growth in which the advancement of women is apparently severely hindered by the burden of a high dependency ratio and by extreme population pressures on scarce material and social resources that limit their opportunities, not only absolutely but differentially in comparison with men. There are also highly visible examples of countries with very low birth rates in which women appear to have achieved a rather high level of equality with men, especially in education and employment, and in which adequate resources are invested in health care, social security, child care, maternity benefits and other essential social services. However, beyond these two extremes it is almost impossible to evaluate the impact on the status of women of different rates of population growth in the middle range. And even including the extremes, it is obvious that demographic conditions may play only a minor role in determining the absolute and relative positions of women in the family and in society at large, as compared with the role played by economic conditions, stages of development, political and social structures, cultural values and beliefs, and governmental priorities for policy and action.

65. Moreover, a vast number of questions remain unanswered concerning the effect of specific population trends on the status of women and on their potential for equality with men. What, for example, is the effect of changing mortality conditions? As health care, sanitation and nutrition improve, one immediate effect should be to make childbearing safer. But the trend could be disadvantageous if it means an "unwanted" increase in fecundity among women who are already overburdened with family responsibilities and who lack the knowledge and means to prevent further pregnancies. And a higher survival ratio among infants, if it occurs at a time of food shortages, could mean that female children are even more likely to be deprived of adequate nourishment when males are given priority for scarce resources within the family.

66. What effect does urbanization have on the status of women? In rural areas with a heavy out-migration of males, the remaining female population may "improve" its status by taking over many activities formerly performed by men and by acquiring a major decision-making role in the family and in the community. Or could the consequences mean only a double burden for the women left behind and an increased competition for the attention of the remaining males?

67. When women move to cities, are their rights likely to be expanded or contracted, and in what ways? Under some conditions, the move may represent a real freedom from the constraints and traditions of village life and an opportunity for higher education, employment and new independence. Under other conditions, it may represent an isolation from a formerly supportive environment, loss of child care and household assistance, and a new division of labour between husband and wife even more rigid than the one left behind. Does the transition from extended to nuclear family, from polygamous to monogamous union, from early marriage to late marriage or non-marriage, from arranged match to free choice always represent an improvement? Or can it sometimes expose women to the possibility of greater male domination or domination of a subtler type? Can the expanded gainful employment of women outside the home in most countries of the world always be taken as a sign of their emancipation, or does it often merely add still another form of domination?

68. There appears to be little doubt that a continued high rate of population growth can have serious implications in retarding economic and social development, with accompanying repercussions on the status of women. This is particularly true in the areas of education, training and employment. In most countries, social services assisting parents with family responsibilities are still in short supply; the positive value of day-care centres as a means of raising women's aspirations and releasing them for education, economic production and political participation is not yet fully recognized. Some critics of current development programmes have expressed the fear that under the pressure of competing economic priorities, women's right to equal participation with men in all aspects of social and economic development will be sacrificed to preferential treatment for males in training and employment, leaving women relatively untouched in their traditional roles. Yet, the participation of women is essential to the developmental process and of great and immediate consequence. Women can be a driving force in society or they can retard progress. Much depends upon the priorities set by development planners.

69. Policy-makers need to take more careful note of the demographic relevance of equality between the sexes. Mention has been made of extent to which equality in the spheres of education, employment, the family and public life appears to be associated with more effective birth planning and with a smaller desired family size among women who marry. Indeed, in some countries where women come closest to exercising their equal rights, birth rates have reached very low levels.

70. But regardless of the demographic conditions or goals of any particular country, the universal human rights aspects of birth planning and the status of women must be affirmed. Constraints on the exercise of the right to decide whether, and when, to bear children affect the exercise of other rights in marriage and the family, education, employment and public life. They may affect directly the right of women and of children to physical and mental health. At the same time, constraints on women's right to equality with men in all these spheres may in turn severely limit the exercise of the right to decide freely and responsibly on the number and spacing of their children.

71. The aim of any population policy must be the enrichment of human life, not its restriction. Thus, the provision of family planning services is no substitute for radical social, economic or political reform, but must be seen as an integral and simultaneous element among a variety of policies and programmes designed to promote the full exercise of all fundamental human rights and freedoms.

72. A policy of raising the status of women and promoting equality between men and women, which expands the range of human rights and freedoms, is an end in itself as clearly stated in the United Nations Charter and in many other international documents. It may also be a significant means to achieve desired population goals, a question only recently provoking serious interest. But the essential purpose remains the full utilization of the talents of all of a society's members and the creation of a new basis for free and happy relations between men and women.

## PROTECTION OF HUMAN RIGHTS AND MEASURES DIRECTED TOWARDS REDUCTION OF MORBIDITY AND MORTALITY IN THE UNION OF SOVIET SOCIALIST REPUBLICS \*

S. Y. Chikin \*\*

1. The relationship between mortality and the demographic, biological, economic and social aspects of human activities, testifies to the importance of these factors as criteria in the realization of the human rights to good health and a full life.

2. The nature of the changes in the mortality of population in the centrally planned economies and in the free-enterprise economies is not identical. The reasons underlying these changes are also different. The elimination of distinctions in mortality among various social groups under socialism is determined by a gradual obliteration of differences in the living conditions of the population in all these groups. It has been achieved on the basis of the most profound and, primarily, economic transformations in the countries of developed socialism.

3. The methods of production and the related labour activity, the level of material well-being, the level of population development, the traditions and customs of the population—all these social factors exert a great influence on the mortality indexes.

4. The Soviet State considers population health protection to be one of the most important tasks legally embodied in the Constitution of the Union of Soviet Socialist Republics. The citizens of the USSR have the right to material subsistence in old age, and also in case of disease and loss of ability to work.

5. This right is ensured by a vast development of social insurance for industrial and office workers at the expense of the State, free medical assistance to working people and the placing at the people's disposal of a wide network of health resorts.

6. In the socialist society, for the first time in the history of the world, the entire population is fully provided with free and qualified medical assistance. The Soviet public health services represent a wide system of measures implemented by the socialist State and the Soviet public and directed towards the betterment of people's health, prevention of disease, provision of healthy conditions for work and private life, a high capacity for work, decreased mortality and promotion of a higher life expectancy for the Soviet people. This

determines the social and sanitary legislation of the Soviet State, as well as the practical activities of the medical and sanitary State-run organizations. Apart from curative, preventive and sanitary services to the population, the system of Soviet public health also covers training and extension courses for medical personnel and research in the field of medicine.

7. The State plan for the development of the people's economy determines the progress of the public health system, in accordance with the tasks of continuous improvement of medical services to the population, and the State budget guarantees conditions for its implementation. The unified State plan of public health development is prepared on the basis of requirements, suggestions and proposals by the various republics, territories, regions and districts, according to the strength and structure of their populations and the plans for the development of their economies and culture.

8. The socialist régime has established the most humane system of free and fully accessible medical help. The Soviet physician is the bearer of the very spirit of this advanced system, its champion and organizer, the servant of the people, and this delineates his whole attitude towards the patients.

9. The availability of medical assistance to the population is inconceivable without an adequate number of medical doctors. The very right to free medical aid cannot in fact be realized if it is not backed up by the training of a sufficient number of physicians to meet the needs of all the people who apply for medical help.

10. By the beginning of 1973 there were, in the USSR, 732,000 practising physicians of all specialties, or more than one fourth of all the practitioners throughout the world. The number of doctors per each 10,000 of the population amounted to 29, which is considerably in excess of their number in any other economically developed country. In the pre-revolutionary period, the country had only 28,000 practitioners of all specialties, or 1.8 doctors per 10,000. Thus, the availability of medical help has increased 16 times. In subsequent years, the number of doctors will grow considerably, in absolute as well as in relative figures, as estimated per 10,000 of population, which will help make medical assistance still more accessible and effective.

11. Over and above their regular income, the industrial and office workers in the USSR receive, at the

\* The original text of this paper (E/CONF.60/SYM.IV/6) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

\*\* Ministry of Public Health of Russian Federation, Moscow, Union of Soviet Socialist Republics.

State's expense, tangible payments out of the public consumption funds, along with the free medical help.

12. The payments and deductions granted to the population from the public consumption funds are constantly increasing. In 1972, the expenditure on social insurance payments, benefits and allowances, pensions, students' scholarships, free education, medical care, maintenance of boarding-schools, crèches, kindergartens, sanatoria, rest-homes and homes for the aged, and other related expenses amounted to 73 thousand million roubles.

13. Freer and better education in the Soviet Union has been highly instrumental in eliminating many diseases and reducing the mortality caused by such diseases, since a literate person treats his health in a more rational way, firmly observes hygienic rules and participates more actively in preventive measures.

14. The same could be said in connexion with the 43 million pensioners. The concern of the State for their well-being is of great significance in reducing many diseases and mortality in general.

15. The right to free medical assistance and its actual availability to the entire population is guaranteed by the fact that the State meets all the expenses for the establishment of the material basis for the public health system and the maintenance of medical institutions, including the salaries of all the medical personnel.

16. The rapid construction of dwellings has provided the urban population with enlarged living-space, increasing it from 6 m<sup>2</sup> of total (useful) area per inhabitant (prior to the revolution) up to 11.4 m<sup>2</sup> (early in 1973).

17. Taking into consideration the fact that every person spends more than half his life in his home, the solution of the housing problem is directly related to the improvement of people's health and the decrease of mortality due to many diseases. Further improvement in living conditions will promote the strengthening of the people's health and the augmentation of their life expectancy.

18. The increase in production of food and its more rational distribution resulted in a higher *per capita* consumption, in the years of Soviet power, of meat and fat (1.8 times), milk and dairy products (1.9 times), fruit and berries (3.3 times), eggs (3.9 times), fish (2.3 times) and sugar (4.8 times). At the same time, the consumption of bread and cereals decreased by nearly 30 per cent, which is indicative of more rational nutritional habits among the population. The increased protein content in food rations has contributed to a better physical development of the Soviet people, an improvement of their health and a higher resistance to many diseases.

19. Great attention is paid to physical culture and sports as important prerequisites to improving health. The material basis for these activities is constantly being extended. Almost every fourth person in the 10-60 age group in the USSR systematically practises physical exercise.

20. As a result of the social, economic and cultural transformations in the USSR, as well as the rapid growth of public health services, the structure of morbidity and mortality among the population has changed sharply. As a result of the appropriate measures taken, morbidity from contagious diseases gradually declined, and for a long time there has been no incidence of smallpox, Asian cholera, plague, parasitic typhus or trachoma, while many other infectious diseases have almost been eliminated. As compared with 1940, the number of cases of enteric fever and paratyphus has decreased eight times; diphtheria, 453 times; and whooping cough, 17 times.

21. Naturally, this trend was reflected in the mortality of the population. Compared with 1913, among urban dwellers, mortality resulting from diphtheria was 650 times lower, that from whooping cough and enteric fever, nearly 400 times; from measles, 90 times; and from tuberculosis more than 15 times. An especially steep decrease was observed in mortality from infectious diseases among children.

22. The main changes that have affected the dynamics and nature of mortality can be summarized as follows:

(a) A considerable decrease of the mortality, above all, in the children's age groups;

(b) A change in the extent and character of diseases, related to an essential reduction in the mortality caused by contagious and parasitic diseases, achieved through the success of medical sciences and the more effective organization of the public health protection, this process having exerted an exceptionally favourable influence on the decrease of mortality in comparison with the pre-revolutionary years when infectious and parasitic diseases took a heavy toll of victims;

(c) A change in the nature of pathology among the population of the economically developed countries after the Second World War, when there appeared a number of new factors adversely influencing public health, such as excessive pollution of the air, a wide use of chemical substances in food-stuffs, radiation and new labour conditions connected with the mechanization and automation of production;

(d) A sharp decrease of infectious and epidemic diseases, together with an increased mean life expectancy and an ever intensified aging process among the population, have resulted in a growing share of chronic diseases that have assumed leading importance in the pathology and causes of population mortality.

23. The specific modifications in the mortality indexes in the USSR are enumerated below.

24. Owing to the new social and economic conditions and the measures taken for the development of public health services, morbidity and mortality among the population had been considerably reduced already by 1926. With the further growth of the people's welfare and the improvement of medical care, subsequent decreases in morbidity and mortality took place. In

1972, the death rate was 8.5 per 1,000 as against 29.1 in 1913. No other country in the world had such a low rate of mortality decrease. Now the USSR stands among the countries with the lowest mortality rates.

25. The Soviet Union has achieved a great and incomparable success in the reduction of infant mortality, which systematically decreased. In 1940, the share of infant mortality in total mortality throughout the country was 32.6 per cent; by 1965, the share of infant deaths below one year of age, compared with the total, decreased to 7 per cent. In 1972, the share of infant mortality in total mortality comprised a mere 5.2 per cent.

26. Especially striking was the change in the average life expectancy, from 32 years in 1897 to 70 years at the current time. In the entire set of indexes characterizing population vitality, average life expectancy occupies a special place. By its very numerical expression this index describes the conditions of existence, labour, private life and medical care, and the effectiveness of social and medical measures directed towards public health protection.

27. The increase of average life expectancy in the country was achieved, first of all, through impressive decreases in infant mortality (aged below one year), and in mortality in the first, second, third and fourth years of life, as well as in the young and middle age groups (up to 60). In its turn it was related to the achievements in the struggle against contagious diseases, tuberculosis, maternal mortality and a number of other diseases that had frequently caused deaths in the infant, young and middle years of life.

28. The decrease in mortality and the extension of the average life-span of the population were undoubtedly important factors advancing scientific and technological progress. In the past, because of a shorter average life-span, a man could give to the society a much smaller return and he did not have time for complete and multi-sided development.

29. In tsarist Russia, infant mortality was especially high, and people's life span was considerably shorter. According to estimates, at that time almost one half of the children died by the age of 15, only 40.4 per cent survived to 45 years and only 29.3 per cent to the age of 60.

30. Now the situation has radically changed: out of 1,000 simultaneously born children, 967 reach the age of 15 and 961 reach the age of 45. By the age of 60, this number shrinks to 780, and by 70, to 627.

31. The current level of mortality in the USSR, as in other economically developed countries, is mainly determined by cardio-vascular diseases and malignant tumours and other growths. These two groups of diseases constitute 64 per cent of all lethal cases. In the economically developed countries, diseases of the blood circulation system are first among the causes of death and currently comprise 40-50 per cent of all the lethal cases due to diseases, whereas in the USSR they

account for 48 per cent. The growth of mortality due to cardio-vascular diseases depends to a considerable extent upon the process of population aging.

32. Reiterating the rights of Soviet man to accessible medical assistance, it should be specially emphasized that in the USSR the most modern accomplishments of medical science are widely incorporated in daily practice for treatment of diseases and reduction of disease-caused mortality. Currently, the problem of fighting cardio-vascular diseases has acquired the most urgent significance.

33. Also of great social and medical importance is the problem of oncological diseases. Within the framework of the Soviet public health system, there exists a ramified special oncological service for the prevention, early diagnosis and treatment of oncological diseases.

34. As is known, the early diagnosis of cancer is the guarantee of its successful treatment. For this purpose, x-ray (recently with Roentgen-optical or electronic amplifiers), radiological, ultrasonic and endoscopic apparatus as well as the latest instruments and other achievements of modern physics and related fields of science and technology are employed.

35. In the struggle against the spread of cancer, an outstanding role is played by large-scale preventive checks among the population. They are intended for diagnosis of pre-cancerous conditions and diseases. There are over 1,360,000 people now in the Soviet Union who have been cured of malignant growths through the help of modern ways of treatment and who pursue their studies and work. In the USSR, as in all the economically developed countries, malignant growths place second among the causes of death (15 per cent).

36. Among the measures for further reduction of over-all morbidity and mortality an important place is held in the USSR by early preventive checks and dispensary observations of the population. This is a peculiar characteristic of Soviet public health system. Execution of these measures permits constant control of the people's health by timely diagnosis of various diseases.

37. The dispensary observations are directed not only at patients requiring qualified medical treatment and prevention of complications, but at large groups of the healthy public with a view to early diagnosis and prevention of diseases. These observations of patients have become very popular among urban and rural out-patient medical institutions. The situation over recent years testifies to an ever-growing role of these principles of medical assistance to working people as an important prerequisite of preservation of the health of the Soviet population, the ability to work, active participation in public life and the total growth for every individual.

38. Recently, in the Soviet Union, much attention has been paid to the organization of specialized medical assistance to the population. The main role in the

provision of such assistance to the rural population is played by the regional, territorial and republican hospitals. In many regions, territories and autonomous republics, there currently are major hospitals with a capacity for 1,000 bed-patients.

39. Of large importance in providing specialized medical help to the urban and rural population are specialized dispensaries: oncological, anti-tuberculosis, skin and venereal disease treatment and others.

40. The Soviet socialist standards and norms designed for protection of human rights are wider and more profound, in their contents and the extent of their practical application, than the international standards governing this sphere.

41. The main principles for the development of public health laws were formed at the inception of the Soviet State and found vivid expression in the Basic Laws of the USSR and the Union Republics concerning the public health system, which were approved by the Supreme Soviet of the USSR in December 1969.

42. The recommendations of the twenty-third session of the World Assembly on Public Health to the effect that the proclamation of the responsibility of the State and the public in respect of public health protection implemented on the basis of a complex of social

and economic measures directly or indirectly contributing to a higher level of health for the population through the establishment of a national system of public health services derived from a single national plan and local plans, and also by way of a rational and effective utilization for the needs of public health of all the efforts and means that can be allotted by society for this purpose at every given stage of its development, have been put into practice in the USSR to the full extent.

43. At the same time, many developing countries are lacking resources for the implementation of these measures. In this respect, major significance may be attached to the recent proposal by the USSR, approved by the twenty-eighth session of the General Assembly, on the curtailment of military budgets and the transfer of funds thus accumulated to help the developing countries.

44. A rational utilization of resources for the development of the economy, food production, establishment of medical institutions, training of doctors and medium medical personnel would largely help assist the ever-growing population in exercising the human rights proclaimed by the United Nations and in prolonging their lives and avoiding premature deaths.

## LAS CONSECUENCIAS DEL EJERCICIO DE LOS DERECHOS HUMANOS PARA LAS MIGRACIONES INTERNAS \*

Oscar Cornblit \*\*

### EL DERECHO A CIRCULAR LIBREMENTE

1. Cada una de las declaraciones de las Naciones Unidas acentúa y promueve el ejercicio creciente de los derechos humanos fundamentales. Estos derechos humanos implican una concepción esencialmente humanística de la persona. A su vez, esta concepción asume una tradición cultural que se ha ido abriendo paso lentamente y con enormes dificultades a través del tiempo, a pesar de los serios reveses sufridos durante períodos de represión, persecución y totalitarismo acentuado.

2. La Declaración Universal de los Derechos Humanos proclamada por las Naciones Unidas representa sin lugar a dudas una afirmación en ese sentido. El preámbulo de la Declaración lo asevera con gran elocuencia proclamando como "la aspiración más elevada del hombre, el advenimiento de un mundo en el que los seres humanos, liberados del temor y de la miseria, disfruten de la libertad de palabra y de la libertad de creencias"<sup>1</sup>.

3. Con este concepto de sociedad formulado por las Naciones Unidas es comprensible que sus diferentes resoluciones consideren especialmente las migraciones.

4. En primer lugar el párrafo 1 del Artículo 13 de la Declaración Universal de Derechos Humanos declara el derecho a circular libremente:

"Toda persona tiene derecho a circular libremente y a elegir su residencia en el territorio de un Estado."

De la misma manera el párrafo 1 del Artículo 12 del Pacto Internacional de Derechos Civiles y Políticos afirma el mismo derecho para "todos" y las restricciones que se especifican son sólo las que se derivan de las necesidades de convivencia social, orden público, derechos y deberes de los demás y el bienestar general en una sociedad democrática<sup>2</sup>. Tales restricciones por otra parte, deben conciliarse con los dere-

chos establecidos en los otros artículos de la Declaración Universal de Derechos Humanos o el Pacto Internacional de Derechos Civiles y Políticos.

5. Otras restricciones a la libertad de circular libremente provienen de la detención de una persona en virtud de causas legalmente fundadas y dictadas por la autoridad jurídica competente<sup>3</sup>. De la misma manera, situaciones de emergencia nacional, o prestaciones de servicios que formen parte de las obligaciones civiles normales de todo ciudadano constituyen limitaciones análogas al principio general de libertad de desplazamiento y de elección del lugar de residencia y de trabajo.

6. Dentro de la misma tónica, debe entenderse que los derechos a circular libremente dentro del territorio de una nación se aplican y valen tanto para los nacionales como para los extranjeros. Por una parte la Declaración Universal de Derechos Humanos establece en el Artículo 2 que "Toda persona tiene todos los derechos y libertades proclamados en esta Declaración, sin distinción alguna de raza, color, sexo, idioma, religión, opinión política o de cualquier otra índole, origen nacional o social, posición económica, nacimiento o cualquier otra condición". Dado que el Artículo 13 en su párrafo 1 declara que "Toda persona" puede circular libremente es claro que no puede hacerse ninguna discriminación basada en el origen nacional de los individuos; por otra parte, este punto fue discutido expresamente en la Tercera Comisión de la Asamblea General donde se presentó una enmienda tendiente a limitar el derecho de circulación exclusivamente a los nacionales, que fue rechazada<sup>4</sup>.

7. El párrafo 1 del artículo 2 del Pacto Internacional de Derechos Civiles y Políticos expresa el mismo principio especificando que todos los estados tienen la obligación de garantizar a todos los individuos dentro de su territorio los derechos reconocidos en el Pacto sin discriminación alguna basada en el origen nacional entre otras posibles causas. En el Pacto sin embargo se exceptúa de esta obligación con respecto al origen nacional en el caso de una emergencia pública, que amenace la existencia misma de la nación. Debe tenerse en cuenta sin embargo que esta restricción sólo es

\* Documento E/CONF.60/SYM.IV/7 preparado para el Simposio sobre las relaciones entre la población y los derechos humanos, Amsterdam, 21 a 29 enero de 1974.

\*\* Director, Departamento de Sociología, Instituto Torcuato Di Tella, Buenos Aires, Argentina.

<sup>1</sup> Preámbulo de la Declaración Universal de Derechos Humanos. Resolución 217 A (III) de la Asamblea General, de 10 de diciembre de 1948.

<sup>2</sup> Las restricciones se describen en el párrafo 1 del Artículo 29 de la Declaración Universal de Derechos Humanos y en el párrafo 3 del Artículo 12 del Pacto Internacional de Derechos Civiles y Políticos.

<sup>3</sup> Párrafos 1, 2, 3 y 4 del Artículo 9 del Pacto Internacional de Derechos Civiles y Políticos.

<sup>4</sup> Documentos Oficiales de la Asamblea General, tercer período de sesiones, Tercera Comisión, 120a. sesión.

aplicable en casos excepcionales y mientras las condiciones de emergencia tengan validez. En situaciones normales se restituyen totalmente las libertades de desplazamiento y residencia libre.

8. También la Convención Internacional sobre la Eliminación de todas las Formas de Discriminación Racial subraya los mismos principios y derechos mencionados en las otras declaraciones. El artículo 5 dispone que todos los derechos de que gozan los individuos valen sin distinciones de raza, color u origen nacional o étnico; incluido en estos derechos está el apartado i) del párrafo d) del mismo artículo, que afirma que toda persona tiene "El derecho a circular libremente y a elegir su residencia en el territorio de un Estado".

9. Sin embargo, debe tenerse presente que hay una excepción a esta homogeneidad de derechos cuando las naciones establecen distinciones entre ciudadanos y no ciudadanos. En el párrafo 2 del Artículo 1 de la ya mencionada Convención Internacional, se admite la restricción de este caso particular de libertad de circulación, diciendo: "Esta Convención no se aplicará a las distinciones, exclusiones, restricciones o preferencias que haga un Estado parte en la presente Convención entre ciudadanos y no ciudadanos."

10. Otras resoluciones y declaraciones de las Naciones Unidas señalan en el mismo sentido, como el estatuto de Nüremberg que considera la deportación de poblaciones civiles como un crimen de guerra<sup>5</sup>. En el mismo sentido deben interpretarse otras disposiciones, como las que se oponen al trabajo obligatorio, porque, en última instancia, llevan consigo la obligación a residir en un determinado lugar. Considerando este hecho, el párrafo 2 del Artículo 5 de la Convención sobre la esclavitud, reconoce que es difícil hacer efectiva la abolición del trabajo obligatorio sin un período previo de transición. De este modo, declara "que, mientras subsista ese trabajo forzoso u obligatorio, no se empleará sino a título excepcional, con una remuneración adecuada y a condición de que no pueda imponerse un cambio del lugar habitual de residencia"<sup>6</sup>.

11. Se hace referencia a la misma cuestión en el párrafo b) del Artículo 1 del Convenio sobre la abolición del trabajo forzoso en el que "Todo Miembro de la Organización Internacional del Trabajo que ratifique el presente Convenio se obliga a suprimir y a no hacer uso de ninguna forma de trabajo forzoso u obligatorio... Como método de movilización y utilización de la mano de obra con fines de fomento económico"<sup>7</sup>.

12. Esta especificación es importante porque señala taxativamente una norma que complementa la de

libertad de circulación y que es la prohibición de desplazamiento forzado, aun cuando este desplazamiento, implícito eventualmente en el concepto de movilización, se realice aparentemente con objetivos ulteriores de bienestar general, como es el de desarrollo económico.

13. Las Naciones Unidas o sus agencias especializadas sustentan invariablemente el principio de la libertad sin restricción de desplazamiento de los habitantes de un país dentro de sus fronteras, al concebir la libertad humana en todos sus aspectos como una de las más altas aspiraciones del hombre, y también por medio de sus resoluciones específicas referentes a las migraciones. Las limitaciones que hemos señalado no alteran el fondo de la cuestión y son excepciones fundadas en situaciones particulares que deben ser razonablemente justificadas.

#### CARACTERÍSTICAS HISTÓRICAS DE LAS MIGRACIONES

14. El avance del proceso de industrialización en todo el mundo ha robustecido la significación de las migraciones dentro de la dinámica general de la población mundial. En estos movimientos de la población, los que se refieren a las migraciones externas son los que más llamaron la atención a partir del primer cuarto del siglo pasado y fundamentalmente después de 1850.

15. A partir de 1930 aproximadamente y sobre todo en las últimas décadas, la significación de las migraciones internas aumenta considerablemente en relación a las migraciones externas, muy especialmente en las regiones del mundo donde se encuentran los países menos desarrollados, es decir, América Latina, Asia, África<sup>8</sup>. Después de 1930 las migraciones de Europa hacia países americanos disminuyen notablemente o cesan por completo, aunque hay algunas excepciones que tienen bastante importancia.

16. Cobran entonces mucha significación las grandes migraciones internas. No debe pensarse sin embargo, que las migraciones internas fueron inexistentes en los períodos anteriores.

17. Si bien afectados por un contexto político social y económico muy diferente al que podría exhibir América Latina, los países de menor desarrollo de diferentes regiones exhiben un pronunciado incremento de las migraciones internas en las últimas décadas, vinculado naturalmente a las grandes transformaciones de la economía mundial<sup>9</sup>. Hay que tener en cuenta sin embargo, que si bien el factor económico es en general el determinante más importante de los movi-

<sup>5</sup> Confirmado por la Asamblea General en su resolución 95 (I) de 11 de diciembre de 1946.

<sup>6</sup> Convención sobre la esclavitud. Ginebra, 24 de septiembre de 1926.

<sup>7</sup> Convenio sobre la abolición del trabajo forzoso. Convenio No. 105 relativo a la abolición del trabajo forzoso, adoptado el 25 de junio de 1957 por la Conferencia General de la Organización Internacional del Trabajo.

<sup>8</sup> Entre 1820 y 1930, los Estados Unidos recibieron el 61.4 por ciento de la migración mundial externa; les siguen Canadá con el 11.5 por ciento, Argentina con el 10.1 por ciento, Brasil con el 7.3 por ciento, Australia con el 4.5 por ciento. Cf. Meier and Baldwin, *Economic Development*, Nueva York, Wiley, 1957, pág. 217.

<sup>9</sup> Para el caso africano véase William A. Hance, *Population Migration and Urbanization in Africa*, Nueva York y Londres, Columbia University Press, 1970, cap. 3.

mientos de población, hay factores de tipo socio-cultural: religiosos, de parentesco, cultura urbana; y políticos: descolonización, guerras y rebeliones, que pueden alcanzar una significación muy grande. En Africa han tenido gran influencia factores de este tipo: en Argelia se produce el éxodo en gran escala de la población de origen europeo, y en Kenya de la población de origen asiático<sup>10</sup>.

18. En vinculación con esto debe recalarse que, las migraciones tanto internas como externas están ligadas fundamentalmente al proceso de urbanización con amplias variaciones y matices dependiendo del lugar y región del mundo donde se producen. Es decir, que en última instancia el desplazamiento de población tiene como destino final la ciudad; el origen, en cambio depende mucho de la etapa del proceso en que se encuentra cada país, puede ser el campo, o poblaciones más pequeñas. Las migraciones han representado por ejemplo el 70 por ciento del crecimiento urbano en Venezuela (1941-1950), el 68 por ciento en Colombia (1938-1951) el 49 por ciento en Brasil (1940-1950)<sup>11</sup>.

19. Al mismo tiempo el proceso de urbanización ha producido un incremento acentuado del tamaño de las ciudades, hecho que a su vez ha representado un incremento agudo de la dominación de la cultura urbana sobre todo el ámbito de la nación. El modo de vida de la ciudad repercute a través de su hegemonía económica, de los medios de comunicación y de la influencia de las instituciones urbanas de todo tipo sobre la vida rural.

20. Todo indica que este incremento de la urbanización, entendido no sólo como un aumento de residentes en zonas urbanas, sino también como un fuerte desarrollo de la hegemonía de la vida urbana a través del crecimiento todavía más pronunciado de las grandes metrópolis, seguirá con ritmo ascendente, aunque con fisonomías marcadamente diferentes de acuerdo al estadio respectivo a que haya llegado cada país.

21. La tasa de crecimiento urbano por la que están pasando los países de menor desarrollo no tiene equivalentes históricos en cuanto a magnitud, en los períodos análogos de los países actualmente desarrollados. Mientras por ejemplo, en los Estados Unidos se dio una tasa anual de crecimiento urbano entre 1890 y 1910 de alrededor de 3 por ciento, las cifras actuales para los países de menor desarrollo son 5.5 por ciento para el este Asiático, 4.7 por ciento para Africa y 4.6 por ciento para América Latina, dándose en algunas subregiones tasas considerablemente mayores todavía<sup>12</sup>.

22. Estas diferencias se deben en parte a una constatación compleja de fenómenos, entre ellas indudable-

mente la disminución de la tasa de mortalidad, pero hay otras que derivan de las características explosivas que adquiere la industrialización para naciones no desarrolladas en el estado actual de desarrollo tecnológico mundial. Las disparidades tecnológicas y de capital son actualmente tan grandes que hacen que la introducción de un nuevo sector industrial en un país sea necesariamente un factor más desequilibrado de lo que lo fue en el siglo pasado, cuando se realizaba según los recursos y la capacidad innovadora de cada país.

23. Dadas las bajas tasas de población urbana que todavía evidencian algunos países de menor desarrollo, es de suponer que los fenómenos de desplazamientos migratorios continuarán todavía durante muchas décadas, si es que las tendencias a la industrialización se mantienen vigentes como hasta ahora.

24. Otra característica que se ha señalado como distintivo del proceso de urbanización en los países de menor desarrollado es el de la primacía de la ciudad más grande en la jerarquía urbana. Para muchos autores ésta es una consecuencia del carácter subordinado de las economías de los países periféricos frente al poder hegemónico de los países centrales.

25. Aunque hemos recalcado la preeminencia del proceso de urbanización en la dinámica de las migraciones internas, no por eso debemos dejar de lado otros tipos de desplazamiento de población, ya sea entre ciudades de un grado de urbanización semejante, entre zonas rurales, e incluso de zonas de alta urbanización a otras de menor nivel.

26. Los desplazamientos de población entre zonas rurales han sido muchas veces intensos en el pasado y varios estudios atestiguan las importantes consecuencias sociales y políticas que ha aparejado su existencia<sup>13</sup>. Lamentablemente no todos los tipos de desplazamientos han recibido la misma atención y por eso hay más opinión formada sobre los fenómenos urbanos ligados a las migraciones que sobre otro tipo de procesos.

#### FACTORES DETERMINANTES Y CONSECUENCIAS DE LAS MIGRACIONES

27. Para comprender la concatenación causal de las migraciones y las consecuencias que han tenido sobre la condición social de los habitantes de un país, los estudios se han centrado sobre los determinantes de la migración, sus características, y sus consecuencias sobre las regiones de origen y destino.

28. Debemos señalar en este sentido que el cuadro que se obtiene a través de los distintos estudios que se

<sup>10</sup> W. Hance *op. cit.* pág. 183.

<sup>11</sup> Véase P. M. Hauser, recopilador, *La urbanización de América Latina*, 1961.

<sup>12</sup> Véase Harley L. Browning, "Primary variation in Latin America during the Twentieth Century", en Schaedel y otros, *Urbanización y proceso social en América*, Lima, Instituto de Estudios Peruanos, 1972, pág. 55; y Manuel Castells, "La Urbanización dependiente en América Latina", *Imperialismo y urbanización en América Latina*, compilado por M. Castells, Barcelona, Gili, 1973, pág. 12.

<sup>13</sup> Durante el período colonial, el rasgo permanente de lo que ahora es Bolivia y ciertas partes del Perú fue una tasa muy alta de movilidad horizontal de la población. En algunas regiones, la proporción de población migrada podía alcanzar un nivel del 30 por ciento o 40 por ciento. Véase Oscar Cornblit, "Society and Mass Rebellion in Eighteenth-Century Peru and Bolivia", *St. Antony's Papers*, No. 22, Londres, Oxford University Press, 1970.

están llevando a cabo es una extrema diversidad de las situaciones emergentes. Esto ha llevado a afirmar a algunos autores que no existe una teoría elaborada sobre migraciones internas. Sin embargo, más bien debe decirse que no existe todavía suficiente cantidad de estudios en situaciones comparables que permitan la formulación de generalizaciones empíricas útiles para la construcción de modelos multivariados sobre el tema<sup>14</sup>.

29. Dentro de las determinantes de las migraciones, las que se refieren al tipo rural-urbano han merecido especial atención. Con respecto a éstas se ha señalado que un factor causal muy importante es el carácter de la estructura agraria. Es decir, allí donde prevalece el latifundio o la productividad rural es baja, hay menor afinamiento de la población en la tierra y esto constituye un factor de expulsión de los habitantes de las zonas rurales. El crecimiento demográfico se traduce en una presión creciente sobre el suelo, y allí donde las posibilidades de ocupación son escasas ya sea por la estructura de tenencia o por falta directa de tierras aptas para la producción, la población migra<sup>15</sup>.

30. Tal punto de vista ha sido cuestionado por otros autores, teniendo en cuenta que en muchos casos no es la población rural que está en peores condiciones sociales y económicas la que migra, sino a la inversa<sup>16</sup>. Esto hace suponer que la selectividad migratoria de las zonas rurales tiene características muy diferentes de acuerdo con la coyuntura económica particular por la que atraviesa la zona. Es decir, en las regiones donde la coyuntura económica es mejor, la selectividad tiende a ser positiva y emigran personas de más alta condición social<sup>17</sup>.

31. El análisis clásico de las motivaciones para migrar divide a los factores determinantes en factores económicos de expulsión y de atracción. Explicaciones demasiado rígidamente ceñidas a este punto de vista han sido criticadas por varios autores, ya que no son suficientes para dar cuenta de las características que interesan en el análisis de la población migrante. Surge

la necesidad de introducir variables de tipo antropológico, normativo y psicosocial<sup>18</sup>.

32. De cualquier manera, el peso de las variables de tipo económico es fundamental, por lo menos a través de la mayoría de las encuestas que se han practicado en América Latina y otras partes del mundo donde las respuestas dadas correspondieron a razones económicas.

33. Surgen, sin embargo, otras causas de migración como educación, o problemas familiares. Por otra parte, si bien la motivación de trabajo es la que surge con mayor frecuencia en los entrevistados de todos los sectores sociales es más acentuada entre aquellos de menor condición social.

34. Los investigadores consideran en general con muchas reservas los estudios realizados sobre las causas de las migraciones, ya que muchos de los individuos entrevistados no pueden establecer con precisión las razones que los llevaron a migrar, especialmente si migraron muchos años atrás. En líneas generales puede decirse que son muchos los factores que precipitan la decisión de migrar, factores además que se extienden a lo largo de un amplio período de tiempo que incluye acontecimientos del pasado más lejano ligados a la infancia del individuo, y otros acontecimientos muy recientes referidos a situaciones de trabajo, de política o familia.

35. En cuanto a las características de las migraciones se han hecho estudios que han tratado de delimitar las áreas de origen, volumen, distancia, y selección de las migraciones entre otras cosas. Se ha hecho hincapié en la migración rural-urbana que constituye la forma de migración más significativa en la mayoría de los países de menor desarrollo.

36. Sin embargo, debe señalarse que otras formas de desplazamiento de tipo rural-rural, o urbano-urbano son también muy importantes<sup>19</sup>. Merece también especial atención la migración de retorno. En algunos estudios se encuentran porcentajes significativamente altos de retornantes entre los migrantes. Dentro del estudio de las características de las migraciones cobra importancia el examen de la selectividad de origen de los migrantes. Es decir, ¿los migrantes son de extracción más alta que los no migrantes en las comunidades de las que parten; no evidencian ninguna diferencia, o tienden a seleccionarse por sus características negativas? La opinión de numerosos autores es que la selección es positiva, tal como la han demostrado diversos estudios en América Latina y Asia.

37. En cuanto a las consecuencias de las migraciones internas éstas han sido estudiadas abundantemente en la literatura científica y periodística, muy especialmente

<sup>14</sup> Sobre esta cuestión véase Oscar Cornblit, "Political coalitions and political behaviour: a simulation model", *Experimentation and Simulation in Political Science*, compilado por Laponce y Smoker, Toronto, University of Toronto Press, 1972, págs. 225-258.

<sup>15</sup> Véase Héctor Martínez, "Las migraciones internas en el Perú", *Aportes*, No. 10 (octubre 1968), págs. 147-149; Manuel Dieguez hijo, "Causas y problemas del caso brasileño", *Aportes*, No. 15 (enero 1970), pág. 147. También Mario Margulis, *Migración y marginalidad en la sociedad argentina*, Buenos Aires, Paidós, 1968, págs. 100-101; y Doris G. Phillips, "Rural-to-urban migration in Iraq", *Economic Development and Cultural Change*, vol. VII, No. 4 (julio 1959), págs. 406 y 420.

<sup>16</sup> Véase Ashish Bose, "The process in south and southeast Asia", *Urbanization and National Development*, compilado por Jakobson y Prakash, Beverly Hills, Sage Publications, 1971, pág. 99.

<sup>17</sup> La información sobre esta cuestión es escasa o casi inexistente. Véase Jorge Balán "Migrant-native socio-economic differences in Latin American cities: A structural analysis", *Latin American Research Review*, vol. IV, No. 1 (primavera de 1969), pág. 8.

<sup>18</sup> Véase Gino Germani, *Sociología de la modernización*, Buenos Aires, Paidós, 1969, págs. 124-142, para consideraciones metodológicas.

<sup>19</sup> Hay una carencia de estudios de migraciones entre zonas rurales. Se puede encontrar buena información dentro de una investigación de mayor alcance en Alison Mc Ewen, "The invisible proletariat", manuscrito sin publicar.

a través de la aparición del fenómeno de los barrios de emergencia; sus características son lo suficientemente repetidas como para que se hayan intentado ya algunas conclusiones de tipo general. La vinculación de los barrios de emergencia con las migraciones internas está dada evidentemente porque una gran parte de sus habitantes son migrantes internos; los matices con respecto a este punto son variados, dándose en muchos casos la migración directa desde zonas rurales y la migración escalonada desde zonas rurales a centros urbanos cada vez más grandes.

38. La llegada de los migrantes a las ciudades trae como consecuencia un aumento pronunciado de la desorganización social.

39. Si bien muchos de estos síntomas de desorganización social han sido especialmente estudiados en los barrios de emergencia, hay que tener en cuenta que el asentamiento de inmigrantes dentro de las ciudades se ha hecho también en otro tipo de viviendas como los conventillos o tugurios. Los primeros estudios sobre el tema ofrecieron una visión general del asentamiento urbano de origen migratorio que se basaba en la suposición que por regla general los migrantes se situaban en las ocupaciones y localizaciones geográficas urbanas de más baja condición, mientras la población local nativa se iba ubicando en los peldaños superiores. Este punto de vista se ha puesto en duda por investigaciones posteriores que han presentado un panorama más complejo.

40. En líneas generales los estudios más recientes tienden a demostrar una gran variabilidad en la inserción de los migrantes en las estructuras urbanas<sup>20</sup>.

41. La extrema visibilidad de las malas condiciones de vida, ha llevado a la introducción del concepto de marginalidad que en un primer momento se refirió exclusivamente a los migrantes rural-urbanos y a su particular inserción ecológica en los barrios de emergencia frecuentemente situados en las zonas periféricas de la ciudad.

42. Fundamentalmente podemos decir que se han desarrollado dos conceptos de la noción de marginalidad. Uno relativo basado en un estado de integración previo de la población urbana nativa y otro absoluto basado en indicadores objetivos de nivel económico social. Desde el punto de vista relativo, el migrante al llegar a la ciudad se encuentra con una cultura en sentido antropológico ya organizada, en la que por distintas causas económicas, sociales y psicológicas no consigue insertarse. La manifestación de esa falta de inserción es la inestabilidad del trabajo, el subempleo, y en general la escasa participación en los roles previa-

mente existentes en la vida urbana. Se produce entonces una segregación entre dos poblaciones: una más tradicional, ligada a un modo de vida preindustrial que no se adapta a las necesidades del desarrollo industrial; y otra, que si bien está estratificada internamente es funcional y adecuada para el desarrollo industrial. En este caso, el problema fundamental estriba en lograr vencer los obstáculos para permitir la integración o asimilación de los marginados a la vida moderna e industrial.

43. El otro punto de vista simplemente señala la existencia de una parte de la población que a través de distintas dimensiones de la vida social muestra un bajísimo nivel de participación ya sea en el consumo de los bienes de carácter material o de los servicios sociales; ya sea en los mecanismos de decisión social que están en la base de la distribución del poder.

44. La literatura sobre el tema es muy extensa, sin embargo merece una especial consideración el problema de la marginalidad política debido a su especial significación para el caso de las migraciones.

45. Uno de los problemas más serios que enfrenta el migrante es a menudo la falta de medios de expresión para poder hacer sentir sus intereses y necesidades. Este hecho no significa necesariamente, la alteración de una relación vital previa en la que sí existían dichos medios expresivos. Muy a menudo las formas de participación política en los lugares de origen eran inexistentes o muy bajas. Esto sucede especialmente en el caso de las migraciones de tipo rural-urbano.

46. Debemos señalar aquí que esta pérdida de mecanismos de acción política, cuando efectivamente la hay, no es atributo exclusivo de la migración rural-urbana, ni tampoco exclusivamente un fenómeno contemporáneo. Por otra parte, las formas de canalización de las demandas pueden ser de tipo tradicional en los lugares de origen y exclusivas de las clases bajas, lo que no evita el hecho de que existe algún mecanismo para expresar demandas específicas.

47. Se ha subrayado abundantemente la conexión que puede haber entre el desplazamiento migratorio y la falta de estructuras institucionalizadas que capten y comuniquen las demandas en los nuevos lugares de residencia, a la vez que obtengan respuestas adecuadas para las mismas, con la aparición de manifestaciones políticas de protesta violenta o de tipo populista. Dejando de lado las posibles formas de respuesta social a dicha situación, el hecho es que la falta de participación política contribuye grandemente a que todas las otras dimensiones de participación social se encuentren deprimidas<sup>21</sup>. En el caso de la invasión con éxito de

<sup>20</sup> Véase Jorge Balán, "Migrant-native socioeconomic differences in Latin American cities", *loc. cit.*, pág. 4. Del mismo modo, hay diferencias bastante notables entre los tipos de comunidades que se agrupan bajo el nombre de "asentamientos de ocupantes sin título". Véase por ejemplo Douglas Butterworth "Squatters or suburbanites? The growth of shanty-towns in Oaxaca, Mexico", *Latin American Modernization Problems*, compilado por R. E. Scott, University of Illinois Press, 1973, pág. 208.

<sup>21</sup> No debe creerse que la carencia de medios para expresar demandas políticas es solamente característica de los sectores inferiores de la sociedad. Otros miembros de la sociedad pertenecientes a escalones más altos de la pirámide social podrían tener iguales dificultades para dar expresión a sus demandas y obtener respuestas adecuadas a las mismas. Tal fue el caso, por ejemplo, de los empresarios industriales en Argentina en los primeros decenios de este siglo, debido, principalmente, al

(Continúa en la página siguiente)

terrenos urbanos es muy visible el peso determinante que tiene la organización política previa. Esto también se puede apreciar en que muchos barrios de emergencia logran superar los estadios primitivos de gran desorganización social y falta de servicios sociales esenciales.

48. Estas observaciones no significan que hay que dejar de lado otras variables de carácter más general que puedan ayudar a grandes sectores de la sociedad a obtener una posición sensiblemente subordinada en todas las dimensiones de retribución social. Hay una abundante literatura, sobre la repercusión que pueden tener de terminados sistemas económicos sociales, sobre el diferente poder de las distintas naciones en el sistema económico y político internacional, y hasta sobre el desarrollo tecnológico y administrativo actual que impone inevitablemente divisiones jerárquicas del trabajo. Estas publicaciones están llenas de sugerencias, aunque a veces sin llegar a aclarar de qué manera determinadas configuraciones económicas y sociales a nivel nacional e internacional se ligan con características específicas del proceso migratorio y de urbanización<sup>22</sup>.

49. Si bien hemos hecho hincapié en los problemas de la llegada de los migrantes a las ciudades, no menos importantes son los que surgen en los lugares de origen. Debido a que la selectividad de la migración es positiva, la situación en los lugares de origen de los migrantes tiende a deteriorarse por la pérdida de los individuos más activos. Muchas de estas pequeñas poblaciones se encontraban ya antes de iniciarse el proceso migratorio en un estado muy deprimido, de manera que el proceso no hace más que agravar el estado de cosas preexistente. Lamentablemente sobre

(Viene de la página anterior)

hecho de que eran inmigrantes (en este caso, externos). Véase Oscar Cornblit, "European immigrants in Argentine industry and politics", *The Politics of Conformity in Latin America*, compilado por Claudio Veliz, Londres, Oxford University Press, 1967, pág. 221. Sobre la cuestión general de la relación de la maquinaria política con los inmigrantes, véase también David Rock, "Machine politics in Buenos Aires and Argentine radical party, 1912-1930" *Journal of Latin American Studies*, vol. 4, parte 2 (noviembre 1972), págs. 233-256. Es también muy importante señalar que en algunos casos la participación política puede ser muy grande y estar estructurada mediante los conductos establecidos o al menos mediante conductos semejantes a los existentes. Esto parece depender en gran medida de la densidad de vida comunal que lleve el individuo. Llama la atención, por ejemplo, cuánto mayor fue la participación política de los colonos de las colonias agrícolas de la provincia de Santa Fe en la Argentina hacia fines del siglo diecinueve, debido a que tenían un tipo de vida comunal muy intenso comparado con el de los agricultores de origen extranjero de la provincia de Buenos Aires en el mismo período que se establecieron de un modo mucho más disperso. Véase Ezequiel Gallo, "Santa Fe 1893: La revolución radical y las colonias agrícolas" (en prensa) Buenos Aires, para el caso de Santa Fe; y Manuel Bejarano, "Inmigración y estructuras tradicionales en Buenos Aires (1854-1930)", *Los Fragmentos del Poder*, compilado por Di Tella y Alperin Donghi, Buenos Aires, Editorial Jorge Alvarez, 1969.

<sup>22</sup> Sobre este punto véase Torcuato S. Di Tella, "La división del trabajo y el concepto marxista de clase social", *Revista latinoamericana de sociología* (de próxima publicación).

este tema es mucho menor el número de estudios realizados a pesar de su enorme importancia<sup>23</sup>.

## CONCLUSIONES

50. Aunque el proceso migratorio pone de relieve de manera muy visible y enfática las malas condiciones de vida que sufre una proporción substancial de la población, no son las migraciones las causas fundamentales de las mismas, si bien en buena cantidad de casos se ven agravadas por la existencia de desplazamientos de habitantes de un volumen superior al que una racionalidad económico-social aconsejaría.

51. La existencia de esa parte marginada de la población, que alcanza porcentajes altísimos en los países de menor desarrollo y que es también bastante considerable en otros que han logrado un ingreso por persona relativamente aceptable, constituye una flagrante transgresión a algunos de los derechos fundamentales anunciados por las Naciones Unidas.

52. De hecho todos los Artículos del 22 al 27 de la Declaración Universal de Derechos Humanos se refieren al derecho que posee toda persona de participar de los bienes sociales y económicos que la sociedad produce. Otras resoluciones de las Naciones Unidas apuntan en la misma dirección, estableciendo solemnemente el derecho inalienable de todos a gozar de los beneficios económicos, sociales y culturales que son patrimonio de la sociedad. Por otra parte, se subraya en estas declaraciones que no es posible alcanzar los ideales de libertad y de ausencia de temor y necesidad si no se logran paralelamente los avances necesarios en el grado de bienestar económico y social de la población.

53. De manera que también es una violación flagrante de los derechos humanos fundamentales la

<sup>23</sup> La migración de lugares rurales puede considerarse también como un modo de encauzar fuerzas potencialmente explosivas que de otro modo podrían haber constituido una base política para alguna forma de cambio radical de la estructura local. Esta posición la sostiene, por ejemplo, Mario Margulis en *Migración y marginalidad en la sociedad argentina*, op. cit., pág. 135. Rivarola expresa una opinión semejante para la migración paraguaya, aunque en este caso, los principales lugares de destino de los migrantes están fuera del país (Brasil y Argentina), no habiendo casi cambio en las proporciones relativas de la población rural y urbana en los últimos años. Véase Domingo M. Rivarola, "Aspectos de la migración paraguaya", *Revista paraguaya de sociología*, Año 4, Nos. 8 y 9 (enero-agosto 1967), pág. 43. Para otros aspectos de las migraciones internas paraguayas, véase Berta H. López, "Estudio de la migración interna paraguaya", *Revista paraguaya de sociología*, Año 9, No. 24 (mayo-agosto 1972), págs. 73-122; y Ramón B. Fogel, "Determinantes negativos de la movilización social en sistemas sociales rurales del Paraguay", *Idem*, págs. 149-162. Stavenhagen considera el caso de las migraciones estacionales e indica que éste es uno de los factores que permite mantener una estructura tradicional de poder. Véase Rodolfo Stavenhagen, "Marginalidad, participación y estructura agraria en América Latina", *Demografía y economía*, vol. IV, No. 3(12) (1970), pág. 281. Por otro lado, Martínez considera que las migraciones tienden a acelerar el ritmo del cambio social en las comunidades de origen, no sólo desde el punto de vista de las innovaciones sino también creando las condiciones para su desintegración. Véase Martínez, Héctor, loc. cit., pág. 159.

existencia de individuos que viven bajo condiciones de vida infrahumanas en cualquier dimensión de la vida y de la cultura que pueda configurar una personalidad humana de acuerdo con las concepciones actuales del hombre integrado y capaz de desarrollar plenamente sus facultades.

54. Ahora bien, es esencial que todos los principios fundamentales que constituyen el conjunto de derechos humanos sean compatibles entre sí.

55. Si la aplicación de un principio pone en peligro la práctica de otros debe encontrarse una solución armónica y racional, que respete básicamente los principios establecidos.

56. Hacer compatibles los principios no significa suprimir algunos en beneficio de otros.

57. Para el caso que estamos considerando podría argüirse que el exceso de migraciones internas está por encima de lo que aconseje una racionalidad económica que intente mejorar el nivel de producción y distribución en cuanto a una asignación espacial adecuada de los factores de producción, y por lo tanto justifica la imposición de trabas al libre desplazamiento de las personas dentro del territorio de un país. Pero debe tenerse presente enfáticamente que la introducción de tales trabas constituye también una flagrante violación al derecho fundamental que tienen todas las personas de elegir libremente el lugar de su residencia<sup>24</sup>.

58. Debemos tener en cuenta que existe una gran variedad de métodos para orientar las migraciones y mejorar las condiciones de vida en las grandes aglomeraciones urbanas, sin transgredir para nada los derechos humanos fundamentales.

59. En este sentido es importante señalar que lo principal aquí es la decisión de no infringir los derechos fundamentales. Una vez aceptado este principio previo, la investigación y la experimentación pueden encontrar soluciones, si es que el repertorio de instrumentos sociales disponibles o conocidos no alcanza para responder a las exigencias de acción planteadas por las necesidades básicas insatisfechas de las poblaciones.

60. Por supuesto resulta aparentemente más sencillo suprimir la libertad de movimiento que buscar soluciones más sofisticadas a los problemas de la migración inadecuadamente orientada. Las soluciones sofisticadas son más costosas, requieren la experimentación continua y también implican riesgos de equivocación. Pero si bien a corto plazo pueden ser consideradas como más costosas e ineficientes con respecto a los objetivos inmediatos buscados, a más largo plazo son provechosas con respecto al progreso de los indi-

viduos como seres humanos. Aun desde el punto de vista de un cálculo económico estricto, a largo plazo todas las medidas que estimulen la capacidad de decisión individual basadas en un desarrollo más completo de la personalidad, favorecen la formación de recursos humanos calificados, flexibles y capaces de generar la iniciativa individual y la creatividad que la moderna tecnología productiva exige. Toda traba legal contra el libre desplazamiento de las personas disuade la capacidad de libre decisión y por tanto conspira directamente contra la estructuración de las bases humanas necesarias para la producción de la civilización actual.

61. Los instrumentos sociales útiles para enfrentar los problemas vinculados con las migraciones pueden ser básicamente de dos tipos: uno está representado por los instrumentos que provee el Estado directamente y el otro por aquellos que surgen fundamentalmente a través de la iniciativa propia de los individuos, que pueden también recibir apoyo indirecto del Estado.

62. El repertorio de medidas posibles al alcance del estado toca fundamentalmente dos aspectos: la situación de los migrantes en los lugares de llegada y las motivaciones que los hacen abandonar los lugares de origen.

63. Respecto a los lugares de origen hay que tener en cuenta que los habitantes de zonas rurales o poblaciones pequeñas están mucho más marginados que los que se encuentran en los puntos más bajos de la pirámide social en los conglomerados urbanos grandes. Todas las medidas que estimulen el mejoramiento de las condiciones de empleo en las zonas rurales o semirurales son importantes, ya sea a través del establecimiento de nuevas industrias o a través de la revalorización de actividades de tipo tradicional, fundamentalmente las artesanías, que tienen una demanda creciente en las zonas urbanas más sofisticadas. Programas especiales para el mejoramiento de la vivienda rural o semirural y de los servicios sociales y médicos son instrumentos fundamentales.

64. Pero el ámbito de las medidas gubernamentales no debiera restringirse solamente a las dimensiones materiales de la vida. La emigración de la gente joven está conectada frecuentemente con la falta de posibilidades de educación, de cultura y de recreación adecuadas.

65. En esta dirección deben contabilizarse la creación y apoyo de instituciones de educación y cultura tales como escuelas técnicas, universidades, escuelas secundarias y las iniciativas individuales que favorecen actividades culturales como la música, las artes plásticas, el teatro, las artesanías y los deportes. Estas medidas no sólo sirven para retener a los jóvenes en sus lugares de origen, sino también para atraer a otros de centros urbanos más grandes y favorecer así las posibilidades de la migración de retorno. Programas especiales para apoyar estas actividades en las poblaciones más pequeñas, deberían ser diseñados.

<sup>24</sup> Durante el período fascista en Italia se promulgó, en 1939, una ley que exigía "permisos de tránsito para la protección de las ciudades". Esta ley fue derogada hace pocos años por una decisión del Tribunal Constitucional de Italia. Véase G. Fofi, "Immigrants to Turin", *Readings in the Sociology of Migration*, compilado por C. J. Janser, Oxford, Pergamon Press, 1966, pág. 276.

66. En general es importante planear el desarrollo de centros y subcentros regionales que en forma de red interconectada satisfaga las distintas dimensiones de la vida contemporánea que la población demanda.

67. Aquí el estado debe actuar para compensar las desigualdades regionales que se producen debido a los factores que automáticamente refuerzas la primacía de algunos centros urbanos. Esto significará la elaboración de un sistema de compensaciones regionales adecuadamente diseñado. Debe señalarse que un diseño adecuado debe tener en cuenta también las posibilidades reales de transferencias regionales de ingresos, ya que éstas despertarán inevitablemente fricciones políticas que pueden adquirir magnitudes considerables de expresión.

68. Dadas las críticas actuales contra las condiciones insalubres de la vida urbana y la contaminación creciente del medio ambiente de las grandes concentraciones humanas, debiera ser relativamente fácil realzar las cualidades de la vida en las zonas rurales. Es cierto que esto no remediará la migración motivada por razones económicas o de trabajo, pero añadirá un elemento importante al contexto de otros tipos de migraciones. En este sentido, y referido a la cuestión de las migraciones basadas en la escasez de oportunidades económicas, es importante subrayar la especial significancia negativa que tienen en zonas rurales los sistemas de tenencia de la tierra de gran concentración. La combinación de las medidas anteriores con programas que estimulen la división de la tierra contribuirán a un mayor afinamiento de la población fuera de los grandes conglomerados urbanos.

69. Es muy importante hacer resaltar que el apoyo a las iniciativas locales debiera ser prioritario. Muchas veces, programas locales que no parecen ser viables en términos estrictamente económicos carecen de apoyo por esas razones. Pero la experiencia demuestra que cuando la gente está primordialmente motivada por algún objetivo está dispuesta a compensar con esfuerzos extras lo que podría ser considerado como una asignación irracional de la mano de obra. Tales son por ejemplo, los programas de vivienda que se basan en el esfuerzo propio de los futuros ocupantes de las mismas. Muchas veces estos esfuerzos se canalizan a través de compañías de ventas de lotes de terrenos, las que por carecer de un plan mínimo de organización urbana contribuyen a mediano plazo al empeoramiento de las condiciones de vida de la población. Pero la capacidad de las poblaciones de construir sus propias habitaciones demuestra que con un mínimo de posibilidades los individuos están muy dispuestos a hacer los esfuerzos necesarios para obtener las mínimas condiciones de habitación digna.

70. Una vez poseedores de una pequeña superficie de tierra, por medio de presiones sobre las autoridades locales, los individuos logran obtener algunos servicios como luz, agua y electricidad al mismo tiempo que construyen sus propias casas, si bien es cierto que a

un ritmo lento y no siempre con la habilidad necesaria. Combinando este interés individual con medidas prácticas de apoyo mucho podría adelantarse en esa dirección.

71. Sin embargo la experiencia en cuanto a declaraciones de derecho en este sentido ha sido poco halagüeña. Debería ser mucho más importante que la declaración de nuevos derechos, la búsqueda de mecanismos prácticos para la implementación de los mismos. Incorporar nuevas declaraciones especiales que se refieran a situaciones particulares no parece una herramienta efectiva para la obtención de resultados concordantes con dichas declaraciones.

72. Una segunda línea de ataque descansa en las iniciativas privadas individuales o colectivas, que proveen la base de una presión permanente sobre las autoridades para que éstas produzcan medidas de gobierno que otorguen a los sectores relegados.

73. Sería aconsejable organizar secciones especiales dentro del aparato del estado capaces de proveer respuestas adecuadas a las iniciativas locales, que de otra manera se perderían dentro de las complejidades de las administraciones burocráticas.

74. Todo el conjunto de medidas que estamos proponiendo apunta a otorgar a los conglomerados urbanos que no forman parte de las grandes concentraciones metropolitanas, atractivos semejantes a los que ofrecen éstas últimas. Muchas investigaciones sobre las migraciones señalan que contabilizando los pros y los contras de la situación de los migrantes que han abandonado sus poblaciones de origen y se encuentran en condiciones de vida muy precarias y marginadas en los puntos de llegada, el resultado es indudablemente favorable al desplazamiento y justifica la migración efectuada. Este hecho por otra parte coincide con la opinión de los migrantes mismos a través de las encuestas. La mayor parte de ellos no están arrepentidos de haber abandonado su lugar de nacimiento.

75. Estas consideraciones podrían traducirse eventualmente en un conjunto de declaraciones sobre derechos humanos correspondiente a los individuos que habitan zonas rurales o poblaciones pequeñas. Aun cuando implícitamente las declaraciones sobre derechos humanos se refieren a todos los habitantes de un país, la especificación de los mismos por zonas rurales o semirurales permitiría alertar más claramente a los gobiernos sobre las dificultades particulares de estas zonas.

76. Todas las iniciativas cuando están destinadas a producir medidas de gobierno tienen un carácter político, aun cuando su cometido fundamental no lo sea.

77. Tal es el caso por ejemplo de las asociaciones de habitantes de barrios de emergencia cuya preocupación principal es obtener viviendas adecuadas. Expertos dedicados al estudio de estos barrios coinciden en señalar el alto grado de iniciativa política que sus habitantes demuestran toda vez que avizoran una mínima posibilidad de éxito en la consecución de sus fines.

78. Es cierto que una vez conseguido el objetivo más claro, como es por ejemplo la ocupación de un predio o la construcción de una casa, el interés decae y la participación en actividades destinadas a mejorar otras dimensiones de la vida cotidiana se vuelve mucho más débil. Pero este hecho podría compensarse con una información adecuada sobre la importancia que pueden tener otras dimensiones de la vida social tales como la atención médica, la educación, los servicios sanitarios, la recreación dominical, la cultura, etc. En esto pueden jugar un papel importante los individuos con capacidad de dirigir que provienen de los propios lugares de residencia. El estado podría ayudar a estas iniciativas dentro de ciertos requisitos mínimos de viabilidad y seriedad.

79. No debe pensarse que tales objetivos son de fácil realización. Hay que luchar contra muchos obstáculos, entre ellos la oposición de líderes al surgimiento de fuentes de poder competitivas. Sin embargo, pueden obtenerse progresos razonables si estas dificultades son previstas de antemano, si se cuentan con mecanismos

de negociación adecuados y con el apoyo de líderes de nivel más alto que pueden hacer valer sus recursos de prestigio y de poder. Los partidos políticos deberían también contar con información adecuada sobre estos temas y estimular la atención especial que requieren los problemas de las poblaciones migrantes, para que estos problemas no se diluyan dentro de la organización general ni de los mecanismos de canalización de demandas de la población.

80. En conclusión, los mecanismos autónomos de acción política deberían ser estimulados y alentados, dado que a la larga son la mejor garantía de que las demandas e intereses sentidos genuinamente por la población serán tenidos en cuenta. Las asociaciones voluntarias son los instrumentos más aptos para el logro de estas metas.

81. Pero es necesario continuar investigando estos procesos y su conexión con la política de los gobiernos. Esto establecerá una base empírica más sólida que facilitará el diseño de proyectos para la solución de los problemas.

## POPULATION AND INTERNATIONAL MIGRATION: THE CASE OF THE MIGRANT WORKERS \*

Prepared by Yash P. Ghai \*\*

1. The basic purpose of this paper is to explore the conditions of migrant workers in the context of the generally accepted principles and provisions of human rights. The focus is on migrant workers in Africa and Western Europe. These introductory remarks seek to place the case of the migrant workers in the context of the Symposium.

2. Traditionally, migration has been viewed as both a response to and a solution of population pressures.<sup>1</sup> Such an approach has been relevant to the experience of European States, whose surplus populations have sought new opportunities in the Americas, Oceania and parts of colonial empires. It is estimated that between 1800 and 1930, 40 million Europeans migrated overseas.<sup>2</sup> There have also been very considerable movements out of Asia, and large numbers of people have migrated from India, for example, not only to neighbouring countries, but to the far corners of the globe.<sup>3</sup> In more recent times, there have been significant migrations to Western Europe. It is doubtful whether migration across national boundaries has the potential today to alleviate population pressures to any significant extent.<sup>4</sup> About the turn of the century, most developed countries introduced immigration restrictions, and it is unlikely that these restrictions will be relaxed to allow the admission of the poor and the unskilled from the poorer parts of the world in other than small numbers. Countries of Africa and Asia have

also begun to introduce restrictions and, indeed, to provide for the expulsion of non-citizen residents.<sup>5</sup>

3. The view that regards migration as a response to population pressures (at least with respect to the experience of the past 100 years) proceeds on the assumption of its voluntary nature. In fact, much of the so-called "voluntary migration" has taken place under the impact of economic forces over which the migrants themselves have had no control and which have clearly been manipulated by the organizers and recipients of migrants. To begin to question the validity of this claim, one has only to look at the colonial policies of labour recruitment, combining fiscal and more overt pressures,<sup>6</sup> amounting in numerous instances to compulsion. It may be argued that such policies are no longer operative, and that the Conventions of the International Labour Organisation (ILO)<sup>7</sup> have put a stop to them. While such policies may have disappeared in their overt form, it is clear that the reality behind compulsion has not. Labour and recruitment practices, not only in South Africa, but elsewhere, including Europe, are determined very largely by the needs of capitalism, with its limited but all-pervasive object of profit. All the migrations discussed in this paper are, in a real sense, regulated by the forces of market capitalism, which looks at labour as merely another factor in production.

4. Also pertinent to the connexion between migration and human rights is the recognition that economic and social development is an essential preliminary to the universal safeguarding of human dignity. It is, therefore, necessary to undertake a very critical evaluation of the cost and benefits of migration with respect to the countries which lose their labour. It is generally stated that the benefits are mutual, but the African experience, at least, shows that this is far from the case; and migration and recruitment practices have, by

\* The original text of this paper (E/CONF.60/SYM.IV/8) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

\*\* Senior Fellow and Lecturer, Yale University, New Haven, Connecticut, United States of America.

<sup>1</sup> See Walter F. Willcox, ed., *International Migrations*, vol. I, part I (New York, National Bureau of Economic Research, 1929). It becomes clear that "population pressures" is a relative concept. It refers less to absolute figures than to the capacity of the economy to absorb labour and to provide decent levels of living. The causes of the inability of an economy to absorb labour are complex, although it would appear to be incorrect to regard the size of the population itself as a cause.

<sup>2</sup> Robert Descloueres, *The Foreign Worker: Adaptation to Industrial Work and Urban Life* (Paris, Organisation for Economic Cooperation and Development, 1967), p. 22. Willcox puts the figure even higher, as being in the region of 55.5 million in the period 1820-1924; *op. cit.*, p. 82.

<sup>3</sup> In 1921, for example, nearly 3 million Indians were resident overseas. See Shivras in Willcox, *op. cit.*, p. 592.

<sup>4</sup> Gunnar Myrdal, *Asian Drama: An Inquiry into the Poverty of Nations* (New York, Pantheon Books, 1968), vol. II, pp. 1459-1462.

<sup>5</sup> In recent years, Indians have been expelled from Burma and Sri Lanka. For expulsions from Africa, see International Labour Organisation, *Employment, Status and Conditions of Non-National Workers in Africa* (Geneva, 1973); Tandon, "The Asians in East Africa in 1972", in Colin Legum and others, eds., *Africa Contemporary Record, 1972-1973* (New York, Africana Publishing Corp., 1973); Margaret Peil, "The expulsion of West African aliens", *Journal of Modern African Studies*, vol. IX (August 1971), p. 205.

<sup>6</sup> S. Aaronovitch and K. Aaronovitch, *Crisis in Kenya* (London, Lawrence and Wishart, 1947).

<sup>7</sup> For the relevant International Labour Organisation Conventions, see paragraphs 12-20.

siphoning the able bodied men of a community, had disastrous consequences on the community and have, in a real sense, caused the underdevelopment of those communities.<sup>8</sup> Not only has their life-style been disrupted, but their capacity for autonomous development has been perhaps irreversibly destroyed. It is quite probable that in a less dramatic but equally chronic manner, the current migrations are doing irreparable damage to the emigrating countries or regions.<sup>9</sup> If so, this is a great set-back to the cause of human rights, for the poorer developing countries or regions are less and less likely to achieve conditions of sustained growth in their own countries, which are a prerequisite of a victory for human rights and freedoms. There is an urgent need for studies of the impact of migrations on the poorer developing countries (from which the bulk of the migrants come)—an impact conceived in broad and long-range terms.

#### MIGRANTS AND HUMAN RIGHTS: THE PROBLEM

5. It is, nevertheless, clear that, for a variety of reasons, some international transfers of populations will continue in the foreseeable future. One of the most important instances of such transfers today are the migrant workers. It is estimated that there are 11 million migrant workers in Western Europe, some of whom come from within Europe, but the majority of whom come from Africa, Asia and the Caribbean.<sup>10</sup> They constitute over 5 per cent of the population of Western Europe (in Switzerland, as high as 16 per cent) and an even a higher percentage of the working population—as much as 30 per cent in Switzerland. In Africa, it is estimated that there are over 2 million migrants, and they constitute a high proportion of wage workers, perhaps 15 per cent or more, in Ghana and the Ivory Coast.<sup>11</sup> A great deal of migration takes place between the countries of Latin America, the total number of migrants being about 2 million.<sup>12</sup>

6. The conditions in which migrant workers find themselves give serious cause for concern. The growing realization of the plight of the migrant workers is evident from the recent concern expressed both by the United Nations and by the ILO. The phenomenon of migrant workers poses serious threats to the maintenance of human rights which have been achieved in

various countries and makes their realization more difficult in others. The plight of migrant workers raises the spectre of servitude, and the total and overwhelming insecurity in which many of them live erases any possibility of a situation where human dignity can be attained. Because of limitations of space, it is not possible here to give a detailed enumeration of the rights that are threatened. Occasional newspaper reports have highlighted the appalling conditions under which migrant workers are transported, especially, but not always, when they attempt an illegal or clandestine entry into a country. A recent headline referred to the practice as "a latter-day slave trade",<sup>13</sup> for it is not only the conditions of transport (which not infrequently cause death) that are appalling, but the fact that the transporters pocket most of the future earnings of the migrants, in addition to the exorbitant transportation charges.<sup>14</sup> Once in the countries of employment, migrants lead a life which is often miserable. They suffer discrimination in almost all aspects of life. They work at the most unpleasant jobs and are among the lowest paid. They have little security of employment; and, in many cases, they feel haunted (not without justification) by the web of the law of work permits and work and residence restrictions. They are often separated from their families because of legal or other restrictions,<sup>15</sup> and their housing conditions are by far the worst. There are serious restrictions on their right to participate in trade union activities, and in most countries they cannot hold office. Where a right exists *de jure*, it is nullified in practice, because the activist migrants are victimized by the police or employers, and are often expelled. Their rights to social security are limited, again if not in law then in practice.<sup>16</sup> In some countries, especially in Africa, there have been mass expulsions of migrant residents—often of long standing—in conditions of very great hardship. In Europe, the first workers to be dismissed in periods of recession are migrants. They live in a state of fear and anxiety, are vulnerable to exploitation because of their ignorance and weak bargaining position, and are afraid to invoke such law as exists for their protection.

7. It is important to view this situation not only as the denial of specific rights, but as a process. "The whole process of labour migration is now manifesting

<sup>8</sup> See W. Rodney, *How Europe Underdeveloped Africa* (Washington, D.C., Howard University Press, 1972).

<sup>9</sup> Paolo Cinanni, "The backgrounds of migration labour", in H. van Houte and W. Melgert, *Foreigners in our Community* (Amsterdam, Kiesing, 1972), pp. 27-36; Wallman, "Conditions of non-development: the case of Lesotho", *Journal of Development Studies* (United Kingdom), vol. VIII (1971); S. Castles and G. Kosak, *Immigrant Workers and Class Structure in Western Europe* (London, Oxford University Press, 1973), pp. 1-8.

<sup>10</sup> International Labour Organisation, *Migrant Workers* (1973), p. 6; see S. Castles and G. Kosak, *op. cit.*, for numerous statistics on migration to Western Europe and for a penetrating study of migrant workers.

<sup>11</sup> International Labour Organisation, *Employment, Status and Conditions of Non-National Workers in Africa*.

<sup>12</sup> International Labour Organisation, *Migrant Workers*, p. 6.

<sup>13</sup> *The Economist*, 24-30 November 1973, p. 41.

<sup>14</sup> Smugglers are not the only group promoting servitude. Castles and Kosak mention that, when expanding efficient firms in Switzerland are unable to hire enough foreign workers owing to restrictive measures of the Government, less efficient firms, with less work on hand, hire out surplus foreign workers to the more efficient firms. The higher wages paid by the more efficient firms are not paid to the workers, but are paid to their former employers, who continue to pay low wages. The authors allege that the practice also exists in the Federal Republic of Germany, S. Castles and G. Kosak, *op. cit.*, p. 161, foot-note.

<sup>15</sup> A survey among Turkish workers showed that 93 per cent were married and 85 per cent had to leave their families in their home countries. J. Tinbergen, in H. van Houte and W. Melgert, *op. cit.*, p. 17.

<sup>16</sup> For a detailed study of these questions in Europe, see S. Castles and G. Kosak, *op. cit.*

the characteristics of the Industrial Revolution: bad housing, ghettos, the prohibition of strikes, insufficient education facilities, intimidation and vague legal protection".<sup>17</sup> In the industrial countries, one of the great forces which fought for the amelioration of the conditions of workers was the trade union movement. It is highly problematical whether that movement would play a similar role in the amelioration of the conditions of the migrant workers. There is some reason to believe that migration may weaken the trade union movement, as the national workers may perceive their interests as different from (when not actually opposed to) those of the migrants. Everywhere, the migrants are paid less than the local population and work under conditions that are much worse. They do jobs that the local people are not prepared to do. There is clear and systematic exploitation. The local workers have experienced an upward mobility which would not have been possible in the absence of migrants and often hold positions superior to those held by migrants, although they have fewer skills. This trend is said to be most pronounced in Switzerland, where a student of the situation has said:

"In the end, in fact, as some people fear, the Swiss could become a race of supervisors having at their service a labour force without political rights, dedicated to the least agreeable tasks, and victims of a more or less total segregation, which would be equivalent to a colonial state, with the difference that the autochthonous people would be the masters and the immigrants the servants."<sup>18</sup>

#### INTERNATIONAL STANDARDS

8. International standards are established mainly through the United Nations Declaration of Human Rights and the two Covenants on Human Rights, Conventions and Recommendations of the ILO, and certain regional declarations and treaties.<sup>19</sup> The right to leave any country, including one's own, is set forth both in the Universal Declaration of Human Rights and in the Covenant on Civil and Political Rights. No declaration projects a general right of immigration, although article 12 (4) of the Covenant would cover situations similar to those of the East African British subjects of Asian origin, whose entry into the United Kingdom of Great Britain and Northern Ireland has been restricted, presumably in contravention of the standards laid down in the Covenant. The same Covenant seeks to regulate the expulsion of aliens and to prescribe certain minimum standards of procedure. The declarations are much more specific on the rights of those who have migrated. The general thrust of the

provisions is that there shall be complete equality between the national and the migrant workers, at least in so far as economic rights (remuneration, social security, trade union rules etc.) and certain social rights are concerned, although developing countries may determine to what extent they would wish to guarantee the economic rights to non-nationals.<sup>20</sup> The principle of non-discrimination underlies several other United Nations declarations.<sup>21</sup> These declarations are not primarily concerned with migrant workers, but the migrant workers are covered by their provisions.<sup>22</sup> Some instruments seek to remove the worst forms of exploitation, which in the past has often been associated with migrant labour. Thus, slavery and similar institutions,<sup>23</sup> forced labour,<sup>24</sup> traffic in persons,<sup>25</sup> and illicit and clandestine trafficking in migrant labour<sup>26</sup> have either been expressly outlawed or strongly condemned. The standards established through the ILO and regional organizations are elaborated below.

#### THE RÉGIME OF PROTECTION OF MIGRANT WORKERS

9. Various techniques have been employed for the regulation of migration and for the protection of migrant workers. There exist, first of all, traditional and general rules of international law. These have been evolving over the years, depending to some extent upon the needs of international commerce or imperialism. With reference to migration, it would be true to say that under general international law, there is no right of immigration into another country.<sup>27</sup> If that country is the one to which the migrant belongs through the bonds of nationality, the weight of opinion is that there is a right to enter.<sup>28</sup> There is a similar ambiguity about the right to leave a country. While the power of a State to prevent a person from leaving that State, except in limited instances to ensure the enforcement of his legal obligations and liabilities, is denied, the matter is different if the person is a national of the State. A number of countries have imposed restrictions on the right of their nationals to leave, and it would be correct to say that the preponderance of opinion is that the matter is one of domestic juris-

II, part seven.

diction.<sup>29</sup> As for the protection of the migrant, there is surprisingly little law. Much of the subject has been concerned with the protection of the property of aliens and their access to the legal system of the country of residence. Thus, there is very considerable literature on the law of nationalization and on the concept of denial of justice and the exhaustion of local remedies, but not much on the migrant who is an employee. Some rudimentary rules of limitation on expulsion would cover such a person, but their purport and extent are far from clear.

10. The United Nations declarations and covenants seek to remove these ambiguities and to strengthen traditional rights of the individuals, or to establish new ones when necessary. These instruments are not, however, strictly speaking, legally binding (although the latter will become so when there are enough ratifications). The cause of the migrant workers has been most advanced by specific Conventions of the ILO. The ILO has a long history of involvement in the problems of migrant labour, and one of its first activities was a recommendation (in 1919) urging member States to treat foreign workers on a parity with national workers, on the basis of reciprocity.<sup>30</sup> It has adopted a number of conventions and passed several recommendations which promote the rights of the migrant workers. At first, the ILO tended to treat the problems of migrant workers in Europe differently from those in the developing countries. Although it now adopts a global approach, there still exist its Conventions and Recommendations, which apply exclusively to some developing regions. It is therefore necessary to look both at the Conventions that apply generally and at those that apply or applied in relation to formerly dependent territories, and which in most cases continue to apply to them even though they have the status of independence.

#### *General conventions*

11. Of the general conventions, the most important is the revised 1949 Convention for Migration for Employment<sup>31</sup> including its three annexes (one or more of which can be excluded when a State ratifies the Convention). States have to provide free and accurate information on employment prospects and the relevant legislation and to facilitate departure and reception of migrants. Migrants are entitled to the same treatment as national workers in a number of respects: remuneration and fringe benefits; membership in trade unions; accommodations; and social security. Some restrictions

<sup>29</sup> *Study of Discrimination in Respect of the Right of Everyone to Leave any Country, Including His Own and to Return to His Country* (United Nations publication, Sales No. 64.XV.2).

<sup>30</sup> Recommendation 2. Other early actions include Inspection of Emigrants Convention (21), 1926; and Migration (Protection of Females at Sea) Recommendation, 1926. Early efforts of the International Labour Organisation were not particularly successful. See Johnstone, *The International Labour Organisation* (1970), pp. 142-144.

<sup>31</sup> It replaced a 1939 Convention on the same subject, but which had excluded "indigenous workers", i.e., workers from dependent territories.

on the last item are permitted, to ensure that there shall have been a minimum contribution or to restrict payments from wholly public funds to non-nationals. Equality in taxes and in the legal enforcement of the rights under the Convention is also guaranteed. The migrant is guaranteed the right to export or import currency and to transfer such part of his earnings as he wishes. The final guarantee relates to safeguards against expulsion. A migrant worker admitted on a permanent basis shall not be expelled if he becomes unable, due to illness or accident, after his entry, to continue to work. The protection extends to the members of his family who have been authorized to accompany him. A State is free, however, to disregard this obligation during the initial period of residence of the worker; so long as the period does not exceed five years.

12. The Convention thus deals with only a limited number of matters of immediate concern to the migrant, and even then in somewhat tentative terms. To some extent, the annexes, especially the first two, make up for the weaknesses of the Convention. The first two annexes deal with the recruitment, placing and conditions of employment—the first when the recruitment is other than under Government-sponsored arrangements for group transfer, the second when it is so. The latter annex provides more extensive protection than the former. Both provide that recruitment may only be undertaken either by public authorities or by private agencies licensed for this purpose, which must be supervised by public authorities. Illegal and clandestine recruitment or migration is prohibited and punishable. Both state the principle that the migrant should not have to pay for any services in connexion with his recruitment or placing. In countries where there exists a system of supervision of employment contracts of migrants, the migrant has to be given a copy of the contract before his departure, if possible; otherwise, he must be given a memorandum of some kind which states the main provisions of the contract, as well as the general conditions of work. The States undertake to supervise such contracts and to punish violations thereof. Additionally, the second annex provides that if the migrant, through no fault of his own, is unable to secure the employment for which he was recruited, or any other suitable employment, he shall not be responsible for the costs of transportation home for himself and his family. The recipient State is obliged to try to find him suitable employment which, however, does not prejudice the welfare of the national workers, and, in some instances, the State is obliged to provide maintenance and arrange for his resettlement.

13. The ILO has also adopted a Recommendation Concerning Migration (1949), which elaborates the provisions of the Convention and states, in particular, how the State should discharge its responsibilities with regard to the rules of recruitment, information services, facilities for reception of migrants and help with initial problems of settling in the new country. It goes beyond

the Convention in suggesting greater protection against expulsion, easing of restrictions on employment opportunities and provision of social services, especially schooling.

14. Another general field in which the ILO has been active is that of social security. As early as 1935, it promoted the adoption of a Convention for the maintenance of migrants' pension rights.<sup>32</sup> The Convention did not provide for new rights of migrants with respect to pensions, but dealt with some aspects of the problems that arise when a migrant has been contributing to certain pension schemes of different States, and ensures that the periods of his contribution to various schemes shall be added when determining eligibility. A Convention of 1962, the Equality of Treatment (Social Security) Convention, imposes an obligation to provide the same régimes for the non-national worker as the national worker, in a number of specified benefits. The obligations of a State are, however, imposed on a basis of reciprocity; and it is envisaged that most of these schemes would be implemented through bilateral or multilateral agreements.

15. Before turning to the conventions dealing with migrant labour in dependent or formerly dependent territories, one should point to some of the deficiencies of the general conventions. They do not provide for any general right of immigration; they do not impose any obligation with respect to equal access to employment opportunities or vocational training; they do not guarantee the right of the migrant to participate fully in the affairs of the trade unions, including holding office; they do not deal with the rights of the family and appear to imply that there is no need for the family to join the migrant, at least if he is a short-term worker. The general scheme of the conventions leaves important matters to be dealt with by bilateral agreements, so that the rights of the migrant depend upon further action, and often in situations when it cannot be assumed that his interests are of primary concern to the relevant parties to the agreements.

#### *Conventions applicable to developing regions*

16. There are no ILO conventions dealing expressly with migrant workers in the developing countries, although they would be covered by general conventions which deal with labour, which, where appropriate, have special provisions for migrant workers. The most important is the Convention on the Recruiting of Indigenous Workers (1936), in which the word "indigenous" refers to the dependent peoples. Various principles underlie the Convention—recruitment by private agencies is to be prohibited, and when that is not desirable or possible, closely supervised. Recruiting is to be progressively replaced by a system of spontaneous offers to be employed, a principle which is reiterated in a Recommendation of the ILO.<sup>33</sup> In Africa, in

particular, the evils of official recruiting have often been as great as those of private recruiting; in practice, official and private recruiters have generally collaborated. Therefore, the Convention prohibits recruitment by administrative officers or pressure by traditional authorities. The second principle stated by the Convention relates to the protection of the communities from which the workers are recruited. Before granting permission to recruit, the effects of the withdrawal of male adults on the social and economic life of the community must be taken into account, and, if necessary, a limit be placed on the numbers that can be recruited. This limit is expressed as a percentage of the male adults of the population. The Convention states that, in certain circumstances, it would be desirable for the worker's family, to accompany or join him. The third principle relates to the health and transportation of the migrants. Transport costs are, in general, to be borne by the employers, and transport vehicles must meet certain minimum conditions of safety and hygiene, although it is envisaged that the workers may have to cover part of the journey on foot. A medical examination is compulsory, with some exceptions permitted. Fourthly, there are a number of administration provisions to ensure that the general principles shall be enforced. So that the migrants may know the conditions of their employment, the employer must provide them with a provisional contract before their departure and this contract must be attested by a public official. The Contracts of Employment (Indigenous Workers) Convention (1939) requires contracts (with various exceptions) to be made in writing, and prescribes the minimum terms of these contracts. Other provisions seek to ensure that a worker shall not be separated from his family for excessive periods; and the employer has to provide facilities for his visit to his home before re-engaging him for another period.

17. These Conventions are drafted in vague and general language and leave too much discretion to public authorities with regard to the extent and the manner in which the principles of the Conventions would be carried out. In any event, the rights guaranteed are minimal. In 1955, the ILO adopted a comprehensive Recommendation concerning the Protection of Migrant Workers in Underdeveloped Countries and Territories. Despite its paternalistic attitude, it goes beyond the Conventions in addressing itself to the problems of the migrants. In particular, it requires equal treatment of migrants with nationals, discusses the need to discourage migration where migration seems undesirable and points to the goal of settling migrants in their new places of work.

#### *Bilateral and regional agreements*

18. It has been a strategy of the ILO to encourage bilateral and regional agreements on migration. The 1949 Convention for Migration urges such agreements, and the accompanying Recommendation sets out a model of such an agreement. A large number of agree-

<sup>32</sup> Maintenance of Migrants' Pension Rights Convention (48).

<sup>33</sup> Eliminating of Recruiting Recommendation, 1936.

ments, mostly bilateral, have been negotiated; and they constitute an important element of the legal régime for the protection of migrants. It is not possible to summarize their terms in the brief scope of this paper, other than to make a few general comments. The emphasis on a series of bilateral agreements results in a system whereby migrant workers of different nationalities have different rights and produces discrimination among them. The agreements do not confer the right to immigrate. As a rule the agreements do not specify the volume of migration, although in Africa it has been customary to specify maximum annual quotas, primarily to prevent a complete denudation of young men from a community.<sup>34</sup> The agreements specify the public authorities of the two countries which would handle recruitment, selection, immigration and emigration; they specify the necessary documentation for travel and require the costs of outward travel to be borne by the employers or the country of immigration (most agreements also require the return journey to be underwritten by the employer; in other agreements, this point is negotiated between the migrant and the employer). Equality of treatment of migrants under the labour legislation is stipulated, and there are often separate and detailed agreements on social security. Some deal with the right of the worker's family to join him (although South Africa has always refused this provision, as well as the settlement of the migrant worker). In Europe, the right of the worker's family to join him usually arises only after the migrant has worked for a specified period and/or has a minimum period of his contract to fulfil. The right is also dependent upon the migrant being able to provide housing of a specified standard. In Africa, employers are usually required to provide housing and, on occasion, a parcel of land which the migrant cultivates for his own needs. Apart from clear provisions of equality of treatment and detailed arrangements on social security, those agreements do not go beyond the Conventions. They do provide for additional machinery to facilitate migration and for supervision of the basic standards. On the other hand, they interpose too many authorities (with vetoes) between the potential migrant and the country of immigration. The fact that a great deal of migration takes place outside the framework of these agreements (despite the clear intention that all migration should take place within the framework) suggests that in some ways, at least, the agreements fail to serve the interests of the migrants.

19. A brief account must be given of regional agreements, for they are clearly the most far-reaching in scope and, in part, suggest standards for other agreements. They are usually part of a wider framework of economic co-operation or integration and come close to giving a right of immigration into a signatory state. The best known examples are the systems in the

<sup>34</sup> For information on various national quotas, see Commission for Technical Co-operation in Africa South of the Sahara, *Migrant Labour in Africa South of the Sahara* (New York, International Publications, 1961).

European Economic Community (EEC) and in the Scandinavian countries, although the African and Malagasy Common Organization (OCAM) group of countries have adopted provisions similar to those of EEC. The EEC rules have as their objective the integration of the labour markets of the member countries, and the logic of this goal has resulted in a series of regulations which have increasingly assimilated the position of the EEC worker into the domestic environment, in terms of job opportunities, residence and social security. The enforcement machinery of the Rome Treaty is available for the enforcement of the rights guaranteed to the workers. The regulations cover only a small proportion of the migrant workers in Europe, only Italy being a country of emigration; but it has a larger importance in establishing standards which will be increasingly difficult to withhold from other migrant workers. It is significant, also, that in providing a model of regional arrangements for labour migration, and apart from the case of OCAM, there have been discussions concerning the introduction of similar schemes among the Arab countries and on a continental basis in Africa.

#### CONCLUSION

20. The examination of the legal régime makes clear that there are serious deficiencies with respect to rights of the migrant worker. First, relatively few countries have ratified the Conventions. The most important countries of immigration in Africa—the Ivory Coast, Southern Rhodesia and South Africa—have not done so, while Zambia, which is also an important country of immigration, has excluded all the annexes of the Convention. In Europe, Switzerland, a major importer of labour, has not ratified the Convention. Secondly, even if more countries could be induced to ratify the Conventions, as has been urged in recent United Nations Declarations, serious deficiencies with respect to the rights of the migrants would remain. One of the most important of the ILO Conventions, Discrimination (Employment and Occupation) (1958), does not cover migrant workers, while the “migrant” Conventions leave important rights unprotected. The Conventions are particularly weak on family-related rights, which have assumed great importance in recent United Nations thought on human rights, on equal access to job opportunities, job mobility and rights of residence and adequate protection against arbitrary expulsion. Thirdly, the limited rights covered by the Conventions are not fully effective, which is due in part to the fact that some migration is not conducted under official auspices. (For example, in France, in 1967, only 22 per cent of migration was official; in 1968, 18 per cent was official; and in 1969, 33 per cent was official.) Even when migration is not illegal, the migrant finds it difficult or inexpedient to invoke legislative or treaty guarantees, in part because, in some instances, migrants feel too insecure to want to battle with employers, landlords and the authorities. It is not

enough to remove legislative restrictions or discrimination. To make that equality real, positive obligations have to be placed upon public and private authorities. While this is done to some extent, much more is needed.

21. Conventions and other legal instruments have their uses and are an essential element in a strategy for the amelioration of the conditions of migrants. But it is clearly necessary to go beyond them. While the ILO has urged economic development in the poorer developing countries, its general attitude towards migration has been that it is a good thing which should be promoted as a mechanism that adjusts demand and supply of labour. The United Nations Declarations also appear to subscribe to the virtues of free emigration, although it is tied to necessary safeguards. This posture may be criticized, not only because of the hardship it would cause migrants but because there is evidence that migration damages prospects of growth and development in the areas of emigration. The remedial action that the United Nations and the ILO take must be clearly related to the needs and conditions of different situations. A universalist, global approach may not be valid. The two regions that are the concern of this paper, Africa and Western Europe, present different problems, which ought to be approached on the basis of different strategies. In both regions, migrants seem to be in urgent need of protection. If there is an economic recession in Europe, much talked about at the current time, the migrant workers might well be the first victims; while in Africa, pressures for and plans of "localization" threaten expulsion for thousands of long-term resident migrants.

22. In many ways, the problems of African States are inherited from the colonial masters. Not only is the migration of people, especially for mining, industrial and plantation work, the result of colonial policies, but the very inability of the new States to deal with the problem is attributable to the under-development of those States, for which imperial and neo-colonial policies and practices are responsible. Most of the migration took place before independence; and, indeed, the very fact of nationality is a new phenomenon. As these States, limited in their development and resources, attempt to deal with the numerous problems of nation-building, as their fragile political systems threaten to collapse and as their citizens demand employment and services, it is not surprising that they turn against non-nationals. In many States, non-nationals occupy important places in the wage economy and sometimes dominate them. In these States, the replacement of non-nationals by nationals is seen as important for the achievement of economic independence and autonomous decision-making. The fact that such strategies fail to identify the real causes of the lack of economic independence, and so are unable to solve the problems, is not often perceived. What appears likely is that expulsions of populations will take place. They have often taken place in conditions of extreme hardship

and have been accompanied by ugly manifestations of xenophobia. As an immediate practical measure, international agencies and the Organization of African Unity (OAU) should adopt a charter to deal with the problems that arise from expulsion. A majority of OAU States are States of either immigration or emigration, and are thus likely to be interested in an orderly resolution of the difficulties. It is unrealistic, as is suggested by the ILO paper on migrant workers in Africa, that African States should adopt the principle of free movement on the continent. It is more realistic to assume that expulsions will take place and plan to minimize hardships by laying down minimum conditions when expulsion occurs. Among these conditions are the right to take belongings out of the country and providing adequate notice of expulsion so that one's affairs may be terminated in an orderly manner. It is also necessary to deal with the obligations of the State of the expellees, including the obligations of the State to receive the expellees and to provide them with a suitable programme of rehabilitation. The long-term solutions, of course, are different and must come to terms with the real causes of under-development, which means the adoption of necessary strategies for growth and equity. The solution that is sometimes proposed, that investment should take place in States with labour surplus is unlikely to help. This policy may discourage external migration, but will promote internal migration, and the problems of urban slums and general insufficiency of services are likely to be just as harsh. What is needed is an emphasis on rural development and the necessity to redefine man's relationship to machines, as well as the principles of industrial organization.

23. In Europe, the problem arises largely, though not exclusively, from the recruitment of migrant labour to run the industrial undertakings. They are to make up for the shortages of labour in Europe or for the refusal of its indigenous population to do certain unpleasant tasks. The surplus available in the poorer developing countries is regarded as a "reserve labour force", to be used or disregarded as necessary. It is viewed almost entirely in terms of the dynamics of the European capitalist industrial economy. The countries of origin of migrant labour do not often show any greater interest in the migrant. Migrant labour is seen as an export whose remittances provide foreign exchange and whose absence from the State eases the pressure from Governments unable to cope with problems of neo-colonialism, corruption and inefficiency. It is, therefore, doubtful if there is any State or institution which is truly concerned about the plight of the migrant in Europe. The fragility of convention and legal guarantees before the forces of the market is a basic factor to be taken into account. It is necessary to establish new, or to reinforce existing, institutions to secure the enforcement of the rights of the migrants. The rights themselves have to be extended, and the discriminatory régimes for workers of different nationalities should be ended.

24. Over the coming decades, the number of migrant workers is likely to increase rather than decrease. Their social and political problems are also likely to become worse. This review has indicated the gaps that exist in the legal régime for their protection and has suggested how these gaps might be filled. The paper has not explicitly discussed the mechanisms that are available for the enforcement of the régimes, although it has been argued that they are defective. Few national or international bodies are charged with the protection of the rights of the migrant. The progressive development of these rights may well require that a body be so specifically charged. The impact of the UN Office

of the High Commissioner for Refugees on the status and rights of the refugees shows the usefulness of such a step and suggests a possible model. Careful thought needs to be given to the institutional questions—what the powers and responsibilities of such a body should be, its relationship to national authorities, access of migrants to this body and whether a new body needs to be established or an existing one given this jurisdiction. What seems obvious is that a body to which there is easy access and which has effective power can do a great deal—strengthening national institutions, establishing standards, mobilizing opinion and so forth—to keep in view the currently sorry plight of the migrants.

## POSIBLE IMPACTO DE LAS TENDENCIAS DE POBLACION SOBRE LOS CONCEPTOS DE LOS DERECHOS HUMANOS Y LOS VALORES \*

*Violeta Sara-LaFosse \*\**

1. Es sabido que América Latina es la región del mundo que presenta los más altos índices de crecimiento de población, y que ese crecimiento se ha hecho evidente a partir de la década de los cincuenta a través de la expansión tan vertiginosa como desordenada de los centros urbanos principales.

2. Ahora bien, la urbanización acelerada de los países latinoamericanos no sólo ha puesto en evidencia la ruptura de equilibrios seculares en la dinámica de población, sino que ha mostrado la caducidad de las estructuras sociales bajo su actual conformación. Algunas de ellas se mantienen, apenas modificadas, desde su origen colonial, y en general expresan y corresponden a formas de relación y valoración opresivas y discriminatorias.

3. El rechazo del sistema y la aspiración de cambio consiguiente por parte de los marginados y dominados, al mismo tiempo que los mecanismos propios del sistema para mantenerse, sumados al esfuerzo de los beneficiarios, han determinado sin duda intentos diversos para superar la situación y la paulatina radicalización de aspiraciones y estrategias. Es así como, durante la década de las sesenta, hemos visto aparecer brotes revolucionarios en casi todos los países de la región.

4. El movimiento popular y la acción de las minorías selectas continúa en este esfuerzo de profundización y esclarecimiento en medio de incertidumbre y fracasos, pero reivindicando permanentemente el cambio y la apertura de nuevas posibilidades. A esto se debe la actitud crítica, el escepticismo sobre las vías medias y los "milagros"; por eso se halla la radicalización y en general el cuadro de una América Latina convulsionada, marcada por la violencia tanto de regímenes que con toda su fuerza tratan de consolidar el sistema, como de grupos políticos que con fuerza y lucidez diferente tratan de cambiarlo.

5. La coyuntura económica, política y social de América Latina, marcada por la voluntad por una parte y la resistencia al cambio por otra, podemos entenderla como una situación conflictiva que surge

de una no correspondencia entre las declaraciones acerca de los derechos humanos, de los cuales son suscritores todos los países, y la posibilidad real del ejercicio de esos derechos que en ellos se concede: la lucha por el cambio es una lucha por acceder al ejercicio de derechos formalmente ya reconocidos.

6. Más aún, las propias condiciones de existencia de las poblaciones ponen en evidencia que hay otros derechos que no están indicados explícitamente ni reconocidos: la lucha por el cambio es también una lucha por lograr el reconocimiento de esos otros derechos.

7. La coyuntura de América Latina por otra parte, está indudablemente marcada por la persistencia del subdesarrollo y los esfuerzos consagrados a superarlo. Ahora bien, la situación de subdesarrollo puede ser considerada como causa de la limitación del ejercicio de derechos humanos y por tanto, el desarrollo como una condición para su pleno ejercicio. Además, los esfuerzos de desarrollo se apoyan en diversos elementos dinámicos del sistema social y entre otros en la población, como motor o condicionante y como beneficiario del proceso; de manera que, es en el marco de la concepción y de los esfuerzos de desarrollo donde debemos inscribir la problemática del crecimiento de población y la del ejercicio de los derechos humanos.

8. Ahora bien, los diagnósticos del subdesarrollo y los esfuerzos para salir de él no son unívocos. Hay diversas formas de encauzar el proceso de desarrollo según opciones tomadas habitualmente por los gobiernos de los distintos países y, a su vez, estas opciones corresponden a interpretaciones distintas del subdesarrollo.

9. En este documento, no vamos a especificar las distintas opciones posibles para encarar el subdesarrollo. Vamos solamente a caracterizar dos opciones opuestas que son como dos polos de atracción, frente a los que los distintos países se acercan en mayor o menor medida según las medidas que adoptan en su política concreta.

10. Hemos retenido como opciones tipo de desarrollo, la modernizante y la revolucionaria. Creemos que a cada opción corresponde una explicación distinta del problema poblacional, una política de desarrollo distinta y finalmente una indicación explícita de ciertos derechos humanos con preferencia a otros.

\* Documento E/CONF.60/SYM.IV/9 preparado para el Simposio sobre las relaciones entre la población y los derechos humanos, Amsterdam, 21 a 29 de enero de 1974.

\*\* Profesora de Sociología, Pontificia Universidad Católica del Perú, Lima, Perú.

11. Dentro de la concepción del desarrollo como un proceso de modernización se explica la superación del subdesarrollo como la transición de una sociedad tradicional a una sociedad moderna. Se considera que los países subdesarrollados están en una etapa de evolución que seguirá las pautas de los países ya desarrollados. Dentro de este contexto se considera que el crecimiento expansivo de la población es el obstáculo más importante al proceso de desarrollo y por lo mismo sería una de las causas que hacen imposible o retardan el despegue hacia el desarrollo.

12. La vía para salir del subdesarrollo sería la de asegurar la eficiencia creciente del sistema productivo y la de reducir las presiones que, debido a la demanda de bienes y servicios y a los movimientos sociales, pueden plantear una población en rápido crecimiento. Es pues indispensable la reducción del crecimiento de la población como condición de éxito de todo otro esfuerzo de desarrollo, y en este sentido, es capital la política de población.

13. La comprensión del desarrollo como un proceso revolucionario explica el subdesarrollo como la resultante de la colonización, que permitió el despojo de los países colonizados y el desarrollo de los colonizadores, situación que se mantiene por la dependencia económica a que están sometidos los países subdesarrollados y por la dominación interna como sistema social que prevalece en dichos países. Consecuentemente con esta visión, la única forma de salir del subdesarrollo es romper los lazos de dependencia externa y transformar las estructuras internas de la sociedad. El crecimiento acelerado de la población es un problema más del estado de subdesarrollo, pero no es el más importante.

14. Bosquejadas las opciones opuestas frente al reto del desarrollo, podemos indicar detalladamente las implicaciones del crecimiento demográfico tanto en la formulación de ciertos derechos humanos, como en las relaciones personales y sociales que están en la base de esos derechos. Las relaciones que veremos preferentemente son las familiares, laborales y comunales.

#### CRECIMIENTO DE POBLACIÓN Y RELACIONES FAMILIARES

15. Las implicaciones del crecimiento de la población en la conformación de la estructura familiar son casi inmediatamente perceptibles, y en todo caso lo son más claramente que en otras esferas de la vida social. Este hecho nos sugiere la conveniencia de iniciar este análisis refiriéndonos a la familia.

16. Por otra parte, por dedicación personal, hemos acumulado elementos de reflexión y evidencias empíricas sobre cuestiones referentes a la familia, en mayor medida que sobre otros temas; de manera que, es en este campo donde trataremos de ofrecer un examen más completo de la situación y de las posibilidades

en las alternativas de bajo crecimiento y crecimiento expansivo de la población.

17. En las etapas de bajo crecimiento demográfico debido a altas tasas de mortalidad, encontramos que los pueblos que están en esa situación aprecian grandemente la fecundidad humana. En realidad, la supervivencia de pueblos diezmos por las enfermedades, el hambre y las guerras depende del nacimiento del mayor número posible de hombres.

18. La consecuencia de esta valoración y forma de supervivencia, si no es búsqueda de poderío, es que la mujer pase la mayor parte de su vida embarazada. Sin embargo, la fuerte mortalidad infantil le permite dedicarse simultáneamente a actividades productivas sedentarias como las tareas agrícolas, o los trabajos artesanales que contribuyen o hacen posible por ellos solos que la familia satisfaga sus necesidades de subsistencia. En cuanto a los hijos sobrevivientes, se les incorpora pronto al trabajo productivo.

19. Las funciones de la familia son principalmente la reproductiva y la económica. La mujer es valorada en tanto que es fecunda, y consecuentemente se llega a considerar que la única finalidad legítima y por tanto socialmente deseable de la relación sexual es la de reproducción. Al mismo tiempo, la gratificación sensorial resultante de la relación sexual, acentuada si la mujer es joven y bella, permite también valorar a la mujer como objeto sexual. Indudablemente esta segunda valoración de la mujer dura mientras el trabajo rudo, las condiciones de vida y las sucesivas maternidades no han mermado sus atractivos o destruido su belleza.

20. Más adelante, una reducción de la mortalidad no acompañada consecutivamente de una reducción de la natalidad ha provocado, como es conocido, un fuerte crecimiento de la población con efectos diferentes según las coordenadas económico-sociales y culturales donde se ha producido en las diferentes regiones del mundo.

21. En efecto, este crecimiento se produjo en primer lugar en países cuyo propio adelanto científico y técnico y cuyos niveles de vida en general les permitieron reducir la mortalidad. Posteriormente, se produjo el crecimiento en países en los que se habían introducido las técnicas médicas y sanitarias de los países avanzados de forma que permitieron combatir las enfermedades y prolongar la vida humana. En este último caso, el mejoramiento de tipo sanitario no estuvo acompañado de una elevación del nivel de vida de las poblaciones.

22. Esta diferencia es muy importante, porque en los primeros países el adelanto científico y técnico fue el fruto del desarrollo de una cultura particular. La reducción de la mortalidad así como la reducción de la natalidad consecutiva estuvieron inscritas dentro de dicho desarrollo y provocaron cambios de mentalidad y de valores en forma espontánea.

23. Por el contrario, en los países donde la reducción de la mortalidad se debe a técnicas importadas que no corresponden a la evolución de sus propias

culturas ni al desarrollo de su economía, se produce un grave desequilibrio, que al tratar de solucionarse con la introducción de técnicas de reducción de la natalidad que contradicen sus valores fundamentales y que no les ofrecen valores alternativos aceptables dentro de su marco cultural, provocan un fuerte rechazo.

24. En esta situación se encuentran actualmente la mayor parte de los países latinoamericanos en los que la reducción de la mortalidad no corresponde a mejores niveles de vida. Por el contrario se da en sociedades en que una gran mayoría tiene un nivel de vida muy bajo, sociedades de pasado colonial que presentan estructuras sociales fuertemente estratificadas, en las que además de la estratificación por clases se presentan otras estratificaciones por origen racial y por formas culturales; sociedades en que se configura una pirámide social de muy amplia base y estrecha cúspide, en las que las grandes mayorías se encuentran marginadas tanto económicamente como en su participación social, cívica y política.

25. En estos países de reciente y, además, drástica reducción de la mortalidad, la mujer ve su participación restringida, aun con respecto a los trabajos sedentarios que realizaba en etapas anteriores. Hay pues, en este período, motivos adicionales que limitan su actividad productiva. Por un lado, el aumento del número de hijos vivos y el esfuerzo para atender a su crianza que le toma gran parte, sino todo, el tiempo antes disponible; y, por otro lado, la industrialización y mecanización de las producciones en que solía participar la desplazan o hacen no competitivos sus productos.

26. La organización industrial de la producción en torno de plantas o baterías de maquinaria, de la administración y los servicios en forma concentrada, con definición específica de tareas y supervisión permanente, crea la necesidad de concentración de trabajadores y permanencia en los locales. Ahora bien, las unidades de producción, al exigir presencia y dedicación completa a los trabajadores, les impiden cumplir al mismo tiempo con la función socializadora al lado de sus hijos. Esa función quedará pues exclusivamente librada al cónyuge que puede permanecer en el hogar, es decir la madre, quien a su vez deberá optar entre trabajar o abandonar a los hijos.

27. En resumen, la creciente reducción de la mujer a tareas domésticas relativas a la crianza de los hijos, acrecienta su valoración en función de su maternidad, al mismo tiempo que la división del trabajo por sexo se acentúa y las posibilidades de real ejercicio de los derechos humanos es diferente.

28. Al mismo tiempo, y en forma concurrente a lo que llevamos dicho, el varón de los sectores mayoritarios de la población, tal como ya señalamos anteriormente, está marginado de una participación real en la esfera económica, sindical, cívica y política, en razón de las características estructurales de la sociedad. Consecuentemente, ve reducidas y tal vez anuladas sus

posibilidades de autoestimación en términos del cumplimiento de sus funciones como ciudadano, como trabajador y como padre de familia. Esto le lleva a valorarse casi exclusivamente por su capacidad sexual y progenitora en forma exacerbada y llega a la ostentación, lo que evidentemente, está cargado de consecuencias sobre la función y la valoración de la mujer.

29. Resulta sumamente interesante observar que en todas las poblaciones marginadas aparecen los mismos valores en torno de la mujer y su papel, así como respecto al papel masculino. Tendríamos así algunos rasgos de una subcultura propia del mundo marginado, formas culturales que resultan de un esfuerzo de adaptación a las condiciones socioeconómicas de su existencia.

30. La percepción de esta realidad, aún limitada al conocimiento de sus aspectos más generales, hace parecer como ajena y no significativa la proclamación formal de derechos a "decidir libre y responsablemente el número y el momento del nacimiento de los hijos"; a "una educación e información adecuada"; y a la provisión de los medios necesarios para hacer posible esa decisión libre y responsable.

31. Es indudable pues que la proclamación de estos derechos no responde a los requerimientos culturales de las poblaciones hacia las cuales va dirigida, ni a sus posibilidades socioeconómicas de ejercerlos. La proclamación de los derechos que acabamos de mencionar es más bien un caso típico de reconocimiento de relaciones humanas existentes en un determinado contexto socioeconómico y cultural, en este caso el de los países desarrollados y su proclamación extensiva a otros países cuya población mayoritaria vive otra situación económico-social y otras formas culturales. Los derechos proclamados vienen a ser incongruentes con los datos de la situación.

32. En efecto, la posibilidad de decisión libre es mínima porque supone un nivel de instrucción que permita un acceso crítico a la información; por otro lado, la "responsabilidad" entendida en este caso como la capacidad de mantener y educar convenientemente a los hijos, dadas las condiciones de subempleo y desempleo de las mayorías marginadas lleva necesariamente a negarles el derecho a procrear. Paralelamente habíamos señalado anteriormente que en estos sectores la mujer es valorada principalmente como madre o como objeto de placer, y el hombre no tiene otra forma de valorarse más que por su capacidad sexual y procreadora. En este contexto pues, una campaña de difusión de los derechos a la procreación "libre y responsable" que ignora la incapacidad por parte de los interesados de ejercer esos derechos lleva a destruir sus valores más preciados y a producir en los individuos una pérdida de significación con el consiguiente riesgo de anomia. En realidad, no se dejaría otra salida que la prostitución para la mujer y la delincuencia para el hombre. El aumento de la prostitución, de las enfermedades venéreas y el aborto clandestino, así como del

alcoholismo y otros comportamientos aberrantes en los últimos años, constituyen otros tantos indicadores de esta situación.

33. La formulación de estos derechos sin embargo, con lo que implican como forma, contenido y criterio de selección de que están privilegiados, es un hecho que solicita explicación. Por nuestra parte, pensamos que esta explicación está estrechamente ligada a la opción de desarrollo subyacente. Así pues, como habíamos señalado anteriormente, la opción modernizante considera que el crecimiento excesivo de la población constituye el obstáculo más importante al proceso de desarrollo; y, dentro de esa óptica es fundamental indicar con explicitud las bases fundamentales de un comportamiento diferente respecto a la procreación. En realidad, la formulación de derechos, cuya legitimidad no discutimos, resulta, por la oportunidad de su formulación y difusión, justificación y racionalización última de políticas previamente definidas.

34. Si esto ocurre como consecuencia de una opción modernizante, es evidente que una comprensión de la problemática del subdesarrollo como una situación de dependencia externa y dominación interna hará definir los objetivos de desarrollo en forma distinta y jerarquizarlos, una vez definidos, en forma diferente. Los mismos principios sobre la decisión libre y responsable para tener hijos, el derecho a la educación e información y el acceso a medios que hagan posible esa decisión libre, cobrarán otra significación y aun contenidos más ricos.

35. Así, reconocer la marginación en general y concretamente el desempleo que afectan a capas importantes de la población, es reconocer la imposibilidad, para el individuo que carece de trabajo, de ejercer el derecho a tener hijos responsablemente. En otras palabras, el principal medio que le permitiría tomar esa decisión libre y responsable es un trabajo estable y bien remunerado, que la sociedad no le ofrece.

36. Una primera condición viene a ser entonces el derecho al trabajo, y el ejercicio de este derecho es una conquista política que exige la participación activa de los individuos afectados. Es evidente que uno de los caminos para lograrlo será el de una educación e información que no se limite a la esfera de lo familiar y sexual, sino que abarque una educación política que permita al individuo conocer sus derechos, y los mecanismos económico-sociales que le impiden ejercerlos.

37. Esta educación político-social tiene además el efecto de permitir que el individuo recupere la conciencia de su propio valor como persona humana tanto en su dimensión individual, como familiar y social. Le permitirá cuestionar la valoración exclusiva otorgada a la procreación y a la capacidad sexual ubicándolos en el contexto de otros valores alternativos, como el valor del trabajo en tanto que esfuerzo creador a través del cual se realiza a sí mismo, contribuye al mantenimiento de los suyos y produce bienes y servicios para la colectividad.

## REDUCCIÓN DE NATALIDAD Y RELACIONES FAMILIARES

38. Veremos ahora cuál es el posible impacto de un crecimiento moderado de la población, debido a una natalidad moderada, sobre el valor de la mujer, de la relación sexual, de la paternidad y de los hijos.

39. La reducción del número de hijos y la prolongación de la vida humana, hacen que la tarea reproductora ocupe una mínima parte de la capacidad y de las energías de la mujer. La mujer puede realizar múltiples tareas, y no solamente las sedentarias y aisladas por estar circunscritas al ámbito doméstico en que actuaba previamente. Se cuestiona la significación casi exclusiva de la mujer en términos de su capacidad reproductora, y del mismo modo se cuestiona la significación predominantemente reproductora de la relación sexual. Se concibe la unión sexual de hombre y mujer como una relación personal, un encuentro de naturaleza sicosomática que asegura la estabilidad emocional de la pareja. La belleza de la mujer, en esta perspectiva, no es una garantía ni un requisito para que la relación sexual se dé significativamente. En definitiva se pone en tela de juicio la tradicional valoración funcional de la mujer en términos de objeto reproductor y de objeto sexual, sublimada en los valores de la maternidad y de la belleza.

40. Por primera vez la mujer genéricamente y no en forma excepcional ve la posibilidad de tener una significación personal y no funcional, de tener un valor en sí misma y no por la utilidad que presta en función de otros, con exclusión de poder desarrollar plenamente todas sus capacidades y potencialidades.

41. Sin embargo esta posibilidad que se abre a la mujer, marcada milenariamente por la división del trabajo por sexo, sólo tendrá viabilidad en una sociedad que rechace como negativa la división del trabajo ya sea por sexo, raza, clase, etc.

42. En los países que han alcanzado altos niveles de desarrollo, interesados en la máxima productividad, se tiende a acentuar la división del trabajo en el hogar, en lugar de reducirla. Esta situación se repite en la clase media de los grandes centros urbanos de América Latina. No se reconoce ni el derecho ni el deber del padre de ocuparse de la crianza de sus hijos. Se supone que el hombre no tiene otra potencialidad que la del trabajo productivo, en el cual se le exigen rendimientos máximos. Siendo al mismo tiempo sociedades de consumo, se estimula en la mujer el afán de posesión, de compra de objetos que han de compensar en ella el vacío que significa su vida. Se exalta la belleza y se comercializa el sexo, consolidando así la imagen de la mujer como objeto sexual.

43. Las contradicciones entre la nueva significación de la mujer exigida por las tendencias demográficas y el mantenimiento de la mujer en una situación de marginación en cuanto a la posibilidad de participación plena, autónoma y en todos los niveles de decisión son manifiestas y provocan reacciones de todo tipo.

44. Es importante anotar que la condición social y jurídica de la mujer no podrá modificarse sustancialmente mientras la mujer vea su vida ligada en forma prioritaria a la realización de tareas domésticas. Hemos señalado cómo el aislamiento en el cual se desempeñan estas tareas, impide a la mujer tener una perspectiva social del trabajo; se agudiza en ella el individualismo imperante en el sistema, retrayéndola de la participación cívica y política.

45. En los casos en los que la mujer participa también en el trabajo productivo, es necesario recalcar que su situación no mejora radicalmente. En efecto, en una sociedad que ha consagrado la división del trabajo humano y la distinción de personas, los trabajos reservados para la mujer, son generalmente menos interesantes y no representan para ella sino un medio de generar o aumentar sus ingresos. Difícilmente puede la mujer aspirar a desempeñar trabajos interesantes que exigen un alto nivel de dedicación puesto que, cuando la mujer trabaja, generalmente no es ayudada ni aun parcialmente en las tareas que implica el ocuparse del hogar y de los hijos. Ella tiene que afrontar una doble dedicación, lo cual necesariamente afecta su posibilidad de dedicación plena al trabajo y a los compromisos cívicos, gremiales o políticos que dicho trabajo puede abrirla como perspectivas.

46. Sólo en los países que se rechaza una sociedad dividida será posible considerar a la mujer con plena capacidad de participación social, tanto económica como política. Esta posibilidad de ejercicio de derechos humanos fundamentales por parte de la mujer será posible cuando se reconozca su aporte a la conservación de la especie humana, que es incluso mayor que el del varón, y su derecho y posibilidades de aportar a la construcción de la sociedad. Se trata de un reconocimiento por la sociedad y no de un requerimiento de cualquier tipo de protección. Los hijos que tiene la mujer no son de su exclusiva responsabilidad, sino que las responsabilidades que derivan de la existencia de éstos deben ser compartidas con el padre y con la sociedad que se beneficia de nuevos miembros.

47. Este reconocimiento exige que se proclamen los deberes y derechos no sólo de la madre sino también del padre de familia a ocuparse personalmente del cuidado que el niño necesita y exige también que donde las exigencias de la producción requieran que todo trabajador varón y mujer se dedique a tiempo completo al esfuerzo productivo, las empresas que tengan trabajadores varones o mujeres provean los servicios adecuados para el cuidado de los niños mientras sus padres trabajan. La comunidad debería ofrecer igualmente esos servicios tanto más que los padres deben tener oportunidad de participar en actividades artísticas, gremiales, deportivas, políticas o culturales en general.

48. En resumen podemos decir que cuando se cuestiona la división del trabajo es posible cambiar la significación funcional de la mujer por una significación personal; es posible cambiar la valoración exclusiva en

términos de la maternidad y de la belleza, proponiendo como alternativa otros de tanta o mayor significación tales como el valor de la realización personal y social por medio de un trabajo creador, de una relación sexual personalizante y de la participación plena en la construcción de la sociedad.

49. La disminución de la preponderancia otorgada a la madre frente a los hijos, hace posible que la paternidad recupere y aun supere la significación que había perdido durante los procesos de industrialización y urbanización.

50. Es decir que la paternidad no quede reducida a la dimensión de proveer lo necesario para el mantenimiento económico de la familia y a lo más la iniciación profesional de los hijos varones, sino que se extienda a un mundo de relaciones más amplio y continuo, o sea que se puedan establecer lazos de compañerismo entre el padre y los hijos de ambos sexos.

51. El padre volvería a asumir un rol socializador con sus hijos, quienes en este contexto tendrían la posibilidad de poderse desarrollar en forma más armónica e independiente, ya que no estarían fijados en forma exclusiva a uno de sus progenitores. Igualmente, es posible que el hombre adulto, en relación positiva y permanente con los otros miembros de la familia, pueda alcanzar una mayor madurez y equilibrio emocional.

52. En realidad, al disminuir la preponderancia otorgada a la mujer y al compartir el hombre los derechos y responsabilidades familiares, la presencia humana del padre y las relaciones que entabla se están valorizando.

53. En este contexto, parece bastante claro que la familia cobrará una importancia y significación distintas de las que tenía anteriormente. Por la misma razón afirmará y promoverá valores distintos, aunque condicionada por las normas que rigen la sociedad en su conjunto.

54. Así pues, dentro de una sociedad marcada por el consumo, la familia continúa caracterizándose como unidad económica, pero esta vez ya no como unidad de producción de bienes para el mercado, sino de transformación de bienes no terminados y de producción de servicios para el consumo final familiar. Al mismo tiempo, es unidad de consumo de bienes y servicios producidos al exterior de la unidad doméstica.

55. En una sociedad tal que por lo general establece una fuerte especialización de funciones, los papeles de marido y mujer resultan complementariamente marcados por la función económica de crear y utilizar recursos. El marido está encargado incluso por el Derecho Positivo, de proveer los recursos necesarios (ingresos) para la compra de bienes finales o semifinales, y la esposa, por su parte, de efectuar la transformación de los bienes y de producir los servicios, incluido el de la adquisición de bienes de mercado.

56. Al contrario, en una sociedad en que la realización de las personas sea el fundamento de bienestar

en lugar de los mayores niveles de consumo, la participación creativa de todos viene a ser una condición primordial. En esa sociedad, la mujer tendría la posibilidad y aun el imperativo de participar activamente a través de su trabajo, de sus inquietudes y aportes culturales y finalmente de su militancia cívica y política. Tendríamos pues todavía otra situación en que la familia puede cobrar una nueva significación más cualitativa y menos cuantitativa; más personal y menos funcional.

57. Es evidente que si no hay exclusión de ninguno de los cónyuges de alguna esfera de actividad socialmente valedera, la relación entre ellos puede ser efectivamente igualitaria, ya que no hay necesariamente dependencia económica de uno respecto del otro, y habrán además experiencias sociales que alimenten un intercambio constructivo y recíproco. La igualdad y reciprocidad en la relación permite por lo mismo la vivencia de una sexualidad más plena y no interferida por intereses materiales.

58. La participación igual y no restringida de marido y mujer en el mundo exterior y en la educación de los hijos les permite, por otra parte, tener un enfoque semejante de los problemas familiares y sociales, y por tanto, al compartir intereses y expectativas pueden encontrar en la vida familiar el apoyo emocional requerido para un desarrollo equilibrado de su personalidad. Aún más, la percepción de su propio desarrollo personal abre a los padres a la comprensión de su papel paternal como identificado principalmente con el desarrollo pleno de la personalidad de los hijos tanto en su dimensión individual como social. Los valores que se pueden interiorizar como expresión de las relaciones que se entablan son los de solidaridad, no sólo al interior del grupo familiar sino en relación a la comunidad. La mujer puede encontrar finalmente su plena significación como persona humana y no meramente como un ente funcional. Al hombre se le da la oportunidad de un desarrollo más equilibrado al realizar completamente su paternidad. La vida humana expresada en las expectativas que se tienen respecto a los hijos viene a ser valorada en términos cualitativos. La calidad de la vida se debe medir en términos de personalización progresiva y no de comodidad material alcanzada.

#### RELACIONES LABORALES Y COMUNALES

59. Hemos señalado que las implicaciones de las tendencias de crecimiento demográfico sobre las relaciones familiares son mucho más perceptibles que las implicaciones sobre las relaciones laborales o comunales. Sin embargo no por ser poco perceptibles pueden ser ignoradas al tratar de explicar la aparición o acentuación de ciertos tipos de relación a esos niveles, el afloramiento de formas de organización y finalmente la apertura de las agrupaciones, formales o no, hacia definiciones políticas de tendencia revolucionaria en amplios sectores de la población latinoamericana.

Anotemos por último que este conjunto de actitudes y esfuerzos de asociación, se concretan en razón de una reivindicación de cambios profundos en la sociedad, justamente, en nombre de derechos humanos no reconocidos aún por las propias Naciones Unidas o cuyo ejercicio real está impedido, de hecho, por la sociedad.

60. El crecimiento expansivo de la población en los países latinoamericanos, dada la estructura social imperante, ha significado en primer término un aumento progresivo del desempleo y la aparición y proliferación de múltiples formas de empleos de poca categoría. Esta abundancia de mano de obra disponible redundan en un bajo nivel de salarios y en una situación de gran inestabilidad en el trabajo, en razón de una insuficiencia dinámica de las economías latinoamericanas para crear los empleos que serían necesarios.

61. La situación, así descrita, ha estimulado el fortalecimiento en la última década del movimiento sindical, en forma que los conflictos de trabajo de mayor envergadura han correspondido a los problemas inherentes a las negociaciones entre patrones y trabajadores. Las reclamaciones salariales forman parte de los motivos que generan conflictos; pero no son los únicos ni los más importantes en cuanto al número de trabajadores que se ven involucrados. Existe pues un malestar que no se remedia con elevaciones de salarios monetarios ni con prestación de servicios por los empleadores. La reivindicación de fondo es una participación en la toma de decisiones, y por tanto se agudiza el rechazo del monopolio actualmente ejercido por los empresarios.

62. Por otro lado, la enorme masa de empleados de categoría inferior cuyas principales ocupaciones de intermediarios comerciales, prestadores de servicios o pequeños artesanos son ejercidas en forma independiente, ofrecen paradójicamente la oportunidad de un desarrollo de la capacidad de iniciativa y de toma de decisiones. Al mismo tiempo estos amplios sectores marginados que viven en los medios urbanos más desarrollados perciben más fuertemente las injustas desigualdades sociales fruto del sistema imperante.

63. Todos estos elementos reclaman una concepción del trabajo más amplia que la de medio para "ganarse la vida". Exigen que se reconozca su carácter personalizante, a nivel social e individual: su significación como factor primordial aunque no preponderante en la producción y como forma de realización individual. Se rechazan entonces relaciones laborales basadas en una división del trabajo que pone de un lado a los que toman las decisiones y dan las órdenes, y del otro a los que solamente las ejecutan. Se buscan relaciones democráticas en lugar de las jerárquicas.

64. Este rechazo de determinadas relaciones laborales y la búsqueda de una nueva valoración del trabajo humano consiguiente llevan a la concepción de derechos humanos que así lo reconozcan y lo hagan posible. El rechazo de situaciones laborales que reducen al hombre a ejecutante, es decir a pieza de una

maquinaria, se basa precisamente en el reconocimiento de la dignidad de la persona humana.

65. Ahora bien, la dignidad de la persona humana está reconocida cuando se afirma que "la educación debe orientarse hacia el pleno desarrollo de la personalidad humana y del sentido de su dignidad" y cuando se establece que "Nadie será constreñido a ejecutar un trabajo forzoso u obligatorio". Este último derecho sin embargo, es desconocido cuando el trabajador debe aceptar un trabajo que lesiona su dignidad, al desconocerle su capacidad de decisión, pero que no puede rechazar porque de él depende su supervivencia y la de los suyos.

66. Creemos, pues, que el reconocimiento de la dignidad del trabajo humano y la denuncia de aquellas estructuras económicas que la ignoran definen la pertinencia para que se proclame el derecho del hombre y de la mujer a un trabajo social que les permita realizarse personalmente y en forma solidaria en un esfuerzo de servicio a la comunidad de la cual forman parte.

67. Finalmente, queremos señalar, las implicaciones de la dinámica de la población sobre un aspecto que en la sociedad latinoamericana se considera imprescindible para tener acceso al quehacer cultural y político de cada país. Nos referimos a la educación, considerada como la llave que abre las puertas de la cultura y que permite al hombre acceder a su condición de ciudadano. (En muchos países latinoamericanos el derecho a la ciudadanía les está negado a los analfabetos.)

68. Ahora bien, independientemente de los costos y plazos que implica, la creencia muy difundida acerca de la potencialidad de la educación para permitir el acceso al trabajo y por ende a la participación social, está fuertemente cuestionada al comprobarse que en estos últimos 20 años han aumentado los requisitos para postular a los mismos empleos de antes, sin que ello signifique una mejora en la condición económica y social que tal empleo otorga.

69. Es innegable que esa valoración de la educación como condición de progreso personal en la sociedad ha estimulado a una gran proporción de la población latinoamericana a extender lo más posible su educación formal. Incluso, se sabe que la proporción de estudiantes universitarios en América Latina es mayor que en otras partes del mundo desarrollado. Esto ha llevado a la situación paradójica de que en una región que no se reconoce como de las más adelantadas hay una plétora de personas con educación avanzada que buscan trabajo.

70. Es interesante anotar que se ha recurrido al expediente de aumentar los requisitos para paliar la enorme demanda de empleo por parte de una población cada día más numerosa en busca de trabajo, y poder

así justificar el empleo de unos pocos e incluso el despido de muchos.

71. Estas comprobaciones ponen pues en tela de juicio y cada vez más radicalmente la concepción de la educación como transmisión de un acervo cultural acumulado, y más bien exigen plantear el hecho educativo a nivel de una actitud crítica del educando frente al mundo que lo rodea.

72. Pero no sólo el aumento de población tiene implicaciones en el hecho cultural, sino que también el fenómeno migratorio tiene innegables relaciones con él. En este caso se trata de las migraciones del campo a la ciudad. Los datos sobre la creciente urbanización de los países latinoamericanos nos muestran que las ciudades más importantes han aumentado numéricamente su dimensión en razón de la migración masiva rural. En algunos casos la población urbana nativa representa apenas entre un cuarto o un tercio del total.

73. La población rural al migrar masivamente a la ciudad encuentra con sus comprovincianos ocasión de revivir en la ciudad sus costumbres nativas y de cultivar con especial añoranza el arte folklórico de su región. La ciudad se ve inundada de este acervo popular, el cual es paulatinamente asimilado y valorado por los medios culturales urbanos. Podemos ver incluso en esta nueva valoración de aspectos culturales provenientes de los sectores mayoritarios, cierta forma de oposición al carácter selecto de la creación cultural, tan generalizado en las sociedades latinoamericanas, y que significa por lo mismo la relatividad de la educación formal como condición para estar en capacidad de dicha creación.

74. Son también los grupos migrantes ubicados en las zonas marginales de las grandes ciudades los que aún precariamente se organizan en forma comunitaria a fin de resolver sus problemas urgentes de acondicionamiento ambiental; crean de esta manera formas de participación directa en los asuntos cívicos, y están igualmente dispuestos a una participación política de mayor aliento.

75. Resumiendo, podemos percibir a través de los aspectos delineados tanto en las relaciones laborales como en las comunales y en las manifestaciones folklóricas, de amplios sectores de la población, como se opera un descubrimiento de sus propios valores y de su capacidad de participación en la toma de decisiones sobre los asuntos que les conciernen, y esto bajo la presión de fenómenos de población.

76. Las diversas manifestaciones que hemos revisado en forma sucinta, corresponden en definitiva a una aspiración fundamental de las poblaciones a ejercer el derecho de decidir sobre su propio destino y de participar en su construcción. Esta es la razón de la búsqueda de formas democráticas nuevas y tal vez informales y su perspectiva política.

## POPULATION AND HUMAN RIGHTS IN LATIN AMERICA : SELECTED ISSUES \*

### *Economic Commission for Latin America*

1. All human rights refer to the "population"—the human race—but for present purposes it is not helpful to approach the theme in such all-inclusive terms. In this paper attention is focused on rights relating to two demographic variables—fertility and spatial distribution—and on two kinds of rights—the right to receive services and the right to self-determination or self-defense against dictation from society or the state. A good deal of the discussion concerning these two rights is also relevant to rights bearing on the third main demographic variable, mortality—that is, on the preservation of life—but consensus on the latter is more pronounced and more deeply rooted in universally accepted human values than are the rights relating to fertility and spatial movements of population.

2. A proliferation of formal guarantees of human rights, enshrined in international declarations and in national constitutions, has proceeded, in semi-isolation, from development planning and policy formulation, on the one hand, and from the continual, unplanned accretion of laws, regulations, bureaucratic mechanisms and public resource allocations responding to short-term needs and particularistic pressures, on the other. Development planners, for the most part, have treated the "rights" as non-binding expressions of good intentions, even when they have done their best to plan for the rapid expansion of educational, health and other social services. Politicians and administrators, struggling to cope with immediate problems, have paid only intermittent attention to the differing general principles urged on them by human rights proponents and planners. Recent governmental endorsements of "integrated development" and "human development" indicate an intention of bringing the different strands of policy-making into closer harmony, but the practical consequences and means of acting on this intention have not yet been spelt out.<sup>1</sup>

3. The formulation and implementation of policies directed towards developing or safeguarding human rights take place in stratified national societies in which incomes, access to employment, access to public

services and capacity to participate in decision-making are very unevenly distributed and in which the public sectors lack the financial and administrative resources needed to meet their commitments for promotion of development and social justice. Consequently, rights that are universal in principle are observed in proportion to the awareness of different classes or interest-groups of the relevance of these rights to their own situations and in proportion to their capacity to exert organized pressure for their observance. Arguments based on "rights" become weapons of different groups to strengthen their claims to a larger share of public resources that cannot be stretched thin enough to satisfy all claims. The State confronts an incessant clamour from interest-groups and localities demanding that it "solve their problems" as a matter of right.<sup>2</sup>

4. Within prevailing patterns of social stratification, with large parts of the population living in poverty and participating only "marginally" if at all in the political process, policy formulation and implementation take on élitist traits that are particularly significant in the case of policies bearing on reproductive behaviour and migratory movements. The minorities that participate in decision-making interpret these factors, as they manifest themselves in the masses, in terms of their own views of national development priorities and family welfare, and in terms of standardized solutions that can be applied to large numbers of people so as to produce changes that will show up in statistical indicators. The underlying interpretations are very diverse. They lead different sectors of opinion to look favourably on high fertility or low fertility, and on rapid urbanization or stabilization of the rural population on the land. The wide differences in real circumstances of the countries of the region justify the differing views to some extent, but differences in ideological premises are probably a more important factor. Whatever the population objectives that are advanced, the articulate minorities are predisposed to view the masses as pawns in a strategy for development, revolution or maintenance of the existing order. It is hard for the planners and ideologists to descend from global theorizing and strategy-making concerning the

\* The original text of this paper (E/CONF.60/SYM.IV/12) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

<sup>1</sup> "Latin America and the International Development Strategy: First Regional Appraisal" (E/CN.12/947/Rev.1), chap. I; and *The Quito Appraisal: A review*, adopted at the fifteenth session of the United Nations Economic Commission for Latin America as resolution 320 (XV), of the progress made in the first two years of the International Development Strategy.

<sup>2</sup> "The State, particularly in its socially motivated activities, comes to resemble a harassed nursemaid trying to meet all the needs and regulate all the activities of its children, too overwhelmed by the multiplicity of its tasks to judge which deserve priority, which are beyond its current abilities, and which are not worth doing at all". *Social Change and Social Development Policy in Latin America* (United Nations publication, Sales No.: E.70.II.G.3), p. 9.

“role of population in development” or the “role of population in revolutionary change” to the real needs and choices confronting millions of individuals and families, which should be the focus of a “human rights” contribution to population policy.

#### FERTILITY AND FAMILY PLANNING

5. In the numerous international and national declarations of rights that have been endorsed during the past two decades, rights to receive services from the State have been spelt out in particular detail—rights to universal schooling, health care, social security, housing and nutrition. More recently, internationally influential sectors of opinion have insisted on the right of the family to decide on the number and spacing of children and on the duty of the State to provide family planning services enabling it to act on this information. As far as the dominant sectors of opinion in Latin America are concerned, endorsement of this “right” has been a good deal more grudging and conditioned by suspicion of the motives of its proponents than in most other parts of the world, but by now most of the Governments have accepted the first clause, if not the second.

6. The growing international insistence on the right to family planning services has two different aspects: the straightforward endorsement of a right of access to a service contributing to family welfare and self-determination, and the expectation that governmental acceptance of the duty to provide family planning services to the whole population will further the broader objective of reducing rates of population increase.<sup>3</sup> While agreement or disagreement with this expectation does not affect the validity of the right, it has a good deal to do with the relative importance attributed to it.

7. It has already been suggested that the publicly endorsed “universal” rights to services in most Latin American countries are not universally and equitably honoured, for lack of public resources, lack of administrative capacity to use them efficiently and the relative incapacity of the neediest strata of the population to articulate forceful and realistic demands. When a new right calling for allocation of scarce public resources is admitted, it must enter into competition, subject itself to tests in relation to wider development objectives and struggle against the pressures making for distortion of distribution and content to which all social and infrastructural services are subject. What priority is it to have

<sup>3</sup> Resolution XVIII on human rights aspects of family planning adopted by the International Conference on Human Rights in May 1968, like several other international declarations on population questions, juxtaposes an observation on rapid population growth as “impairing the full realization of human rights” with an affirmation of the basic human right of couples “to decide freely and responsibly the number and spacing of their children and ... to adequate education and information in this respect” (*Final Act of the International Conference on Human Rights* (United Nations publication, Sales No.: E.68.XIV.2)). Such declarations have not posed the problem of a possible clash between human rights objectives if, as has been argued, family planning based on free decisions does not prove an effective means of slowing population increase.

in relation to a number of older established rights that are not fully honoured? Is the social demand for it so strong that immediate large-scale implementation is politically expedient? Is the provision of the service, under conditions of high fertility, a prerequisite of the realization of other human rights? Is the State justified, from the standpoint of its over-all objectives and priorities, in not only furnishing services to the groups actively demanding them, but in campaigning to bring the problem and the services to larger groups that are unaware or apathetic? If it chooses the latter alternative, is the State administratively capable of meeting the full potential demand? It can be argued that the availability of external resources earmarked for family planning exempts this service to a large extent from the need to compete with other social services for domestic resources, but Governments can scarcely accept the implied dependency in such a delicate area of national policy.

8. The social demand for family planning is undoubtedly on the increase, but it is a long way from the universality of demands for educational and health services. During the coming decade, pressures from the urban population for free family planning services are bound to become stronger; but if the public agencies simply respond to the demand without anticipating or stimulating it, access to such services will not become universal for a long time, and, as in the case of other social services, the rural population will be served last and least. As long as the “human rights” case is not fortified by governmental conviction that lower rates of population growth are essential to development, and that family planning programmes can be an effective means of lowering them, the programmes can expect only modest shares of public resources. There is as yet no firm consensus either in governmental circles or in general public opinion on the role of population increase in development, although the weight of opinion seems to be swinging towards advocacy of lower rates of increase. The differences in national situations are so wide that it cannot be demonstrated that population increase plays the same role or calls for the same kind of public action throughout the region.

9. For the present, the strongest part of the case for active State promotion of family planning information and services as a right is linked to redistributive policy. In typical national situations of uneven modernization, the more affluent of the population already have access to family planning, whether the State approves or not, while the low-income masses that can least afford large families have little or no access, nor, in the case of most of the rural population, even an awareness of the possibility of fertility regulation.<sup>4</sup> This argument is stronger on paper, however, than as a determinant in public resource allocation.

<sup>4</sup> Economic Commission for Latin America, “Population and modernization in Latin America”, *Population Debate*, vol. I, part four; and “Population Trends and Policy Alternatives in Latin America”, *Economic Bulletin for Latin America*, vol. XVI, No. 1, 1971 (United Nations publication, Sales No.: E.71.II.G.5), pp. 71-103.

10. The conventional formulation of the "right" here being discussed—the right of the couple or of the woman alone to decide freely on the number of children wanted and to act effectively on the decision—implies a right to reject family planning or to use the service so as to have more children rather than fewer, even if the State is determined to reduce the rate of population increase and even if it is objectively evident that additional children will be disastrous for the family's welfare. (Conversely, of course, the formulation implies a right to practise contraception even if public policy favours rapid population increase.) At this point, the definition of "rights" and "duties" becomes more complicated. Does the family or the individual really have a right to unlimited reproduction, if it is demonstrable that this will be harmful to the interests of society and will damage the life chances of all the children of the family? If not, what can society do about it? If compulsion is ruled out as neither legitimate nor practicable, to what extent is the State justified in using incentives, penalties and tactics of indoctrination? These questions have been little discussed in the Latin American context, except in the form of rhetorical rejections of any interference in free choice, and they have not had much practical importance, in view of the lack of consensus on population policy objectives and the weakness of the State in implementing any complex policy designed to achieve societal change. The State already intervenes in family life in many ways—through marriage and divorce laws, compulsory education, tax policies, social security etc.—and has converted certain "rights" into obligations. Once a sufficient degree of public consensus is reached concerning desirable fertility levels, it would be absurd to expect society to renounce all tactics designed to exert pressure on the decisions of families or women. The trouble is that the range of tactics meeting the combined criteria of legitimacy in terms of values, public receptivity, public administrative capacities and reasonable unit costs is not promising. Promotional campaigns would be essential, but the capacity of the State in most countries of the region to mobilize the masses of the population behind determined developmental objectives is low and is likely to be overtaxed by campaigns having other, more pressing objectives. Proposals for penalties on large families, through taxes, deprivation of public services etc., would be unacceptable in terms of rights and unenforceable in situations of mass poverty, in which many families cannot pay taxes and receive scarcely any services from the State. Financial inducements for smaller families would be prohibitively costly, hard to administer on a relevant scale and in all probability politically impracticable.

11. Although the question of the right to use or reject family planning services is thus far not very relevant at the societal level, because of the lack of coherent policies and lack of capacity to apply compulsion, it is already acquiring some importance to individual women through the extension of family planning within maternal health services. These services com-

monly attempt to introduce women to the desirability of using contraception or undergoing sterilization at a time when they are likely to be most receptive—immediately after childbirth. If the personnel of the services are convinced of the necessity of limiting the number of children in low-income families or of reducing population increase rates in general, and if their relations with clients partake of the usual feelings of middle-class paternalism and professional authority towards the lower class and the "ignorant", the woman's right to make a free decision on the basis of informed understanding of the alternatives is likely to get short shrift. Recent controversies in certain high-income countries and also in India concerning the requirement of sterilization as a condition for receipt of public assistance or hospital care point to an abuse that can become more serious to the extent that official and professional opinion becomes more assured of the necessity of fertility regulation. Such abuses cannot be obviated altogether by legal protection of the woman's rights as long as the current traits of social stratification do not undergo far-reaching changes. They are one aspect of a much wider problem. Relations between the "marginalized" masses and the official or private sources of aid and professional services are a contradictory mixture of resigned dependency, the quest for a "patrón" capable of eliciting benefits from the authorities, demands backed up by what has been labelled "representational violence" (demonstrations, seizure of public buildings, blocking of highways etc.) and wholesale rejection of the tutelage of a public order in which the masses have no effective voice. It is obviously desirable that couples and women needing family planning services participate in an organized way in the planning and delivery of the services, but this desideratum requires major advances in a more general struggle for informed participation by the masses in the decisions that affect them.

12. The tension between the right to receive services, the right to self-determination in their use and the State's interpretation of the best interests of the society takes a different form in the case of abortion. The known facts on the incidence of illegal abortions in Latin America indicate an enormous demand on the part of urban women from all social strata, a demand unlikely to be entirely obviated by family planning services, since women motivated to practice contraception would continue to seek remedies for lapses or failures. The demand for legalized abortion as a right, spurred by women's movements in other regions, has barely touched Latin America as yet, however, and would undoubtedly encounter formidable societal resistance. The proponents of family planning as a human right appear to have avoided the question for tactical reasons.<sup>5</sup>

<sup>5</sup> "No government representative appears to have characterized voluntary abortion as a 'human right' . . . Given these views, it is unlikely to be fruitful to take up the issue in the early stages of developing the family planning right", Daniel G. Partan, *Population in the United Nations System: Developing the Legal Capacity and Programs of UN Agencies*, Law and Population Book Series Number 3 (Durham, North Carolina, Rule of Law Press, 1973), p. 28.

13. Various proposals have been made outside Latin America by crusaders for "zero growth rates" concerning the mass application of techniques of fertility control that would altogether rule out free choice—e.g., the dissemination of sterilizing agents through food or water supplies. For the immediate future, fortunately, Latin American Governments will have neither the will nor the capacity to apply such techniques of "population engineering". If the techniques themselves, however, become easier to apply and if in the future Governments should be seized with a conviction of desperate urgency in the slowing down of population growth, entirely new questions of rights and values would have to be confronted. Would the right of the family to decide on the number of children then be judged a luxury that society cannot afford? If the technique were applied equitably to the whole of the population would it be an interference with basic rights of a different order than, say, compulsory vaccination or fluoridation of drinking water?

#### SPATIAL DISTRIBUTION, MIGRATION, ENVIRONMENTAL PROTECTION AND RESOURCE EXPLOITATION

14. The bearing of human rights on fertility control has been the subject of a great deal of polemical and hortatory literature. The bearing of human rights on spatial movements of people and settlement patterns has, in some of its aspects—particularly that of migrations across national boundaries—also been extensively discussed; but it has received much less attention as a broad problem area, the contours of which are bound to change with rapid population increase and spatial concentration. The subject will come increasingly to the fore, in the two aspects of rights to receive services and rights to self-defense against societal dictation, to the extent to which development policies, which have thus far practically disregarded the spatial dimension, strive to incorporate objectives relating to human settlement, geographical distribution of economic activities, husbanding of natural resources and preservation of an ecological balance.

15. It is now generally accepted that current patterns and trends of spatial distribution of population and land use have many disadvantages for development and human welfare. With relatively sparse populations, most of the Latin American countries combine the ills of excessive concentration in huge urban agglomerations, soil exhaustion and excess labour force in the older agricultural zones and destruction of soils and forests in thinly settled zones now in process of occupation. As national population density increases and the consumption level rises, these problems are exacerbated. Elaborate regulation of population behaviour and movements become unavoidable to ensure that millions of unco-ordinated individual and group actions shall not add up to irreparable damage to the long-term interests of the society as a whole. Thus far, consensus on the role of spatial distribution of population in development has been insufficient to serve as frame of reference for

comprehensive policies bearing on distribution patterns. National policies commonly favour a slowing of the growth of the largest cities, discouragement of out-migration from rural localities and small towns and planned colonization of zones hitherto empty of population. (Concrete actions in pursuit of these policies have been piecemeal and generally offset by other measures stimulating continued concentration.) The more realistic policy formulations do not call for a sharp reversal of trends, but for changes in proportions: the larger cities will continue to grow, but, it is hoped, more slowly; the rural areas will not absorb the whole of their natural increase, but it is hoped, a larger share; the zones of colonization will not be occupied in a disorderly flood of people, but, it is hoped, at the pace at which infra-structural investments can be afforded and destruction of natural resources minimized. It is hoped that the propensity of the population to migrate will respond to a combination of moderate incentives and disincentives.

16. However, if the population continues to grow at current rates while traditional ways of livelihood lose viability and the increasing dominance of urban markets and consumption patterns make the whole population more homogeneous culturally and more mobile, this response cannot be counted on, even if public measures become more consistent and better planned than heretofore. To what extent is the State then justified in interfering with the rights of persons to live where they want and as they want? To what extent is it capable of doing so effectively and equitably? The State already possesses some legal instruments adaptable to this purpose. Their use for control of population movements has heretofore been limited by the low priority given to spatial distribution objectives by the dominant forces in the Governments, on the one hand, and by the capacity of the groups affected to defend their immediate interests by various tactics of pressure or evasion, on the other.

17. Such tactics as those described below are relevant, but all of them present short-comings in terms of feasibility and legitimacy in the prevailing real situations.

18. The State can deliberately refrain from allocations expanding the supply of housing, jobs and social services in urban centres that are judged over-populated. As the larger cities are invariably favoured over the remainder of the population in such allocations, the apparent denial of "rights" might really be a step towards more even treatment for the population as a whole. However, the population of the larger cities normally has a more widely diffused consciousness of rights vis-à-vis the State and greater capacity to exert organized pressures than the remainder of the population, so that the political viability of a policy of this kind is questionable, while the economic viability would depend upon a simultaneous transformation of structures of production and distribution.

19. The State can introduce systems of job permits and residential permits for the urban population, making it an offence for migrants to stay in the cities without such permits. Measures of this kind are well known in other

parts of the world, and current systems of identification documents offer a readily available administrative framework. However, the use of a system of permits to control migration to the cities would require a more efficient and incorruptible administration than can be expected in most national situations. In practice, the impact on the rate of city growth would probably be small, and the main result would be to place part of the urban population—in general, the poorest and most marginalized strata—in a situation of illegality, exposed to job discrimination and exactions from the police. Even the current systems of identity documents and social security records, as they are applied to population groups with little education or awareness of legal rights, lend themselves to abuses.

20. The State can, representing the interests of the society as a whole, prohibit residence in certain zones or under certain substandard conditions, and evict the population involved. This legal power has commonly been used for the clearance of urban slums and shantytowns and for the eviction of rural settlements in the way of dam-building projects. It has also been used to some extent to prevent rural land use that is judged excessively destructive of soils and forests—cultivation of erodible slopes, goat grazing, charcoal burning. The compulsory resettlement of rural groups that are too sparsely settled to be reached by educational and health services and by police action is sometimes also attempted, particularly in the case of forest-dwelling Indian tribes, and in zones in which the authorities are determined to prevent contact between peasants and guerrilla movements.

21. Such interventions in human settlement, while limited in scope and haphazard in objective, have accumulated a deplorable record of unilateral action, unfulfilled promises and bureaucratic incapacity to envisage the impact on human lives of “progressive measures”. Cultivators displaced by dams have, at best, faced long delays in receiving promised compensation or equivalent land grants; shantytown dwellers whose settlements have been eradicated have commonly either been left to fend for themselves or have been herded into public housing inaccessible to their sources of employment. Marginal peasants for whom goats represent the only form of capital and source of cash income have sometimes been forbidden to keep goats without the offer of any compensatory source of livelihood. In many cases, the groups confronted by such measures have been able to defend themselves in one way or another; but the defensive tactics naturally focus on immediately perceived interests and, if successful, leave the real damages to society—including themselves—to be perpetuated.

22. The State can direct urban groups to planned residential areas or new towns and rural groups to zones of agricultural colonization. Legally obligatory eradication of individuals and families, as a policy instrument for spatial redistribution of population, is hardly conceivable in Latin America; but semi-compulsion has

occasionally been attained by removing families from their previous homes and leaving them no practicable alternative to acceptance of space in a housing project or colonization scheme. Measures of this kind are unacceptable in terms of human rights and experience indicates that they are also ineffective and prohibitively high in financial costs per family resettled. “Planned” paternalistic resettlement schemes in Latin America have a consistent record of failure.

23. In spite on the drawbacks and dangers of policy instruments such as those described above, it is to be expected that as state responsibilities for development widen and population increase intensifies existing problems, a great deal of interference with the preferences and free choices of individuals, families and local groups will be unavoidable. From a developmental point of view, the justification of such measures will depend upon their coherence and consistency with the style of development desired and upon their capacity to contribute significantly to national objectives at bearable costs. It is obviously absurd for the State to interfere with the choices of the people concerning residence and livelihood through measures that are at cross-purposes with one another, that commit major resources to accomplish minor objectives or that exempt the powerful whose activities bring about the more serious environmental damages. From a human rights point of view, the justification for such measures will depend upon the capacity of the State to apply them equitably and in full consultation with the groups affected, to seek a sympathetic understanding of the full human implications of the measures being considered and, above all, to respect its obligation to provide opportunities for livelihood and human relationships that are equivalent to or better than those of which the group is being deprived. Ideally, the group affected should gain through the process of change itself in its capacity to understand and defend in an organized way its own interests, long term as well as immediate, and to relate these interests to a coherent interpretation of the interests of the wider society. The remarks made in the preceding section concerning the difficulty of attaining authentic popular participation in decision-making in societies with prevailing relationships between bureaucracies and professionals, on the one hand, and the masses of the population, on the other, obviously apply also to measures bearing on spatial distribution, environmental protection and resource use.

24. The discussion up to this point has centred on issues that arise within Latin American national societies. It is well known that population increase and spatial mobility, interacting with political upheavals and unevenly distributed economic growth, are generating, on a rising scale, several kinds of population movements across national frontiers which raise issues of human rights.

25. Where job opportunities and wage levels, or access to land for cultivation, differ widely on the two sides of a frontier, migrants—mainly originating in the

underemployed rural population—cross from the less promising to the more promising country. Until recently, such migratory currents were on a modest scale and were tolerated or welcomed by the authorities of the recipient countries as sources of cheap labour, particularly for seasonal agricultural work. At this stage, the principal human rights issues relate to exploitation of the migrant workers, usually with even less access to social services, social security, protective legislation or union organization than the rural citizens of the recipient countries. With the increase of national population, the scale of such migrations has grown and receptivity has dwindled. Migration of unskilled workers to countries outside Latin America, previously of considerable importance to Mexico and some Caribbean countries, has been practically cut off or deprived of legality. Within the more affluent Latin American countries, the national labour force, itself rapidly expanding and suffering from insufficient employment, becomes more resistant to low-wage competition from abroad. The concentration of alien agricultural workers and squatter-cultivators in thinly populated frontier zones excites preoccupations over national security. In some of the large cities, the growth of slums and shantytowns populated mainly by alien migrants occasions prejudice, sometimes with racial overtones. Since large parts of the populations of the countries of emigration are desperately poor, with dwindling capacity to survive by subsistence agriculture and seasonal wage labour, and frontiers are long and practically unguardable, the recipient countries cannot cut off such migration at the border. Attempts to hunt down and deport the migrants who have slipped through, under prevailing conditions in the frontier zones, are bound to involve arbitrariness and brutality, followed by resentment in the country of emigration. Thus far, this kind of problem has occasioned protracted negotiations and a few violent confrontations between individual countries. More effective regional recognition of the rights of illegal migrants as human beings is needed; but as long as prevailing styles of development continue to generate an excess of labour, underemployed or in low-productivity occupations, a "human rights" approach to this problem can hardly amount to more than a treatment of symptoms.

26. The plurality of political régimes in Latin America, the occasional violent shifts from one kind of régime to another, the emergence of developmental strategies that clash with status expectations, property holdings and consumption patterns of certain social classes and groups, and also the growth of movements that reject the existing order in favour of revolutionary or terrorist action, is generating on an unprecedented scale, movements of refugees, exiles and voluntary migrants motivated by insecurity, deprivation of previous source of livelihood, or rejection of the personal consequences of the prevailing national development strategy. While the migrants discussed above come

mainly from the poorest strata of the population, migrants in the second category, whatever their political complexion, come mainly from the middle and upper strata, are relatively well-educated and include important proportions of professionals, university students and would-be *entrepreneurs*. The Latin American countries have well-established norms concerning the rights and obligations of political exiles, but once politically motivated movements across national frontiers become large scale and heterogeneous, such norms become hard to apply and irrelevant to some of the real problems. The first category of migrants poses the basic issue of rights to minimum livelihood and human dignity. The second category poses a wide range of more specific issues with which the individual countries are likely to be grappling for a long time to come: rights of alien professionals to practice their professions; rights of students to finish their education; rights of aliens with capital to compete with local enterprises; rights of exiles to act on their political beliefs. In the nature of things, middle-class migrants are in a better position to make themselves heard, to grapple with regulation and to take advantage of services than are the others.

#### CONCLUDING NOTE

27. The present paper does not offer "solutions" to the problems it poses, and the forbearance is deliberate. It would be ingenuous for a brief survey covering a region of great internal diversity to pretend to offer universal practical recipes for the treatment of symptoms of basic maladjustments in the processes of economic growth and social change, or to propose additions to the innumerable guarantees of rights in laws and constitutions. The dominant forces in the various national societies are now trying to deal both with the symptoms and with the underlying causative factors, guided by widely differing conceptions of the nature of development and of priorities for human welfare, constrained by widely differing combinations of pressures and sources of political backing, always confronting "a flood of generalized advice... so voluminous and heterogeneous as to overstrain their capacity to digest and choose".<sup>6</sup> The present paper has outlined some of the requisites of choices, giving due weight to human rights within policies bearing on fertility and spatial movements of population, and some of the measures that have been proposed or applied, trying to suggest the complexity of the issues and the inapplicability of simplified and universalized prescriptions. The choices that emerge must strive to reconcile different values and development objectives, all legitimate in themselves, presenting themselves differently in each national society, none attainable in full in societies struggling to cope with current processes of growth and change.

## POPULATION AND HUMAN RIGHTS IN AFRICA \*

### *Economic Commission for Africa*

1. The discussion of human rights in relation to population questions in Africa cannot be divorced from the general consideration of the meaning and implication of human rights in all other spheres of human life and development. The context of the discussion has to be related to the wider perception of human rights as portraying those inherent and fundamental values which, in general, underlie all domestic and international laws, conventions, treaties, covenants and resolutions.

2. Within the framework of development in Africa, the expression of human rights is ensured through the promulgation of laws and regulations affecting the rights and privileges of persons in their self-development. Further, articulation of human rights by Governments is also reflected in the development plans of various African countries. Indeed, the basic rights constitute the foundation on which the approach and the underlying philosophy of social and economic planning are based.

3. In the current scheme of things in development in Africa, important population issues requiring close examination of the implications of human rights are many. These issues include: welfare of children, youths, the aged and women; operation and regulation of the levels and patterns of fertility; mortality, morbidity and migration, internal as well as external, including refugee movements; family welfare and marriage; problems of employment, wages, equal pay and just working-hours; access to adequate education and means for cultural expression and identity; and problems of family planning in relation to mother and child care.

4. All these issues find expression in different national and international instruments. The major international instruments, such as the United Nations Charter and the Universal Declaration of Human Rights, are widely recognized and have their underlying principles and values inculcated in other less universal instruments of human rights. Particular instruments such as specific United Nations General Assembly resolutions, treaties, conventions, resolutions adopted at various meetings of the United Nations Economic Commission for Africa (ECA) on population, national laws and regulations, which will be referred to later in this paper, have similar value-reference points as the more universally applicable instruments. If anything, the specific instruments represent the articulation of the

universal codes and values to particular situations. The instruments to be invoked in the presentation will depend upon their relevance to any of the broad population issues to be dealt with.

#### RELATIONSHIP BETWEEN HUMAN RIGHTS AND FERTILITY

5. Within the framework of the generally prevailing high level of fertility and the frequency of births in relation to family formation (marriage) and maternal health and child care, concern for human rights has been expressed under various auspices by Governments and organizations in Africa. Deserving special attention are those rights related to marriage and the family and to the "right to decide freely and responsibly on the number and spacing of children".

#### *Rights relating to marriage and the family*

6. Africans of full age traditionally exercise the right to marry freely and to establish families within their local communities and within the provisions of their respective cultural and legal norms. The laws, religion and culture of each individual country define the legal status of marriage. Fundamentally, the norms agree on the freedom to marry and found families without any limitations due to race, nationality or religion, in the manner upheld in the Universal Declaration of Human Rights.<sup>1</sup> Despite this universal desire to encourage marriage, however, there are usually traditional expectations that marriages should be contracted between families belonging to the same ethnic group. In some communities, the traditional expectation is that the families should preferably come from the same local community. Consequently, intertribal and interracial marriages usually find disfavour, but are not rejected if already contracted. Increasingly, such marriages are occurring among educated Africans in the cities and among those who have travelled abroad for further education. Persons involved in such marriages find themselves no longer under the control of kinsmen; and, being engulfed in broader and more heterogeneous relationships, choose their partners from outside their immediate local and traditional home areas. The important point here is that once contracted, and especially if blessed with children, such marriages are allowed to

\* The original text of this paper (E/CONF.60/SYM.IV/13) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

<sup>1</sup> See art. 16, para. 1.

thrive mainly as a result of modernization and social change.

7. The one extreme form of the negation of the principle of free contract of marriage between people of different racial groups in the continent exists in South Africa, where such marriages are prohibited by law. That the law constitutes an affront to the freedom of choice and movement is clearly underlined by the fact that illicit affairs take place between the races.

8. The Universal Declaration of Human Rights is explicit with respect to the principle that marriage shall be entered into only with the free and full consent of the intending spouses.<sup>2</sup> This is also another area where traditional expectations are being markedly eroded by the forces of social change, especially education and urbanization. Traditionally, early, universal and arranged marriages were common and were buttressed by various marital customs. There are now clear indications that in societies where these customs prevailed, signs of change were emerging. Many studies now show that the age at marriage is higher in urban areas and among educated and working-class females.<sup>3</sup>

9. It should, however, be conceded that, as yet, many women have not received the benefits of education and working in the modern sector, and so the change has not permeated the rank and file. It is, perhaps, in this spirit that the African Regional Meeting on the Role of Women in National Development in 1969 called for more rapid changes affecting the legal status of women. At the meeting, most participants agreed that girls can have husbands of their own choice, depending upon the type of marriage contracted.<sup>4</sup> All delegates except one expressed disapproval of polygamy. It was also observed that there are still many countries where, at the death of the husband, the wife and all property and chattels of the deceased revert to his brother or to the next male heir (this does not necessarily impose co-habitation). This, however, excludes cases where husbands died intestate.<sup>5</sup> It was also observed that many countries of Africa had already established equal legal status for both sexes in all fields, the women being entitled to acquire property and to choose a profession.<sup>6</sup>

10. However, despite such legal recognitions, the meeting maintained that, with regard to cultural, tradi-

tional and religious practices, special efforts should be made by national authorities and women's organizations to review existing family legislation in order to achieve: a legal limit to the minimum age for marriage and the amount of dowry to be paid; the free choice of partners in marriage; and the legal protection of widows in every respect.<sup>7</sup>

11. In general, several specific recommendations intended to enhance the legal status of women were made to Governments, institutions and international bodies concerning the role of women at home, in community and in national development;<sup>8</sup> the role of women in education, training and employment;<sup>9</sup> and the role of women in political, social and public life.<sup>10</sup> The significance of the points of view of this meeting cannot be underrated. From 32 African countries, about 85 women with responsibilities in government and organizations participated in the meeting.

*Freedom and responsibility to decide number and spacing of children*

12. The principles involved here recur in several documents of the United Nations and the Economic Commission for Africa (ECA). The Secretariats of the UN and ECA undertake the implementation of mandates received from States Members of both organizations, especially those arising from the sessions of the General Assembly and the Economic and Social Council, and of the Conference of Ministers of ECA.

13. For the moment, mention should be made of two or three resolutions adopted in the period 1966-1972, which clearly deal with relevant mandates on population, family size and spacing of children. The first, General Assembly resolution 2211 (XXI) of 17 December 1966, recognized, *inter alia*, the sovereignty of nations in formulating and implementing their own population policies with due regard to the principle that the size of the family should be the free choice of each individual family. The second, General Assembly resolution 2542 (XXIV) of 11 December 1969, confirmed, among other things, that parents have the exclusive right to determine freely and responsibly the number and spacing of their children, and that provision of knowledge and means necessary to enable them to exercise that right should be made available to individuals. Also, the Economic and Social Council, by its resolution 1672 (LII), *inter alia*, urged upon States Members of the United Nations to give full attention to their demographic objectives and to co-operate in achieving substantial reduction of the rate of population growth in those countries which considered their current rate of growth too high, and to ensure, in accordance with their national policies and needs, that information and education about family planning, as well as the means to practice family planning effectively, should be

made available to all individuals by the end of the Second United Nations Development Decade.

14. Elaboration of the above-mentioned principles in the African context has been recommended by various bodies of ECA, including the African Population Conference, Accra, 9-18 December 1971, and the First Session of the Conference of African Demographers, Accra, 18-22 December 1971. Both bodies have recommended, among other things, that adequate attention, through studies and investigations, be given to fertility regulation, including high fertility as well as sub-fecundity and sterility prevailing in some parts of Africa. They also recommended that maternal and child health services should form a part of family planning programmes.<sup>11</sup> For programmes to be effective, they should involve all aspects of family life and welfare, including such relevant and desirable services as educational services and rural extension activities.<sup>12</sup>

15. In discussing the prospects of fertility levels and differentials in Africa, the Working Group which assembled at Addis Ababa, 18-22 December 1972, considered the relevance of family planning. It observed that while the approach of the countries to population policies could differ, depending upon the different characteristics of the population, the factor of population growth and its components—fertility, mortality and migration—should be brought into the mainstream of economic and social development. This consideration demanded that population problems also include problems of high fertility as well as the high incidence of sub-fecundity, sterility and infant and childhood mortality.<sup>13</sup>

16. The Working Group also considered that family planning should include the application of preventive medicine and that by doing so, infant mortality could be reduced, with the result that family planning programmes would be made more acceptable. The previously mentioned report of the meeting on the role of women in national development put these views succinctly:

"The meeting recommended that family planning should be included as part of the normal and routine maternal and child-care work of the basic health services as well as in the educational, community and social welfare services. It was agreed that this was desirable in order to enable mothers to have children by choice rather than by chance, to help the infertile, to protect the health and welfare of mothers and their children and family, and to reduce the problem of repeated unwanted pregnancies, which invariably interfered with professional training, and effective participation in social, commercial, civic and cultural community life."<sup>14</sup>

<sup>11</sup> "Report of the first session of the Conference of African Demographers" (E/CN.14/533), para. 86.

<sup>12</sup> *Ibid.*, para. 80.

<sup>13</sup> "Report of the Working Group on Fertility Levels and Differentials in Africa, and the prospects for the future" (E/CN.14/589), paras. 137-139.

<sup>14</sup> "Report of the Regional Meeting on the Role of Women...", para. 97.

17. In terms of responsibility, the Working Group stressed the need of individual couples in fostering family planning mainly in connexion with improving marital relationships.<sup>15</sup> That it should be "couples" and not "families" which should take responsibility in deciding to adopt family planning is, in the African context of extended family relations, significant. Part of the ethos upheld by extended families in Africa is the enlargement of their membership through having as many children as possible. In the context of modernization and technological change, couples, more than the extended family, are in a better position to appreciate the social, economic and moral responsibility of family planning.

18. Mention should also be made of the Regional Conference on Education, Vocational Training and Work Opportunities for Girls and Women in African Countries, held at Rabat, Morocco, 20-29 May 1971, under the joint sponsorship of ECA and the German Foundation for the Developing Countries. The Conference recommended that:

"Family planning should be considered a supplementary activity of the maternal and child health centres and be promoted through the health services, health education services, community centres or social welfare services and that it should be adapted to the conditions and the needs of the country".<sup>16</sup>

19. It is interesting to examine the specific application of family planning rights in different countries of Africa in terms of policies, attitudes and the availability of the knowledge and means of obtaining family planning services, especially as reflected in African development plans and other sources.

20. Three broad categories with respect to the disposition of countries of Africa towards family planning were recently indicated at a meeting of ECA, which was held at Addis Ababa from 1 to 3 May 1973.<sup>17</sup> Briefly, and taking into account developments since the meeting, the first group (of about 18 countries) comprises those countries which do not officially promote family planning programmes; the second group (of about 15 countries) consists of those which currently do not have national policies but which have programmes run by voluntary agencies, with or without government support.

21. The third group is the most significant, comprising eight countries which have official population policies: Botswana, Egypt, Ghana, Kenya, Mauritius, Morocco, Swaziland and Tunisia. Presumably, Zaire has since moved into this group, for it is on record that the Government of Zaire, out of increasing concern for the

<sup>15</sup> "Report of the Working Group on Fertility Levels...", para. 140.

<sup>17</sup> "Background information" (on the Third Regional Inter-Agency Co-ordination Meeting on Population) (E/CN.14/POP/81/Rev.1), annex III, pp. 7-8.

health of the people, particularly mothers and children, has been promoting the principle of "desired births".<sup>18</sup>

22. In relative terms, the articulation of human rights, judged by the positions of the three groups indicated above, has been most effective among the group of 8 countries with official national programmes, for even they, too, have many active voluntary organizations working in the field of family planning. It has been shown, for instance, that the programmes in Tunisia, Mauritius and Egypt have been associated with some decline in fertility.<sup>19</sup> In Tunisia, the crude birth rate dropped from 46.8 in 1960 to 36.2 in 1970; it declined from 43.0 in 1960 to 36.9 in 1969 in Egypt. The reduction in Mauritius has been most impressive, with the crude birth rate falling from 38.5 in 1960 to 26.0 in 1970. The change in fertility in Tunisia is, however, the combined effect of family planning and of the laws raising the age of females at marriage and abolishing polygamy.

23. In spite of the progress reported in some of the countries, doubts have, in general, been cast about the intensity and impact of many of the programmes run by Governments and voluntary agencies. One major criticism has been that most of the programmes are concentrated mainly in the urban areas, to the neglect of rural areas, which have not only higher fertility and most of the total national population, but also a poorer sanitary and health infrastructure. In view of this situation, the Working Group on Fertility, in December 1972, stressed that rural areas should be supplied with family planning information and services for those who wish to use them.<sup>20</sup>

24. Other major criticisms by the Working Group dealt in general with the inadequacy of information and education about family planning. With respect to one problem, delegates urged that, in order to obviate some of the fears about the notion and practices of family planning, family-life education should be encouraged at all levels of the educational system. Such education will be necessary if the reported practice of induced and septic abortion, with its dangerous consequences, especially among young unmarried mothers, was to be checked.<sup>21</sup> In another respect, poor education and the side-effects of the methods used were blamed for the high drop-out attendance rates in various family-planning clinics. Delegates to the Working Group consequently called for adequate research by medical doctors before introducing certain methods.<sup>22</sup>

25. On a more general note, the impact of programmes could be strengthened through co-ordinating and implementing measures with complementary effect on fertility and family size. A good example of such

complementarity may be seen in the measures adopted and implemented in Tunisia. There, legislative action has been taken by the Government to limit family allowances for industrial workers to four children only, to prohibit polygamy and postpone the age at marriage; abortion is permitted when there are five or more living children, when there is a health hazard or when pregnancy occurs while using an intra-uterine device.<sup>23</sup>

26. Lastly, strategies should be worked out and action taken to effect changes in the status of women in order to ensure that they should fully exercise the right to decide freely and responsibly. Such actions should be geared to ensuring that the effective exercise of rights could ensure proper child-spacing and better family health and reduced fertility as desired goals of the right of family planning. To this end, increased educational opportunities for women and increased female participation in wage employment will contribute to the changing attitudes among women towards family planning and population programmes. The view is strongly held that if a woman finds it essential to limit the number of her children, she not only should be given the opportunity to do so, but should be given adequate education, a stable economy, a meaningful social standard and other fruits of a well-planned development. Consequently, family programmes should not be proposed as alternatives to, or in isolation from, other social and economic development programmes.<sup>24</sup>

27. On a more general note, a monolithic approach to policy formation, in view of the diversity of views and of the economic-demographic problems in Africa, should be eschewed. While supporting policies designed to deal with the problems of rapid demographic growth, the reduction of subfecundity and relative sterility obtaining in some parts of Africa should also be given adequate attention. The importance attached by some countries of Africa to this dual approach was evident during the deliberations and recommendations of African representatives at the fifth session of the Conference of African Demographers at Accra, Ghana, in December 1971. The delegates clearly endorsed programmes of fertility regulation, including high fertility, as well as subfecundity and sterility.<sup>25</sup>

#### MIGRATION, POPULATION DISTRIBUTION AND HUMAN RIGHTS

28. The principles that support freedom of movement, especially in relation to work and settlement where jobs are available, have been promoted and respected in varying degrees, depending upon the internal and external policies pursued by countries of

<sup>18</sup> *African Population Newsletter*, No. 9 (May 1973), pp. 23-24.

<sup>22</sup> *Ibid.*, para. 142.

<sup>23</sup> See International Planned Parenthood Federation, "Population programmes, voluntary activities and evaluation in Africa", in "Working Group on Fertility Studies and Evaluation of Population Programmes" (E/CN.14/473).

<sup>24</sup> "Family planning and the changing role of women", in Seminar on Family Life Education.

<sup>25</sup> "Conference of African Demographers...", paras. 79 and 86.

Africa. Fundamentally, the principles that "Everyone has the right to freedom of movement and residence within the borders of each state"<sup>26</sup> and that "Everyone has the right to leave any country, including his own, and to return to his country"<sup>27</sup> are promoted in the legal and policy instruments of many countries.

29. In addition to recognizing these rights of both internal and external migration, many countries of Africa have, by being party to conventions, protocols and agreements governing specific aspects of refugee problems, upheld the principles promulgated in articles 14 and 15 of the Universal Declaration of Human Rights concerning the status and protection of refugees.

30. However, notwithstanding the general recognition of the basic element of the principles, there are variations between countries in the specific application of the rights of free movement within and out of the borders of each State. Of special significance in this respect is the variation between the white-ruled countries of Africa and the independent African States. In the former, significant legal, social and economic constraints have been put in the way of the full assertion of rights for certain segments of the population. In the black independent States, questions of sovereignty and internal economic pressures have also modified the activation of the instruments that define the rights relevant to free movement, internal and external.

#### *Internal migration, distribution and settlement*

31. Nearly all the independent African countries have recently been experiencing rapid urbanization at a rate much higher than that obtaining in any other region of the world. In a number of major cities, the growth has been as high as 12 per cent per annum; while in a few others, rates as high as 15 per cent have been recorded. The major part of this growth has occurred because of the migration of young people from the rural to urban areas for an improved level of living, especially employment.

32. Whether all the rural migrants achieve their goals is a different issue. The fact that, for many countries, the crucial problem has been one of how to control the excessive in-flow of migrants in the face of an urban-infrastructure inadequate for survival merely confirms not only the existence in these countries of the right to move freely, but the fact that the countries are beginning or planning to apply brakes to this form of movement. The control, in the view of the Governments of many countries of Africa, is purely motivated by other human right considerations, including the right to a decent and good level of living, which eludes many rural migrants.

33. Governments of various countries of Africa have employed different measures in dealing with this problem of over-urbanization. Examples of policies reviewed during the Seminar on Statistics and Studies of Migra-

tion and Urbanization, Moscow, 11-22 September 1972, at which several African government representatives were present, throw immense light on the various postures adopted. As a rule, almost all the views expressed were in favour of spreading development projects throughout the entire country in order to promote balanced development between rural and urban areas.<sup>28</sup>

34. More specifically, the objectives of the various policies explained by the representatives are to develop agricultural settlements, create new jobs for the rural population, train youths for satisfactory rural settlement, reclaim marginal lands, breed livestock, implement rural electrification schemes and industrialization projects, provide low-cost housing in towns, build roads in rural areas, introduce national service schemes for graduates in rural areas, establish co-operative villages with mechanized agriculture and self-help schemes and introduce "site and service schemes" for building owner-occupied houses in low-income areas.<sup>29</sup> All these programmes have had varying degrees of success. Their effective implementation requires not only capital and effective administration, but the good will of nationals in accepting the measures as being in their best interest and as not infringing their freedom of movement and work anywhere in the country.

35. Actual infringement of the right to move, live and work where desired occurs largely in South Africa and in Namibia. Discriminative legislations that restrict the urban residence of Africans to certain demarcated zones have been promulgated and effected. Adult male workers have been restricted to definite and specified urban jobs. As a result of these policies, a breakdown of many families and many forms of social and economic deprivations of workers have taken place.<sup>30</sup> In terms of residence, no length of stay in an area would give a man permanent residence, even if he so desired. "Gathering all members of a group into designated area has meant uprooting and resettling hundreds of thousands of people in what surely must have been, and still is, one of the largest involuntary movements of peoples in modern times."<sup>31</sup> It is on record that the Seminar on Statistics and Studies of Migration and Urbanization condemned South Africa and such Territories as Angola, Mozambique and Southern Rhodesia for implementing restrictive and discriminatory policies.<sup>32</sup>

36. Quite recently, the inhuman use of forced labour in African territories under Portuguese domination was unanimously condemned at the Third Meeting of the Technical Committee of Experts, held at Addis Ababa.

from 2 to 8 September 1972.<sup>33</sup> At the same meeting, the Committee also unanimously condemned the shameless exploitation of, and profiteering from, the illicit and clandestine trafficking in African labour in France and other European countries. Observing that, at the invitation of the Administrative Secretary-General of the Organization of African Unity (OAU), an inter-secretariat committee of OAU, ECA and the International Labour Organisation (ILO) was currently sponsoring a field study of the problem, the Committee recommended that the investigations, while remaining an intersecretariat project, should be incorporated into the work programme of the Social Development Section of ECA.<sup>34</sup>

#### *International migration*

37. Traditionally, and even after the advent of colonialism, the African has been on the move to lands far and near for trade, pilgrimage and adventure. In traversing and sojourning in any territory in the past, he was required to adapt to the rules and customs of the people of the area. In exchange for traditional courtesies, he was guaranteed safety and protection.

38. After the advent of colonialism and the consequent Balkanization and partition of the continent by the Metropolitan Powers, a new dimension of recognition and protection was added. The traveller, in travelling to territories under a different Metropolitan Power, needed travel documents authenticated by the authorities in power in his home area. Also, travel out of Africa to other continents not only became possible, but had to be supported with official travel documents.

39. Following the attainment of independence from the Metropolitan Powers, countries of Africa, conscious of and eager to assert their sovereignty, have imposed legal controls on the crossing of their borders. In consequence, emigration and immigration, even between contiguous territories with related ethnic groups and common customs, have come under greater surveillance, although not without problems of over- and under-enumeration. The relatively more accurate recording of movements have been only those which take place at the national air, sea and land terminals.

40. If the attainment of nationhood and the assertion of national sovereignty gave rise to immediate constraints on movements, the social and economic demands of nation-building have also led to new controls on immigration and residence. In many countries, there has been a cut-back in the number of immigrants entering for employment. Thrust with the right of shaping their own destiny, the countries of Africa have been training and educating their own nationals, who have been displacing the immigrants. One of the ways the Governments have ensured the supply of labour in fields where national supply has been inadequate has been by offering contract appointments

and also by ensuring that prospective immigrants are issued work permits before entry into the country.

41. The preservation of jobs for nationals has led to some forms of discrimination against immigrant settlers or foreigners. A report presented to the African Population Conference at Accra, Ghana, 9-18 December 1971, sums up the situation thus:

"During the last two to three years many governments have had to expel large numbers of the foreigners living in their countries. Among the main reasons for these expulsions is the need to reserve jobs for nationals in order to reduce unemployment. Countries which have been foremost in the expulsion of foreigners for one reason or another are Ghana, Zaire Sierra Leone and Guinea. In addition to the policy, a number of countries have enacted laws which reserve certain jobs for their nationals only and have expelled foreigners from the reserved economic sectors. Ghana, for instance, has a law which excludes all foreigners from certain jobs including the retail trade, especially petty-trading. As an extension of this policy, the residence permits of foreigners engaged in these jobs are usually not renewed when they expire. Other countries which have recently enacted similar laws are Kenya and Uganda."<sup>35</sup>

42. Given a situation of rising unemployment in many countries of Africa, it will not be surprising if many more countries adopt a "closed-shop" policy, at least with respect to certain categories of jobs which tend to have a large segment of immigrant employees in them.

43. As was indicated in connexion with internal migration, the white-ruled territories, especially South Africa, practice racial discrimination in formulating and implementing their international immigration policies. Their policies have been conceived within, and guided by, the separate development policy of the Government. Within the *apartheid* system, non-whites have been unwelcome in South Africa, despite that country's tolerance, for purely economic reasons, of black immigrant labourers from neighbouring countries. Louis Dollot sums up the situation as follows:

"Les problèmes de contacts revêtent au contraire ici un caractère dramatique. Les Blancs représentent seulement 3,5 millions sur 18,7 millions d'habitants en 1968. La politique de ségrégation raciale des dirigeants Afrikaners, descendants des anciens Boers, n'empêche pas cependant la venue, il est vrai, en général temporaire, d'une importante main-d'œuvre en provenance des territoires voisins, attirée par les hauts salaires, notamment dans les mines. L'immigration, à la fois très sélective et très limitée, est cependant plus ouverte depuis quelques années."<sup>36</sup>

44. Although tolerated, the coloured immigrant workers are subjected to unfavourable and unjust condi-

<sup>33</sup> "Report of the Third Meeting of the Technical Committee of Experts" (E/CN.14/571), paras. 120-121.

<sup>34</sup> *Ibid.*, paras. 120-121.

<sup>36</sup> Louis Dollot, *Les Migrations humaines* (Paris, Presses Universitaires de France, 1970), p. 95.

tions of work. They are not protected by any trade-union laws, as non-white unions are virtually prohibited. Like the bulk of the indigenous coloured persons, the coloured immigrant workers are subjected to all forms of racial discrimination. The right to residence and settlement is also denied, even to long-standing coloured immigrants. The Indian experience in Natal illustrates the South African attitude as follows: "L'Afrique du Sud, inquiète de l'accroissement des Indiens du Natal, a complètement fermé ses portes aux Indiens et a même tenté, en vain, d'en rapatrier un certain nombre . . ." <sup>37</sup>

#### *Refugee movements*

45. International population redistribution is not only related to the free movement of persons across national boundaries. It is also concerned with the forced migration of persons displaced by wars, revolution and other forms of social and political cataclysms. Such displaced persons often end up as refugees in places other than the land of their birth or nationality. The international community, on a purely humanitarian and non-political basis, has come to accept responsibility for protecting and caring for refugees.

46. Many acclaimed instruments, upon which the mutual recognition of, and approach to, refugee problems are based, exist. These are defined in international instruments and national laws through which legal protection is extended to refugees. By way of providing this protection on behalf of the international community, the United Nations High Commissioner for Refugees (UNHCR) has been promoting the conclusion and ratification of international conventions for the protection of refugees. Such international conventions invariably articulate and involve the basic principles expressed in article 14 of the Universal Declaration of Human Rights, especially the right of everyone to seek and to enjoy asylum from persecution.

47. The granting of asylum constitutes the most essential aspect of refugee work. A major international convention in the granting of asylum and protection to refugees is the Convention Relating to the Status of Refugees, of July 1951. This Convention provides for the granting of basic rights to refugees in their country of asylum, and lays down the minimum standards for their treatment and daily needs for survival and preservation of their human rights and personal dignity. But the Convention was limited in scope and coverage of events. It applied only to events that occurred before 1951 and also gave States the option of limiting its geographical applicability. There was, therefore, great need for improvement, which was furnished, in 1967, by the Protocol Relating to the Status of Refugees, which recently came into force and corrects the limitations of the 1951 Convention. Apart from the Convention and Protocol, there are many other instruments, too numerous to mention. <sup>38</sup>

<sup>37</sup> *Ibid.*, p. 88.

<sup>38</sup> United Nations High Commissioner for Refugees, *Collection of International Conventions, Agreements, and Other Texts Concerning Refugees* (Geneva, 1970).

48. The international instruments enjoin activities, not only within the legal field, but in the area of giving material assistance, especially those needed to make the refugees self-supporting and to enable them to rehabilitate themselves in the country of asylum. Without such assistance, the enjoyment of human rights by the refugees will not be easy. This is why the execution of such programmes of material assistance forms part of the activities of the High Commissioner.

49. In Africa, the work of the High Commissioner has been closely linked to developing new settlements, in addition to provision of relief and such essential infrastructure as schools, water-supply, health facilities and roads. In all these activities, and in others, the High Commissioner draws upon the expertise of the organs and of the specialized agencies of the United Nations. The experiences of the United Nations Children's Fund (UNICEF) in child welfare, the Food and Agriculture Organization of the United Nations (FAO) in the choice of crops, the World Health Organization (WHO) in health services, the United Nations Educational, Scientific and Cultural Organization (UNESCO) in education, and the International Labour Organisation (ILO) in training, have been drawn upon in settling and rehabilitating refugees. The significance of such co-operation is better appreciated by examining the huge and expensive assistance and rehabilitation programme for Algerian refugees, <sup>39</sup> the return to south Sudan <sup>40</sup> and the recent continuation of the exodus from Burundi. <sup>41</sup>

50. States Members of the Organization of African Unity recognize the basic principles of human rights embodied in most of the international conventions and agreements. <sup>42</sup> The policies of these states have been clearly articulated in the OAU Convention concerning refugees, which was unanimously adopted at the Summit Meeting of Heads of State at Addis Ababa in 1969. The Convention, in its preamble, clearly takes cognizance of the provisions of other instruments, including the Charter of the United Nations, the Universal Declaration of Human Rights and various General Assembly resolutions affirming and reaffirming the principle that human beings shall enjoy fundamental rights and freedoms without discrimination. <sup>43</sup>

51. On the practical side, OAU has developed close relations with the United Nations High Commissioner for Refugees. In a resolution adopted in 1965, OAU had already called upon those of its member States not yet party to the 1951 Convention on the status of refugees

<sup>39</sup> United Nations High Commissioner for Refugees, *The Red Cross and the Refugees* (Geneva, 1963), pp. 23-30.

<sup>40</sup> "South Sudan: a joyful comeback", *UNHCR Bulletin*, No. 3, June 1973.

<sup>41</sup> "Burundi exodus continues", *UNHCR Bulletin*, No. 4, July 1973.

<sup>42</sup> United Nations High Commissioner for Refugees, "Background paper on the Office of the United Nations High Commissioner for Refugees" (HCR/85/71), p. 10.

<sup>43</sup> Organization of African Unity, "OAU Convention Concerning the Specific Aspects of Refugee Problems in Africa" (CM/267/Rev.1), 1969, paras. 1-11.

to adhere to that instrument. Moreover, UNHCR and OAU signed an agreement on 13 June 1969, providing for close co-operation in all matters concerning refugees in Africa.<sup>44</sup> For example, UNHCR, *inter alia*, co-operates with the Bureau of the Placement and Education of Refugees, established at Addis Ababa within the framework of OAU, in solving the problems of African refugee students who seek resettlement opportunities in an African country other than that of their current residence, as well as for the growing number of refugees living in towns in Africa, many of whom are former civil servants, members of the liberal professions, merchants and so forth.<sup>45</sup>

52. The refugees in Africa are, in the main, assisted through local settlements, mostly in rural surroundings, through the co-operative effort of UNHCR and the Governments of the host countries. The number of refugees of concern to UNHCR appears large, and speaks well of the efforts of the host countries, which apparently have other numerous development programmes. The relative responsibilities of some African countries towards refugees can be appreciated from some recently published data.

"At the beginning of 1971, the main refugee groups of concern to UNHCR in Africa totalled nearly one million and included the following: 4,000 refugees (mainly from Angola) in Botswana; 40,000 (coming from the Democratic Republic of the Congo and Rwanda) in Burundi; 27,000 (coming from the Sudan as well as from the Democratic Republic of the Congo and Chad) in the Central African Republic; 490,000 (coming from Angola, Rwanda, Sudan and Zambia) in the Democratic Republic of the Congo; 21,000 (coming from Sudan) in Ethiopia; 67,000 (mostly from Portuguese Guinea, with a few hundred coming from other African countries) in Senegal; 61,000 (mostly from Ethiopia, plus 6,000 from the Democratic Republic of the Congo and a few hundred from Chad) in Sudan; 71,500 (mainly from Mozambique and Rwanda, with smaller groups coming from a number of other countries) in Tanzania; 180,000 (from Sudan, Rwanda and the Democratic Republic of the Congo) in Uganda; and 16,000 (mainly from Angola, Mozambique and Namibia) in Zambia. Moreover, UNHCR is concerned with some 6,000 refugees from various African countries at present living in a number of countries in West Africa (such as Cameroon, Dahomey, Gabon, Ghana, the Republic of Guinea, Ivory Coast, Liberia, Sierra Leone and Togo); as well as with 10,500 refugees to whom asylum was granted in various countries on the African continent, such as Algeria, the People's Republic of the Congo, Kenya, Lesotho, Morocco, Swaziland, Tunisia, and the United Arab Republic. Towards the end of 1970, the Governments of Gabon, the Ivory Coast and Nigeria

jointly invited the UNHCR's good offices and technical assistance in facilitating the return home by way of an airlift of some 5,000 Nigerian children evacuated during the civil war in Nigeria. This operation was brought to a successful conclusion in February 1971."<sup>46</sup>

53. From available indications, the situation with respect to distribution of refugees by countries, as shown above for 1971, may not have altered dramatically. Some of the countries may have received more refugees as shown by provisional figures for 1972, which also shows that the total number dealt with by the UNHCR has exceeded the million mark.<sup>47</sup>

54. The individual's right to asylum suggests the need for the right to voluntary repatriation to the refugee's country of origin. Voluntary repatriation, apart from naturalization, is an important means of ridding the refugees of their status and giving them a nationality again. Article V of the OAU Convention Governing the Specific Aspects of Refugee Problems in Africa clearly emphasizes the voluntary character of repatriation and the obligations of the country of origin in facilitating the settlement and the total rehabilitation of the returning persons without penalties for having left the country. Major examples of the repossession of the nationality and protection of the country of origin include the repatriation, following the Evian Ceasefire Agreement of 18 March 1962, of 61,400 persons from Morocco and 120,000 from Tunisia to Algeria. The co-operation of both the Tunisian and Moroccan Governments with UNHCR and the League of Red Cross and Red Crescent Societies was crucial to the success of that gigantic operation.

55. More recently, following the end of 17 years of hostilities between the Sudanese Government and the former South Sudanese Anyanya movement, UNHCR co-ordinated all emergency relief within the Sudan in order to facilitate the return of 180,000 South Sudanese from Ethiopia, Uganda and Zaire. The emergency relief programme, covering the airlift of food and other essential supplies and equipment, was operated with the co-operation of the Sudanese Government and was extended to at least half a million other persons displaced during the conflict. To carry out the measures under the programme, UNHCR raised \$20 million in cash and kind and also received the support of several international agencies and organizations.

#### HUMAN RIGHTS, MORBIDITY, MORTALITY AND HEALTH CARE

##### *Right to good health and freedom from disease and sickness*

56. Human life, its health and longevity, are fundamentally and traditionally valued in all African

<sup>44</sup> United Nations High Commissioner for Refugees, "Background paper . . .", paras. 30-32.

<sup>45</sup> Louis Dollot, *op. cit.*, p. 88.

<sup>46</sup> United Nations High Commissioner for Refugees, "Background paper . . .", paras. 63-64.

<sup>47</sup> *Official Records of the General Assembly, Twenty-eighth Session, Supplement No. 12*, document A/9012/Corr.1.

societies. Each society, in principle, recognizes its legal or moral duty to protect life and guarantee survival and well being. For instance, whereas in the past, slavery and human sacrifice were practised for religious or other social reasons, current laws and policies pursued by Governments of countries of Africa have outlawed these practices as inhuman and criminal. Thus, slavery remains a criminal offence in the statute books of the countries in the region.

57. But while preserving life constitutes a fundamental and inherent right, man's efforts to enforce it are often thwarted by the circumstances of his existence and by the controls imposed by his environment. Sickness, disease and death may all have genetic correlates; however, the major correlates of ill health and death tend to be what the environment of society provides for his survival. Here, then, lie the responsibilities of Governments to afford every citizen the right to a level of living adequate for good health and well being, "including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age, or other lack of livelihood in circumstances beyond his control".<sup>48</sup>

58. African development plans really show tremendous concern for improving health and general well-being. In most of the plans, there is a heavy expenditure on improving services<sup>49</sup> which, though comparatively inadequate, have shown marked improvement in nearly all countries of Africa. Efforts have been directed to greater and better control of communicable diseases, education in preventive measures, introduction and use of new drugs and development of health centres, including maternal and child health services. These improvements are reflected in the declining morbidity and mortality rates in parts of the continent.

59. Notwithstanding the improving situation, there are, by comparison with levels in the developed countries, inadequacies which cause disparities in the availability of medical, health and sanitary services to different segments of the population and areas of a country. Such disparities underline the failure of all citizens to enjoy equal rights to medical, social, economic and health facilities.

60. Of the inadequacies, health services feature very prominently. For instance, the ratio of between 25,000 and 50,000 persons per medical doctor in Africa compares poorly with between that of 500 and 800 in some countries of Western Europe. The *per capita* ratio of nurses, midwives and other medical technicians reflects comparable critical shortages.<sup>50</sup> These ratios clearly indicate that Africa has a long way to go before attaining the minimum WHO target of one medical doctor to 10,000 and one nurse to 5,000 persons for the first

<sup>48</sup> Universal Declaration of Human Rights, art. 25, para. 1.

United Nations Development Decade, which ended in 1970.<sup>51</sup>

61. The general scarcity in the availability of health facilities is more heavily weighted against the rural than the urban areas. In the former, life expectancy is very much lower, and the mortality and morbidity rates very much higher. The capital or premier cities, more than any other area, tend to have a lion's share of the facilities. Thus, in many countries of the region, most of the best equipped hospitals and most of the medical doctors, perhaps as many as two thirds of the medical doctors, are concentrated in towns, in spite of the fact that such towns contain a relatively small proportion, from 10 to 20 per cent, of the total population.

62. Two main factors are related to the relative scarcity of health facilities and personnel. The first is the rapid rate of population growth, which has been out of step with, and higher than, the increase in the supply of medical resources and facilities. In many places, increase in facilities has either been relatively slow or static. The second main source of the scarcity has been the inadequate supply of medical and paramedical training centres in the countries of the region. In the absence of national training institutions, the majority of the countries have followed the expensive alternative of training their staff abroad. With respect to the rural areas, quite apart from the misallocation of resources and the large population concentration, there has been an increasing tendency for medical officers, in particular doctors, to reject being assigned to work in the rural areas, where life is considered unattractive. This situation has led a few Governments (e.g., Ghana, Nigeria and the United Republic of Tanzania) to begin national service programmes in rural areas for all graduates, including medical doctors, so that they may appreciate the magnitude of the problems in rural development.

63. The over-all scarcity of resources assumes enormous significance when pitted against the basically very poor environmental and sanitary conditions around which the major public health problems in Africa revolve. The problems and their impact are exacerbated by the existence of widespread ignorance of hygienic practices and environmental sanitation. Very much related to this question of ignorance and disease is the problem of malnutrition, which, along with communicable diseases, presents a serious menace to health in Africa.

64. In order to tackle effectively the problems of ignorance, disease and the general health problems in Africa, Governments of African countries should evolve public health priorities which reflect the prevailing environmental conditions. Having done this, they should undertake health planning within which resources should be allocated according to the public health priorities. The priority area should cover campaigns against communicable diseases at the curative and

<sup>51</sup> "Social change and social development in Africa (provisional draft)", vol. II, p. 276.

preventive level; it should embrace the planning and development of national health services and should evolve an effective programme for training sufficient and efficient medical personnel with knowledge of prevailing local conditions.

*The right to food and freedom from hunger and malnutrition*

65. Attempts to solve the problem of nutrition also have had limited success. Recent reports show that most of Africa has experienced a decline in food production in recent years. Consequently, a number of countries imported food to meet their normal requirements.<sup>52</sup> The recent drought in the Sahelian region of Africa, against which many countries were ill-equipped to meet the challenge, only serves to underline the importance of developing food programmes. These should include internal measures for dealing with emergencies, in place of wholesale reliance on importation of food, aid and charity, as happened during the drought.

66. So far, experience has shown that not many countries have viable food programmes intended to increase production. While more planning has gone into the production of cash crops, with some success, food crops continue to be grown on small allotments by traditional methods.

67. A succinct medical summary of the nutrition problem in Africa was recently made.<sup>53</sup> The report stated that the problem is characterized by an insufficiency of calories, protein of animal origin, occasional deficiency in calcium, iron, iodine, vitamins A, B<sub>2</sub>, thiamin, niacin, C and D. These deficiencies result from inadequacy of food production and distribution, from ignorance, prejudices and taboos, from high population growth rates, low purchasing power and the prevalence of parasites and infections in the environment. The resulting nutritional diseases, especially protein-calorie malnutrition and avitaminoses, cause death, especially among children, and increase the susceptibility of the population to such acute and chronic infectious diseases as measles, tuberculosis and pneumonia.

68. The seasonal shortage of food in many countries has been exacerbated, in part, by the lack of storage facilities. Those which are available are still managed very poorly, with the result that much of the stored food is wasted. In this respect the African situation is complicated by the fact that application of modern farming methods in general is hindered by inadequate communication and transport facilities, the ignorance and apathy of farmers and inadequate supply of production instruments for modern farming.

69. The obstacles to the full enjoyment of the right to food, namely, adequate calories and protein supply, can also be removed by efforts made in other directions. Improvement in health, education, nutrition, housing and other components of the level of living will not only

help to improve farming methods and productivity, but will make the population better understand the value of good food and how to select and prepare it. Greater effort should therefore be directed along these lines to the most vulnerable groups, in terms of calorie and protein deficiency, in the rural areas and among the poor working-class groups. These less fortunate groups, with very weak earning power, lack cash to buy food and, in fact, health and other services, even if these were available. They are also the least informed groups in society, and need education and training on nutritional needs.

70. Women, especially those in the pre- and post-partum periods, and children constitute two significant elements of the vulnerable population. While nutrition services should be extended to them, it is also clear that men, too, need nutrition education, since, in most African societies, in particular, in East Central and Southern Africa, the men keep the money incomes.<sup>54</sup>

71. For any one country, a number of measures should be adopted to ensure that citizens shall enjoy their right to food. First, development plans must strike a balance between the production of cash and food crops. Contingency measures against shortages should also be built into the plans. Secondly, practical steps should be taken against wastage of food crops through deterioration in the field and inadequate transportation and storage facilities. In particular, knowledge of domestic food preservation and of sun-drying of fruits and vegetables is essential. Thirdly, some legislation relating to the quality, storage and transportation of food is also necessary; it should include provisions for advice to local farmers on handling and preserving food-stuffs. The advice could conveniently be given under an extensive and intensive agricultural extension service scheme. Lastly, international aid programmes should be further encouraged to give assistance, technical and financial, in storing, handling, transporting and preserving food-stuffs in order to avoid wastage which, granting production increases, is the crux of the African food problem.

72. With respect to international aid, the activities of the United Nations organs and OAU deserve special mention in that they underline the awareness in the region of the lack of the full exercise of the right to food. The WHO and FAO have, in this connexion, been involved "in appraisal of nutritional problems, national food and nutrition policy, organization of services for feeding programmes, nutrition education, training of personnel, development and use of new protein-rich food, enrichment of foods as well as some other programmes dealing with food and nutrition."<sup>55</sup> The establishment of the Joint FAO/WHO/OAU Regional Food and Nutrition Commission for Africa, at Accra, Ghana, further attests to the growing co-operation

<sup>52</sup> Food and Agriculture Organization of the United Nations, *The State of Food and Agriculture, 1970* (Rome), pp. 108-112.

<sup>55</sup> "Social change and social development . . .", p. 300.

among the agencies in tackling a fundamental problem requiring a multidisciplinary solution. There is no doubt that Africa needs such joint effort in solving its food problems.

#### IMPLICATIONS OF POPULATION TRENDS FOR THE FORMULATION AND EXERCISE OF HUMAN RIGHTS

73. The principal feature of past and current population trends in Africa has been and is the high rate of growth associated with a very high and constant fertility and a relatively high, but declining mortality. Internally, most countries of the region have been experiencing rapid rates of urban growth; while externally, emigration is being frowned upon and is tending to decline in volume.

74. Attempts so far made at indicating prospects for the future imply a continuation of the generally high level of fertility. Recent estimates by the United Nations<sup>56</sup> show that the prevailing gross reproduction rate of 3.1 in Africa, which seems to be the highest in the world, will be maintained until late into the decade of the 1980s, when a sizable fertility decline would begin, reducing the gross reproduction rate by about 16 per cent in 10 years.<sup>57</sup> But this net decline will be far less than anticipated in the other major developing areas, which had an earlier onset of fertility decline and a gain in momentum over time. In fact, towards the end of the century (1995-2000), the estimate clearly shows that Africa would be the only major area with a gross reproduction rate above 2.0, which is the value currently employed by the Secretariat of the United Nations to distinguish between developing and developed countries. The assumptions of the estimate imply that, by the end of the century, fertility in Africa would still be significantly higher than fertility in East Asia, South Asia and Latin America.

75. To a certain extent, mortality, more than fertility, has been more responsive to innovations and technological change. Current indications are that mortality, as a result of low cost, but effective, medical and public health programmes fostered by various Governments of countries of Africa, sometimes with external aid in cash and kind, promises to decline faster than implied above in the years ahead. Thus, the current rate of 21 deaths per 1,000 population (1965-1970) will decline to 10 per 1,000 by the period 1995-2000, implying that Africa would then have a rate comparable to that currently obtaining in Europe, for example.<sup>58</sup> Similarly, the current level of life expectancy of about 45 years is expected to increase significantly, if assumptions are correct, to 58.5 years during 1995-2000.<sup>59</sup> Nevertheless, these optimistic assessments have been unequivocally qualified to show also that, optimistic as

the picture of the gains in life expectancy is, Africa would still lag behind other areas of the world in having the lowest life expectancy. In quantitative terms, UN estimates show that "Africa would still be seven years of life-expectancy-at-birth behind the level projected for South Asia, 10 years behind that for East Asia, and 13 years behind Latin America".<sup>60</sup>

76. The prospects for urbanization are that the current rate of growth will continue to accelerate rapidly. Recent estimates based on medium assumptions by the United Nations anticipate a rate of growth of about 5.0 per cent up to 1985.<sup>61</sup> This rate will again be the most rapid in the world; and, if the assumptions prove to be correct, it would raise the proportion of the urban population to 30 per cent in 1985 and 39 per cent at the end of the century.<sup>62</sup> Should these increases materialize, it will mean a worsening of the current problems facing many countries of Africa. Apparently, the current failure of the provision of social amenities (employment, schools, hospitals, housing etc.) to keep pace with the growing demand for such services in towns will continue, with the attendant social disorganization and deterioration of the environment and level of living.

77. It appears certain from the foregoing discussion that the general prognosis for Africa is a likely continuation of rapid population growth up to, and even beyond, the end of this century. Even if a widespread family planning programme were implemented, the current age structure holds great potentials for significant growth in size of population.

78. The impact of the implied population trend on the exercise of recognized human rights, given the social and economic circumstances of many countries, can be serious. The impact will invariably affect rights related to motherhood, in terms of maternal and child care; it will affect rights to good health, reduction of morbidity and mortality, adequate food supply, employment and income. Whether rights are diminished or enhanced does, and will, depend upon the dynamic, as well as the static, relationship between the rate of social and economic development and the rate of population growth.

79. Accelerating population growth in Africa may aggravate the problem of capital shortage, which is one of the most important obstacles to economic development in countries of Africa. The higher the rate of population growth, the greater the proportion of capital expended on the consumption of goods and the provision of social services and, therefore, the less the proportion put to production.

80. A high rate of population growth is sometimes cited as a stimulus to economic development. However, as stated in a United Nations report:

"... while in a well-developed dynamic economy the demand for capital investments may serve as a

<sup>56</sup> "Where does Africa stand in the world demographic picture?" (E/CN.14/POP/52), p. 3.

<sup>57</sup> *Ibid.*

<sup>58</sup> "World population prospects, 1965-1985 (as assessed in 1968)" (ESA/P/WP.37).

<sup>59</sup> "Where does Africa stand...", p. 3.

<sup>60</sup> *Ibid.*

<sup>61</sup> "Urban-rural population: individual countries, 1950-1985 and regions and major areas, 1950-2000" (ESA/P/WP.33/Rev.1).

<sup>62</sup> "Where does Africa stand...", p. 9.

stimulus to continuing economic growth, the case of the under-developed is different. For most of them it is difficult to save and invest enough from their meagre annual income to permit economic development to proceed at a satisfactory pace, even without rapid population growth. It is true that if these countries can industrialize and better utilize their human as well as their natural resources, some of them, at least, will undoubtedly benefit in the long run from a substantially larger population. But even where a large population would be advantageous, in the long run economic progress will be hindered, if numbers increase so rapidly as to put an excessive strain upon the economy.”<sup>63</sup>

The point is that for economic development, the rate of growth of the population of a country is more relevant than its size; and, as has been observed earlier, the rate of growth of the population of African countries is accelerating and would, if unretarded, put the region ahead of others by having the highest rate of growth within a decade.

81. The problems relating to the general inadequacy of the public infrastructure to meet the growing needs of the population in urban areas, and the growing demand for education and employment, have received attention in a number of African development plans. For example, in Kenya, it has been shown that if fertility is not reduced in the next 25 years, the number of illiterate children will double, even with all the efforts that the Government could exert. The policy statement on the population of Ghana mentions that if the number of births could be cut by 2 per cent each year, there could be almost 2 million fewer children in 1985 and over 3 million fewer children in 2000, thus freeing funds for other types of investment and also increasing the proportion of children who can be educated.

82. The situation in which most of the African countries find themselves is typified by the following statement drawn from the 1966-1970 Ugandan development plan: “Uganda must keep moving in order to stay in the same place. Growth in output and employment of nearly 3 per cent per annum is necessary in order to maintain *per capita* standards and hence for increasing *per capita* income an even higher rate of growth has to be achieved.”

83. In general, there has been a growing awareness of the effects of rapid population growth and urbanization on social and economic development. Most African development plans, as in the examples shown above, have some demographic content, and most recognize the nexus between rapid population growth and poor education, nutrition and health, high infant and child mortality and poverty in general. Poverty on a significant scale undoubtedly affects the majority of Africans. The very small minority with education, skill and training live well. This minority mostly belong to the urban

group of middle-class administrators, technicians, executives and businessmen. The growing disparity between the fortunate middle class and the poor, mostly rural lower class, appears very glaring in the cities where differences in the life-styles of the group stares one right in the face in the crowded streets. There are many observers who feel that the disparity should be bridged through upgrading the level of living of the working class.

84. Quite significantly, the Governments of a number of African countries, such as Kenya, the United Republic of Tanzania and Zambia, have in policy and in concrete terms addressed themselves to the problem of poverty with a view to improving not only the lot of the urban poor, but the significantly large and impoverished rural dwellers.<sup>64</sup> Continuing efforts are made by many countries to achieve a redistribution of income and wealth through administering various taxation and income policies. Furthermore, many Governments have been expanding the scope of their social services and programmes for rural and community development. To achieve these, substantial sums of money have been spent in selected countries. Available estimates show that expenditure on social and community services represented in 1969 between 21.0 and 48.5 per cent of total national expenditure in 14 countries.<sup>65</sup> A large proportion of the social and community expenditure was for education, health services and housing programmes. In order to assist in raising the cash income of the farmers, priority has also been given to agricultural schemes, including farm settlements, irrigation, co-operative farming and consolidation of land holdings.

85. But while most countries implement the above-mentioned programmes and, indeed, many others, the point ought to be made that much remains to be done; and, moreover, that in terms of future population increase, the programmes have limited scope. They almost all concentrate on solving social problems arising out of past social, technological and economic changes. To grapple with the future, all social welfare programmes must look ahead and should therefore increasingly focus on developing preventive and consolidating services involving popular participation of the majority of the population to help in identifying future needs.

86. One area to which efforts should be directed is the promotion of universal health and family security service. Those currently in operation cover only wage earners in urban and large industrial enterprises. The

<sup>65</sup> “Social change and social development”, p. 226, table 6.

<sup>63</sup> *Report of the World Social Situation, 1957* (United Nations publication, Sales No. 57.IV.3), chap. II.

large population in the rural areas are completely left out of any insurance or public assistance schemes covering old age, invalidism, death, work injury and so on. To have any real lasting effect on social and economic progress now and in the future, existing schemes, and many others not yet in operation, should be organized, given local conditions, to cover all segments of the working population in towns and villages.

87. Apart from economic, social, financial and technical provisions in the development plans for improving the social situation, specific legislation and policies have been promulgated, even if their effective implementation remains questionable. Attempts by a number of countries in formulating population policies intended to reduce the rate of growth have already been noted. But formulating a policy is one thing; its effective implementation is another. There is still so much to be done to put existing population policies on the way to achieving maximum benefits from their operation.

#### ACTION REQUIRED TO SAFEGUARD AND PROMOTE HUMAN RIGHTS IN THE LIGHT OF CURRENT AND PROJECTED POPULATION TRENDS

88. Increased concerted action at both national and international levels is called for in order to encourage Governments of African countries to promote the realization of human rights in the light of current and projected population trends. At the national level, it will be necessary to ensure that planners, as well as individuals within the community, should be made aware of the demographic, social and economic situation and how it affects their exercise of human rights. Without a general individual awareness, the situation where community health, survival and well-being are imperilled because of ignorance at the individual level might develop to the detriment of all. It must be conceded that creating individual awareness largely makes the task of government planners and implementers of projects simple.

89. In view of the high level of illiteracy in the continent, awareness has to be promoted through formal and informal education programmes. Intensive and extensive adult literacy campaigns for men and women, especially in the rural areas, should be encouraged. Modern teaching techniques adapted to local conditions should be employed along with the use of the mass media.

90. Already a significant body of research has been going on in many countries through national as well

as international efforts and assistance.<sup>66</sup> Basically, attempts should be made to foster increased collaboration among research workers with a view to making rational use of scarce resources, especially by avoiding duplication of efforts. By the very nature of the problems, the collaborating teams should be multidisciplinary and should draw from the experiences of demographers, sociologists, statisticians, economists, jurists and medical specialists. More important for planning purposes, all efforts should be made to co-opt and involve as many planners and government officials in order to ensure that research findings shall be sufficiently integrated into development plans. It might even be advisable physically to locate research units within government planning offices, and require that these units work on special problems of national development.

91. Action at the international level should also cover education and research. International assistance, already on a significant level, should be increased; but, more importantly, it should involve interagency co-ordination and promotional action. The efforts of the agencies should be complementary rather than competitive. The promotional action of ECA in this respect includes studies, research, dissemination of information, technical assistance, regional advisory services and holding of meetings. In particular, the annual interagency co-ordination meetings of, respectively, UN and non-UN organizations interested in population matters has been very useful. The biennial Conference of African Demographers has also very much helped in fostering and raising the level of awareness in the African region. The adoption of recommendations on important population questions for action by the Conference of African Ministers has been, and will continue to be, useful in deciding priority items in research and planning.<sup>67</sup>

92. As the title of the section indicates, the action required outlines those for safeguarding and promoting human rights in the light of current and projected population trends. There are, of course, action programmes required in other related fields, such as the role of women in national development, training programmes in home economics and other family-oriented fields etc., which the secretariat of ECA is promoting.

<sup>66</sup> For a record of research programmes by national and international agencies, see "Report of the expert group on population" (E/CN.14/488).

<sup>67</sup> For important recommendations, see, for example, "Conference of African demographers...", para. 86; "Report of the Seminar on Statistics...", para. 133; and "Report of the Working Group on Fertility Levels...", para. 148.

## POPULATION AND HUMAN RIGHTS: EDUCATION AND INFORMATION\*

### *United Nations Educational, Scientific and Cultural Organization*

1. The United Nations International Conference on Human Rights, held at Teheran from 22 April to 13 May 1968, and convened to review progress achieved and to identify obstacles encountered in the field of human rights since the adoption, in 1948, of the Universal Declaration of Human Rights, proclaimed that, "The protection of the family and of the child remains the concern of the international community. Parents have a basic right to determine freely and responsibly the number and spacing of their children."<sup>1</sup> The Universal Declaration itself declares (article 16) that "Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and to found a family". Resolution XVIII adopted by the Conference in 1968 stated that it considered that "couples have a basic human right to decide freely and responsibly on the number and spacing of their children and a right to adequate education and information in this respect".<sup>2</sup>

2. In the same resolution, the Conference observed "that the present rapid rate of population growth in some areas... reduces the possibilities of rapidly achieving adequate standards of living... [and] education... thereby impairing the full realization of human rights. It recognized that moderation of the present rate in some areas would enhance the conditions for offering greater opportunities for the enjoyment of human rights."

3. The preamble to the resolution recalled General Assembly resolution 2211 (XXI) of 17 December 1966, "which recognized *inter alia* the sovereignty of nations in formulating and promoting their own population policies, with due regard to the principle that the size of the family should be the free choice of each individual family".

4. The Declaration on Social Progress and Development, adopted by the General Assembly on 11 December 1969, one year after the International Conference, states in part III, Means and Methods, article 22 (b), that the achievement of the objectives of social progress and development requires "formulation and establishment, as needed, of programmes in the field

of population, within the framework of national demographic policies and as part of the welfare medical services, including education, training of personnel and the provision to families of the knowledge and the means necessary to enable them to exercise their right to determine freely and responsibly the number and spacing of their children".<sup>3</sup>

5. In part II, Objectives, article 11 (f) of the same Declaration, it is stated that a main goal to be attained is "the guarantee that all individuals, without discrimination of any kind, are made aware of their rights and obligations and receive the necessary aid in the exercise and safeguarding of their rights".

#### HUMAN RIGHTS AND LAW

6. The declaration of the right of couples to have children and to determine freely and responsibly how many and when, was (like the other statements cited above) adopted in the context of concern about the effect of rapid population growth on the realization of human rights and on economic and social development on which, in turn, the realization of many human rights depends. The sovereignty of nations in formulating population policies, but with due regard to the principle that the size of the family should be the free choice of the couple, was recognized by the United Nations. At the time, in some countries, campaigns to persuade couples to practise family planning and to have fewer children were in course or being prepared, either directed by Governments or agreed to by them. In other countries, couples wishing to limit the number of their children were prevented from or hindered in obtaining the information and the means to do so, which were readily available in other countries.

7. Two principles are seen to be juxtaposed: the freedom and human rights of the individual and the responsibility and sovereignty of the State. The various United Nations declarations on human rights, on the rights of the child, on social progress and development, and others, are generally acknowledged to express the will of the international community to set standards for all peoples and States. They can be viewed as constituting an authoritative guide, produced by the General Assembly, to the interpretation of the Charter of the United Nations. Some jurists regard them as part of the law of the United Nations. They have considerable

<sup>3</sup> Official Records of the General Assembly, Twenty-fourth Session, Supplement No. 30, resolution 2542 (XXIV).

\* The original text of this paper (E/CONF.60/SYM.IV/14) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

<sup>1</sup> Final Act of the International Conference on Human Rights, Teheran, 22 April to 13 May 1968 (United Nations publication, Sales No. E.68.XIV.2), chap. II.

<sup>2</sup> *Ibid.*, chap. III.

moral influence on national legislation. Many jurists would not regard them as legally binding; this, they say, is only achieved when the provisions of the declaration are embodied in a covenant, which is a treaty duly adopted, and which is only binding on the States that ratify the covenant: hence the various covenants and conventions prepared by the United Nations and the specialized agencies. Others hold that this is to confuse instruments and the rights concerned; and they maintain that legal force may be derived from non-treaty sources: natural law; customary international law; and general law.

8. A related question concerns the choices which may be forced on States when, at certain points in time, different rights may appear to conflict, or when the national financial resources required to implement them are limited. The right of couples to have as many children as they wish may be seen to conflict with the realization of the rights to an adequate level of living, to health and to education and to other rights.

9. Juridical or legislative action is not the only way to the recognition and enjoyment of human rights. It is essential, but not sufficient. Even if the juridical framework were complete and unambiguous, pervasive shortages of resources would mean that not all claims advanced as rights could be met at the same time. Questions of choice intervene to move the matter from the realm of jurisprudence into that of economics, social engineering and politics.

#### RIGHTS AND DUTIES

10. The right of couples to determine the number and spacing of their children is qualified in the above-quoted paragraph 16 of the Proclamation of the International Conference on Human Rights by "freely" and "responsibly". "Freely" appears to mean without being subjected in their choice and subsequent action to any direct or indirect constraint: that society and the State may try to persuade couples to adopt a given attitude and behaviour, but not to penalize them for not doing so by discriminatory treatment in relation, for example, to children's allowances, employment or migration within their own country. "Responsibly" means the responsibility of each of the couple to the other and of the couple towards their children and those that may be born. It also means the duty of the individual towards the community and the country and even the community of peoples (see article 29 of the Universal Declaration of Human Rights), "in which the free and full development of his personality is possible". This means that both men and women, since both are involved in the choice, must be given education and information to help them to take responsible decisions, in the knowledge of what these decisions mean for themselves and for others, in terms of health and food and of education, of social and economic development and of the quality of the social and natural environment.

11. Hence, the State has a duty, and an interest if it wishes people to behave responsibly, to develop popu-

lation policies for the common welfare and, having done so, to inform, persuade and assist people to act in accordance with plans and laws adopted by the democratic process. It has the duty to try to ensure that this education and information shall be made available and intelligible to all—men and women, adults and young boys and girls, of all social classes and levels of literacy and education, in towns and rural areas, and in indigenous, local and minority languages, as well as in official ones, without discrimination of any kind.

12. States that wish to see their populations grow can readily accept that couples exercise the right to have children and to have as many as they wish. But are they entitled to try to deny information and means to couples who wish to have none or to limit the size of their families and to penalize them for doing so? Or, are those States which have policies to limit population growth in the interest of the community, entitled, if persuasion fails, to try to oblige couples to limit the size of their families, or even to have no children, by means of economic and social pressures? This might seem to be an attempt on the basic rights of human beings "born free and equal in dignity and rights and endowed with reason and conscience" and on the right to marry and found a family. What, in this context, should be the interpretation of article 29 of the Universal Declaration of Human Rights: "In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society", in relation to article 30 which declares: "Nothing in this Declaration may be interpreted as implying for any State, group or person any right to engage in any activity or to perform any act aimed at the destruction of any of the rights and freedoms set forth herein"?

13. It can be maintained that the right to have children does not cover the right for a couple to have as many children as it wishes, even if it considers itself to be acting responsibly in so doing. If it comes to be recognized by a country that the unlimited exercise of the right to have children would jeopardize the exercise of other rights by the community and other individuals (including the children to be born) and might even endanger the future of human life on earth, would society then be entitled to exercise pressures to prevent this happening? In this view, it could be urged that to attempt to limit the size of families for all couples by measures democratically adopted, with no discrimination of class, income, race etc., would contradict neither the principle of equal rights nor that of the right to marry and found a family.

#### POPULATION GROWTH AND HUMAN RIGHTS

14. Resolution XVIII, adopted by the International Conference of 1968, recognized that the current rapid

rate of population growth in some areas affected the full realization of human rights. In many countries, rapid population growth is making it more difficult to extend to more, let alone to all, men and women, the right to work, to free choice of employment and to freedom of movement and residence within their country; the right to social security and the economic, social and cultural rights indispensable to dignity and free development of the personality; the right to a level of living adequate for health and well-being, including food, medical care and social services; the right freely to participate in the cultural life of the community, to enjoy the arts and to share in the advancement of science and its benefits. Yet, there are reasons and evidence for believing that if these rights were more widely enjoyed, they would, in turn, contribute to reducing the rate of population growth which threatens their own realization. The guarantee of regular and continued gainful employment reduces the need for children to supplement the family income. The reduction of the mortality rate, resulting from the extension of health services, affects the emotional and economic motivations towards large families. The provision of social security benefits and, in particular, old-age pensions makes it less necessary for parents to seek insurance for their old age by having many children. The extension of education, which is essential to the implementation of all human rights, may be seen to have direct and indirect relations to the solution of population problems.

#### EFFECTS OF RAPID POPULATION GROWTH ON EDUCATION

15. The right to education is far from being realized for a large part of the world's current population and particularly for girls and women. Even at the primary level which, according to the Universal Declaration and the International Convention on Discrimination in Education, should be compulsory and free for all, from 20 to 50 per cent of the children concerned, in three vast regions of the world, are not going to school. Only 43 per cent of those enrolled are girls and women; the percentages are as low as 38 at the primary level in Asia, 32 at the second level and 26 at the third level in Africa. At population growth rates for 1970-1985 as estimated by the United Nations, it is anticipated that the population aged from 5 to 14 years will increase over that period by 10.8 per cent in the developed and by 42.4 per cent in the developing countries. Even if birth rates were to drop sharply at once, which is improbable, it would be difficult for developing countries, most of which are already spending on education what seems to be the maximum percentage possible of their national budgets, to expand their educational systems so as to maintain enrolments even at their current levels, let alone to raise them. This threatens the realization of the right to education, and of rights related to education, as well as the economic and social development upon which, in turn, the expansion of education depends. The current rapid rate of population

growth is not only a quantitative problem: it also threatens the quality of education and with it the quality of life.

16. The total world population is increasing at the rate of 2 per cent per annum, and in some countries at a much higher rate. In some of the age groups from 0 to 24, which are the immediate concern of formal education systems, the rates of increase over the period 1965-1970 were even higher: 0-4, 2.15 per cent; 5-9, 1.35 per cent; 10-14, 2.02 per cent; 15-19, 2.71 per cent; 20-24, 3.07 per cent.

17. At the beginning of the current decade, total enrolment was increasing by only 2.5 per cent per annum, compared with an average over the years 1960-1970 of 4.1 per cent; in Africa and Asia the previously high rates have dropped to 3.5 per cent and 2.3 per cent, respectively. The lowest enrolment rates are found in the areas of greatest increase in growth of population: Africa, the Arab States, Asia, and Latin America.

18. Around 1970, only 71 per cent of children of primary school age were attending school. Whereas in Europe, the Union of Soviet Socialist Republics and North America, the percentage approached 100, in Latin America, it was 78; in Asia, 59; and in Africa, only 48. The percentage of children of secondary-school age, from 15 to 19, attending school was 54 per cent for the world. But again, while in Europe and North America, the percentage ranged from around 70 to 90, in Latin America, it was 49; in Asia, 44; and in Africa, 25. The third-level enrolment, as a percentage of the population aged from 20 to 24, was 1.5 in Africa, 4.9 in Asia, 6.3 in Latin America, 17 in Europe and the USSR and 48.2 in North America.

19. In 38 countries and territories, education at primary level is still not compulsory. In 90 out of the 152 self-governing educational systems for which data were available, the duration of compulsory education did not include any part of secondary education and in a further 28 it included no more than two years.

20. Since 1960, the percentage of enrolment of girls and women to total enrolment at all levels has remained at around 43; in Asia, it is 37; in Africa, 39; and in the Arab States, 35. At the primary and secondary levels, there is roughly parity between boys and girls except in Asia, where the percentage of girls at primary level is 38 and at secondary 35, and in Africa, where the figures are 40 and 32. At the third level, the percentages of women by regions are: Europe and USSR, 42; North America, 41; Latin America, 35; Asia, 28; and Africa, 26. This means that, when a comparison is made of the number of girls attending school with the total number of girls in the population, the proportion of girls at secondary-school age going to school is estimated at less than 10 per cent in Africa and the Arab States, around 20 per cent in Asia, 25 per cent in Latin America, over 30 per cent in Europe and the USSR, and around 45 per cent in North America. At the third level, university and higher education, the proportion of women is 1 or less out of 100 in Africa, the Arab States

and Asia; 2 in Latin America, 7 in Europe and the USSR, and 20 in North America.

21. The number of adult illiterates, aged 15 and over, continues to rise although the percentage has dropped from 39.3 in 1960 to 34.2 in the 1970s. With an estimated world adult population in 1980 of 2,820 million, it is thought that there will still be 820 million adult illiterates and an illiteracy rate of 29 per cent in spite of the effects of increased primary education enrolments and literacy campaigns.

#### EDUCATION AND POPULATION GROWTH

22. It is difficult to estimate the effects of education, in total enrolments and at different levels, on fertility and population trends. That there is a relationship between the level of education and the rate of fertility is generally accepted, but the complex relationships between education factors and other social and economic variables have not been adequately examined. There is no proof that there is a direct causal relationship between growth in education and fertility, leading automatically to lower birth rates. However, there is a significant difference in the rate of population growth between countries at different levels of educational development. Countries with high literacy rates and high enrolments for both men and women at all levels tend to have lower population growth rates than countries which are educationally less advanced, and they tend to have relatively low or moderate birth rates.

23. Surveys indicate that better educated people desire somewhat smaller families than uneducated people (although the difference may be equally valid as between rich and poor) and that they are having about the number of children they desire, while those with little or no education are having substantially more. Surveys of knowledge, attitudes and practice conducted in developing countries show a downward trend in fertility as educational attainments increase. The duration of schooling required to reduce fertility significantly is, on the evidence available, at least around six years, and might indeed be as long as from 10 to 14 years.

24. Adults who have reached a certain educational level usually desire education for their children. Because of the direct or indirect costs of education, this leads, in many societies, to limiting the size of the family. Education of girls and women probably postpones the age of marriage and the birth of children. The opening-up of employment opportunities for educated girls and women may also contribute to the spacing and limitation of births. There may be other consequences of education—increased material desires or changes in cultural aspirations—which contribute to the limitation of family size.

25. Whatever may be the direct or indirect effects of the enjoyment of education in itself on population trends, there is no question that some education is

necessary to the exercise of the right to education and information on population and fertility matters. Population education, in and out of school, is not just sex education or family planning education, nor is it propaganda or indoctrination. The object is to promote knowledge and understanding of population phenomena within the framework of economic, social and cultural development. It is an appropriate area of study in all countries, whatever their population situation and problems. The purpose is to help children and adults to see how population changes affect them, their community and the world and how their behaviour can affect changes. The teaching methods employed enable them to learn how, in this and other fields, to take responsible decisions and to exercise their rights. The State has an interest in increasing the number of those who understand the problems and may choose to adopt the attitudes and take the action desired by society. While knowledge by itself may not lead to the desired action, it is indispensable and is likely to be more readily communicable to those with a degree of general education.

26. The growth of education is, therefore, seen to be necessary because, in relationship with other factors, it may affect behaviour in relation to population problems and also because it increases the possibilities of explaining population issues and their relation to human rights and responsibilities, and how to exercise them, to larger numbers.

#### COMMUNICATION MEDIA AND POPULATION EDUCATION

27. Resolution XVIII of the International Conference provides for couples the right to adequate education and information bearing on their right to determine freely and responsibly the number and spacing of their children. This right derives from the right, declared in article 19 of the Universal Declaration, "to seek, receive and impart information and ideas through any media and regardless of frontiers". For the men and women who have long left school, for the hundreds of millions of illiterates and the tens of millions, year by year, who will not go to school, means must be found to give them information, which it is their right to receive and which is necessary to the implementation of population policies. Given the vast numbers involved, it is natural to think of the media of mass communication, press, radio, television and film, as the primary means of communication between Governments and peoples.

28. Two preliminary conditions to the use of the mass media for this purpose should be borne in mind. First, in most of the countries of the world outside Western Europe and North America, radio and television broadcasting services are directly controlled and operated by the State. States, therefore, have the power to use or not to use the media, either in the course of general broadcasting or for special programmes, to give information about problems and policies and to attempt

to change the image of what constitutes a normal, happy family. The press and the cinema, which in most of the developing countries are still largely privately operated, reach very small parts of the public because of illiteracy and the small number of cinemas and limited cinema attendance. In most developing countries, the actual listener coverage of radio broadcasting and, even more, of television is small and largely limited to urban areas, although transmission services cover the whole of most of them. Forty countries in Africa and 20 in Asia have fewer than 10 radio receivers for every 100 people. As for television, in Latin America, only two countries have more than 10 receivers for 100 people; and in Asia, 20 have fewer than 10; although television now exists in 24 countries of Africa, there are fewer than three receivers for 100 people in any of them. In many countries with populations speaking a number of different languages, radio and television services are confined to only a few of them. Even allowing for family and community use of radio and television receivers, mass coverage is relatively small and limited.

29. In any event, in order that the use of the mass media may be effective, through information, education, motivation and instruction, as a basis for judgements concerning rights related to population, there needs to be support by other more personal means of communication, supplemented by traditional, community or folk means of communication. The mass media and the traditional media—story-tellers, puppet and theatre shows—can be used to give general information and education and to create a social atmosphere and attitude. The mass media can also be used to exhort to action and to advertise the existence of means and services for family planning. But the final persuasion and motivation to make the desired choices require person-to-person communication within communities.

#### ACTION TO PROMOTE HUMAN RIGHTS IN THE LIGHT OF POPULATION TRENDS

30. It is suggested that action, at the national and international levels, is required in the following fields:

(a) Innovation and renovation of the formal education system—structure, content and methods—to permit and improve the provision of education at different levels to increasing numbers, within the limits of financial and human resources likely to be available for the expansion of education, special attention being given to girls and women, to rural areas, to migrants to urban areas and to immigrants;

(b) Expansion of out-of-school education for adults and young people through increased use of the resources of the formal education system, of the means of communication, both mass media and traditional folk media, and of industrial and commercial establishments;

(c) Promotion of research projects, organized co-operatively by demographers, economists, social scientists, psychologists, anthropologists, humanists and educators, on attitudes and behaviour of people in relation to population questions and human rights, and to their own personal problems, and on what factors, economic, social, cultural and educational, have contributed or might contribute to changes in attitudes and behaviour, all of which is essential to sound policy decisions and to the effectiveness of population plans and of population education;

(d) Development of courses, methods and techniques of population education at different levels, and for different groups within populations;

(e) Development of education and training in population education for teachers and communication personnel, using both mass media and traditional folk media.

## HEALTH AND HUMAN RIGHTS \*

### *World Health Organization*

1. The World Health Organization definition of health, one of the fundamental human rights, is so broad "a state of complete physical, mental and social well-being" that it encompasses elements referred to in a large number of declarations, proclamations and covenants of the United Nations, and of the specialized agencies.<sup>1</sup>

2. Those elements relevant to economic, social and cultural conditions of life and to the environment, are numerous. They concern the right to live; to work, to free choice of employment, to equal pay for equal work, to just and favourable remuneration for work supplemented, if necessary, by other means of social protection; to rest and leisure; to an adequate level of living, including food, clothing, housing and the necessary social services, as well as to social security in the event of unemployment, sickness, disability, widowhood or old age; to education to participate in the cultural life of the community; to the improvement of all aspects of environmental and industrial hygiene; to the prevention, treatment and control of epidemic, endemic, occupational and other diseases; and to the creation of conditions that would assure health service and attention in case of sickness to all. The equality of men and women is affirmed.

3. The family, which is recognized as the fundamental group unit of society, is entitled to the widest possible protection and assistance. Steps should be taken for the reduction of the stillbirth rate, of infant mortality and for the healthy growth and development of children. Mothers have a right to special protection before and after childbirth. The vulnerability of the newborn child, as well as of the mother, is recognized. A separate declaration has been made on the rights of the child, to ensure that he shall be safeguarded in years of physical and mental immaturity. This declaration defines conditions that are required for physical, mental, moral, spiritual and social development, and underlines the fact that the child needs love and understanding for

full and harmonious development. The position of the family in society is further delineated as it concerns marriage. Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and found a family, and marriage shall be entered into with the free consent of the intending spouses.

4. While the sovereign right of Governments in formulating and promoting their own policies is unequivocally stated, there is a proviso that due regard must be given to the rights of families. The Proclamation of Teheran expresses the latter in the following terms: "Parents have a basic right to determine freely and responsibly the number and the spacing of their children." The World Health Assembly has recognized that human reproduction involves both society and the family. The Assembly has drawn attention also to the part played by economic, social, cultural, psychological and health factors in solving population problems. Health services, including family planning care, are basic to any approach.<sup>2</sup>

5. The responsibility of Governments is engaged by these declarations and resolutions, in so far as they have ratified or assented to them. The involvement in the right to health and all its ramifications is clear for the 138 member States of the World Health Organization, each one of which has accepted its Constitution which states the following principle: "Governments have a responsibility for the health of their peoples which can be fulfilled only by the provision of adequate health and social measures."

#### HEALTH AND CONTRIBUTORY RIGHTS

6. The policies and programmes of the World Health Organization (WHO) are based on the recognition and acceptance of health as a human right. According to this Constitution, "the enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being, without distinction of race, religion, political belief, economic or social condition".

7. The relationship of health to the potential of the community is recognized in the phrase, "highest attain-

\* The original text of this paper (E/CONF.60/SYM.IV/18) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

<sup>1</sup> Among the declarations and instruments that could be cited are the Universal Declaration of Human Rights, the International Covenant on Economic, Social and Cultural Rights, the Declaration of the Rights of the Child and the Proclamation of Teheran. The text of these instruments is to be found in *Human Rights: A Compilation of International Instruments of the United Nations* (United Nations publication, Sales No. E.73.XIV.2).

<sup>2</sup> World Health Organization, *Handbook of Resolutions and Decisions of the World Health Assembly and the Executive Board*, vol. 1, 1948-1972 (Geneva, 1973), resolutions WHA 18.49, WHA 19.43, WHA 21.43 and WHA 22.32.

able standard of health". For health as a "state of complete physical, mental and social well-being" is an ideal. There are, thus, implications for Governments who should provide the best possible conditions for the health of their peoples, but the "right" to health currently has moral rather than legal force.

8. Health depends upon the genetic inheritance of the child and the physical, social, cultural and economic circumstances into which it is born, and their maintenance or improvement throughout life. Biologically speaking, all children are not born equal. They have neither equal opportunities of prospering nor equal life expectancy.

9. Therefore, for most people, the WHO all-encompassing definition of health is visionary; and the possibility of enjoying the right to health is remote in a world where millions are still suffering from easily preventable diseases, where approximately half the total population is either undernourished or malnourished, and where just as many have no access to adequate health care.

#### *Socio-economic rights*

10. A number of rights must be exercised or observed in order to attain the highest possible level of health. Some depend upon or are directly related to health services; others are concerned with the broad socio-economic *milieu*. The latter include the right to food, work, education, social security, rest and leisure, and the freedom to participate in the life of the community. It is the responsibility of Governments to encourage and facilitate the enjoyment of these rights by their people and to refrain from anything that might restrict or interfere with that enjoyment. Measures or neglect that limit the exercise of the right to health or to health care can be interpreted as a violation or infringement of the right to health. Similarly, the infringement of certain civil and political rights may affect the individual's physical, mental and social health directly or indirectly, and in so doing, violate the right to freedom, as well as to health.

#### *Basic health services*

11. The WHO has attempted to formulate guiding principles and practical measures to help Governments to carry out their duties in achieving the health rights of their peoples. The most fundamental requirement is the building of a system of health services to improve individual and family health and to provide the foundation and framework for such essentials as nutrition, maternal and child care, including family planning, prevention, control and treatment of communicable diseases, sanitation and water-supply, health education and occupational health.

12. The objectives of such services are to foster normal growth and development, physically and mentally, in order to permit each individual to realize his potential. This is dependent upon continuity of care from conception to maturity. People who have not had these

services are far more susceptible to preventable disease and premature death. Their capacities may be seriously impaired, which, in turn, affects economic status and fertility. Women who have not attained satisfactory physical development are less likely to arrive at a successful conclusion of pregnancy.

#### *Rights of families*

13. The family is recognized as the basic social unit. Internationally, the rights of families and especially the right to decide freely on the number and spacing of children, have been clearly enunciated. The whole question of human reproduction has wide implications for society as a whole and for the size and quality of population.

14. A population is not a turgid, undifferentiated mass. It is composed of individuals, mainly living in families. They are born, become ill, recover, remain incapacitated or die. They congregate in cities and towns, or live in villages and sparsely settled areas. They are producers and consumers; they inherit and transmit definite ideas and traditions; they enjoy or are deprived of health or of adequate means of livelihood.

15. Nevertheless, such abstractions as demographic patterns and trends are useful in the study of populations. They are as vital in the planning of health programmes as in the framing of population policies. The concentration, the age and the resources of a people living in a given area have a direct influence upon their health and upon their requirements for health services. A densely populated area may mean that there is insufficient work, food and amenities for everyone. The more people there are to make use of limited resources, the smaller each share will be. If the resources are not renewable, or can be renewed only after a lapse of time, they will be exhausted even more rapidly. In such circumstances, high fertility rates and high death rates often go together, with the human wastage that this implies.

16. On the other hand, some of the most affluent parts of the world are densely populated: certain urban centres offer attractive employment which leads to a demand for services of all kinds to improve the quality of life.

17. However, it cannot be said that a low population density necessarily benefits the inhabitants of an area. A low birth rate or a high infant and/or maternal mortality rate may result in a work force that is insufficient to exploit the country's natural resources, and this affects the people's capacity to produce sufficient material wealth to support health and other services.

#### *Mortality rates*

18. From the demographic point of view, the mortality rate of a population is the most reliable indication of its state of health and therefore of its enjoyment of the right to health. The trends of foetal, infant and child mortality are particularly sensitive in this respect.

19. Freedom from early or unnecessary death, regardless of racial origin or social class, has not been achieved even in countries with relatively high levels of living and where, in general, such questions are given serious attention. Substantial differences in the infant death rates between social and ethnic groups in the same country are by no means uncommon.

#### *Declining mortality and birth rates*

20. When mortality declines in a population, birth rates usually follow a downward trend. The same complex circumstances of social and economic development and of progress in health care appear to operate, first on the avoidance of fatal illnesses and then, sooner or later, on reproductive behaviour. Recent research has shown that the more rapid the decline in infant mortality in a country, the shorter the time interval between this decline and a fall in the birth rate.

21. Many countries are taking vigorous steps to lower death rates. This is the aim of a number of health programmes, the development and application of which has been stimulated and sponsored by WHO. Research is still needed to identify the particular circumstances that affect mortality rates, trends and patterns in each country and region, especially those which prevent them from declining. Further epidemiological investigations, accompanied by clinical and laboratory research, are necessary to improve knowledge of the origin and course of the conditions responsible for high death rates.

#### *Fertility*

22. To consider death rates separately from fertility rates is a matter of strategy and not of essence, since they have an obverse relationship and are as indivisible as health itself. Health care not only may lead to the avoidance of unnecessary death, but may bring about increased birth rates by controlling infections which lower fecundity, by improving the nutritional status of mothers and children, by lengthening the fertile span of women and by increasing the chances of survival of all members of the family. Yet, as mentioned above, the complex circumstances of life that contribute to higher levels of living, not forgetting educational opportunities, often lead to the voluntary limitation of the size of the family, with or without official approval or aid.

#### *Family planning*

23. In order to exercise the right to determine the size of the family, parents must have access to knowledge and means. Family planning is a way of thinking and living that is adopted voluntarily as a result of knowledge, attitudes and responsible decisions being made by individuals and couples, in order to promote the health and welfare of the family group. Family planning includes education in the regulation of fertility, the provision of advice and services for contraception, abortion care and sterilization, and of facilities for the treatment of infertility. Access to such services and their utilization may lead to larger or smaller families,

depending upon individual desires. Lack of family planning may have exactly the same result, but here not only individual desires, but ignorance, poverty, malnutrition and disease, may be concerned. Family planning is not synonymous with reduction in the birth rate. It is the expression of each family's own population policy, since it provides the means of making a responsible decision about the number and spacing of children.

#### *Maternal and child health*

24. Family planning is an important factor in achieving the aims of maternal and child health services, so as to ensure that every expectant woman and nursing mother shall maintain good health, have a normal delivery, bear healthy children and learn the art of child care. For the child, the aims are to ensure that each one shall live and grow up surrounded by love and security in a healthy environment, receiving adequate nourishment and with the opportunities to learn the elements of healthy living. Good spacing gives the mother time to recover, physically and mentally, from her last pregnancy, to breast-feed and otherwise give her child adequate nourishment, and the time to attend to physical and mental needs that influence growth and development. There is now ample evidence, from the many countries in which appropriate research has been conducted, that a woman's best childbearing period is between 20 and 35 years of age, that the risk to the mother increases with each pregnancy after the fourth and that spacing of pregnancies two or three years apart is good for the health of the mother and the child. Experience shows that large families, repeated unspaced pregnancies and pregnancies in women under 20 years of age and in those approaching middle age, all entail definite risks. Among them are the increased possibility of miscarriage, abortion and infant mortality, of malnutrition in the child and of retarded physical and intellectual growth. Pregnancy and labour may be more difficult for the mother, who may even be exposed to serious illness and death. The whole family will probably suffer where such conditions prevail. It is not necessary to underline the effect of the death of the mother on the health of the father and children. Family planning is a rational means of reducing these risks, especially when it is made available in the context of maternal and child health care and comprehensive health services.

#### *Integrated services*

25. Services planned to take care of the multiple facets of health are essential if some of the problems inherent in family planning are to be solved. Fears from many causes are associated with the use of contraception in some parts of the world. The anonymity of all-inclusive services can inspire confidence in a woman who might hesitate to attend a clinic devoted exclusively to family planning or the distribution of contraceptives. There is no embarrassment involved in being seen in a centre where all health problems can be discussed and

a woman is assured of the privacy to which she has a right. If the community is so organized, she will be helped to give birth under optimum conditions and be well disposed to consider the use of contraceptives in the future and to seek help if they do not function to her satisfaction. The couple that has been aided to produce a child, when this appeared impossible, is obviously more open to health advice of all kinds.

#### *Nutrition*

26. The rights to food, to the satisfaction it gives and to freedom from hunger are accepted as basic. The nutritional importance of food, especially in the circumstances surrounding human reproduction, is a further illustration of the complexity and the interdependence of all health factors. Undernourishment does not prevent conception, but repeated pregnancies adversely affect the nutritional state of both mother and child. Where there are food shortages, the child usually suffers first, becoming vulnerable to the infections that are often the final blow in some of the less-favoured countries of the world and cause high mortality rates. While the desire to have large families often represents a need for manpower and for social security, it also reflects the well-founded pessimism of the poor concerning the life expectancy of their children. The interrelationship between infectious diseases, social and economic deprivation, quantity and quality of food and of the physical and mental development of the child cannot be gainsaid. Nevertheless, the staff of health services can contribute by advising on the best possible use of the available community resources. Technical means are available for avoiding some of the more obvious deficiency diseases, among them severe forms of protein-calorie malnutrition, nutritional anaemias, endemic goitre and vitamin A deficiency, which contribute to foetal wastage and high infant and maternal mortality and their consequences.

#### *Rights of the child*

27. In the past, society concentrated on the care of the pregnant woman, not only because of her obvious vulnerability, but because it is at this point in the vital chain that any care has its most dramatic effect. Various United Nations declarations and the WHO Constitution express a new point of view, in which the child's health is considered to be of equal importance to that of the mother; and within recent years, a separate declaration on the rights of the child has been adopted by the United Nations.

28. Ideally, the child should be able to be born free of hereditary defects; with adequate foetal development and without birth trauma, to be wanted and to be loved. The child needs the right kind of food, protection from the major infections and from injury, and access to education that will lead to the development of a sense of responsibility. The growing child needs to be protected from danger and this need for care and protection is recognized as a basic human right. The child also must be taught to protect himself and others: the

right to protection carries an implicit obligation to undertake responsibilities. The development of the responsible person is of particular importance when it is a question of exercising the right to family planning.

#### *Women's rights*

29. Women's rights are associated with the exercise of many rights and have health implications and possible demographic consequences. A woman's education and the degree to which she participates in the social, economic and cultural life of the community condition her attitude towards life and her expectations, her status in the family and the community, and will probably influence her decision about the number and spacing of her children. An educated woman is likely to marry later, which may affect the size of her family. Being literate, she can more easily take advantage of information and instruction on family planning. If she avails herself of the right to work outside the home, this may also be a factor in influencing family size. Whatever the couple's decision about the number and spacing of children, the informed woman's contribution is likely to be a responsible one. Large families can prevent women from enjoying their full rights, from pursuing educational opportunities, from exercising the right to free employment and from fully enjoying the right to health.

#### *Family responsibility*

30. If sound decisions about family planning or population policy are to be made, they must be made by responsible people, fully aware of the consequences of their decisions for themselves and for others. Government action, either positive or negative, can clash with the desires of families and individuals and seriously affect their rights. Even where family planning is accepted and promoted, there can be a denial of rights where an aesthetically satisfying or biologically safe method of contraception is not available. Only education at all levels and using all known techniques (from mass media to formal higher education) can reconcile the many and varying points of view involved in this situation. Neither the imposition of policy nor the provision of services is enough. National interest cannot transcend human behaviour, especially traditional behaviour. It is essential that policy makers and community leaders possess knowledge of all the factors involved so as to inspire confidence and free communication with families requiring advice and help on birth control or infertility.

#### *Influence of tradition*

31. Tradition and family planning sometimes go hand in hand. Many societies have ancient methods of spacing children: some kind of birth control is used almost everywhere. Certain practices are being discarded by societies in transition, and the development of women's rights leading to monogamy can mean greater risks to the mother due to the possibility of more frequent child-bearing, if no other method is substituted for the

enforced abstinence of polygamous marriage. As the old ways are left behind, modern contraceptives are sometimes viewed with suspicion as interference with traditional or inherent rights. The gap in communication can be even greater when the offer of help has authoritarian overtones rather than the ring of disinterested service. Health workers who understand the force and utility of tradition in community life can use it to bridge the gap in understanding. There is much to be learned here, for tradition itself can erect substantial barriers to free choice of family size. It may operate as social disapproval of small families; pity for the childless woman, who possibly is subject to ostracism or even divorce by her husband; or praise and admiration for the woman who produces many sons, no matter what the consequences for her health or that of her family.

#### *Legal obstacles*

32. A number of other obstacles exist to making free and responsible choices of family size and they constitute infringements of declared human rights. Some are legal. In certain countries, laws forbid the sale or distribution of contraceptives. In others where it is permitted, the fact may not be mentioned publicly or advertised. In not a few countries, no form of family planning, neither information, services, nor means, is available. Sometimes the distribution of contraceptives is separate from health services; and there is no follow-up nor means of reassuring or helping women who subsequently have difficulties, exposing them to psychological distress and health risk and often causing them to abandon the methods recommended. Even where other forms of contraception are permitted, abortion laws may prevent women from interrupting pregnancy when contraception has failed. In a few countries, abortion on demand is accepted, but this is rare. The range is from this liberal position to the other extreme where access to legal abortion is denied even in those cases where there are serious medical and other indications.

33. Abortion is not recommended as a substitute for contraception as it is not conducive to the optimum physical and mental health of the mother. However, when there are indications that abortion care is necessary and a national policy has been declared on this matter, it should be provided under the best possible medical conditions.

#### *Economic obstacles*

34. A whole range of economic problems, from the national to the individual, may interfere with the right to health and to free choice of the size of the family. Governments may not be able to afford the cost of delivering health services to the whole or part of the population, nor to provide the staff to operate them. Individuals may not be able to pay for contraceptive devices, abortion care or treatment of infertility, not to speak of the necessities of life upon which health depends. The desire for a large family may be economically based, especially in an agricultural com-

munity. The illiteracy that so often accompanies poverty may in itself be an obstacle to making an informed and responsible decision about family size.

#### *Research*

35. Both the United Nations and the World Health Organization have recognized the human right to information and access to family planning services. However, there are many aspects of the question on which definite knowledge is lacking. Only careful research can provide the answers to problems that must be solved if the full expression of human desires, of individuals and members of families and of society, is to be achieved. Some of these problems are biomedical and are related to scientific aspects of human reproduction, while others are behavioural. All have clinical and public health importance.

36. Since the early 1960s the research programme of WHO has taken into account the many unknowns that prevent the successful delivery of family planning services. Special emphasis has been given to problems related to fertility regulation and birth-control methods, and to the study of infertility. Pregnancy wastage, foetal physiology and the mechanics of labour have also been studied. Research into the biomedical aspects of reproduction include reproductive biology and physiology, pharmacology and clinical questions concerned with the widespread use of contraceptives. The aim is to provide Governments with the best technical advice possible for family planning programmes and to increase understanding of human reproduction leading to the development of a variety of safe, acceptable and effective methods for its regulation. At the same time, investigations have been carried out in a variety of cultures and under different social conditions to determine how best to make knowledge of these methods accessible and available to the public, and to provide desirable and suitable services.

#### SUMMARY

37. In view of the wide range of human rights proclaimed by the United Nations and referred to above, any conclusions concerned with health must sooner or later lead to a discussion of whose health care is primary and be assessed in relation to the various priorities of a country and its constituent parts, namely, the community, the family and the individual. A number of differing interests are involved and compromises will inevitably have to be made if the health and harmonious relations of all peoples are to be achieved. Hence, the following questions will be likely to recur.

38. The sovereign rights of States are undisputed. Governments decide upon their own policies from the point of view of the greatest good for the greatest number. Yet, many social, economic and political conditions set and determined by a Government may affect the decisions made by a family unit as to when to have

children and how many. Governments may, for example, offer, depending upon their policies, positive or negative financial inducements with regard to family size, such as will have obvious implications for the health of the family. In the same light, information and services for family planning may, or may not, be made available. This, too, directly affects a couple's achievement or avoidance of parenthood—a major event in their life and mutual harmony.

39. However, the subject is a complex one, and today the difficulty in the implementation of human rights lies in the gap between actualities and the

complex nature of the rights themselves and their requirements.

40. Human rights, without implementing legal instruments, are likely to remain pious wishes. However, the culture, religious and ethical situations in individual countries need to be considered, even if, from the strictly logical point of view, experts might well consider having recourse to what appear to be rational solutions.

41. The interest of WHO in respect of the health aspects of human rights is clear. In association with member States, the Organization is concerned to implement the objectives of its Constitution and the policies laid down by the World Health Assembly.

## LE STATUT LEGAL DE LA FEMME MUSULMANE DANS PLUSIEURS PAYS DU MOYEN-ORIENT \*

*Commission économique des Nations Unies pour l'Asie occidentale\*\**

1. Le Moyen-Orient étant composé d'une population en grande majorité musulmane, la législation des pays de cette région est nécessairement inspirée du droit musulman. Or, la loi musulmane (*shari'a*) découle directement des textes sacrés de l'Islam; il est donc difficile de concevoir un droit indépendant de la religion. Ainsi, pour étudier le statut de la femme musulmane, il faut se référer aux sources traditionnelles du droit musulman, c'est-à-dire aux textes sacrés de l'Islam.

2. "Aujourd'hui J'ai parachevé votre religion et vous ai accordé Mon entier bienfait. J'agréé pour vous l'Islam, comme religion"<sup>1</sup>, "Nous n'avons rien omis dans l'Ecrit"<sup>2</sup> "Et Nous, avons fait descendre sur toi l'Ecriture (comme) Eclaircissement de toutes choses, (comme) Direction, Miséricorde et Annonce pour les Musulmans"<sup>3</sup>. Le Coran, première source de la loi, est le livre sacré de l'Islam, il renferme les révélations successives d'Allah à son Prophète Mohammed. Il se compose de 114 chapitres (*sourates*) divisés eux-mêmes en 6 219 versets (*ayats*). Les textes coraniques qui ont trait au droit se caractérisent par deux tendances : d'une part, les textes juridiques sont peu nombreux, d'autre part les prescriptions juridiques sont formulées en principes généraux ne comportant pas de détail (sauf pour les grands crimes et les droits successoraux qui sont réglés d'une façon assez minutieuse). Ces deux tendances ont rendu le droit musulman apte à évoluer.

3. Le Coran a pour compléments indispensables les récits (*hadiths*) qui relatent le comportement du Prophète dans diverses circonstances de sa vie et dont l'ensemble forme la tradition (*Sunna*). La *Sunna*, deuxième source principale de droit musulman, constitue avec le Coran les deux sources principales de ce droit. Cette source n'est que l'expression indirecte de la volonté divine; c'est la conduite du Prophète, les paroles prononcées par lui, ses actes ou enfin ses attitudes tacites, approbatives ou reprobatives.

\* Document E/CONF.60/SYM.IV/17 préparé pour le Symposium sur la population et les droits de l'homme, Amsterdam, 21-29 janvier 1974.

\*\* Résumé d'une étude préparée pour le Bureau des affaires économiques et sociales de l'Organisation des Nations Unies à Beyrouth par M. William Haddad, docteur en droit, chargé de cours à la Faculté de droit de l'Université libanaise, avec la collaboration de M. Soufy Ahoutalib, docteur en droit, professeur à la Faculté de droit au Caire.

<sup>1</sup> Coran, Sourate V, 5/3.

<sup>2</sup> *Ibid.*, Sourate VI, 38.

<sup>3</sup> *Ibid.*, Sourate XVI, 91b/89.

4. L'étude du Coran et ses explications ont donné naissance à une science appelée *tafsir* (interprétation ou explication). Le *tafsir* n'est pas une source de la loi mais l'outil indispensable à la compréhension du Coran et de la *Sunna* tant du point de vue du sens à accorder aux mots que de celui de la graphie.

5. Par ailleurs, lorsque le Coran et la *Sunna* expliqués par le *tafsir* ne prévoient pas de solution à un problème posé, on peut avoir recours à deux nouvelles sources (dérivées) de normes juridiques, l'*idjmaa* et le *qiyass*. Celles-ci ne reposent plus sur l'interprétation littérale des textes, mais consacrent le rôle du raisonnement collectif et individuel dans l'élaboration de la règle de droit, l'*idjtihad*.

6. L'*idjmaa*, troisième source du droit musulman a pour fondement le dogme de l'infaillibilité de la communauté musulmane lorsqu'elle est unanime. Ce n'est pas une assemblée publique ni un concile religieux. L'accord à l'unanimité ne saurait être conçu comme le résultat d'un plébiscite imposé à tous les peuples musulmans. Au point de vue de l'objet, le rôle de l'*idjmaa* est de statuer sur un problème qui n'a pas été tranché par le Coran ou la *Sunna*. L'*idjmaa* se réduit en dernière analyse à un facteur d'évolution du droit musulman. Grâce à lui le droit musulman a acquis une souplesse suffisante pour s'adapter à l'évolution de la société musulmane.

7. Le *qiyass* est le raisonnement analogique utilisé lors de la résolution de certains problèmes en les ramenant à des cas semblables réglés conformément à l'esprit de la loi. C'est la quatrième source de la loi et la première fondée sur un critère purement humain, donc faillible. Les controverses qu'elle a suscitées nécessitent que la loi soit définie de manière précise de façon à éviter les déductions arbitraires et inconséquentes. Il arrive que deux déductions formulées par deux théologiens-juristes (*mudjtahids*) différents peuvent être parfaitement contradictoires. C'est pourquoi la déduction analogique ne peut s'ériger en loi qu'avec le consensus des docteurs et relève alors de l'*idjmaa*.

8. L'*idjtihad* est l'effort de création législative opéré par le *mudjtahid*, au moyen du *qiyass* et de l'*idjmaa* pour résoudre les problèmes qui se posent à la communauté musulmane conformément aux fondements de la *Shari'a* (Coran et *Sunna*). Il vise à renouveler la loi afin de l'adapter constamment aux exigences nouvelles de la communauté. C'est le principe même d'évolution de l'Islam du septième au dixième siècle de notre ère,

époque à laquelle il va disparaître pour faire place au conformisme, le *taqlid*.

9. Les deux notions contraires d'*idjtihad* et de *taqlid* sont conciliables par le fait que cette dernière ne s'applique qu'aux principes fondamentaux de l'Islam. Celui-ci est le fondement religieux sur lequel reposent les différentes écoles du *fiqh* (interprétation des textes sacrés en matière juridique). Les seuls juristes ont été les fondateurs (*imams*) des quatre rites orthodoxes :

a) En premier lieu, le rite (école) hanéfite, fondé par l'Imam Abou Hanifa (mort en 767 de notre ère) en Irak. Son école est celle des partisans de la "raison" (*ra'y*); elle compte le plus grand nombre de fidèles : plus d'un tiers des musulmans du monde entier<sup>4</sup> (Irak, Syrie, Egypte, Jordanie, Liban, Pakistan, Inde, Afghanistan, Union des Républiques socialistes soviétiques et Turquie);

b) En deuxième lieu, le rite (école) malékite, fondé par l'Imam Malek (mort en 795 de notre ère). Ses partisans appelés "gens du *hadith*" par opposition aux gens du *ra'y*", sont au nombre de 85 millions environ<sup>4</sup> (principalement en Afrique du Nord, au Nigéria, au Soudan et au Koweït);

c) En troisième lieu, le rite (école) chaféite, fondé par l'Imam Al-Chafei (mort en 820 de notre ère) est une sorte de synthèse des deux rites précédents. C'est le second par son importance numérique : 130 millions d'adeptes en Indonésie, à Bahreïn, en Arabie méridionale, en Insulinde, en Afrique orientale, en Egypte et en Syrie.

d) En quatrième lieu, le rite (école) hanbalite, fondé par l'Imam Iban Hanbal (mort en 855 de notre ère) prône le retour à la tradition rejetant toute innovation. La secte des Wahhabites, fondée au dix-huitième siècle en Arabie, compte les seuls adeptes de ce rite. Le hanbalisme est la doctrine officielle de l'Arabie Saoudite.

10. L'importance de ces écoles a varié selon les pays et les époques pour des raisons politiques. A l'heure actuelle, elles se reconnaissent mutuellement comme orthodoxes puisque leurs divergences ne sont que rituelles ou juridiques et que le Prophète aurait dit dans un *hadith* "les divergences d'opinions régnant dans ma communauté sont une manifestation de la grâce de Dieu"<sup>5</sup>. Les adeptes des quatre grandes écoles sont désignés sous le vocable de "gens de la Tradition" (*ahl-el-Sunna*)<sup>6</sup>.

11. En outre, des sources spontanées, telles la coutume, l'*Orf*, la jurisprudence, l'*amal* et le règlement, le *qanoun* et la loi sont des sources inépuisables qui entraînent l'évolution du droit positif dans les différentes écoles. Bien que les coutumes locales n'aient jamais été considérées comme les sources de la loi musulmane, elles

ont acquis une importance certaine par des moyens divers. La majorité des docteurs n'a jamais accordé à l'*Orf*, la coutume, la valeur d'une règle légale. Son rôle est d'adapter la loi plutôt que de la modifier. D'autre part, la règle jurisprudentielle, l'*amal*, qui a souvent pour fondement la coutume, vient aussi suppléer à la carence de la *Shari'a* dans le développement du droit positif.

12. Le règlement administratif, le *qanoun siyasi* est une nouvelle source du droit, qui découle du pouvoir de légiférer, accordé au souverain pourvu que sa décision n'aille pas à l'encontre d'anciennes règles fondamentales de la *Shari'a*. C'est une sorte de sécularisation de la loi islamique dans le domaine politique.

13. On s'apercevra que treize siècles plus tard, le statut de la femme dans certains pays du Moyen-Orient demeure régi par les dispositions de la *Shari'a* et qu'en dépit d'une certaine évolution la *Shari'a* demeure la source juridique fondamentale.

#### LE STATUT JURIDIQUE DE LA FEMME D'APRÈS LA LÉGISLATION CORANIQUE

##### *Le statut de la femme dans la famille*

###### *Les fiançailles (Khutba)*

14. L'importance des fiançailles (ou promesse de mariage) est toute relative en droit musulman, puisque les parties peuvent ne pas y donner suite sans encourir de sanction légale. Elles peuvent être conclues à tout âge. Les fiançailles n'ont donc, en principe, aucun effet juridique, mais une indemnité pourrait cependant être accordée dans le cas où la rupture des fiançailles causerait un dommage. Cette indemnité est fondée sur la responsabilité délictueuse.

15. Il n'est pas rare dans certains pays que l'on arrive à la "conclusion du mariage" ou "signature du contrat" *katb el kitab* sans que les fiancés aient pu se voir. Cette pratique va à l'encontre de la règle religieuse la plus stricte qui permet au prétendant de voir le visage et les mains de sa future épouse.

###### *Le consentement au mariage*

16. Le mariage en droit musulman est un contrat consensuel, il n'est soumis à aucune condition de forme et n'implique aucune solennité, ni religieuse, ni civile. Le consentement mutuel suffit pour la conclusion du mariage, mais la présence de deux témoins musulmans est exigée pour sa validité.

17. Théoriquement, toute personne pubère doit donner son consentement au mariage et toute personne impubère peut être contrainte au mariage en vertu du droit de contrainte matrimoniale, le droit de *djabr*. Le mariage des mineurs ou des simples d'esprit est soumis au consentement de leur représentant légal, le *wali*.

18. Le titulaire du droit de *djabr* est le père, mais l'ordre selon lequel il est dévolu, en l'absence du père, varie selon les rites. L'institution du *djabr* est établie dans l'intérêt de l'enfant.

<sup>4</sup> Voir S. Mahmassani, *Cours de droit musulman et libanais*, Beyrouth, Faculté de droit, 1967 (en arabe).

<sup>5</sup> *Idem*.

<sup>6</sup> Le rite chiite qui se rapproche des écoles orthodoxes par bien des points s'en écarte par son refus d'accepter la fermeture de la "porte de l'effort" (*idjtihad*).

19. La durée du droit de *djabr* est variable selon les écoles. Pour les Hanéfites, elle cesse à l'âge de la puberté pour les garçons comme pour les filles. A cet âge, la femme comme l'homme aura le droit de se marier sans avoir besoin de l'autorisation du *wali*; elle pourra conclure son mariage elle-même ou par un mandataire. Pour les Malékites la durée du *djabr* cesse après la puberté au moment de la perte légale de la virginité. Contrairement aux Hanéfites, les Malékites, Chaféites et Hanbalites ne permettent pas à la femme de conclure seule son mariage, même si elle n'est plus soumise au *djabr*; c'est toujours son *wali*, qui la représente après avoir obtenu son consentement, et s'il s'abstient, elle peut s'adresser au juge.

20. La validité du mariage du mineur contracté par le *wali* dépend de l'autorité du *wali*. Le père a une autorité absolue, les autres *wali* ont une autorité restreinte. Si le mariage est contracté par le père de l'enfant (ou le grand-père), il est supposé être conclu dans l'intérêt de l'enfant, aussi reste-t-il toujours valable et irrévocable à moins que le contraire soit prouvé. On justifie cette règle par l'amour et la tendresse du père envers ses enfants. Par contre, s'il est conclu par un *wali* autre que le père, le mariage est révoqué à moins qu'il ne soit dans l'intérêt des mineurs. Dans ce cas, même si le mariage est conclu dans les meilleures conditions, l'enfant a, à l'âge de la puberté, l'option de puberté (*khyar alblough*), c'est-à-dire qu'il a le droit de s'adresser au juge pour demander la dissolution du mariage.

#### Illégalité du mariage de la femme musulmane

21. L'homme musulman peut en principe se marier avec une femme du Livre (chrétienne ou juive).

22. En revanche, le mariage de la femme musulmane avec un non-musulman ne peut en aucun cas être toléré. L'interdiction est absolue. La justification en est la suivante: le mariage d'un musulman avec une femme juive ou chrétienne ne porte pas atteinte à la religion des épouses puisque l'Islam reconnaît les deux religions du Livre. Quant au mariage d'une musulmane avec un non-musulman, il est considéré comme préjudiciable à la foi de la femme musulmane, car l'homme chrétien ou juif ne reconnaît pas la religion musulmane, postérieure aux deux autres. La femme musulmane qui en connaissance de cause, ne se conforme pas à cette interdiction est considérée comme apostate<sup>7</sup>. En droit musulman, l'apostasie est une cause d'extinction de la personnalité et de mort civile absolue<sup>8</sup>. L'apostasie est même passible de lapidation. L'impossibilité légale du mariage de la musulmane avec un non-musulman a toujours fait l'accord unanime de la communauté musulmane<sup>7</sup>.

#### La dot maritale (mahr)

23. La dot est une des conditions essentielles du

<sup>7</sup> Voir M. Chaltout, Al-Fatwa, *Les avis donnés par les Ulémas*, Le Caire, publications de l'Administration générale de la Culture islamique, 1959, (en arabe).

<sup>8</sup> Voir F. M. Pareja, *Islamologie*, Beyrouth, Imprimerie Catholique, 1964.

mariage, un mariage sans dot est considéré comme nul chez les Malékites.

24. Les Hanéfites ne vont pas jusqu'à le considérer comme tel: mais en cas de décès ou de répudiation, la dot non fixée lors du mariage sera calculée en fonction de la situation sociale de la femme avant celui-ci, c'est la dot de parité ou d'équivalence (*mahr-al-mithl*).

25. Il faut préciser que la dot est totalement distincte du trousseau et qu'elle doit se présenter sous forme d'argent ou de valeurs immobilières mais en aucun cas de choses interdites. Elle peut être réduite à une valeur symbolique; cette solution est admise pour un homme pauvre, mais dans la majeure partie des cas la dot doit correspondre à la condition de la femme.

26. C'est une erreur que d'assimiler la dot à un prix de vente car le mariage (*nikah*) n'a jamais été identifié à un contrat de vente. La dot est accordée légalement à la femme pour subvenir à ses besoins en cas de répudiation par le mari, d'autre part elle invite ce dernier à réfléchir avant de prendre une telle mesure. La dot est généralement divisée en deux parties, l'une payable au moment de la conclusion du mariage (*moucadam*) et la seconde à sa dissolution (*moukhar*). En cas de décès du mari, le *moukhar* est la première somme prélevée sur l'héritage.

27. Quant au moment où la dot doit être payée, il faut distinguer entre le contrat valable et le contrat vicié (annulable). Dans le premier cas, elle n'est exigible qu'après la consommation effective du mariage. Si le mariage valable est résilié avant sa consommation, la femme recevra la moitié de la valeur du *mahr*.

28. Allant à l'encontre des dispositions légales dans ce domaine, on constate aujourd'hui que le montant du *mahr*, loin d'être dérisoire, atteint souvent des sommes élevées dans quelques pays islamiques.

#### Le devoir des époux

29. La supériorité bien établie de l'homme sur la femme n'empêche pas qu'il ait aussi des devoirs envers elle: premièrement, le devoir de cohabitation, une fois le mariage consommé; deuxièmement, la consommation du mariage et l'accomplissement du devoir conjugal; troisièmement, le mari doit bien traiter sa femme à l'exemple du Prophète; quatrièmement, l'entretien, le *nafaqa*, est l'obligation fondamentale du mari, s'il ne s'y soumet pas, la femme a le droit de demander la dissolution du mariage.

30. Les devoirs de la femme sont faciles à déduire: premièrement, elle doit obéissance à son mari pour toutes choses licites, elle ne peut se refuser à lui qu'en ceinture ou malade; deuxièmement, elle ne doit pas quitter le domicile conjugal à moins qu'une autre résidence n'ait été prévue dans leurs accords; troisièmement, elle doit vaquer aux occupations ménagères si son mari ne peut lui offrir des serviteurs; quatrièmement, elle doit fidélité à son mari: "Dotez-les équitablement, qu'elles soient chastes, qu'elles n'aient pas d'amants"<sup>9</sup>.

<sup>9</sup> Voir L. Milliot, *Introduction à l'étude du droit musulman*, Paris, Sirey, 1953.

### La polygamie

31. Le mari musulman peut simultanément avoir quatre épouses légitimes et autant de concubines qu'il le désire. Institution préislamique, la polygamie a été transformée en tétragamie par l'Islam. Du point de vue de sa réglementation, la polygamie est déterminée par deux conditions : égalité entre les épouses et obligation de les entretenir.

32. La femme qui ne voudrait pas encourir le risque d'avoir des co-épouses a le droit de faire insérer dans son contrat de mariage une clause entraînant sa dissolution si le mari venait à prendre une autre épouse. D'ailleurs, peu nombreux sont les hommes qui pratiquent actuellement la polygamie.

### Le concubinage

33. La limite imposée à l'homme en matière de polygamie ne concerne que les épouses légitimes, pour les concubines le nombre est illimité. Le concubinat qui trouve sa source dans le Coran relève à la fois de l'esclavage et de la polygamie.

34. Institution très répandue dans l'Arabie préislamique, l'esclavage cadrait bien avec les mœurs guerrières de l'époque. L'Islam améliora cet état de choses, recommandant l'affranchissement des esclaves et faisant disparaître l'esclavage presque complètement.

### La répudiation et autres formes de dissolution du mariage

35. La répudiation (*talaaq*) qui signifie en arabe "libération d'un lien" est le moyen par lequel le mari renonce à tous les droits qu'il a sur la femme en vertu de son contrat de mariage<sup>10</sup>. C'est un droit accordé uniquement à l'homme qui, en vertu de la Loi Divine, peut à tout instant, sans formalités, rompre le lien conjugal. La femme ne jouit pas de ce privilège, à cause de sa nature émotive : trop impulsive, elle risquerait de ne pas réfléchir suffisamment avant de prendre une décision aussi grave.

36. La répudiation est mal vue en droit musulman. Le mari a la possibilité de répudier sa femme trois fois. La répudiation est révocable les deux premières fois, mais elle devient irrévocable après la troisième fois.

37. La répudiation révocable ne prive pas le mari de son droit de reprendre sa femme et cela sans avoir besoin d'un nouveau contrat. Elle n'a aucun effet sur leur engagement réciproque. Au contraire, la répudiation irrévocable a pour effet la dissolution du mariage, le mari ne peut plus reprendre sa femme sans son consentement et leur engagement réciproque n'existe plus.

38. Par ailleurs, le mariage peut être dissous par le *qadi*, à la demande de l'épouse :

a) Si le mari ne subvient pas à son entretien;

- b) En cas d'absence prolongée du mari;
- c) Au cas où il y aurait eu conclusion d'un mariage en dépit de liens de parenté interdits;
- d) En cas de vice rédhibitoire inhérent à l'époux (impuissance, maladie);
- e) S'il y a sévices ou mauvais traitements.

39. Le Coran ne condamne pas la séparation par consentement mutuel des époux "Si une femme craint, de son époux, rudesse ou indifférence, nul grief à leur faire s'ils procèdent entre eux à quelque arrangement, car l'arrangement est un bien"<sup>11</sup>. Le *khoul* est l'institution par laquelle le mari répudie son épouse à la demande de celle-ci qui s'engage à lui verser une compensation; il est blâmable, dit Al-Ghazali, que le mari lui réclame plus qu'il n'a donné en dot<sup>12</sup>.

### La garde des enfants (hadana)

40. En ce qui concerne la garde des jeunes enfants ce sont les femmes qui ont le pas sur les hommes. Dévolue à la mère, la *hadana* passe, si cette dernière venait à faire défaut, aux femmes de la ligne maternelle de préférence. Cependant la mère, d'après l'opinion de plusieurs juristes, perd automatiquement ce droit si elle se marie avec un homme qui n'est pas parent de l'enfant à un degré tel que la garde puisse éventuellement lui être dévolue<sup>13</sup>. La personne à qui est dévolue la *hadana* doit veiller à l'entretien et à l'éducation de l'enfant sans en assumer les frais.

### Le droit à la contraception

41. Le Coran et les *hadiths* sont émaillés d'exhortations à la procréation. Mais ceci n'implique pas que les pratiques contraceptives aient été condamnées par l'Islam. La seule qui soit mentionnée dans les textes sacrés est le "coïtus interruptus" ou (*azl*). Les *hadiths* nous apprennent qu'on y avait recours du temps du Prophète et qu'elle aurait reçu son approbation dans certains cas.

42. Les Etats qui ont inauguré une politique de famille planifiée, l'Égypte en particulier, ont obtenu des docteurs de la Loi, des *fatwas* en faveur de la limitation des naissances. M. Chaltout, Cheikh d'Al-Azhar<sup>14</sup>, est en faveur de celle-ci dans les cas suivants : femmes trop fécondes; personnes atteintes de maladies graves ou contagieuses; personnes incapables de faire face aux responsabilités familiales.

43. Quant à l'avortement, il est admis par le même auteur, dans le cas où la vie de la mère se trouverait en danger. Au cours des siècles les *Ulémas* se sont penchés sur le problème des pratiques abortives. Cependant la divergence de leurs vues prouve que les textes sacrés permettent des interprétations multiples.

<sup>11</sup> Voir Coran, Sourate IV, 127/128.

<sup>12</sup> Al-Ghazali, *Le livre des bons usages en matière de mariage*, traduction française annotée par L. Bercher et G. H. Bousquet, Paris, A. Maisonneuve, 1953.

<sup>13</sup> L. Milliot, *op. cit.*

<sup>14</sup> M. Chaltout, *op. cit.*

<sup>10</sup> F. M. Pareja, *op. cit.*

### *Le statut de la femme en matière successorale*

44. Le système successoral musulman est un système original, il ne ressemble ni aux systèmes de l'antiquité ni aux systèmes modernes. Il est différent des coutumes pré-islamiques, souvent contradictoires.

45. Les textes coraniques réglementent la succession d'une façon très détaillée. D'après ces textes la succession est attribuée aux parents des deux côtés. Certains héritiers ont une part fixée, les autres ont le reste. La femme n'est pas exclue de la succession. Les textes lui reconnaissent le droit successoral soit en sa qualité de mère, sœur ou fille. La part qui lui revient est égale à la moitié de celle de l'homme.

46. Il y a toutefois des cas d'exception dans lesquels la part de la femme peut être égale à celle de l'homme : cas des sœurs utérines; cas du père et de la mère se trouvant héritiers avec des enfants mâles.

47. Le Coran favorise ici la mère qui, en Islam, jouit d'une plus grande considération que la femme qui n'a pas d'enfants. Il favorise aussi la veuve en lui accordant une part imposée de l'héritage de son mari (un huitième si le mari a des enfants, un quart à défaut d'eux).

### *Le statut de la femme en droit pénal musulman*

#### *Unité et diversité des peines suivant le sexe*<sup>15</sup>

48. Le droit pénal musulman se caractérise par la division des crimes en deux genres les crimes dits *hudud* (limites du Dieu), les crimes dits *taisir* (faits illicites). Les premiers sont des infractions punies de peines fixées dans le Coran et la *Sunna* : le vol, le brigandage, la fornication, la rébellion, l'usage du vin, l'injure et la diffamation. Les *taisir* sont des faits illicites qui ne constituent pas un crime *hrad*. La peine dans ce cas est laissée à l'appréciation du juge. La réglementation des *hudud* est très rigide tandis que celle des *taisir* est très souple.

49. L'ensemble des *fouqahas* est d'avis que les peines infligées pour le meurtre d'un homme ou d'une femme doivent être les mêmes. Ils s'accordent aussi pour appliquer les mêmes sanctions sans distinction de sexe pour tous les crimes en dehors du meurtre, soit les *hudud* soit les *taisir*.

#### *Le prix du sang (diya)*

50. Conscient des méfaits de la vendetta, vengeance illimitée, qui dégénérait souvent en guerre dans l'Arabie préislamique, l'Islam s'est efforcé d'humaniser la justice privée, en lui substituant le talion "principe d'égalité et de proportionnalité". Dans le même esprit, il a substitué au talion la compensation légale. Moyennant le prix du sang répandu par l'offenseur, la partie lésée renonce à sa vengeance<sup>16</sup>. C'est le Coran qui consacre la *diya* en

<sup>15</sup> Pour l'ensemble du problème, voir A. M. Ibrahim. *La peine en droit musulman et dans le Code pénal égyptien*, Thèse, Le Caire, 1944; Abou Zahra, *Le crime et la peine*, Le Caire, 1958.

<sup>16</sup> L. Milliot, *op. cit.*

imposant son usage pour le meurtre non intentionnel et intentionnel.

51. Le principe ainsi posé devait être réglementé dans les détails par le Prophète et l'ensemble des juristes musulmans. Ainsi le montant de la *diya* devait-il varier selon qu'il s'agissait du meurtre d'un homme ou d'une femme, d'un musulman ou d'un non-musulman, d'un adulte ou d'un enfant. Une distinction a également été établie entre meurtre et lésion corporelle<sup>17</sup>. Plusieurs juristes sont d'avis que la *diya* de la femme est équivalente à la moitié de celle de l'homme. Ils posent cette règle par analogie à la part de la femme dans la succession. D'autres juristes refusent cette conclusion: la *diya* est une sanction pénale contre le meurtre d'une personne or la femme a une personnalité juridique égale à celle de l'homme, par conséquent sa *diya* doit être égale à celle de l'homme; ils ajoutent que la différence entre l'homme et les femmes dans la succession n'est pas une règle générale<sup>18</sup>.

#### *L'adultère ou zina (fornication)*

52. L'Islam n'a pas de terme pour désigner l'adultère proprement dit; celui-ci est englobé dans le concept de *zina* ou fornication: "tout acte sexuel tombant sous le coup d'une prohibition divine coranique" selon la définition de L. Bercher. C'est le talion le plus important de la religion musulmane.

53. Le même sort est réservé au fornicateur et à la fornicatrice. Mais les peines varient selon qu'elles s'adressent à un coupable *mouhçan* (homme ou femme légalement marié) ou un *non-mouhçan*. Le *mouhçan* encourt la peine de mort par lapidation, peine qui n'a pas été prévue dans le Coran mais formulée par la Tradition. Au contraire le *non-mouhçan* est puni de 100 coups de fouets (ou de 50 s'il est esclave).

54. Les preuves de *zina* peuvent être les suivantes: premièrement, la grossesse résultant de relations illicites, si le mari prouve qu'il n'a pas eu de rapports avec son épouse, dans ce cas, l'époux peut invoquer la théorie de "l'enfant endormi" (2 à 5 ans); deuxièmement, l'aveu, que le juge doit tout faire pour éviter, doit être fait quatre fois pour donner le temps non seulement à la réflexion mais aussi à la possibilité de rétractation; troisièmement, la preuve par témoignage, à laquelle il est difficile d'avoir recours puisque "la loi exige quatre témoins mâles, pubères, libres, sains d'esprit et dignes de confiance".

55. Il serait intéressant de signaler que la prostitution devrait être théoriquement inexistante dans les pays islamiques, d'une part à cause de la structure familiale (polygamie et concubinage), d'autre part à cause du sévère interdit qui frappe le *zina*. Elle a de plus été condamnée dans un verset du Coran "... ne forcez pas vos esclaves femmes à la prostitution, alors qu'elles veulent vivre en *muhçana*! Quiconque les force (sera seul coupable)"<sup>19</sup>. La prostitution a été tolérée seulement dans

<sup>17</sup> J. El-Hakim, "La *diya* dans le droit syrien et libanais".

<sup>18</sup> A. M. Ibrahim, *op. cit.*

<sup>19</sup> Voir Coran, Sourate XXIV, 33.

quelques pays mais souvent les autorités locales en ont profité pour lever des taxes sur les prostituées.

56. Nous devons noter aussi que le droit musulman ne connaît pas l'institution de l'enfant illégitime. Il ne permet ni la reconnaissance de l'enfant naturel ni sa légitimation.

#### *Principe de la supériorité du témoignage de l'homme dans le cadre de la procédure pénale en droit musulman*

57. Pour la plupart des juristes le témoignage de la femme n'est pas admis dans les affaires graves (*hudud*). Elle ne peut pas témoigner dans les affaires relatives à l'Etat. Son témoignage est toutefois admis dans des questions comme celles de l'avortement. Quelques juristes acceptent le témoignage de la femme dans les *hudud* de la même façon que dans les autres cas<sup>20</sup>.

58. En dehors de ces cas, le témoignage d'un homme peut être remplacé par celui de deux femmes. Ceci serait motivé par la nature sentimentale de la femme qui l'entraîne à imaginer autre chose que la vérité.

59. Des auteurs musulmans contemporains se sont élevés contre ce genre de justification qui n'est plus valable à notre époque: "L'ignorance de la femme à l'époque où elle était soumise à l'homme justifiait sans doute la règle relative à l'infériorité de son témoignage. Mais la femme moderne, généralement aussi instruite et évoluée que l'homme ne saurait encore être considérée devant les tribunaux comme inférieure à cet égard à l'homme même illettré<sup>21</sup>."

#### *La femme et la vie publique*

60. Rien dans le Coran ou la *Sunna* n'interdit à la femme de participer à la vie publique dans ses différents aspects: politique, administratif, religieux et social.

61. Si la femme a longtemps été tenue dans l'ignorance et l'est encore dans certaines régions, ceci n'a certainement pas de fondement coranique, bien au contraire, un *hadith* affirme qu'il faut donner à la fille les mêmes possibilités de s'instruire qu'au garçon.

#### *La femme et la vie politique*

62. Dans l'Arabie préislamique, la femme traitée en objet par certains était digne d'accéder au pouvoir par d'autres. L'avènement de l'Islam uniformisa la condition de la femme entre ces extrêmes.

63. Sans l'écarter de la vie politique de la communauté, le Prophète lui a refusé la possibilité d'accéder au pouvoir: "Un pays gouverné par une femme est un malheureux pays" dit un *hadith*. Par contre, il lui a accordé de participer à l'investiture du chef de la Communauté musulmane (*biya'a*) après qu'elle l'eût revendiquée.

64. Tout au long de l'histoire de l'Islam, on trouve des femmes sur la scène politique. Les hommes, un peu

partout, se coalisèrent pour reléguer la femme au foyer et l'empêcher de prendre une place importante dans les domaines réservés à l'homme. Ce n'est qu'à partir du début du XX<sup>e</sup> siècle que des modernistes musulmans se sont élevés contre la condition inférieure réservée à la femme. Parmi ceux-ci il faut citer Qassem Amin, Mohammed Abdou, Mohammad Rachid Ridha et l'ensemble de l'école salafiya dont le courant réformiste continue à rayonner.

#### *La femme et la vie administrative*

65. On doit distinguer entre les fonctions de souveraineté et les fonctions administratives. "Les femmes manquent de jugement et de religion, elles n'ont jamais émis une opinion valable" et "Dieu, par souci de perfection, n'a jamais choisi ses prophètes parmi les femmes". Le *hadith* précité nie à la femme la possibilité d'accéder au pouvoir. Les juristes qualifient le ministère, le gouvernement des provinces (*wali*) et le pouvoir judiciaire comme des démembrements du pouvoir suprême, aussi ont-ils dit que toutes ces fonctions sont inaccessibles à la femme. Les Hanéfites font une exception pour les fonctions du *qadi* (juge) en disant que la femme peut rendre la justice, comme juge ou arbitre, dans toutes les affaires où son témoignage est admis. Pour les fonctions administratives, il n'y a pas de textes qui interdisent à la femme de les occuper. Or il est de principe que tout ce qui n'est pas interdit est supposé permis. L'histoire nous rapporte quelques exemples rares d'enseignantes, d'infirmières ou d'accoucheuses. Cela s'explique par le fait que les femmes, dans le passé, ne travaillaient pas en dehors de la maison. Mais l'histoire nous rapporte plusieurs exemples de la participation de la femme dans les guerres (*djihad*). Tous les juristes sont d'avis que la femme a le droit de participer à la guerre; cette participation devient un devoir quand l'ennemi envahit un pays musulman, et cela même sans l'autorisation de son mari.

#### *La femme et la vie religieuse*

66. Elle peut professer l'Islam comme l'homme et avoir les mêmes récompenses dans l'au-delà. Les obligations religieuses de la femme sont en fait celles de l'homme, à la différence que ce dernier peut les accomplir publiquement. Même dans les mosquées les places réservées aux femmes les cachent aux yeux des hommes, tout en leur permettant de suivre la prière. La prière, l'aumône, le jeûne et même le pèlerinage<sup>22</sup> ne sont pas interdits à la femme; bien au contraire, ils lui attirent comme à l'homme la miséricorde d'Allah. Mais elle ne peut en aucun cas diriger une prière, c'est une fonction religieuse essentiellement masculine.

67. Il ne faut pas oublier non plus que la femme est souvent la cause de l'impureté de l'homme qui l'a approchée. En effet, ce dernier doit alors procéder à des ablutions avant de prier.

<sup>20</sup> A. M. Ibrahim, *op. cit.*

<sup>21</sup> Voir M. J. Beyham, *La fille de l'Orient dans la civilisation de l'Occident*, Beyrouth, 1952 (en arabe).

<sup>22</sup> A la Mecque, le pèlerinage des femmes s'effectue dans les mêmes conditions que celui des hommes.

## La femme et la vie sociale

68. La participation de la femme à la vie sociale et son droit au travail sont fonction, d'une part, de son instruction et, d'autre part, de la latitude qu'on lui donne de se mêler aux hommes. Aussi convient-il d'examiner chacune des données de cette importante question.

### Le port du voile

69. Il convient tout d'abord de définir cet élément du vêtement féminin dans l'Islam. Ni un objet de parure ni une protection contre la chaleur, la pluie ou le froid, le voile a une fonction quasiment religieuse : couvrir le visage, parfois même le corps tout entier pour les cacher aux hommes qui n'ont pas le droit de les voir. Or, le port du voile n'a été imposé par le Coran qu'aux seules femmes du Prophète : "Quand vous demandez un objet aux (épouses du Prophète), demandez-le de derrière un voile! Cela est plus décent pour vos cœurs et leurs cœurs<sup>23</sup>."

70. Bref, le port du voile a pour but d'éviter à la femme les regards concupiscent de l'homme. Donc "être voilée, c'est être décente". Et le symbolique port du voile pourrait être remplacé par les prescriptions suivantes<sup>24</sup>:

a) Avoir l'ensemble du corps couvert, à l'exception du visage et des mains.

b) La femme doit en outre éviter de se produire dans ses atours (bijoux et vêtements de soie); cette interdiction s'étend aux parfums et au maquillage. Il ne faut pas susciter le désir de l'homme.

c) D'après un autre *hadith*, les femmes qui imitent l'homme ou les hommes qui imitent les femmes ne font pas partie de la communauté.

d) S'abstenir d'imiter les non-croyants.

71. De tout ce qui précède, il ressort que la femme musulmane doit surtout se vêtir de manière discrète et chaste pour ne pas attirer les regards. Quant au port du voile, c'est un comportement social plutôt qu'une obligation religieuse.

### L'instruction de la femme musulmane

72. L'instruction de la femme dans une société qui lui impose le voile n'est pas sans poser de problème. Le problème du contenu de l'enseignement offert à la femme se pose avec autant d'acuité que celui du voile.

73. Pour certains, l'instruction dont il est question pour la femme est celle qui consiste à lui enseigner la religion et rien que la religion. Mais ceci n'est fort heureusement pas l'opinion de la majorité des juristes musulmans. Le principe généralement admis, surtout par les modernistes, est en faveur du droit de la femme à l'instruction sous toutes ses formes et à tous les niveaux. Cette tendance est parfaitement justifiée par le fait que le Coran s'adresse particulièrement à des "gens qui

<sup>23</sup> Voir Coran, Sourate, XXXIII, 53.

<sup>24</sup> Pour tout ce qui suit, voir M. N. Al-Albani, *Le voile de la femme musulmane dans le Coran et dans la Sunna*, Le Caire, Imp. Salafiya, 1943.

savent". La *Sunna*, d'autre part, abonde dans ce sens : "Demandez à être instruits, même en Chine." Il ne reste plus à la femme qu'à recevoir cette instruction sans enfreindre la loi coranique et ceci par son comportement digne en face des hommes qu'elle est appelée à côtoyer.

### Le droit de la femme musulmane au travail

74. Le problème du voile est encore plus important ici que dans le domaine de l'instruction, car le travail amène les femmes à se mêler aux hommes dans tous les secteurs de la vie publique. Ce n'est qu'après une lutte acharnée que la femme avec l'aide des réformistes est arrivée à acquérir ce droit, qui, en fait, ne lui est pas nié par le Coran. Puisque la femme jouit de sa pleine capacité financière et que les activités commerciales lui sont permises (exemple de Khadija, femme du Prophète), elle devrait être autorisée à exercer toutes sortes d'autres activités.

75. Une fois de plus les traditionalistes ont consacré l'usage aux dépens de la loi qui offrait toutes possibilités d'adaptation. Et bien qu'à notre époque la femme ait acquis le droit au travail, des restrictions viennent en entraver l'exercice; par exemple, la femme mariée doit pour pouvoir travailler obtenir la permission de son mari, sinon elle sera considérée comme rebelle (*nachiza*) et privée de la *nafaqua*.

76. De longs siècles de réclusion et d'ignorance ont permis à l'homme d'exercer des droits abusifs sur la femme. Fort du principe que c'est lui qui subvient aux frais du ménage, il prétend que la femme n'a aucune raison de travailler. Il faudra encore de nombreuses années pour que ces préjugés soient complètement déracinés dans l'ensemble du monde islamique.

### LE STATUT DE LA FEMME MUSULMANE DANS LE DROIT POSITIF: ÉTUDE DES ASPECTS LÉGAUX DE LA CONTRACEPTION ET DE L'AVORTEMENT

77. La première partie de cette étude présente un aperçu des fondements de la loi religieuse musulmane qui inspire directement les législations civiles de la plupart des pays arabes. Ces derniers ont édicté, dès le début de notre siècle, des législations qui réglementent plusieurs aspects du statut personnel. Toutes ces législations sont basées sur le droit musulman dans son ensemble. Le législateur ne se limite pas à l'opinion d'une école déterminée, mais il choisit l'opinion qui s'adapte le mieux aux besoins de la société moderne, quels que soient l'école ou le juriste qui admettent cette opinion. Ceci ressort de la dernière partie de l'étude de M. William Haddad concernant le statut de la femme musulmane dans le droit positif de certains pays arabes de la région.

78. Nous essayerons, dans la suite de cette étude, de voir comment la loi coranique a été interprétée en ce qui concerne la contraception et l'avortement dans cinq pays pris à titre d'exemple.

## *Le statut juridique de la femme musulmane au Liban*

### *Le cas de la contraception et de l'avortement*

79. Le Liban étant un Etat multi-confessionnel<sup>25</sup>, sa constitution reconnaît les différents droits communautaires en matière de statut personnel et successoral, le droit national libanais n'intervenant qu'au niveau des juridictions pénales, publiques et administratives. La femme musulmane sera donc soumise au droit musulman pour ce qui est de son statut privé et au droit national dans tous les autres domaines.

80. On désigne sous le vocable de "musulman" au Liban, les communautés sunnite, chiite et druze. L'ensemble des dispositions qui déterminent la condition de la femme dans ces communautés s'inspire largement du droit musulman. On notera cependant certaines différences car, en réalité, au niveau juridique, ces trois communautés ont chacune un statut particulier, leurs propres tribunaux, leurs magistrats et le pouvoir de légiférer.

### *La contraception*

81. Plusieurs facteurs contribuent au Liban à une expansion démographique dont les conséquences sont difficiles à prévoir. Le multi-confessionnalisme maintient une certaine mentalité tribale qui consiste à voir dans le nombre un élément de puissance surtout du point de vue électoral.

82. Au Liban, le contrôle des naissances est réglementé par le code pénal (articles 537 et 538). Nulle publicité en faveur de la régulation des naissances n'est autorisée. Les sanctions relatives à l'avortement sont d'autant plus graves qu'il s'agit d'un médecin, d'une sage-femme, d'un droguiste ou d'un pharmacien (articles 539 à 545).

83. L'importation et la vente des produits contraceptifs n'étant permises qu'à des fins médicales (lutte contre la stérilité) et non pour la limitation volontaire des naissances, les pharmaciens étaient tenus d'exiger jusqu'à une date récente des ordonnances médicales pour les délivrer. Mais ces règlements étaient peu appliqués et en 1969 le Ministère de la Santé rappelait dans une circulaire l'obligation de se conformer aux dispositions prévues par la loi.

84. Cette rigidité au lieu de réduire la vente desdits produits encouragea l'importation frauduleuse de contraceptifs (surtout de provenance égyptienne). Constatant leur échec dans ce domaine et le préjudice subi par les importateurs libanais, les autorités responsables durent réviser leur attitude à ce sujet. D'après des informations recueillies auprès de l'Ordre des pharmaciens,

la vente des pilules s'élevait en 1970 à près de 30 000 doses par mois.

85. Bien que les articles 537 et 538 du code pénal demeurent toujours en vigueur quant aux sanctions prévues pour la propagande anticonceptionnelle, la vente, ou la détention des objets et des produits destinés à empêcher la conception, seules les dispositions concernant la propagande sont appliquées (peines de prison allant d'un mois à un an et amendes de vingt-cinq à cent livres suivant les cas).

### *L'avortement*

86. La loi reste très sévère en ce qui concerne l'avortement : la propagande destinée à faciliter les pratiques abortives est punie d'une peine de deux mois à deux ans d'emprisonnement et de cinquante à deux cents livres d'amende (article 539 du code pénal). La même peine est réservée à quiconque aura vendu, mis en vente ou détenu dans le but de mettre en vente, des objets destinés à provoquer l'avortement ou qui d'une manière quelconque en aura facilité l'usage (article 540 du code pénal).

87. La femme coupable d'avortement ou de tentative d'avortement est punie d'une peine d'emprisonnement allant d'un an à trois ans (article 542 du code pénal). Les autres personnes coupables d'avoir provoqué ou tenté de provoquer l'avortement d'une femme, même si cette dernière se révélait ne pas être réellement enceinte, sont passibles d'une peine d'un à trois ans de prison. Cette peine sera de quatre à sept ans de travaux forcés, si les moyens employés entraînent la mort de la femme et de cinq à dix ans, si la mort a été causée par le recours à des méthodes auxquelles la femme n'avait pas consenti.

88. Quiconque se livre à des pratiques abortives sur une femme sans son consentement est passible d'une peine minimum de cinq ans de travaux forcés, et de dix ans minimum si la femme meurt des suites de l'avortement (articles 542 à 544).

89. Des circonstances atténuantes sont accordées à la femme qui se fait avorter pour sauver son honneur ou aux membres de sa famille jusqu'au deuxième degré qui l'aident à avorter (article 545).

90. En fait il semble que les pratiques abortives soient courantes au Liban, en particulier dans les milieux aisés, mais la plupart des avortements portés à la connaissance des autorités ne concernent que ceux qui ont eu pour conséquence un décès ou une atteinte grave à la personne.

## *Le statut juridique de la femme musulmane en Syrie*

### *Le cas de la contraception et de l'avortement*

91. La législation syrienne présente de nombreux points communs avec la législation libanaise, les variantes provenant de la différence de structure des populations de ces deux pays. La population de la Syrie étant plus homogène que celle du Liban, sa législation l'est aussi. Le code du statut personnel régit toutes les

<sup>25</sup> L'arrêté 60/LR du 10 mars 1936 et ses amendements énumèrent 17 communautés religieuses dont cinq musulmanes; sunnite, chiite ou jaafarite, alaouite, ismaélite et druze et 12 non musulmanes: maronite, grecque orthodoxe, grecque catholique, arménienne orthodoxe ou grégorienne, assyrienne chaldéenne (nestorienne), chaldéenne, latine, évangélique (protestante), arménienne catholique, syriaque orthodoxe, syriaque catholique, israélite.

communautés musulmanes et s'étend même aux autres minorités religieuses dans les cas non prévus par leurs propres codes du statut personnel, surtout pour ce qui a trait à la succession. En effet, ces codes ne régissent que les fiançailles, le mariage et ses effets.

92. Les tribunaux *shari'è* sont les seuls compétents en matière de statut personnel pour les musulmans. Les Druzes ont cependant l'avantage d'avoir leur tribunal dont le président est druze, à Soweida dans le Djebel-El-Druze. Quant aux Druzes résidant ailleurs, ce sont les tribunaux *shari'è* du lieu qui sont habilités à trancher leurs conflits aussi bien avec les membres de leur communauté qu'avec les membres d'une autre. Pour ce qui est des communautés non musulmanes, elles ont leurs propres juridictions confessionnelles semblables à celles du Liban. La juridiction civile n'intervient ici qu'en cassation.

93. La législation qui régit le statut personnel des communautés non musulmanes est la même que celle qui existe au Liban et qui date de l'époque du mandat français. Le code du statut personnel applicable aux musulmans étant relativement récent (17/9/1953) il ne fait en principe pas de différence entre alaouites, sunnites et druzes. Dans ce domaine, la Syrie à la différence du Liban a rompu avec la législation ottomane, tout en gardant ses fondements d'origine inspirés du droit musulman.

94. La *Shari'a* demeure en Syrie la première source de droit, après les lois, elles-mêmes conformes à l'esprit de l'Islam. Ces lois ne sont d'ailleurs que des interprétations modernes de la *Shari'a*, répondant aux exigences de notre époque.

#### *La contraception*

95. La population syrienne demeure dans son ensemble traditionaliste et conservatrice; l'influence occidentale y est faible. La minorité formée par les modernistes et les tenants du laïcisme, quoique très active, se heurte à une forte majorité qui reste très attachée aux enseignements du passé. Des considérations d'ordre religieux, moral et politique militent en faveur d'une natalité élevée.

96. La vente des pilules et autres produits contraceptifs est autorisée sur le marché syrien, en dépit des restrictions légales qui la limitent à des causes thérapeutiques. La quantité de produits vendus est beaucoup trop importante pour avoir été utilisée à des fins uniquement thérapeutiques; d'après les renseignements communiqués par les services compétents, il y aurait entre 25 000 et 30 000 femmes syriennes qui emploieraient les pilules<sup>26</sup>. En outre, les produits anti-conceptionnels permettant d'éviter les maladies vénériennes sont légalement vendus. Quant aux produits strictement contraceptifs (les spermicides par exemple) ou bien entendu abortifs, ils sont strictement prohibés<sup>27</sup>.

97. L'interdiction de principe imposée par le code pénal ne concerne pas uniquement les produits mais

s'étend aussi à la publicité faite en leur faveur; toutefois pour être réprimée, celle-ci doit être publique et tendre à répandre et à faciliter l'usage de ces produits, sinon elle ne fera l'objet d'aucune poursuite. Un débat scientifique ou politique ou même une conversation à ce sujet ne tombent pas sous le coup de la loi<sup>27</sup>.

#### *L'avortement*

98. Comme la contraception, l'avortement est légalement toléré lorsque des impératifs médicaux le prescrivent. Ainsi l'article 523 du code pénal autorise l'avortement thérapeutique alors que l'article 525 du même code prévoit des sanctions graves pour l'avortement criminel.

99. En fait, les avortements criminels ne sont portés à la connaissance des autorités que lorsqu'il en résulte un décès ou une atteinte grave à la personne qui subit l'opération abortive. Ceci explique le nombre réduit des procès relatifs à l'avortement examinés par les tribunaux syriens.

100. L'avortement thérapeutique n'est autorisé que si la vie de la mère est en danger. En vertu de l'article 47 du décret n° 1 du 5 janvier 1970, il doit respecter les règles suivantes :

1) L'avortement doit être effectué par un médecin spécialisé et être approuvé par un autre médecin.

2) Un rapport doit être rédigé avant l'opération pour en démontrer la nécessité absolue.

3) Les quatre copies dudit rapport doivent être signées par les médecins, l'intéressée, son mari ou son *wali*. Une copie sera remise à la famille et à chacun des médecins.

101. Ces dispositions sont venues renforcer celles du code pénal à la suite de la multiplication des avortements qui ont dernièrement alerté les autorités. Des mesures strictes sont d'ailleurs prises à l'égard des contrevenants. Tout membre du corps médical ayant pratiqué un avortement illégal sera condamné par un arrêté du Ministre de la Santé à ne pas exercer sa profession durant au moins un an. Cette sanction s'ajoute à celles prévues par le code pénal. En cas de récidive le contrevenant sera rayé de l'Ordre des Médecins et son diplôme lui sera retiré (article 50 du décret n° 2 du 5 janvier 1970).

#### *Le statut juridique de la femme musulmane en Irak : le cas de la contraception et de l'avortement*

102. Le statut de la femme irakienne présente beaucoup de points communs avec celui de la femme syrienne. On peut sans doute attribuer ceci à l'identité idéologique des systèmes politiques en vigueur dans ces deux pays. La *Shari'a* demeure la première source de législation.

103. En ce qui concerne l'avortement, les lois et les règlements (article 417 à 419 du code pénal) en vigueur en Irak sont similaires à ceux des autres pays de la

<sup>26</sup> Service commercial de la Société Pharmex, Damas.

<sup>27</sup> J. El-Hakim, *op. cit.*

région. L'avortement n'est autorisé que pour des raisons thérapeutiques notamment si la vie de la mère est en danger.

104. Le code pénal ne contient pas de références précises à l'utilisation des contraceptifs, aussi la vente des pilules et autres produits anticonceptionnels est-elle pratiquement libre.

105. L'établissement d'un centre de planning familial a été autorisé à la fin de 1969. Il a commencé ses activités en 1970 à l'Hôpital de Karakh à Bagdad. Il a pour but la sauvegarde de la santé de la mère et de l'enfant. Son action ne s'insère pas dans le cadre d'une politique nationale de limitation des naissances mais plutôt dans celui de l'amélioration du bien-être de la famille.

*Le statut juridique de la femme musulmane au Koweït : le cas de la contraception et de l'avortement*

106. La femme koweïtienne semble jouir d'une position privilégiée parmi les autres femmes arabes. Il est important de noter, au sujet du statut juridique de la femme au Koweït, que ce pays reste fidèle aux traditions juridiques musulmanes.

107. En dépit de la diffusion de la civilisation européenne dans ce pays, le droit musulman y reste la loi fondamentale non seulement en ce qui concerne les statuts personnels, mais aussi à l'égard d'une partie importante des statuts réels. Le droit civil appliqué au Koweït est la *Nadjalla*, codification ottomane des opinions de l'école hanéfite. C'est un exemple très intéressant de l'adaptation des règles musulmanes aux exigences de la société moderne.

108. L'avortement est sévèrement puni par le code pénal (articles 174 à 177) koweïtien: dix ans de prison à toute personne jugée coupable de ce crime. Quant à ceux qui disposent ou procèdent à la vente de produits abortifs avec préméditation, ils sont passibles d'une peine de trois ans de prison et 3 000 roupies (225 dinars koweïtiens ou 630 dollars des Etats-Unis).

109. Pour ce qui est du contrôle des naissances le Koweït s'est rangé du côté des auteurs musulmans qui ont admis sa légitimité. La vente des produits contraceptifs est libre au point d'outrepasser l'arrêté du Ministère de la Santé imposant une ordonnance médicale pour l'utilisation desdits produits. Cependant leur vente ne touche qu'un nombre réduit de familles: leur dissémination est limitée par les résistances traditionnelles aussi bien que par certains facteurs économiques (coût des produits contraceptifs). On doit rappeler en outre que si le pays compte près de 750 000 habitants, plus de la moitié est d'origine étrangère et il n'existe pas, au niveau national, de conscience d'un problème de surpopulation.

110. L'utilisation des produits contraceptifs est en fait limitée à une fraction de la population: étrangers résidant au Koweït, et jeunes couples koweïtiens, soit étudiants ayant intérêt à terminer leurs études universitaires avant d'avoir des enfants, soit jeunes ménages adoptant les mesures occidentales en ce qui concerne le nombre d'enfants.

111. Enfin l'article 59 du code pénal de 1960 stipule que la femme enceinte condamnée à mort qui met au monde un enfant vivant verra sa peine commuée en emprisonnement à vie.

*Le statut juridique de la femme musulmane en Arabie Saoudite : le cas de la contraception et de l'avortement*

112. En matière de système juridique, l'Arabie Saoudite constitue un cas particulier puisque la *Shari'a* reste la loi fondamentale de ce pays et qu'elle y est appliquée dans toute son intégrité. Cet attachement à la loi fondamentale est renforcé par le *Wahhabisme*, doctrine officielle du royaume. Dans cette doctrine le pouvoir politique revêt la forme d'une sorte de théocratie où le souverain, autorité suprême, est également le chef religieux de la communauté, l'*Imam*. Maître du pouvoir exécutif comme du pouvoir législatif, il délègue son autorité à ses juges qui sont des *cheikhs* initiés au droit musulman. Il n'existe donc pas de tribunaux civils ou autres. Le statut personnel de la femme est, par le fait même, régi par la loi coranique et il suffira de se référer au chapitre relatif au statut de la femme en droit musulman.

113. Il est intéressant d'étudier l'attitude de l'Arabie Saoudite à l'égard du problème de la limitation des naissances. En fait, sans publicité excessive à ce propos, les produits anticonceptionnels sont vendus librement sur le marché. Cette situation résulte d'une décision prise par le Ministre des Finances, décision permettant à la direction de la douane d'autoriser l'importation de ces produits. Cette décision est d'autant plus intéressante qu'il s'agit d'un pays qui ne souffre pas d'une forte densité de population et qui se montre d'une grande intransigeance dans le domaine de l'application de la loi coranique. Ce serait une preuve de plus que l'Islam le plus orthodoxe n'est pas hostile à la limitation volontaire des naissances. Cette attitude a soulevé bien des remous dans les milieux conservateurs mais les autorités ont estimé qu'il était bon de laisser les gens libres de leur décision. Nous ne possédons malheureusement pas de chiffres relatifs à l'utilisation de ces produits en Arabie Saoudite, mais il semble que leur usage soit relativement courant dans les classes aisées de la société urbaine.

114. Quant à l'avortement, il reste prohibé, à l'exception de l'avortement thérapeutique qui doit être décidé par une commission médicale. L'avortement volontaire est certainement pratiqué, mais il est difficile de donner des chiffres puisque seuls, les cas de décès et d'accidents qui en résultent sont connus.

## ANNEXE

### Glossaire des termes arabes <sup>a</sup>

<p>A. Allah : Dieu            Ahl al-sunna : les orthodoxes            Aila : serment de continence            Amal : jurisprudence            Ayat : verset du Coran</p> <p>B. Biya'a : acte d'investiture</p> <p>C. Coran : livre sacré de l'Islam</p> <p>D. Diya : prix, du sang            Djabr : contrainte matrimoniale</p> <p>F. Faqih : juriste, légiste            Fatwa, fatawi : avis doctrinal, consultation juridique            Fiqh : interprétation de la <i>shari'a</i>, science du Droit            Fouqaha : juristes, légistes</p> <p>H. Hadana : droit de maternité, garde de l'enfant            Hadith : tradition, conduite, comportement de Mahomet            Hudud, hrad : peines fixées par la loi</p> <p>I. Idjmaa : accord législatif, assentiment de la communauté            Idjtihad : création de la règle de droit            Imam : fondateur de rite — successeur spirituel et temporel de Mahomet chez les chiites            Islam : ensemble des peuples musulmans, acte de soumission à Dieu</p> <p>K. Katb el kitab : signature du contrat            Khoul : institution par laquelle le mari répudie son épouse à la demande de celle-ci qui s'engage à lui verser une compensation            Khutba : fiançailles            Kufr : hérésie, mécréance</p> <p>M. Mahr : dot maritale obligatoirement et uniquement donnée par le mari à sa femme</p>	<p>Mahr al-mithl : dot de parité ou d'équivalence            Mouhçan : fornicateur (ou fornicatrice) légalement marié(e)            Mudjtahid : juriste, théologien ayant le pouvoir de créer la norme juridique, législateur</p> <p>N. Nachiza : femme rebelle            Nafaqua : entretien de l'épouse            Nikah : union légale, mariage et concubinage</p> <p>O. Orf : coutume</p> <p>Q. Qadi : juge            Qanoun : ordonnance, décret            Qiyass : déduction analogique            Qur'an : livre saint</p> <p>R. Ra'y : rationalisme, jugement humain</p> <p>S. Shari'a : loi formelle, écriture sainte, Coran et <i>Sunna</i>            Sunna : conduite du Prophète, ensemble des hadiths, orthodoxie            Sourate : chapitre du Coran</p> <p>T. Tafsir : explication, commentaire du Coran            Taisir : faits illicites            Taqlid : conformisme, imitation            Talqq : répudiation            Ta'wil : science ésotérique de l'interprétation</p> <p>U. Umma : communauté mère de l'Islam, l'Etat musulman, la communauté musulmane            Usul : principes, fondements</p> <p>W. Wali : mandataire, tuteur testamentaire ou matrimonial</p> <p>Z. Zina : fornication</p>

## LES DROITS DE L'HOMME ET LA MORTALITÉ \*

Ion Filipescu \*\*

1. Les droits de l'homme sont conçus comme droits fondamentaux humains<sup>1</sup> ou bien comme droits minimums d'un être humain<sup>2</sup>. L'application des droits de l'homme tient de la compétence intérieure des Etats, domaine où l'Organisation des Nations Unies ne peut pas intervenir, sauf s'il est question d'une situation susceptible de mettre en péril la paix et la sécurité internationale (Art. 2, par. 7 de la Charte des Nations Unies)<sup>3</sup>. La violation des droits de l'homme ressort de la compétence de l'Organisation internationale dans certains cas et seulement à certaines conditions<sup>4</sup>. Il y a des actes internationaux, par exemple la Convention de sauvegarde des droits de l'homme et des libertés fondamentales<sup>5</sup>, qui réglementent la protection internationale de ces droits<sup>6</sup>.

2. Les Etats se trouvent à différents stades de développement économique, social et politique. Il y a même des peuples qui n'ont pas encore acquis leur indépendance politique et économique. Dans certains Etats, la discrimination raciale est pratique courante. En pareille situation, l'application et la protection des droits de l'homme varie forcément d'un pays à un autre.

3. L'inégalité économique et sociale à l'intérieur de certains pays affecte aussi sérieusement l'utilisation et l'exercice des droits de l'homme. Dans certains pays, la situation de ces droits est composée de beaucoup d'éléments dont nombre ne sont pas des problèmes de droit, la constitution pouvant être seulement l'un des

éléments de la situation<sup>7</sup>. Etant donné qu'actuellement le monde est hétérogène au point de vue politique, économique et social, la protection des droits de l'homme ne peut être uniforme<sup>8</sup>. Le droit — tout comme l'Etat — est déterminé, quant au fond, par le fondement économique de la société, par les relations de production qu'il reflète<sup>9</sup>. Pour assurer une protection effective des droits de l'homme dans tous les pays, il est nécessaire donc d'éliminer le décalage entre les pays développés et ceux en voie de développement, comme aussi les différences économiques et sociales existantes entre les catégories sociales de certains pays. Une telle œuvre donnera un contenu réel, effectif, aux droits de l'homme, dans tous les pays et pour tous les hommes.

4. La mortalité est l'un des phénomènes démographiques les plus importants. Jusqu'à certains niveaux, la mortalité est révélatrice de l'amélioration des conditions socio-économiques et sanitaires d'un pays. D'autre part, les niveaux élevés de morbidité et mortalité constituent des obstacles à un développement rapide et soutenu<sup>10</sup>. La mortalité a un rôle important dans la formation et la structure de la population d'un pays. C'est pourquoi, parallèlement à une fertilité élevée la diminution de la mortalité est l'un des facteurs qui contribue à la croissance de la population.

5. Les droits de l'homme et la mortalité se conditionnent, dans une certaine mesure, réciproquement. Cette relation est complexe. D'une façon schématique, nous pouvons en mentionner quelques aspects significatifs. Ainsi, l'exercice des droits de l'homme mène à la diminution de la mortalité et au retardement de celle-ci, dans le sens de l'augmentation de l'espérance de vie. Par contre, si le droit à la vie n'est pas juridiquement garanti, dans le sens que la peine capitale peut être appliquée dans des cas où elle ne se justifie pas et si les conditions qui évitent des condamnations sans faute grave n'existent pas, cela peut conduire à la croissance de la mortalité et, par conséquent, à la réduction de la durée de la vie. Le décès d'une personne peut être provoqué aussi par des criminels qui tuent ou qui

portent atteinte à l'intégrité de la personne. C'est pourquoi les garanties juridiques des droits à la vie signifient aussi la création de conditions qui assurent la sauvegarde de l'être humain, des attributs de la personnalité et de ses droits et libertés contre pareils faits socialement dangereux. Selon une opinion<sup>11</sup>, l'inviolabilité de la personne comprend non seulement le droit à la liberté, mais aussi le droit à la vie et à l'intégrité personnelle; d'après une autre opinion<sup>12</sup>, le droit à la vie est protégé par tous les droits fondamentaux énoncés dans la constitution. En outre, dans la mesure où la mortalité dépend du niveau de vie et de l'assistance sanitaire, ce qui suppose le droit à l'alimentation, au logement, aux conditions de travail, aux soins médicaux, c'est-à-dire le droit à un certain confort socio-économique et médical, les droits de l'homme influencent directement la mortalité et contribuent à la croissance de la durée de la vie humaine<sup>13</sup>. En conséquence, les programmes nationaux pour la réduction de la mortalité doivent contenir aussi les mesures en faveur de la santé, de l'alimentation et autres éléments de confort social<sup>14</sup>.

6. A son tour, la mortalité influence les droits de l'homme. Dans la mesure où une mortalité élevée peut être un obstacle au développement socio-économique, elle enfreint la création de facteurs assurant l'exercice effectif des droits de l'homme. La diminution de la mortalité contribue à la croissance de la population et à l'augmentation de l'espérance de vie à la naissance et à différents âges. La croissance de la mortalité aura un effet contraire sur le droit à la vie. L'espérance de vie augmente d'autant plus que la diminution de la mortalité se réalise en priorité parmi les jeunes et surtout parmi les enfants. La diminution de la mortalité signifie, du point de vue économique, que l'investissement fait par la société pour l'éducation et la formation professionnelle d'une personne se récupère et qu'il existe la possibilité que chaque personne contribue au développement de la société durant une période de temps plus grande. Les démographes montrent que la diminution ou la croissance de la mortalité influencent la fertilité. L'intervention de la mort met fin au droit à la vie de la personne en cause. Le rapport entre la mortalité et les droits de l'homme pourrait être considéré aussi sous cet aspect.

#### LE DROIT À LA VIE

7. Le droit à la vie est expressément ou implicitement prévu dans plusieurs documents internationaux<sup>15</sup>. Ce droit peut être pris dans deux sens<sup>16</sup>:

<sup>11</sup> Voir N. Prisca, *Le droit constitutionnel*, Bucarest, 1969, p. 249.

<sup>12</sup> Voir I. Moraru, *Le droit constitutionnel*, Bucarest, 1973, p. 101.

<sup>13</sup> Voir *L'analyse démographique des tendances et niveaux de la mortalité* (Séminaire interrégional sur l'analyse de la mortalité, Mamaia, Roumanie, 20 septembre-3 octobre 1972, (ESA/P/AC.2/2), p. 19 et 20.

<sup>14</sup> Voir rapport du Secrétaire général sur le projet de plan d'action mondial de la population (E/CN.9/292), p. 13.

<sup>15</sup> Parmi ceux-ci : la Déclaration universelle des droits de

a) Le droit de ne pas être tué, de ne pas être arbitrairement condamné à mort ou à exécution. En général, ce droit est considéré par rapport à l'Etat qui exerce le droit de condamner à mort et d'exécuter une telle décision. Mais la mort peut être provoquée par des membres de la société, notamment en cas d'assassinat. Pour sauvegarder le droit à la vie et empêcher les faits qui lui portent atteinte, l'Etat incrimine les faits qui portent atteinte à l'existence et à l'intégrité de l'être humain, qu'il déclare comme infractions;

b) Le droit de vivre, comprend notamment le droit à l'alimentation, à l'habillement, au logement et aux soins médicaux qui représentent les facteurs réduisant et retardant la mortalité, dans le cas où le droit à la vie est assuré dans le premier sens. Par la diminution de la mortalité on réalise le prolongement de la vie, donc le droit de vivre.

8. En général, le droit à la vie est utilisé dans le premier sens lorsqu'on a en vue les droits civils et politiques de l'homme et dans le deuxième sens lorsqu'on se réfère aux droits économiques, sociaux et culturels.

9. Le droit à la vie est le fondement de tous les autres droits de l'homme, dans le sens que sans celui-ci on ne peut poser le problème des autres. Le droit à la vie, le droit à la liberté et le droit à la sécurité personnelle sont des droits élémentaires de l'homme. Chaque personne a droit à la vie. L'étranger jouit du droit à la vie, à la liberté et à la sécurité personnelle, avec toutes les conséquences découlant de ce droit (art. 1 et 3 de la Déclaration universelle des droits de l'homme). Les droits élémentaires, y compris le droit à la vie, sont reconnus aussi dans la Déclaration des droits de l'enfant de 1959, sans aucune distinction. Le malade mental jouit du droit à la vie comme toute autre personne. (Déclaration des droits du déficient mental adoptée par l'Assemblée générale des Nations Unies, le 20 décembre 1971). L'extermination des handicapés ou des malades mentaux motivée par le fait que leur maladie

l'homme du 10 décembre 1948, art. 3; le Pacte international relatif aux droits civils et politiques, en date du 16 décembre 1966, art. 6; le Pacte international relatif aux droits économiques, sociaux et culturels, en date du 16 décembre 1966, art. 11 et 12; la Déclaration des droits du déficient mental, en date du 20 décembre 1971, art. 1, 2, 3 et 7; le Statut du Tribunal militaire international de Nuremberg, art. 6; la Convention pour la prévention et la répression du crime de génocide, en date du 9 décembre 1948, art. II; la Déclaration des droits de l'enfant, en date du 2 novembre 1959, art. 2, 4, 5 et 9; la Convention internationale sur l'élimination de toutes les formes de discrimination raciale, en date du 4 janvier 1969, art. 5; la Déclaration sur le progrès et le développement dans le domaine social, en date du 11 décembre 1969, art. 10, 18 et 19; la Convention de sauvegarde des droits de l'homme et des libertés fondamentales, en date du 4 novembre 1950, art. 2; la Convention interaméricaine des droits de l'homme, art. 4; la résolution 2676 (XXV) de l'Assemblée générale du 9 décembre 1970 sur la protection des civils en temps de guerre; les Conventions de Genève du 12 août 1949 pour la protection des victimes de la guerre; la Convention de Vienne sur le droit des traités, en date du 27 mai 1969, art. 60, point 5.

<sup>16</sup> Voir Vernon van Dyke, *Human Rights, The United States and World Community*, New York, Oxford University Press, 1970, p. 9 et 10.

est incurable, ou à des fins eugéniques, a été considérée comme crime de guerre ou crime contre l'humanité<sup>17</sup>. Le droit à la vie fait partie intégrante de l'être humain et on ne peut renoncer à ce droit. L'exercice du droit à la vie implique le droit à une alimentation adéquate, au logement, à la santé et à l'éducation. La réduction de la mortalité conduit à la croissance de l'espérance de vie. Celle-ci est en relation inverse avec la durée de la vie<sup>18</sup>. Le droit à la vie fait partie de la catégorie des droits personnels non patrimoniaux liés à l'existence physique de l'individu. Ces droits sont absolus, dans le sens qu'ils sont opposables à tous les autres et intransmissibles, ce qui explique aussi l'impossibilité de renoncer au droit à la vie. Les lois pénales nationales considèrent comme infractions les actions contre la vie, tel le meurtre, l'infanticide, le suicide ou l'encouragement au suicide. Certaines législations nationales incriminent aussi les actions qui, par les conditions créées ou les effets qu'elles produisent, peuvent mettre en danger la vie d'une personne ou mettre fin à sa vie, par exemple les mauvais traitements infligés aux mineurs.

10. A l'occasion des discussions engagées lors de l'adoption de l'article 3 de la Déclaration universelle des droits de l'homme et de l'article 6 du Pacte international relatif aux droits civils et politiques, s'est posée la question de déterminer le moment à partir duquel commence le droit à la vie et quand il cesse. Juridiquement, la personnalité ou la qualité de sujet de droit commence à la naissance et, quand il s'agit des droits de l'enfant, à l'instant même de la conception, conformément au principe "*infans conceptus pro nato habetur quoties de commodis ejus agitur*". A condition qu'il naisse vivant ou, dans certaines réglementations, viable, l'enfant conçu peut acquérir des droits. Pareillement, on a proposé que les textes mentionnés précisent que le droit à la vie commence au moment de la conception<sup>19</sup>. Cette proposition n'a pas été acceptée. En effet, l'article 3 de la Déclaration universelle des droits de l'homme prévoit seulement que chaque individu a droit à la vie, à la liberté et à la sécurité de sa personne, et l'article 6, paragraphe 1, du Pacte international relatif aux droits civils et politiques dispose que le droit à la vie est inhérent à la personne humaine, qu'il est protégé par la loi et que personne ne peut être arbitrairement privé de la vie. D'autre part, la Déclaration des droits de l'enfant, en date du 2 novembre 1959 [résolution 1386 (XIV) de l'Assemblée générale des Nations Unies] se rapporte à de pareils droits qui doivent être reconnus aux enfants, sans aucune exception, sans aucune discrimination. Du contenu des textes il ressort que l'on

envisage l'enfant né. Quant il s'agit du droit à un nom et à la qualité de citoyen (principe 3), on précise même que ceux-ci existent dès la naissance. Donc, à la lumière des documents internationaux mentionnés, on acquiert le droit à la vie à l'instant même de la naissance. Cette solution est conforme au point 16 de la Proclamation de Téhéran du 13 mai 1968, selon lequel "Les parents ont le droit fondamental de déterminer librement et consciemment la dimension de leur famille et l'échelonnement des naissances"<sup>20</sup>. On trouve une formulation identique dans l'article 16 de la Déclaration sur le progrès et le développement dans le domaine social, en date du 11 décembre 1969 [résolution 2542 (XXIV) de l'Assemblée générale des Nations Unies].

11. Par contre, dans la Convention interaméricaine des droits de l'homme, on prévoit que le droit à la vie commence au moment de la conception<sup>21</sup>.

12. Le droit à la vie avant la naissance ne peut être considéré en dehors des dispositions légales réglementant l'avortement et spécialement celles qui l'incriminent. En effet, dans la mesure où la loi permet l'avortement, il ne serait pas question de parler du droit à la vie à partir du moment de la conception ou pendant la conception. Par contre, lorsque la loi ne permet pas l'avortement, on peut parler du droit à la vie du fœtus et les atteintes qui lui sont portées sont sanctionnées par la loi.

13. Quand l'avortement a un caractère d'infraction<sup>22</sup>, l'objet matériel de la protection pénale est constitué par le produit de la conception (le fœtus), dénommé parfois — dans la littérature juridique — personne en formation. En prévoyant que l'avortement est en soi une infraction distincte, la loi pénale a tenu compte du fait qu'il est nécessaire d'assurer la réalisation de naissances normales et de la vie humaine. Cette loi exprime aussi l'équilibre entre le droit de naître et le droit de la femme à disposer librement de son corps<sup>23</sup>.

14. Il n'existe pas de recommandations internationales concernant l'avortement et l'adoption de telles mesures n'est pas désirable.

15. On peut tirer au moins deux conclusions :

a) La réglementation légale concernant l'avortement peut aider à déterminer le moment à partir duquel commence le droit à la vie avant la naissance;

b) L'incrimination de l'avortement signifie, dans certaines conditions, la protection du droit à la vie du fœtus par des moyens de droit pénal.

16. L'avortement doit être envisagé aussi du point de vue de la natalité, de la santé de la mère et des enfants à naître de la même mère, de l'égalité fonda-

<sup>17</sup> Voir *Judgement of the International Military Tribunal for the Trial of German Major War Criminals*, Nuremberg, 30th September and 1st October 1946, Londres, Her Majesty's Stationery Office, Cmd. 6964, p. 60.

<sup>18</sup> Voir *Rapport du Séminaire interrégional sur l'analyse de la mortalité*, Mamaia, Roumanie, 20 septembre-3 octobre 1972 (ST/TAO/Ser.C/145-ST/SAO/Ser.R/15), p. 13 et 14.

<sup>19</sup> Voir *Normes des Nations Unies concernant les rapports entre les droits de l'homme et les diverses questions relatives à la mortalité et à la morbidité humaines* (E/CONF.60/SYM.N/3/Add.1) p. 3.

<sup>20</sup> Voir *Acte final de la Conférence internationale des droits de l'homme*, Téhéran, 22 avril-13 mai 1968 (publication des Nations Unies, n° de vente: F.68.XIV.2) p. 5.

<sup>21</sup> Voir Vernon van Dyke, *op. cit.*, p. 10.

<sup>22</sup> Voir Vintilă Dongaroz, *Explications théoriques du Code pénal roumain*, Ed. Academiei, 1971, tome III, p. 251 et 252.

<sup>23</sup> Voir Organisation mondiale de la santé, *La législation de l'avortement dans le monde: aperçu des lois et règlements en vigueur*, Genève, 1971, p. 5 et 6.

mentale des êtres humains. L'avortement dans certaines conditions équivalant à un génocide doit être condamné.

17. La question concernant le moment à partir duquel commence le droit à la vie a été posée aussi en pratique. Ainsi, conformément à l'article 2 de la Convention de sauvegarde des droits de l'homme et des libertés fondamentales, un ressortissant norvégien a soutenu que la loi du 12 octobre 1960, qui autorise l'interruption de la grossesse dans certaines circonstances, viole le droit à la vie garantie par ladite convention européenne<sup>24</sup>. Le requérant a demandé à la Commission européenne de répondre à la question de savoir si le droit à la vie, reconnu à l'homme, s'applique aussi à l'embryon humain et, sinon, à partir du quel stade de son développement il jouit, partiellement ou totalement, de ces droits. La demande a été déclarée inadmissible, n'étant pas conforme à l'article 25 de la Convention, le requérant ne prétendant pas que lui-même est la victime de la loi incriminée et la Commission n'ayant pas la compétence d'examiner abstraitement la conformité de ladite loi avec les dispositions de la Convention.

18. Le droit à la vie cesse avec le décès de l'individu. Les causes du décès peuvent être diverses. Parfois, le droit à la vie est refusé à certaines personnes, dénommées malfaiteurs par certains auteurs<sup>25</sup>. Il y a des auteurs qui considèrent qu'aucun Etat ne peut garantir à ses sujets le droit à la vie<sup>26</sup>. Les lois pénales nationales peuvent prévoir la peine capitale. La question de la légitimité de la peine capitale<sup>27</sup> a provoqué de vives discussions depuis toujours, mais surtout au dix-huitième siècle, depuis que Cesare Baccaria, et ensuite l'école classique pénale avec son représentant Francesco Carrara, avaient soutenu que cette peine est sujette à critique de plusieurs points de vue. On a invoqué des arguments aussi pour soutenir la peine capitale. Les lois pénales nationales ont prévu les cas et les conditions dans lesquelles on peut appliquer la peine capitale.

19. A propos de la peine capitale il faut considérer encore un autre aspect. Ainsi, dans la mesure où les lois pénales considèrent comme infractions punies de la peine capitale certains actes socialement dangereux et portant atteinte au droit à la vie, elles défendent par des moyens pénaux, le droit même à la vie. La qualité d'exemple de cette peine constitue un facteur qui empêche les actions pouvant mettre fin à des vies humaines.

20. Les expériences médicales sur des sujets humains, y compris la transplantation des organes, posent des questions juridiques et morales qui exercent leur influence sur le droit à la vie.

<sup>24</sup> Voir Répertoire de la jurisprudence relative à la Convention européenne des droits de l'homme, 1955-1967, Editions administratives, U.G.A., S.A., Heule, Belgique, p. 9.

<sup>25</sup> Voir Evan Luard, *The International Protection of Human Rights*, Conclusions, Londres, Thames and Hudson, 1967, p. 313.

<sup>26</sup> Voir C. Ezejiakor, *Protection of Human Rights under the Law*, Londres, Butlerworths, 1964, p. 50.

<sup>27</sup> Voir Teodor Vasiliu, *Le Code pénal en Roumanie*, Ed. Stiintifică, 1972, p. 390 et 391; Vintilă Dongaroz, *Explications théoriques du Code pénal roumain*, Ed. Academiei, 1970, tome II, p. 24 et 25.

21. Les guerres ayant pour but d'acquérir des territoires étrangers, de subjuguier et de piller les autres peuples, d'étouffer la lutte de libération nationale et sociale des peuples, constituent une négation du droit à la vie<sup>28</sup>. Aussi la guerre en tant que moyen d'apporter une solution aux différends internationaux est-elle interdite par le droit international<sup>29</sup>.

22. Contrairement à ce qui se passait dans le passé, les parties à un conflit sont obligées de respecter, pendant la guerre, les règles de conduite consacrées par les lois et les coutumes. Pour la défense des droits de l'homme, et en premier lieu du droit à la vie, il est nécessaire de prendre d'une manière résolue toutes les mesures et d'accomplir toutes les actions de nature à prévenir la guerre et à éliminer définitivement de la société.

23. Pour le jugement des principaux criminels de guerre de la puissance européenne de l'Axe, le Tribunal militaire international de Nuremberg a été constitué aux termes de l'Accord de Londres du 8 août 1945, le Statut de ce tribunal portant la même date.

24. Conformément à l'article 6 du Statut, les personnes qui ont commis, individuellement ou en tant que membre d'une organisation, l'un des crimes définis dans ledit article, ont été jugées et punies: a) crime contre la paix, b) crime de guerre, c) crime contre l'humanité.

25. L'Assemblée générale des Nations Unies a réaffirmé ces règles aux termes de sa résolution 95 (I) du 11 décembre 1946.

26. Le 26 novembre 1968, l'Assemblée générale a adopté, par sa résolution 2391 (XXIII), la Convention sur l'imprescriptibilité des crimes de guerre et des crimes contre l'humanité.

27. *L'apartheid* et sa politique d'agression constituent une grave menace contre la paix et la sécurité internationale<sup>30</sup>. En même temps, ils constituent un péril pour les droits de l'homme, y compris le droit à la vie. L'accomplissement des droits des peuples à l'autodétermination et à la décolonisation a une grande importance pour l'exercice des droits de l'homme<sup>31</sup>.

<sup>28</sup> Selon des calculs effectués par un savant suisse, dans les derniers 5 500 ans il y a eu 14 500 guerres, qui ont fait périr 3 640 000 000 d'hommes. (V. A. Romanov, *Isklučenje vojni iz jizni obscestva*, Moscou, 1961, p. 12; Grigore Geamănu, *Droit international contemporain*, Bucarest, Editura Didactica si Pedagogică, 1965, p. 710 et 711).

<sup>29</sup> Le Pacte Briand-Kellog (1928) est le premier document international visant à interdire la guerre comme moyen de résoudre les différends internationaux. La Charte des Nations Unies prévoit que l'interdiction de la guerre d'agression est un principe fondamental du droit international.

<sup>30</sup> Voir *Rapport du Secrétaire général sur l'activité de l'Organisation*, 16 juin 1972-15 juin 1973 [Documents officiels de l'Assemblée générale, vingt-huitième session, Supplément n° 1 (A/9001)], p. 16.

<sup>31</sup> A l'article 7 de la Convention de Vienne sur le droit des traités, en date du 23 mai 1969, il est fait mention des principes de droit international contenus dans la Charte des Nations Unies, tel le principe de l'égalité en droits et de l'autodétermination des peuples et le principe du respect universel et effectif des droits de l'homme et des libertés fondamentales pour tous. (C. Comorovschi, V. Duculescu, "Interdiction de la discrimination raciale dans le droit international", *Revue Roumaine d'études internationales*, Bucarest 2 décembre 1951, p. 56).

28. L'Assemblée générale des Nations Unies a condamné, par ses résolutions 2184 (XXI) du 12 décembre 1966 et 2202 (XXI) du 16 décembre 1966, la violation des droits économiques et politiques des populations autochtones ainsi que la politique d'*apartheid*, les considérant comme crimes contre l'humanité.

29. Le génocide est une grave atteinte portée au droit à la vie, parce qu'il consiste dans l'extermination de groupes de population considérés d'après des critères de race, de nationalité, ou de religion, ou dans la provocation de lésions corporelles, ou encore dans la création de conditions de vie qui mènent à la destruction desdits groupes (déportation et asservissement, par exemple). Pour punir le crime de génocide, l'Assemblée générale des Nations Unies a adopté, par sa résolution 260 A (III) du 9 décembre 1948, la Convention pour la prévention et la répression du crime de génocide.

#### LE DROIT À L'ALIMENTATION

30. La durée de la vie dépend de manière décisive de l'alimentation et des conditions de logement. Le droit à l'alimentation est l'un des droits de l'homme. Les documents internationaux se référant à ce droit présentent quelques différences. Ainsi, l'article 25 de la Déclaration universelle des droits de l'homme prévoit que chaque personne est en droit à un niveau de vie suffisant tandis que l'article 11 du Pacte relatif aux droits économiques, sociaux et culturels va plus loin et prévoit le droit de chaque personne d'améliorer constamment ses conditions de vie. La Déclaration sur le progrès et le développement dans le domaine social prévoit, à l'article 10, point 2, parmi les objectifs poursuivis, l'élimination de la faim et de la malnutrition et la garantie du droit à une alimentation appropriée. La Déclaration des droits de l'enfant, adoptée par l'Assemblée générale des Nations Unies aux termes de sa résolution 1386 (XIV), prévoit en principe le droit de l'enfant à l'alimentation, au logement et à des soins médicaux adéquats.

31. Les documents internationaux traitent aussi des moyens qui garantissent la réalisation du droit à l'alimentation<sup>32</sup>: l'amélioration des méthodes de production, la conservation et la distribution des aliments conformément aux connaissances techniques et scientifiques; une meilleure utilisation des ressources naturelles par le développement ou la réforme des régimes agraires; la répartition équitable des ressources alimentaires mondiales, compte tenu des problèmes tant des pays importateurs que des pays exportateurs d'aliments; le principe selon lequel aucun peuple ne peut être privé de ses propres moyens de subsistance. On reconnaît que l'élimination de la faim et de la malnutrition est l'un des

<sup>32</sup> Le Pacte international relatif aux droits économiques, sociaux et culturels, art. 131, par. 11, point 2; la Déclaration sur le progrès et le développement dans le domaine social, art. 10 et 18; la Stratégie internationale du développement pour la deuxième Décennie des Nations Unies pour le développement, par. 69.

principaux objectifs du progrès et du développement dans le domaine social.

32. Le niveau de vie des hommes n'est pas le même dans tous les pays. La Déclaration universelle des droits de l'homme stipule, dans son préambule, qu'elle représente un idéal à réaliser pour tous les peuples et toutes les nations, par un ensemble de mesures qui seront adoptées progressivement.

33. Le niveau de vie est le facteur principal qui détermine la durée de la vie des hommes et, en conséquence, le taux de mortalité. Le niveau de vie est fonction du degré de développement politique, économique et social des Etats<sup>33</sup>. De façon concordante, le taux et les tendances de la mortalité sont différents dans le monde<sup>34</sup>. L'on considère même que le niveau de la mortalité, jusqu'à un certain degré, est influencé par des facteurs économiques et sociaux, l'activité des services de santé ne jouant pas grand rôle<sup>35</sup>.

34. Le taux de la mortalité dépend aussi de la structure par âge de la population. En effet, le niveau de la mortalité, dans certaines conditions sociales et économiques, diminue plus vite dans les pays ayant un niveau élevé de mortalité, au début d'un intervalle donné, que dans les pays ayant un niveau de mortalité moindre. Par conséquent, l'espérance de vie est d'autant plus réduite que la durée de la vie est plus longue<sup>36</sup>.

35. La durée moyenne de la vie dépend, en grande partie, du niveau de la mortalité infantile, qui peut atteindre 25 p. 100 du total de la mortalité, dans certaines conditions socio-économiques<sup>37</sup>.

36. Indépendamment des facteurs qui peuvent influencer la mortalité, la conclusion fondamentale qui se dégage est que l'espérance de vie à la naissance dépend du degré de développement socio-économique des différents pays, car tous ces facteurs sont finalement conditionnés<sup>38</sup> par le degré de développement socio-économique.

37. Ayant en vue des statistiques publiées par l'Organisation des Nations Unies au sujet de 59 pays<sup>39</sup>,

<sup>33</sup> En ce qui concerne les rapports entre le développement et la population, ce qui intéresse la politique démographique, les Etats sont d'avis différents (voir "Rapport intérimaire sur la deuxième enquête auprès des gouvernements sur la population et le développement [E/CN.9/282], p. 4 à 7).

<sup>34</sup> Voir *Rapport du séminaire interrégional sur l'analyse de la mortalité*, Mamaia, Roumanie, 20 septembre-3 octobre 1972, (ST/TAO/Ser.C/145-ST/SAO/Ser.R/15), p. 7.

<sup>35</sup> *Ibid.*, p. 9.

<sup>36</sup> *Ibid.*, p. 14.

<sup>37</sup> Voir "La mortalité infantile dans les pays du Marché commun", *A.B.C. de la démographie belge*, Société belge de démographie, p. 53.

<sup>38</sup> Le rapport entre la mortalité masculine et féminine, la mortalité infantile par groupes d'âge et la mortalité par groupes d'âge peuvent présenter des particularités en certaines situations (voir "Rapport du Comité spécial d'experts chargé d'étudier les méthodes de révision des tables types de mortalité des Nations Unies", New York, 17-21 avril 1972 [E/CN.9/273], p. 16 à 18).

<sup>39</sup> Voir le tableau 183 de l'*Annuaire statistique, 1966* (publication des Nations Unies, n° de vente: 67.XVII.1) en se référant au "produit intérieur brut par habitant" et le tableau 46 de l'*Annuaire démographique, 1969* (publication des Nations Unies, n° de vente: E/F.70.XIII.1) en se référant à "l'espérance de vie à la naissance".

on a conclu que l'espérance de vie à la naissance, pour les personnes de sexe masculin, par rapport au produit intérieur brut par habitant (pour 1969) est la suivante : 65 ans et davantage pour 19 pays ayant un revenu excédant 1000 dollars (70 ans et plus pour 5 pays); 59 ans (à deux exceptions près) pour 29 pays disposant d'un revenu de moins de 400 dollars; l'espérance de vie oscille entre 50 ans et 69 ans pour 14 pays ayant un revenu par habitant allant de 400 à 1000 dollars.

38. L'espérance de vie à la naissance dans le monde entier est de 53 ans<sup>40</sup>. La répartition géographique est la suivante : Afrique, 43 ans; Asie (moins l'URSS), 52 ans; Europe (moins l'URSS), 71 ans; Amérique latine, 60 ans; Amérique du Nord, 70 ans; Océanie, 65 ans; URSS, 70 ans. Evidemment, à l'intérieur des continents il y a des différences importantes découlant du degré de développement économique, social et politique.

39. Etant donné les grandes disparités existant entre les revenus des différentes classes sociales à l'intérieur de certains pays, la durée moyenne de la vie doit être calculée d'une manière différenciée. Les rectifications dépendent aussi d'autres facteurs, comme par exemple : la profession, le lieu de travail, les conditions géographiques internes, le lieu de domicile urbain ou rural, le sexe, le fait que les enfants sont nés de parents mariés ou non mariés.

40. Le développement de la science et du progrès technique ont certains effets sur les droits de l'homme<sup>41</sup>, y compris le droit à l'alimentation. Ce dernier droit est aussi influencé par le niveau de l'enseignement qui dépend du développement de l'économie nationale. Ensuite, il y a une relation entre ce développement et celui de la science et du progrès technique. Pour toutes ces raisons, la coopération internationale scientifique et technique contribue, finalement, à la réalisation du droit à l'alimentation.

41. L'espérance de vie à la naissance est plus grande, en général, dans les pays développés du point de vue économique que dans les pays moins développés. Les conditions de vie élevées contribuent à une réduction de la mortalité mais d'une manière différente selon les âges, c'est-à-dire qu'elles favorisent les jeunes et les adultes, moins les vieux et que leur influence est presque insignifiante aux âges très avancés de la population. Le supplément d'espérance de vie à la naissance est plus grand dans les pays ayant une durée de vie plus réduite. Aux âges avancés, le taux de la mortalité a tendance à s'uniformiser avec celui des pays moins développés. Dans certains pays où existent de grands écarts sociaux, l'effet du niveau de vie sur la mortalité est très différent d'une classe sociale à l'autre. Par conséquent, le régime politique peut influencer, dans

<sup>40</sup> Voir "L'analyse démographique des tendances et niveaux de la mortalité", Séminaire interrégional sur l'analyse de la mortalité, Mamaia, Roumanie, 20 septembre-3 octobre 1972 (ESA/P/AC.2/2), p. 4 et 5.

<sup>41</sup> Voir "Droits de l'homme et progrès de la science et de la technique: conséquences des progrès scientifiques et techniques sur les droits économiques, sociaux et culturels" (E/CN.4/1115).

certaines limites, la durée moyenne de la vie. On suppose que dans des conditions de vie égales, c'est la profession et le lieu de travail qui exercent une influence sur la durée de la vie.

42. Le taux de la mortalité pour la population urbaine est plus bas que celui de la population rurale, y compris les groupes d'âges plus avancés, en raison de différentes conditions de confort. Par conséquent, au fur et à mesure que l'industrialisation et l'urbanisation se développent, la mortalité diminue. La croissance du taux de la fécondité influence le taux de la mortalité par rapport à la mortalité maternelle et à celle des nouveau-nés. Les facteurs géographiques influencent, dans une certaine mesure, le taux de la mortalité. L'espérance de vie des hommes est plus basse que celle des femmes. Le développement économique et social peut changer l'importance et la place des groupes de causes de décès. En effet, ces groupes de causes de décès se manifestant différemment selon les catégories d'âges, l'effet de l'amélioration des conditions de vie sur l'espérance de vie diffère dans chaque catégorie d'âge.

#### LE DROIT À LA SANTÉ

43. L'état de la santé est évalué par le niveau de la mortalité et de la morbidité<sup>42</sup>. Dans la Constitution de l'Organisation mondiale de la santé se trouve la définition suivante "la santé est un état complet de bien-être physique, moral et social et ne consiste pas seulement en une absence de maladie ou d'infirmité"<sup>43</sup>.

44. Le droit à la santé est prévu comme l'un des droits de l'homme. Ainsi, l'article 25 de la Déclaration universelle des droits de l'homme montre que chaque personne a le droit à un niveau de vie suffisant pour assurer sa santé, et l'article 12 du Pacte relatif aux droits économiques, sociaux et culturels reconnaît à chaque personne le droit de jouir de la meilleure santé physique et mentale qu'elle puisse réaliser.

45. La relation entre la santé et la mortalité, en ce qui concerne la durée de la vie, est évidente. La population ayant une bonne santé réalise une durée de vie supérieure à celle d'une population ayant une santé précaire. Les facteurs génétiques déterminent aussi la longévité.

46. Finalement, la santé dépend des conditions économiques et sociales et, en même temps, celles-ci l'influencent. Il ressort que les plans de développement national doivent comprendre aussi des programmes sur la santé.

47. Dans les législations nationales il y a des spécifications qui assurent, par des procédés juridiques, la protection de la santé des hommes. La protection la plus efficace est celle du code pénal. Ainsi, les lois nationales

<sup>42</sup> Voir "Rapport du Séminaire interrégional sur l'analyse de la mortalité", Mamaia, Roumanie, 20 septembre-3 octobre 1972 (ST/TAO/Ser.C/145-ST/SAO/Ser.R/15), p. 25.

<sup>43</sup> Voir *Documents officiels de l'Assemblée générale, onzième session, Annexes*, point 31 de l'ordre du jour (A/3525), par. 145.

réglent les infractions concernant l'endommagement de l'intégrité corporelle et de la santé. L'objet juridique spécifique de ces infractions est représenté par les relations sociales qui consacrent le droit absolu à la sécurité de la personne physique, c'est-à-dire à l'intégrité physique ou psychologique de la personne physique. La réglementation de la protection paternelle et tutélaire peut avoir aussi une grande importance pour assurer la santé de l'enfant, en contrôlant la manière dont celui-ci est élevé et éduqué.

48. L'assistance médicale représente l'un des moyens importants de la protection de la santé. La Déclaration universelle des droits de l'homme, aux termes de son article 25, et le Pacte relatif aux droits économiques, sociaux et culturels, aux termes de son article 12, prévoient le droit aux soins médicaux appropriés, qui doivent se réaliser par les mesures que les Etats adopteront. La Déclaration sur le progrès et le développement dans le domaine social, adoptée par l'Assemblée générale le 11 décembre 1969, va plus loin et stipule, à l'article 10, rubrique *d*, que la protection de la santé de toute la population doit être réalisée, s'il est possible, gratuitement; et l'article 19, rubrique *a*, se réfère aux services médicaux gratuits pour toute la population et aux moyens d'assurer l'assistance préventive et curative accessible à tous. Les paragraphes 68 et 69 de la Stratégie internationale du développement pour la deuxième Décennie des Nations Unies pour le développement de 1970 prévoient la continuation des efforts pour l'éradication, dans le plus grand nombre de pays, des maladies qui affectent encore sérieusement les hommes. Pour certaines catégories de personnes, par exemple les femmes enceintes, les enfants, les déficients mentaux, il y a des documents internationaux qui prévoient des mesures spéciales pour la protection de la santé<sup>44</sup>. Par sa résolution 2842 (XXIV) du 18 décembre 1971, l'Assemblée générale a demandé au Secrétaire général de préparer, en collaboration avec les organismes spécialisés, un rapport comprenant des suggestions pour la politique nationale et les actions internationales concernant les nécessités et le rôle des personnes âgées dans la société, dans le contexte du développement.

49. L'organisation et l'octroi de l'assistance médicale dépendent du degré de développement économique, social et politique du pays. Par conséquent, le rôle de

<sup>44</sup> La Déclaration des droits de l'enfant, en date du 2 novembre 1959, art. 2, 4, 5 et 9; la Déclaration des droits du déficient mental, en date du 20 décembre 1971, art. 1, 2, 3 et 7; la Convention n° 100 de l'Organisation internationale du Travail sur l'égalité de rémunération, en date du 6 juin 1951, art. 2 et 3; la Déclaration sur l'élimination de la discrimination à l'égard des femmes, en date du 7 novembre 1967, art. 10.

cette assistance pour assurer la santé n'est pas le même dans les Etats plus développés du point de vue économique et dans les pays moins développés<sup>45</sup>. En outre, dans ces derniers, les diverses classes sociales ne jouissent pas d'une assistance médicale égale. L'assistance de la population urbaine diffère de celle de la population rurale. Les dépenses pour certains soins médicaux sont tellement élevées qu'ils sont inaccessibles à la plus grande partie de la population.

50. La protection de l'environnement joue un rôle important pour la garantie de la santé. Cette protection peut être réalisée par l'emploi rationnel des ressources naturelles, par la prévention et par la lutte contre la pollution de l'environnement et les effets nocifs des phénomènes naturels. Les facteurs suivants doivent faire l'objet, spécialement, d'une protection: l'air, les eaux, le sol et le sous-sol, les forêts et toute autre végétation terrestre et aquatique, la faune terrestre et aquatique, les réserves de la nature. Les mesures de protection de l'environnement peuvent être adoptées par des réglementations sur le plan national ainsi que par des actes internationaux.

51. Le niveau de culture générale et d'éducation sanitaire de la population, de plus en plus élevé, joue un rôle important en ce qui concerne la santé. La généralisation de l'enseignement obligatoire et la création d'un réseau d'écoles de différentes sortes assurent le niveau de culture générale et le niveau d'éducation sanitaire correspondant. De telles mesures devront être réalisées dans tous les pays. Dans le cadre de ces mesures il faudrait déterminer aussi les professions et les occupations dangereuses pour lesquelles les femmes ne devraient pas être engagées et, en même temps, créer les conditions qui permettraient la formation professionnelle des femmes pour des emplois qui leur soient spécifiques.

52. La protection du travail a comme but d'assurer les meilleures conditions possibles de travail, ainsi que de prévenir les accidents de travail et les maladies professionnelles. La protection du travail contribue donc, dans une large mesure, à assurer la santé.

53. Etant donné le rôle joué par la femme dans la production sociale et en tant que facteur important pour l'assurance du fonds biologique de la société, des mesures spécifiques s'imposent pour la protection de la santé de celles-ci, mesures tant à caractère juridique qu'à caractère social-économique.

<sup>45</sup> Dans les pays en voie de développement, la diminution rapide de la mortalité au cours des dernières décennies a été, en général, indépendante des conditions économiques; voir à ce sujet "L'analyse démographique des tendances et niveaux de la mortalité", Séminaire interrégional sur l'analyse de la mortalité, Mamaia, Roumanie, 20 septembre-3 octobre 1972 (ESA/D/AC.2/2), p. 33.

**Part Eight**

**FAMILY PLANNING**

# HEALTH AND FAMILY PLANNING \*

## World Health Organization

### FAMILY PLANNING AS A HEALTH PRIORITY

### Maternal health

1. The principal theme of this paper is the inter-relationship of health and family planning and its implication for health service delivery systems.

2. Family planning can favourably influence the health, development and well-being of the family and, in particular, has an effect on the health measures for health. Thus, family planning care is an integral part of the health care of the family.

3. The health impact of family planning can be considered within the framework of the following influences:

(a) Avoidance of unwanted pregnancies and the occurrence of wanted births that might otherwise not have taken place;

(b) A change in the total number of children born to a mother;

(c) Allowing a natural interval between pregnancies;

(d) Changes in the time at which births occur, particularly the first and the last, in relation to the age of the parents, especially the mother.<sup>1</sup>

4. Social, economic and cultural factors impinge on all aspects of human reproduction. For example, high parity (a large number of births) or short pregnancy intervals are commonly associated with low socio-economic status, poor nutrition, poor hygiene, overcrowding, poor education and poor health practices. These interrelated factors in turn tend to be linked with unfavourable outcomes of pregnancy, such as premature or difficult labour, low birth-weight babies, birth trauma and infection, in which it becomes difficult to establish clear causal relations. At the same time, however, there is little doubt that selected interactions of factors, including high numbers and short intervals of pregnancies, increase the risk of unfavourable outcomes. It is on the basis of this evidence that the health benefits of family planning are founded. As will be seen, the benefits are most striking in relation to the health of mothers and children.

### Mortality

5. While maternal mortality is slightly less with the second and third pregnancies than with the first, it rises with each pregnancy beyond the third and increases significantly with each pregnancy beyond the fifth. It is at times possible to dissociate the effects of parity from those of the mother's age, but usually the two factors are interlinked. Excess female mortality at childbearing ages over male mortality at equivalent ages further quantifies the loss in such situations. The tragic implications of maternal death in relation to health and welfare of the family certainly require no elaboration.

### Morbidity

6. The long-term effects of pregnancy and its complications have not been fully assessed, but it is evident that repeated inadequately spaced pregnancies deplete a woman's store of nutrients, including protein, calcium and iron. Iron deficiency anaemia and folic acid deficiency are common in developing countries and not uncommon in some developed countries. In South America, iron deficiency anaemia has been found to affect about 5-15 per cent of men and 10-35 per cent of women; in Asia, about 10 per cent of men and 20 per cent of women, rising to 40 per cent in pregnancy; and in the Middle East, approximately 20-25 per cent of pregnant women. In Europe, it is estimated that 10-15 per cent of women suffer from iron deficiency anaemia; and in the United States of America, the corresponding level has been determined, mainly amongst the poorest sections of the population, at about 20 per cent.<sup>2</sup> In studies sponsored by the World Health Organization (WHO) in different parts of the world, the percentage of women with anaemia ranged from 21 per cent to 80 per cent.<sup>3</sup> Pregnancy predisposes women to the manifestations of anaemia because folic acid and iron needs increase sharply during this period, especially where malabsorption or poor diet are involved. In developing countries, therefore, there tends

\* The original text of this paper (E/CONF.60/SYM.IV/BP/14) was submitted to the Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974.

<sup>3</sup> *Nutritional Anaemias*, report of a WHO Scientific Group, World Health Organization Technical Report Series, No. 405 (Geneva, 1968).

to be a widespread prevalence of maternal malnutrition and anaemia, sometimes labelled "maternal depletion", due to superimposition of an almost continuous sequence of pregnancy and breast-feeding demands on poor maternal diet and heavy physical work. It has been suggested that if the number of pregnancies were limited to three or less, the incidence of severe or moderate anaemia might be reduced by as much as two thirds. The incidence might be further reduced by better pregnancy spacing.<sup>4</sup>

7. Maternal malnutrition and anaemia are aggravated by infection and chronic illness, which further increase the risks associated with repeated pregnancy. In some developing countries, malaria and parasitic infestation contribute to the severity of maternal anaemia connected with malnutrition. Such hazards of infection are greater where there is restricted access to antiseptic conditions, and inadequate drugs and health care facilities.

8. The pregnancy risks associated with obstetrical complications, such as placenta previa, abruptio placenta and rupture of the uterus; a history of medical conditions of the mother, including toxæmia of pregnancy, hereditary disorders, diabetes mellitus and certain psychiatric and neurological conditions, are aggravated by high parity, particularly grand multiparity.<sup>5</sup> Where health and socio-economic conditions are marginal, many of these problems become especially prevalent and more marked as parity and age of the mother increase.

#### *Abortion*

9. Intervention to interrupt pregnancy would appear to provide the clearest indication that a pregnancy is unwanted for personal, social or medical reasons. Family planning can help the mother to prevent unwanted pregnancies which might result in unqualified termination of pregnancy with known health hazards for the mother.

10. In an increasing number of countries, pregnancy may be legally interrupted for social or personal reasons, as well as on medical grounds. In many parts of the world, however, women choose hazardous, unqualified and illegal abortions rather than accept the burdens of additional unwanted pregnancies, resulting in serious risk to their life and health.<sup>6</sup> The common practice of abortion is shown in figures from studies in South America, where it was found that one of every four pregnancies among married women and one of every three in broken and common-law homes ended in abortion.<sup>7</sup> In a random sample of 3,776 women

(20-45 years of age) living in three cities of Chile, 41 per cent gave a positive history of abortions; and 75.1 per cent of this group admitted to having had up to three induced abortions.<sup>8</sup> For a random sample of 1,662 Peruvian women between 20 and 30 years of age living in the area of the capital (Lima), abortion rates of 20 per 100 pregnancies in the upper socio-economic level, 18 in the middle and 12 in the lower bracket were found.<sup>9</sup> The particular complications of unqualified and illegal abortion include infection, haemorrhage and mechanical injury, and, at times, acute renal failure and thrombo-embolism.

#### *Foetal and neo-natal health*

##### *Mortality*

11. Peri-natal mortality (a sum total of late foetal and early neo-natal mortality) is closely related to maternal age at pregnancy and parity—two variables which can readily be altered by family planning. A highly significant correlation has been noted between increasing peri-natal death rates and multiparity, although the incidence is also high among primigravida (first pregnancies).

12. Studies show that peri-natal mortality is elevated among young mothers under 17 years of age, is at its lowest level between 20 and 29, and rises sharply thereafter. Among mothers over 40, the rate of peri-natal mortality is several times that among those under 20. The excess rates among young girls are accentuated when associated with higher birth orders. Older mothers of birth order one are at high risk of peri-natal loss; but for all of the younger age categories, there is a direct relationship with parity. Peri-natal mortality rates have been reported to be lowest when the interval from the end of one pregnancy to the beginning of the next is between two and three years.<sup>10</sup>

##### *Foetal malnutrition*

13. In recent years, foetal malnutrition has received more attention. It has been discussed as the end-result of two rather different pathological phenomena. In one, maternal vascular disease may restrict blood flow to the placenta, while in the other, maternal malnutrition is believed to reduce the quantity of essential nutrients reaching the foetus.<sup>11</sup> Maternal malnutrition and anaemia have been described above in relation to their serious effects on maternal health; but where nutritional reserves are depleted and food intake during pregnancy

<sup>11</sup> M. Winick, "Fetal malnutrition", *Clinical Obstetrics and Gynaecology*, vol. 13, pp. 526-541.

is poor, the toll on the developing foetus may also be substantial, adversely affecting birth weight, peri-natal mortality and brain development. Even in developed socio-economic conditions, maternal nutrition is considered to play a role, since pre-pregnancy weight of the mother and weight gain during pregnancy have been shown to be positively associated with birth weight of the infant.<sup>12</sup> In developing countries, the widespread prevalence of chronic malnutrition among women of childbearing age leads to a high incidence of low birth-weight infants. A large proportion of peri-natal deaths and peri-natal morbidity occurs among the low birth-weight babies, who thus represent a high risk group in general. Hence, the control of birth weight is considered a prime means of reducing peri-natal mortality and immediate and long-term morbidity.

14. Birth spacing is similarly associated with birth weight and therefore is another important factor in infant survival and health. It has been shown that spacing of at least two years between pregnancies has helped to improve birth weights.<sup>13</sup> Short intervals between pregnancies have been shown to be associated with low birth weight, early neurological retardation, as well as lower mean intelligence quotient (IQ) scores at four years of age, even when controlled for socio-economic status and other factors.<sup>14</sup> Foetal malnutrition also has been demonstrated to have a definite retarding effect on brain growth during the critical period before birth.<sup>15</sup> The results of a well-controlled experiment in four Guatemalan villages are of interest, as they show that by supplementary feeding of the pregnant women who are chronically malnourished, the birth weight of their babies is improved.<sup>16</sup>

#### Child health

15. Many studies have documented significant relationships between the health of children, family size and spacing. Only some selected representative reports can be cited here.

#### Post-neo-natal mortality

16. As concerns mortality of infants after the first month of age, 1-12 months, infants of the youngest mothers with the highest parity are at greatest risk, with maternal age being the more important of these two factors. Deaths during this period are associated with such environmental factors as housing, sanitation, nutrition and exposure to infectious diseases. Many studies support the strong associations between high post-neo-natal mortality, pregnancy at an early age and high parity.<sup>17</sup> The timing and spacing and control of the number of births as a means of achieving lower post-neo-natal mortality is highly relevant to family planning practice.

#### Maternal care

17. Care provided by the mother for her infant, and her interests and attitudes towards her children in relation to family size, were analysed as a part of longitudinal studies of pregnancy and childhood in the United Kingdom of Great Britain and Northern Ireland.<sup>18</sup> The adverse effects of increasing family size on infant care, use of medical services, interest in school progress and desire for better schooling were consistent.

#### Infectious disease

18. It has been shown through detailed longitudinal family studies that the prevalence of infectious gastroenteritis and respiratory disease are directly related to family size.<sup>19</sup>

#### Height and weight

19. Child growth has also been found to be associated with family size. Data indicate quite clearly that children in large families are smaller and that first-born children with one or more siblings do not reach the height and weight obtained by those who remain only children.<sup>20</sup> A study of pre-school malnutrition at Candelaria, Colombia, showed a significantly higher prevalence of growth retardation among children from families with five or more living children than a

matched group of families with four or fewer children.<sup>21</sup>

### *Intellectual development*

20. Few studies dealing with the relationship between family size and intellectual development have used acceptable methods and they are confined to western cultures. However, these show a definite adverse effect of family size on intelligence. One of the most adequately controlled investigations is the long-term follow-up of the large sample of children in the United Kingdom (see para. 17). At 8 years, the children completed four tests—non-verbal intelligence, sentence completion, reading and vocabulary; at 11 years, the reading and vocabulary tests were repeated. For all socio-economic groups, there was a consistent decline in the scores with larger family size.<sup>22</sup> The longitudinal studies indicate that early childhood influences, before age 7, produce the greatest effects.

21. As mentioned earlier, children from large families are more likely to suffer from deficiencies of parental care. Thus, it might be inferred that the quality and quantity of adult contact (that of parents and, in extended families, other adults) may be the most influential factor determining achievement, motivation and perhaps ability. It is clear that the more children a mother has, the less attention she can provide for any one of them. However, other environmental factors, such as crowded living status, reduced income and lower *per capita* spending for food, all associated with large families, also must deter the full intellectual development of such children.

### *Family health*

22. The relationship between family size and selected measures for maternal and child health have been reviewed. In many instances, they reflect the effects of family overcrowding and its correlates. Thus, it might be postulated that the larger the family, the higher the probability of poor adult health—unrelated to their immediate effects of reproduction or growth and development. However, methodologically sound studies to support such a hypothesis are scarce and originate largely from western countries. Therefore, associations of adult health with family size will be alluded to only briefly. For example, the development of rheumatoid arthritis has been shown to be more frequent in persons from larger sibships, and peptic ulcer among fathers increased with the number of children in the family.<sup>23</sup> It has also been suggested that marital adjustment may be associated with family size.

<sup>21</sup> J. D. Wray and A. Aguirre, "Protein-calorie malnutrition in Candelaria, Colombia: I. Prevalence, social and demographic factors", *Journal of Tropical Pediatrics*, vol. 15 (1969), pp. 76-98.

<sup>23</sup> E. Chen and S. Cobb, "Family structure in relation to health and disease", *Journal of Chronic Diseases*, vol. 12 (1960), p. 544.

23. Effective family planning can favourably influence the health, development and well-being of family members and the family unit as a whole. It is therefore considered as an important preventive measure in the health care of the family. It may also improve the quality of life through its impact on family health. For example, when children are born at optimum times and are wanted, it is more likely that they will be well cared for and that their environment will be conducive to normal growth and development, while family members can more easily share an emotionally satisfying relationship that will promote family health.<sup>24</sup>

### *Infertility and sub-fertility*

24. Although major emphasis has been placed upon the health benefits of pregnancy, spacing and family size limitation, family planning properly encompasses also a concern with infertility and sub-fertility from the physical and psychological points of view. In some social and cultural milieux, a woman's status and happiness, as well as a man's, are related to his or her fertility or sub-fertility. Hence, ideally, family planning as a component of health services should seek to determine the specific cause of sub-fertility, begin the appropriate treatment and continue care until a child is born to the couple.

### CHARACTERISTICS OF MATERNITY WITH RESPECT TO HEALTH ASPECTS OF REPRODUCTION

#### *Maternal health and fertility*

25. Maternal health and nutritional status as they relate to fertility have been discussed. Although acute catastrophic starvation, such as was experienced during the Second World War, results in sub-fertility, it is not shown that chronic malnutrition has a major influence. However, among pregnant women and infants, improved nutrition might indirectly affect fertility. For example, reducing infant mortality might lengthen the duration of lactation which would tend to increase the intervals between births and thus reduce fertility. This is, however, a matter of great dispute; and if lactation affects the interpregnancy interval, its effect *per se* is small.<sup>25</sup> On the other hand, socio-economic and cultural changes associated with improved nutrition and falling infant mortality may result in a concomitant decrease in breast-feeding and/or a relaxation in the taboos on coitus during lactation, which would have a reverse effect and tend to raise fertility. Infections, especially venereal diseases and genetic disorders, and age at menarche are among the additional biological factors which affect fertility.

#### *Post-partum amenorrhoea, breast-feeding and weaning practices*

26. Post-partum amenorrhoea and breast-feeding and weaning practices, as they relate to fertility, merit

<sup>24</sup> United Nations Children's Fund/World Health Organization Joint Committee, "Review of family planning aspects of family health", Geneva, 1-2 February 1972 (E/ICEF/L.1281).

<sup>25</sup> A. M. Thomson, F. E. Hytten and A. E. Black, *Lactation and Reproduction* (in press).

consideration. Although post-partum amenorrhoea reduces fertility for a total population, there are, unfortunately, limited data concerning post-partum amenorrhoea variations between and within populations. There is evidence that the duration of post-partum amenorrhoea is related to the duration of lactation and to the outcome of previous pregnancy—it being shortest following abortions, slightly longer following stillbirths and neo-natal deaths and longer still if the infant survives the first month.<sup>26</sup>

27. Breast-feeding appears to prolong post-partum amenorrhoea and, consequently, to delay ovulation and pregnancy. However, the duration of protection against conception provided by lactation varies considerably between different population groups.<sup>27</sup> It may be that cultural patterns of breast-feeding, the extent and frequency with which an infant is nursed and the previously mentioned prohibitions concerning sexual intercourse during lactation are more important explanations of subsequent pregnancies than is lactation *per se*. There are some data to suggest that children weaned early are those whose growth and health has been failing, whereas those weaned later are those whose growth and health were better.<sup>28</sup>

28. In developing countries, weaning practices play a major role in relation to child survival as well as fertility. Therefore, mothers should be encouraged to breast-feed and additional supplementary foods should be added as the child grows. Regrettably, as societies become modernized, preference for artificial feeding has proceeded at an alarming pace. When mothers in impoverished communities with low levels of education choose not to or are unable to breast-feed, their infants may develop fatal gastro-enteritis and nutritional or other diseases that could have been prevented. The death of the infant is often followed closely by another pregnancy. Conversely, a new pregnancy may lead to death of the preceding child—the “last but one”—possibly as a result of early weaning.<sup>29</sup>

#### *Hormonal contraceptives and breast-feeding*

29. Considerable interest and concern has focused on the effects of hormonal contraceptives on lactation. Although the question is not fully resolved, there seems to be general agreement that combined oral contraceptives may have an adverse effect on lactation. The risk of pregnancy is low during the first four or six weeks post-partum; therefore, hormonal contraceptives could be postponed until lactation is well established. Another possibility is to provide other methods of

<sup>26</sup> *Biological Components of Human Reproduction: Studies of their Variations in Population Groups*, report of a WHO Scientific Group, World Health Organization Technical Report Series, No. 435 (Geneva, 1969).

contraception which have no effect on lactation and then to transfer to the estrogen-progestin combined oral pill, if this is considered the method of choice, after cessation of breast-feeding.<sup>30</sup>

#### *Socio-cultural determinants and fertility*

30. In addition to the biological and related factors associated with fertility, socio-cultural determinants should be noted. For example, the primary obstacles to family planning include: early age at marriage; attitudes related to high levels of mortality, especially childhood mortality; the dependence of women's status in the family and society upon fertility; and the importance given to the birth of sons, or to large families as a means of ensuring support and security in illness or old age. Sometimes the methods used in provision of family planning care are not acceptable in a given setting or for individual families. Furthermore, major or minor side-effects may discourage acceptance or continuation, especially where there are no easily accessible health services or good quality for care and follow-up. Professional and auxiliary health workers' attitudes to family planning are also an important consideration; traditional birth attendants, in particular, might perceive child spacing as reducing the need for their services. However, with proper orientation and appropriate support by health team members, they may play a positive role in efforts for provision of improved maternal and child care, including family planning.

31. In summary, reproductive behaviour is affected by varying health and health-related factors, depending upon the characteristics of each society under consideration.

#### THE RATIONALE AND ADVANTAGES OF INTEGRATING FAMILY PLANNING WITH MATERNAL AND CHILD HEALTH AND OTHER FAMILY AND COMMUNITY HEALTH MEASURES

32. The health benefits of family planning cited above illustrate that family planning is a health need for the family. However, many factors will affect decisions to seek and effectively to continue practising family planning. For example, in developing countries where childhood mortality is still high, parents find it difficult to alter their high fertility patterns. Their personal experiences, from an early age onward, have taught them that some of their children will die, regardless of what action they take. Retrospective, cross-sectional and longitudinal studies suggest that increased childhood survival is essential to the widespread acceptance of family planning and recognition of the fact that the practice of family planning and birth spacing will favourably influence child survival.<sup>31</sup> The evidence from mathematical models points in the same direc-

<sup>30</sup> A. M. Thomson, F. E. Hytten and A. E. Black, *op. cit.*

<sup>31</sup> S. Hassala, *Influence of Child Mortality on Population Growth* (Ann Arbor, University of Michigan microfilm, 1966); E. Driver, *Differential Fertility in Central India* (Princeton, N.J., Princeton University Press, 1963).

tion.<sup>32</sup> It also appears that these dynamics have played a role in the demographic revolution.<sup>33</sup>

33. In fact, where infant and childhood mortality are high, isolated family planning programmes are unlikely to convince unresponsive or resistant couples. Many field-workers have found that when family planning programmes are not integrated with or based on family health care provided in health services, it is difficult to sustain their initial impact. Of even greater significance are the more positive reactions of parents to programmes which include family planning among the other family health care measures directed towards reducing child morbidity and mortality than to programmes concerned solely with family planning. Further documentary evidence is needed to support this observation.

34. The nature of modern contraceptive methods is such that supportive health services are required for their proper administration to couples in need. Many aspects of family planning care require the personnel, skills, techniques and facilities of health services. The use of the intra-uterine device (IUD), hormonal contraception and surgical sterilization requires health care for case selection, implementation, follow-up and management of side-effects. The support of the medical community and the health teams is highly desirable and its participation for servicing the programme indispensable. Where family planning programmes are not adequately integrated with health programmes, there is likely to be duplication and fragmentation of resources. At the outset, it is important to secure the most prestigious medical support possible for family planning efforts. The medical profession should be involved in selecting the contraceptive methods to be provided. Unless medical and health workers at all levels, from academic professors to the village midwife, are mobilized and support family planning efforts, community support will be deficient. The provision of measures for family planning as a part of continuing family health care in health services fosters acceptance of contraceptive methods in the face of rumours and concern among the general public. Lastly, the continuing care and follow-up required for medically administered contraceptive methods can be more efficiently provided through integration of family planning and health services resources.

35. There are many logistic reasons for integrating programmes for dealing with the priority needs of mothers and children, including family planning. Funds can be pooled, a stronger infrastructure developed, supervision strengthened, duplication of facilities avoided and workers can relate family planning to many of the reasons for the mother's visit for health care (the need for family planning is most evident to

parents in connexion with maternity and child care). In most of the world's countries, manpower and other health resources are relatively scarce and careful consideration must be given to their most efficient use. Where funds and personnel are diverted into isolated family planning programmes, there is not only the danger that health services will be weakened, but the likelihood that basic infrastructure, which is important for health objectives of family planning, will be weakened. It would appear that administration of family planning must be carefully balanced with other health services and interdependent programmes developed.

36. It is recognized that at the current time adequate health services are scarce in the rural areas of the developing world. Accordingly, there is concern about the relatively long period of time that will be required to strengthen health services and to bring about significantly reduced infant and childhood mortality and for parents to recognize this reduction. However, many Governments are equally concerned and are planning and implementing programmes that will provide elements of the basic health needs of these areas, including family planning care integrated with maternal and child health activities within health services. The question is how best to balance the former with the latter, considering carefully the special conditions of each country and its varying locales.

#### *Maternity-centred family planning*

37. Maternity-centred family planning (integrated MCH/FP care) has as its objective improving the health of mothers, children and the family and emphasizes the provision of integrated adequate maternal and child and family planning care, including pre-natal care. It provides: screening and referral of high risk cases; assistance during childbirth; care of the newborn, the infant and the child; counselling of both parents; nutrition advice and immunization; monitoring of growth and development of children, with family planning and contraception advice as appropriate; proper supervision of the use of the fertility regulation methods and follow-up for possible complications and management. It also includes advice for couples who need care for sub-fertility and infertility. This approach takes into account the fact that whenever there is contact with mothers and children through health services, in hospital, homes and health centres, the opportunity must be taken to improve maternal and child health care, including family planning information, advice and service.

38. Maternity care represents the most obvious element of health services for the introduction of family planning. In any population, a large number of women can be found who have had rapidly repeated pregnancies. Many of them wish to avoid or postpone further childbearing, but do not know how. Under the usual family planning programmes, women are not contacted promptly after a pregnancy so that inquiries repeatedly find them currently pregnant and therefore

<sup>32</sup> D. M. Heer, "Mortality level, desired family size and population increase; further variations on a basic model", *Demography*, vol. 6, No. 2 (1969), pp. 141-149.

<sup>33</sup> A. R. Omran, "The epidemiologic transition: a theory of the epidemiology of population change", *Milbank Memorial Fund Quarterly*, vol. XLIX, part 1 (1971), pp. 509-538.

ineligible for contraceptive advice. In fact, it has been determined that without contraception and without lactation, approximately 80 per cent of fertile women will conceive again within a year following delivery.

39. The ante-natal, lying-in, post-partum and inter-conceptual periods seem to offer unique opportunities to advise women about family health in a systematic manner. When the pregnant women in either urban or rural areas can be seen by a nurse, midwife or doctor, education and health care services for mothers and children, including family planning, can be provided. In addition, through the health personnel, the husbands can also be offered family planning education and services.

40. The advantages of providing family planning in relation to the maternity cycle and as an aspect of maternal and child health care are:

(a) Activities can be focused on those known to be fertile;

(b) Delivery or abortion is a time of high motivation for family planning for health reasons and one often providing contacts with the health worker;

(c) The trust that develops through contacts with health workers can influence women to accept and practice maternal and child health measures, including family planning;

(d) Family planning is a health need for mothers and children and families, and should be a natural part of their health care;

(e) Integrated services appear more logical to the families and the need for family planning becomes more obvious to parents in connexion with events in the reproductive cycle such as pregnancy, delivery and child care;

(f) The technical and managerial skills and expertise of health workers providing maternal and child care are most closely related to and thus suited for provision of family planning advice and care;

(g) The administrative structure and other existing resources can be used, avoiding duplication and competition; thus, cost/effectiveness is greater than with other approaches;

(h) Through continuity with maternal and child health/family planning care, follow-up and necessary reinforcing guidance can be provided;

(i) Family planning and other maternal and child health measures can be provided together with the most convenient, accessible, acceptable and meaningful form for the consumers in a given setting;

(j) Health measures to reduce child mortality will make couples more receptive to limiting the number of their children.

41. Except in the case of post-partum sterilization, follow-up of the mother should extend beyond the immediate post-partum period. The insertion of IUDs

can conveniently be done in the post-partum period and oral contraceptives may be prescribed. However, follow-up must provide continuing care, reassurance about the frequent minor side effects which occur, and reinsertion of spontaneously expelled IUDs. Many women neglect to return for post-partum attention, but do appear at child health clinics seeking care for their infants. By routine inquiries about the mothers' and families' needs and desire for family planning during each contact for infant care, health workers can attend to and follow up a large number of mothers effectively. Furthermore, family planning can be logically presented as a requirement for successful infant care and nutrition.

42. As abortion laws become more liberal, in some countries, family planning care may include early pregnancy diagnosis and access, if indicated, to qualified and safe abortion care in health services. Provision of abortion care would include appropriate physical and psychological support and follow-up of women, as well as advice on contraception to avoid abortions becoming necessary.

#### *Other activities in health services and family planning*

43. Although the broadly conceptualized, integrated maternal and child health and family planning activities known as the maternity-centred approach, if fully implemented, can be capable of reaching a high proportion of the population in need of family planning, other health activities and health workers can also make meaningful contributions.

44. For example, nutrition rehabilitation centres and day-care centres for pre-school children are highly suitable settings for discussing health aspects of family planning with parents. Where indicated, the provision of supplementary iron, in cases of low maternal haemoglobin levels, either through its addition to contraceptive pills or as a routine preventive measure for all contraceptive patients, is a highly promising approach.

45. Psychosis, cancer, mental retardation and other chronic diseases are known contra-indications to pregnancy. Those providing care in such cases have the opportunity as well as the responsibility to ensure that effective birth control services shall be provided. In fact, family planning care could be made available to patients requiring any kind of medical and surgical care.

46. Health education is among the health disciplines which can contribute directly to family planning programmes. The professional skills of the health educator are closely applicable to the problem of education for fertility management, through improving and supporting direct education measures, guidance of mass media, development of the health aspects of family life education (including sex educational aspects of school health and of out-of-school youth and adult education programmes), strengthening marital counselling and gaining the co-operation of community leaders and groups and other potential collaborators.

## REVIEW OF THE STATUS OF DEVELOPMENT OF FAMILY PLANNING AS A PART OF HEALTH SERVICES

### *Variations in planning and evaluation*

47. There is wide variation in patterns of programme planning—from the subjective projection of activities based on past experience to the deliberate, systematic and objective process of collecting data and mobilizing resources. Most programmes combine both these patterns. A general description of what has occurred in the past decade is given below.<sup>34</sup>

48. In countries where health and humanitarian concerns predominate, the stimulus for family planning usually originates in medical circles, often with local, private family planning associations playing an active role in creating a favourable climate of opinion. Where economists are concerned about the effect of population growth on development plans, family planning activity typically originates in the planning board or its equivalent.

49. The official programme is most often the responsibility of the Ministry of Health and at the field level is closely linked to the maternal and child health care given in health centres. A physician with experience in public health is usually appointed to direct the programme and often begins by designating family planning as another health service, to be administered through the existing network of centres or through separate family planning clinics that are especially established.

50. An initial problem in planning a national programme is the need to relate the objectives of family planning to those of national development and to present the health benefits of family planning in an explicit, convincing and consistent way. A common difficulty is that of setting realistic objectives, which take sufficient account of such constraints as limited national resources and the current state of contraceptive technology with due consideration to local availability. This can usually be done by setting objectives on the basis of operational experience, which shows what can realistically be expected of the programme. Another problem is the need to design a programme of adequate managerial format that will facilitate implementation, monitoring and evaluation.

51. Some Governments initiate special evaluation studies to assess the performance of their family planning programmes. Statistical data are usually collected on numbers of acceptors, procedures performed and supplies distributed. Various aspects of the programmes are evaluated; but, as the United Nations Advisory Mission to India pointed out, the assessments tend to be scattered and *ad hoc* in the absence of the over-all plan for evaluation.<sup>35</sup> The Mission suggested

<sup>34</sup> B. Berelson, "National family planning programmes: where we stand", *Studies in Family Planning*, vol. 39 (supplement) (1969).

<sup>35</sup> "An evaluation of the family planning programmes of the Government of India" (ST/SOA/SER.R/11), para. 268.

that, to be effective, evaluation of programme performance has to be undertaken at all stages; and, ideally, evaluation begins along with the planning of programme operations and should take into account all objectives of the programme.

52. By 1969, it became apparent that the older programmes in Asia were reaching a plateau in their level of achievement. This levelling-off reflects saturation and calls for further programme development. As services became available, the programmes reached those couples ready to adopt family planning who represented a large backlog of potential acceptors. Further programme development in these countries requires new modes of programme delivery, a variety of educational approaches and studies of the optimum combinations of contraceptive methods to be offered in a given socio-cultural setting.

### *Current status of maternity-centred family planning*

53. The effectiveness of including family planning services in large hospital maternity units has been demonstrated. The Population Council began an international post-partum programme in 1966, which has been expanded to over 250 hospitals in a number of countries or areas, including multihospital networks in Colombia, Honduras, Hong Kong, India, Indonesia, Pakistan, Philippines, Puerto Rico, Thailand, Tunisia and the United States of America. The primary purpose of the programme is to reach fertile women immediately following delivery or abortion when they are especially receptive to family planning. In fact, it has been shown that in an urban setting, where most deliveries occur in hospitals, the majority of fertile women will make contact with the programme within a period of above three years.

54. During the first two years of operation of the 25 hospitals then participating in the programme, 236,000 new acceptors were enrolled, representing 11 per cent of the estimated community target population. A little more than half of the acceptors were women who had been delivered in these hospitals and the remainder were "indirect acceptors", women who had been informed by others using the services and who had been attracted from the same community. Information outside the hospital was mainly by word of mouth. It is evident that this is a quite extensive and highly important means for providing information or for communicating the need for family planning programmes in health terms. In the seven hospitals in the United States, 45 per cent of the delivered cases accepted contraception; 21 per cent accepted in the 18 hospitals outside the United States.<sup>36</sup>

55. Based upon the achievements of the post-partum programmes, WHO has developed a substantially broadened approach, i.e., maternity-centred pro-

<sup>36</sup> G. I. Zatuchni, "Overview of program: two year experience", in G. I. Zatuchni, ed., *Postpartum Family Planning, A Report on the International Program* (New York, McGraw-Hill, 1970), pp. 83-84.

grammes with the linked objectives of improving maternal and child health care and providing family planning as an integral part of this care at all stages of the maternity cycle and during child care (WHO MCH/71.2, 1971). The rationale and advantages of the maternity-centred approach were discussed above in paragraphs 32-46.

56. This programme has been developed by WHO since 1970, when a consultation of experts from various countries, institutions and universities identified the following three main areas for action:

(a) An operational programme, designed to improve the obstetrical, gynaecological and paediatric services of major hospitals in urban areas where hospital-based family planning services would also be provided;

(b) Field studies and pilot demonstrations to explore the extension of maternity-centred family planning activities to small units and rural areas;

(c) Activities concerned with relevant education, training and the collection of data on health benefits of family planning.

57. As stated above, the principal experiences with this approach has been with post-partum programmes in large maternity hospital services. These programmes have been given priority because large numbers of cases could be conveniently reached administratively and evaluated. There has been less experience with the post-partum approach in smaller maternity units, home delivery services and in rural areas. Some countries have had experience with developing rural maternal and child health services and home delivery programmes. Family planning activities are already well advanced in some of these, for example, the rule of the rural auxiliary nurse-midwife in India, the MCH regional training centres and health centre programmes in Thailand and the lady family planning visitor and village organizer in Pakistan.

58. To cover the bulk of the population, it is essential to extend this activity to small units in rural areas, as these areas have been less well served with MCH/family planning services and much more remains to be accomplished here. As rural maternal child health and family planning care becomes a major part of government health programmes, further experience and experiment in programme design should be forthcoming. Because the experimental approach is necessary, documentation and evaluation of all aspects of such a programme should have high priority.

59. In 1970, WHO began the planning of maternity-centred programmes as described in paragraph 56,<sup>37</sup> and by 1972, at the request of Governments, WHO provided varying degrees of assistance to over 40 countries for development of this maternity-centred family planning programme.<sup>38</sup> Collaboration with the United

Nations Fund for Population Activities (UNFPA), the United Nations Children's Fund (UNICEF), the World Bank, the United States Agency for International Development, the Population Council, the International Planned Parenthood Federation and other United Nations and private agencies has been prominent in the development of these projects.

60. Programmes emphasizing the extension of maternity-centred family planning activities to smaller health units and rural areas have recently been developed with WHO assistance in some countries. In these programmes, clinical facilities, supplies, equipment and transport to outlying areas are being improved. Where possible, the number of health centres may be increased to achieve better coverage of the population. Better systems of supervision are being planned to permit optimum use of available medical and auxiliary personnel and related family health education programmes are beginning and community groups are being involved in this effort. Improved registration of vital statistics is being promoted. All levels of staff—but especially nurses and midwives—receive further training, largely through one or more centres selected by each country or territory to develop national training programmes and conduct pilot demonstrations and research.

61. The integration of family planning with maternal and child care is also developing with WHO assistance through a variety of other means. In a number of countries, maternity-centred family planning is included as one component of a comprehensive project to strengthen basic health services.

#### PLANNING, ADMINISTRATION AND IMPLEMENTATION OF FAMILY PLANNING IN THE CONTEXT OF HEALTH SERVICES

62. It is impossible to outline the ideal organization for a national family planning programme, in view of the numerous factors upon which such organization would depend. The general administrative setting, division of basic responsibilities, management of personnel, financial arrangements and other essential components are conditioned by the basic structure of Governments, the availability of trained staff, the kind of regional and local authority which exists, the mode and levels of payments and a series of other factors which have an impact on public administration and service in general.

63. Fundamentally, the introduction of family planning into health services involves tasks that are similar to those faced in introducing and providing any other medical and public health measure. There are problems of administration and management of the training of staff, of introducing the subject of fertility regulation into health education activities, of relating the new services to the other ongoing health activities, of team work, of reaching the population coverage, of

<sup>37</sup> *The Work of WHO, 1970: Annual Report of the Director-General to the World Health Assembly and to the United Nations, Official Records of the World Health Organization, No. 188 (Geneva, 1971), chap. 6.*

<sup>38</sup> *The Work of WHO, 1972: Annual Report of the Director-*

*General to the World Health Assembly and to the United Nations, Official Records of the World Health Organization, No. 205 (Geneva, 1973), para. 9.14.*

developing appropriate health education programmes, of selecting specific technology suited to the community, of supply channels, of transport and of utilization and evaluation. Both from the point of view of the effects on health and from that of organization, services concerned with family planning and those concerned with the general health needs of a community are interdependent.

64. In the past two decades, WHO has assisted Governments in the preparation of plans for the development of public health programmes. In some instances, the approaches to the establishment or expansion of public health services that were embodied in those plans were periodically discarded and new approaches adopted, often without benefit of a thorough evaluation. Governments and WHO could have profited from such evaluations; for example, detailed knowledge might have been acquired of those aspects which were successful and those which failed. However, a basic principle on which there is general agreement has emerged from the experience of WHO in providing assistance to health programmes in developing countries. The fundamental differences in the conditions that influence health care—even in countries that are apparently at a similar level of development—make it indispensable for each country to evolve its own pattern of health services. To assist countries in their efforts to design a national health structure, WHO can give guidance on the basic principles of health care and on the management skills needed to deliver that care. Specific blue prints for the development of public health services, which might be copied by countries, have never been developed, nor would it be desirable to devise such plans.

65. Briefly, the organizational structure of a system of health care should indicate the levels of responsibility for policy-making, administrative supervision and operational functioning, as well as the channels of communication both vertically—among these three levels—and horizontally—with other sectors of the health services at each level.

66. Within this structure, there are many decisions to be made: for example, the required number of peripheral health centres must be determined; whether peripheral centres should be developed before or after establishments at the intermediate or central level have been strengthened must also be determined. These decisions cannot be generalized; they must be made by individual Governments. Many of the activities in the WHO research programme have been concerned with finding a mechanism that would enable Governments to make such decisions objectively and to sharpen a country's ability to develop its own pattern of health services. One current effort in WHO that appears to be producing results adopts the following project systems analysis approach.<sup>39</sup>

<sup>39</sup> World Health Organization, "Health project formulation, a manual of concepts and procedures" (document PSA/71.1/Rev.1).

67. Before any programme is expanded, there must be an objective determination of what is functional and a decision taken on specific programme goals. Then, during a one- to two-year period of trial and error, programme achievements that have been attained through the tactics employed can be compared with the goals. This approach differs fundamentally from the familiar demonstration or pilot project approach. It rests upon the use of a new mechanism that is derived from the modern managerial techniques employed in industry, and through which Governments identify the development objectives of proposed projects and to plan the activities required to achieve those objectives.

68. One salient feature of the project systems analysis method is that evaluation is built into the planning process. The monitoring of progress is held to be an integral part of project formulation so that plans are constantly tested and assessed. Modification of the plan continues until the service is operating at the level required to attain the project objectives. The evaluation techniques can also be used to follow up completed projects, so that no activities are expanded or new projects created without an assessment of the results of completed projects. The basic objective of technical assistance is the achievement of long-term and self-sustained development and no project can be considered to have reached this objective until follow-up measures have demonstrated it. The evaluation of project activities in a specific field can be extremely complex because many factors influence the final result. The problems inherent in the creation of isolated projects have brought about an appreciation of the need to co-ordinate and integrate projects into a comprehensive programme with broad objectives and prospects of effective impact.

69. Another characteristic of project systems analysis is its orientation. It is truly suited to project-oriented national programmes. As such, it cannot form the basis of agency-oriented programme formulation, but it can be applied to family planning activities in countries aided by international agencies.

#### *Problems of organization, administration and service*

70. Countries with higher levels of health resources have been able to train health manpower relatively quickly to carry out family planning tasks. They have been able to utilize the multiple points of contact with the target populations offered by health services and to provide the continuity of care and supervision that improve family planning efforts. Better health resources are usually associated with improvements in the other socio-economic factors that enhance successful family planning practice, not the least significant of these being an effective administrative structure in the country in general, and in the health services specifically, through which the planning, implementation and evaluation of the programme can be conducted, controlled and supervised.

71. Health services are organized at central, intermediate and peripheral levels, and the recognized levels of administrative action are for policy-making, for administrative and executive supervision and for functional service.

72. In considering the problems of over-all administration for the implementation of a family planning programme, action has to be adapted to the three levels of organizational structure of health services.

#### *Central level*

73. The central administrative unit serves at the national level for planning, administration and policy formulation.

74. This central unit may or may not be the central co-ordinating body for the national family planning programme, but will be concerned only with administering the programme within the public health sector and ensuring close co-operation and co-ordination with activities under the administrative control of other sectors or agencies.

75. In some countries without regional autonomy, this body will have national authority and administrative control. In other countries where regionalization is well developed, the main administration, control and supervision of the programme will be at the regional headquarters. The reference made to the central level of administration will apply equally to such administrations.

76. It is important that the personnel involved with policy-making at the central level should be familiar with and active in field activities and peripheral unit problems.

77. The policy-making responsibilities of the central body will relate to national policy on family planning activities, indicating the objectives and targets of the programme. The specific issues for which decisions will be required are: the fiscal arrangements for the programme; the operational standards, including the training of personnel and operational units; evaluation criteria and system of data collection and analysis; the development of training at professional and auxiliary levels; enabling legislation; research policy; the establishment of field experiments, pilot projects and demonstration units.

78. The administrative and executive action to be undertaken by the central unit will be concerned mainly with two areas which are interdependent: first, the general planning for the establishment of a network of services for family planning within the public health sector, including the provision of the resources and transport required for the programme; secondly, the maintenance of co-ordination with other government ministries or departments, other sectors and agencies such as leading professional bodies and community groups to encourage the integration of effort in the programme and for co-operation in the fields of evaluation and research.

79. The major responsibilities of the central unit with regard to the functional operation of the programme will be in maintaining close personal contact with field activities to encourage and support uninterrupted implementation of the programme, including the continuous flow of supplies and to provide necessary technical guidance and supervision.

80. These activities may involve the drafting of necessary legislation, the design of standard record systems and the preparation of various health education materials including mass media and desirable operational manuals for the guidance of field workers.

#### *Intermediate level*

81. The intermediate organization is chiefly responsible for the general administration of the work of several peripheral units and for providing consultant supervision and referral services to such units.

82. Policy decisions may be required particularly on the phasing of the programme in relation to local strategies, while administrative and executive action, as at the central level, will relate to the supervision of the logistics of the programme and the maintenance of co-ordination and co-operation with other agencies. The particular areas of concern will be training programmes, the provision of supplies and evaluation techniques.

#### *Peripheral level*

83. The special problems of coverage of rural areas were mentioned above in paragraphs 36 and 57-60. The obstacles are compounded by severe shortages of trained health personnel, limited facilities and geographically uneven dispersion of villages. Access to basic health services is also affected by poor roads and lack of transport for patients and staff.

84. Resolution WHA 21.43 of the Twenty-first World Health Assembly<sup>40</sup> requests that family planning be integrated within basic health services. This conclusion was not based on assumption about the value of integration; rather, it derived from considerable experience with single-purpose mass campaigns and was particularly pertinent to the nature of family planning as a personal, preventive practice.<sup>41</sup> An attack against an infectious disease may involve changing one or more components of man's environment, or may require only a single injection. Family planning involves the entire socio-cultural and psychological complex of the conjugal relationship itself, with couples being required to take repeated action of a highly personal nature.

85. Where coverage in rural areas is sought, emphasis must be placed on developing the health infrastructure at least to the minimum for implementation of

<sup>40</sup> World Health Organization, *Handbook of Resolutions and Decisions of the World Health Assembly and the Executive Board, Volume 1, 1948-1972*, sect. 1.6.3, resolution WHA 21.43.

<sup>41</sup> *Proceedings of the World Health Assembly, Twenty-first Assembly*, Official Records of the World Health Organization, No. 168 (Geneva, 1968), pp. 52-53.

basic health services, including maternal and child health and family planning. In realistic efforts to expand programmes to the periphery, financial costs and organizational difficulties increase, particularly where recruitment, selection, training and supervision of professional and indigenous staff are concerned. There also will be the need to improve physical facilities, purchase equipment and supplies, provide and maintain transport for personnel, improve reporting and evaluation and adapt the programme to community needs.

86. The main objective of the maternity-centred approach outlined earlier is to extend priority integrated maternal and child health/family planning, as part of the health services, to dispersed rural populations, which in developing countries often comprise more than four fifths of the total population. Two particular problems related to adapting the maternity-centred approach in rural areas are the small number of women delivered by trained personnel and the need to involve the community, including traditional birth attendants, in the programme. As to the first problem, the introduction of improved and expanded maternity care and counselling on all aspects of family health through home visiting can help, as can the integration of family planning in child care services. As to the second problem, some steps are being taken to encourage active community participation in the family health/family planning programme.<sup>42</sup> Education of the parents on aspects of child health and the importance of regular return visits for child health care should begin in the ante-partum period. During bedside or home visits in the puerperium, the necessity of regular clinic attendance for the child should be given emphasis equal to that on family planning. Lastly, when an IUD is inserted post-partum, or a prescription for a contraceptive given, the importance of child visits and the reasons for these should be reiterated.

87. It has been suggested that discussions with opinion leaders, such as village headmen, members of town committees, religious leaders, youth leaders and teachers, would help legitimize family planning and create a climate that should lead to some regular means of communication and community support for the programmes. Indigenous village field-workers may be useful in identifying pregnant and post-partum women and expediting the referral of the women and their young children for maternal and child health care, including family planning. As a part of their activities, field-workers also can assist opinion leaders in the generation of consumer involvement in the programme. The traditional birth attendant, who in many developing countries attends the great majority of rural deliveries, should be most closely involved in the maternity-centred family planning programme. Success in attaining her co-operation is crucial to the programme.

<sup>42</sup> World Health Organization, "Plan of organization for a family planning project in Western Samoa" (document WHO/WES-0509).

may prove mutually helpful.

#### *Hospitalization of women for delivery*

88. The development of small regional or maternity hospitals for delivery may be of value in rural areas; but problems of transportation, heavy capital investment and acceptance by rural women of institutional deliveries make early widespread deployment of such facilities impractical except in relatively densely settled areas. Indeed, it has been observed that beds in some maternity units and health care centres in rural areas are under-utilized.

#### *Home deliveries by trained midwives or auxiliary midwives with pre-natal and post-natal attendance of mothers at the health centre for maternal and child health/family planning care*

89. Such a system may provide excellent care, but would require such a large number of trained midwives that it is unrealistic as a model for general implementation in the great majority of developing countries, unless the traditional birth attendant is also utilised. On the other hand, a few countries have extended their health infrastructure and trained a relatively large number of auxiliary midwives. Even in such favoured situations, transport of and attendance by the villagers remain major problems. In Thailand, a project to provide 3,600 motor-cycles to trained midwives and nurse-midwives has begun. Maintenance of the equipment, a systematic plan for assuring contact between the midwife and the population under her care and acceptance of the trained midwife by the local population are substantial challenges to this promising and ambitious project.<sup>43</sup>

#### *Home deliveries by traditional birth attendants with some professional supervision*

90. As indicated, in most rural areas, shortages of trained personnel, lack of transport and long-standing patterns of birth attendance make utilization of traditional midwives highly desirable, provided they receive essential training and support. In fact, in many rural situations, the involvement of the traditional birth attendant is necessary and unavoidable.

91. Training courses for traditional birth attendants have been given for many years under projects assisted by WHO and UNICEF. The usefulness of these efforts has depended upon many factors, including the attitudes of health workers in accepting them, careful design and adjustment to the experience of the trainees and the maintenance of close contact with them after training. More recently, efforts have been made to

<sup>43</sup> H. C. Taylor and A. L. Banks, "Family planning programmes in Thailand", report to the World Health Organization, 1971.

involve the traditional birth attendants in family planning activities. Success has been limited; but, none the less, the implementation of organized systems with adequate administrative and logistic support appear justified. If traditional birth attendants are to be used extensively, they must be brought under skilled supervision and their role accepted by all the members of the health team. The problems of legal status, registration and training require solution. The trained midwife needs to establish a rapport with and give close support to the traditional birth attendants so that supervision can be carried out openly and constructively. In order to provide adequate services, screening and referral systems have to be developed for high-risk cases.

#### *Education of families and the community*

92. Although most of the family planning programmes have active contact for motivation and follow-up with women of childbearing age, the role and involvement of the family cannot be over-emphasized. First and foremost are the husbands, who are often overlooked in educational programmes. Special attention may need to be given to arranging educational activities either on a person-to-person basis or in groups to engage men in discussion with health personnel on family planning issues. It is important that the climate be such as to enable them to ventilate their views which should serve as a spring-board for providing the needed information for correcting wrong notions. Labour unions and industries would be potent channels for reaching men. In cultures where the extended family still exists, the educational programme should attempt to reach the family constellation, particularly the heads of the clans. Reference groups, such as influential friends, respected leaders in the community, religious and youth leaders and professional groups, mass media people, administrative and legislative groups and community service workers, need to be considered and involved in planning a systematic health education programme of the community.

93. General information programmes using mass media—radio, newspapers, posters, pamphlets, cinema, television and the like—should create awareness and justify the programme. These efforts should be reinforced by personal contacts, either individual or in groups. Organizing study groups, seminars or parents' classes, or integrating family planning in already organized discussion groups, would help the educational efforts. Sustained exchanges of information and involvement of the target groups are important to keep the programme uppermost in their minds as well as to instil in them the feeling that people care about them as individuals and are concerned about their total well-being.

94. There is no single best method that can be recommended. Various previously employed techniques should be considered and new ones tested. It must be remembered, however, that the underlying philosophy

of integration requires that educational efforts must be directed equally, if not primarily, to the utilization of maternal and child health services.

#### *Collaboration and co-operation between integrated health programmes and other community programmes or family planning activities outside the health sector*

95. It is essential for those responsible for the planning and implementation of health services at the central, intermediate or local level to lay down procedures for ensuring effective collaboration and co-operation with other official and non-official agencies involved in various aspects of the family planning programme. Public education, for example, may be enhanced through agencies responsible for communications, information and publications. Personal support may be achieved by co-ordination with community development workers, agricultural extension agents, religious and youth leaders and with teachers. Social welfare agencies, because families receive grants on the basis of family size, child protection services and services for unmarried mothers, obviously should be involved and health personnel should be aware of their activities. The manufacture and importation of contraceptive supplies may require co-ordination with commerce and customs. The need to obtain support from census and social research departments as well as professional education institutions has been apparent for many years. Experience in some countries has demonstrated that the labour ministry and the military can be involved to advantage. Obviously, it is essential to communicate effectively the objects and needs of the family planning programme to finance services. Legislation related to family planning activities should define responsibilities of health care workers in realistic terms, taking into account the circumstances prevailing within the country.

#### EDUCATION AND TRAINING OF HEALTH AND OTHER WORKERS FOR THEIR ROLES IN HEALTH ASPECTS OF FAMILY PLANNING

96. A serious obstacle that has to be overcome in setting up a permanent community organization for the provision of health services, including family planning, is the world shortage of health manpower, especially in developing countries.<sup>44</sup> Health manpower planning is needed to help Governments estimate the quantity and type of knowledge, skills and abilities required to implement their health programmes.

97. Every country undertaking the introduction or expansion of family planning activities faces the problem of determining the type, qualification, number, recruitment and training of health and other workers required for the programme. Because of the acute shortage of qualified personnel, large-scale training

<sup>44</sup> World Health Organization, "Proceedings of the World Health Assembly, Twenty-Fourth Assembly", *Official Records of the World Health Organization*, No. 194, pp. 559-579.

programmes are often initiated before answers to these basic questions have been found.

98. Some instruction in family planning should be given to all health personnel, indicating the need for the inclusion of family planning in the regular curricula of schools of medicine, nursing and midwifery and other health sciences. As a long-term objective, all personnel should understand that family planning is a part of general health care and therefore part of their responsibilities.<sup>45</sup> In addition, the introduction of family planning in health services necessitates a clear definition of the duties of all categories and levels of health personnel, the orientation of staff already in service or available for employment and the inclusion of family planning in the basic education of all relevant personnel to ensure that they will have sufficient knowledge and skill to be employed by the health services.

99. An integrated approach to the teaching of family planning involves the subjects of physiology, obstetrics and gynaecology, paediatrics and social and preventive medicine. Until recently, comparatively little use was made in medical teaching of the rapidly increasing range of audio-visual media which can help teachers to improve the speed and effectiveness of student learning. Complicated equipment is not necessary to achieve innovation in teaching methods and even simple audio-visual aids may help offset teaching staff shortages in developing countries.<sup>46</sup>

100. The teaching of management skills has been almost totally neglected in education and training programmes for health personnel. One of the fundamental tasks of management, whether in the national health service or in a peripheral health post, is to adapt rationally to changes as they occur. The purpose is to minimize the disrupting effect of unforeseen developments and to maximize opportunities for the achievement of shifting objectives.<sup>47</sup> Management skills are especially pertinent to the introduction and integration of family planning into the health services and should be included in the training given to all health personnel. The development of managerial and administrative skills and specializations is equally important for administration and training. This aspect, however, has not received sufficient attention in most countries, and this deficiency is one of the most important deterrents to the development of effective family planning programmes. Trained personnel are required for manpower planning functions, for the design of manpower training and development strategies, and for the administration, operation and evaluation of service programmes.

<sup>45</sup> World Health Organization, *Family Planning in Health Services*, report of a WHO Expert Committee, Technical Report Series No. 476 (1971).

<sup>46</sup> M. A. C. Dowling, "Audio-visual media in medical training", *World Health Organization Chronicle*, vol. 26, No. 1 (1971), pp. 3-6.

<sup>47</sup> N. MacKenzie, M. Eraut and H. C. Jones, *Teaching and Learning: An Introduction to New Methods and Resources in Higher Education* (United Nations Educational, Scientific and Cultural Organization/International Association of Universities (co-editors) publication, Sales No. ED.70/XVII.9/A), chap. XIV.

101. There is also the need to orient teaching to the work to be performed and to recommend the development of field-training areas that focus on the provision of comprehensive health care for the family and community. The strengthening of teaching activities should not concentrate on family planning in a narrow sense, but should be broadened in order to train staff better to provide comprehensive care.

102. All personnel engaged in health programmes involving family planning need preparation in health education. Well-qualified health education staff are required to help make a systematic and detailed study of the educational needs of different groups of people in the community, in particular, adolescents and future parents, as well as to identify, strengthen and give support to the educational functions and tasks of staff at each level of the family planning programme.

103. The general education and training requirements outlined above must be supplemented by consideration of specific categories of personnel and their particular needs.

#### *Medical education*

104. The inclusion of human reproduction, family planning and population dynamics in curricula is of relatively recent origin and is still in the initial stages of development in many countries having family planning programmes. Some studies undertaken on medical students' knowledge of, and attitude towards, family planning indicate little awareness of its objectives and the role they themselves might have to play in this regard, in their future careers. However, increasing awareness of the need for such education in recent years is producing efforts to include this area in medical school curricula.

105. The formulation of appropriate courses of study in medical schools, the integration of new subject-matter in existing curricula, the development of resources and new methods of teaching should give priority to the advanced training of the teaching staff of relevant disciplines, in particular preventive and social medicine, in gynaecology and obstetrics and in paediatrics; to the introduction of interdisciplinary teaching; to the improvement and expansion of medical faculties and teaching institutions; and to the development of rural and urban field practice areas in which students can acquire knowledge and skill in the delivery of maternal and child health care, including family planning.

106. Paediatricians, obstetricians and general practitioners already employed in the health services or in private practice should receive orientation or refresher courses. Various medical associations in collaboration with Governments could organize the training. The content of such training would be: a general review of various aspects of human reproduction and population dynamics; government policy concerning the inclusion of family planning activities in its regular health programme; the health benefits and promotional

aspects of family planning; the integration of family planning into the daily work of educating patients and their families; and clinical training in newly developed contraceptive techniques.

#### *Nursing and midwifery*

107. As in medical education, the subjects of human reproduction, family planning and population dynamics can and should be incorporated in curricula of schools of nursing and midwifery. Staff who will be expected to include family planning in their daily work in health centres, clinics and hospitals must be well informed, understand the tasks they are to undertake, especially the supervision and training of auxiliary staff and receive some orientation on the role played by each member of an interdisciplinary health team. In addition to competence in their own professional field, they must have a thorough knowledge of human reproduction, family planning and population dynamics; of the principles and methods of health education; and of the variables of demographic and health statistics as they relate to biological, social and cultural factors that condition the health of the individual, the family and the community as a whole.<sup>48</sup> In traditional communities, where only female health personnel are acceptable in MCH and family planning care and where women physicians are in short supply, certain technical procedures, such as the insertion of intra-uterine devices, may be delegated to the nurse-midwife. For this purpose, special training courses and supervision have to be organized.

#### *Training of administrators, managers and manpower specialists*

108. The special skills required to plan, execute, administer and evaluate family planning programmes must be developed by the establishment of appropriate training programmes. Such programmes should provide training for top- and middle-level managerial personnel with emphasis on personnel supervision and supervisory staff and networks; modern managerial techniques, programme evaluation and operations research; and the basics of manpower planning, and utilization, training and development. Training for manpower development specialists should include manpower planning and the design of manpower training and development strategies, task performance and analysis, personnel management and supervision, training needs and assessment and training evaluation and design of training curricula and materials.

#### *Training in health education*

109. Staff at all levels need to know and be able to use the skills of health education in giving family planning information and education, so that they can encourage people to make their own decisions and take action for the improvement of their family's health.

<sup>48</sup> World Health Organization, "Nursing and midwifery in family planning" (document WHO/NURS/69.79).

Unfortunately, few countries have enough professionally qualified health educators to form a health education unit capable of guiding and assisting in the planning, implementation and evaluation of family planning educational activities. There is also an acute shortage of teachers of health education, not only for the preparation of health educators and other health workers, but for the training of teachers in primary and secondary schools, teacher-training institutions and functional literacy classes.

110. Staff engaged in the education and training of others, i.e., the educators, should be given highest priority for preparation in health education, health aspects of family planning and related matters of importance to the health care and well-being of individuals, families and community groups.

#### *Health auxiliaries*

111. The need to improve the training of auxiliaries, especially auxiliary nurses and midwives, to render services to families, particularly to mothers and children, has been discussed. The training of sufficient numbers of auxiliaries to render service in maternal and child care and family planning in the rural areas is given high priority.

112. Auxiliary staff in the outposts of the health services play a key role in the total health service system. They are usually the first to be called upon in times of need. Their integrity, attitudes, knowledge and skills may determine whether the people will accept or reject modern medicine when it is extended to the villages. It is of utmost importance that they obtain all the support they require from professional staff.

113. If the activities of auxiliaries are to be effective, the following must be assured: clearly defined responsibilities; supervision that includes continuing in-service training, guidance and encouragement; the support of a multidisciplinary team; an effective system of referral to appropriate services; maximum community participation in the health programme; and the regular provision of adequate supplies.

114. Continuing in-service training should include further preparation in family health care, including family planning; the principles and methods of individual counselling; methods of working with groups to help create an atmosphere conducive to the acceptance of new ideas such as family planning; and ways of involving the whole community in the planning and delivery of an improved health service.

#### *Workers in other sectors*

115. Personnel in such fields as social work, home economics, teaching, community development and agriculture have an important role to play in increasing community and individual awareness and improving the availability of health services, including family planning. Before such personnel can play an effective role, they must be aware of the relevance of the benefits of family planning to the goals of their own disciplines.

Only then can family planning be effectively integrated into work at the field level.

116. Encouragement should be given for the integration of the health aspects of family planning into the basic curricula of schools of public administration, social work and home economics, teacher-training colleges, community development and agricultural institutes and similar institutions that prepare personnel who may come into contact with health programmes or be involved in aspects of family planning.

117. Orientation courses for these groups should consist of information on factors influencing maternal and child health and family health, including the health benefits of family planning for families, government policy on family planning, organization and delivery of family planning through community health services, methods of contraception, the attitude of the community towards child-bearing, child-rearing and family planning and the counselling of individuals and groups in matters related to family health and family planning. These workers can contribute to the acceptance in their own fields of family planning as a means of improving family and community health.

#### EVALUATION OF FAMILY PLANNING PROGRAMMES IN HEALTH SERVICES

118. Specific aspects of family planning evaluation and operational research programmes are covered in another paper prepared by WHO for the World Population Conference.<sup>49</sup> Some general concepts in relation to the evaluation of family planning programmes are described below.

119. It is now generally accepted that evaluation should be built into the process of planning, and continuous evaluation is essential to systematic measurement of success, or failure, of the programme in meeting its over-all objectives. In most family planning programmes, evaluation is receiving more emphasis, but relatively few countries have implemented systems to produce the information required as a basis for continuous decision-making. Nevertheless, family planning programmes appear to have become more concerned with evaluation than have many other health activities. Ideally, the effectiveness of family planning programmes integrated with health services should be measured by their achievement of the health benefits and fertility regulation discussed earlier in the paper. However, such changes are influenced by many social and environmental factors that lie outside the realm of health services. Moreover, such changes only come about slowly.

120. Despite these difficulties, much can be accomplished by the commitment of adequate resources and competent professional personnel to planning and evaluation at the central level, with appropriate training

for staff at the intermediate and local levels. Six general requirements, applicable to family planning and maternal and child health services evaluation, have been identified: (1) defining programme objectives; (2) determining the component activities (inputs) and the results (outputs); (3) deciding on simple and feasible measurements and standards; (4) identifying basic situations for control or comparison; (5) establishing the measurement process (methods of measurement and data collection); (6) collating, analysing and interpreting the information and relating it to objectives.<sup>50</sup>

121. Most family planning programmes have emphasized the setting of objectives, human and material inputs (such as personnel for clinical services), information and education activities, facilities, equipment, supplies and funds. Attempts can be made to assess the effects that different types and quantities of inputs have on achievement of output objectives; for example, to determine which aspects of clinic staffing, location, hours of operation, number of patients etc., produce given outputs.

122. Attempts may be made to answer questions of the relation of inputs to outputs through comparative studies. For example, the relation may differ so clearly, according to the characteristics of the area, the personnel or the administration, that important conclusions can be drawn immediately. Assessments can also be made of people providing the services. Changes in their number, distribution, characteristics and ability are of great importance to the programme, while the attitudes of health personnel and their knowledge of family planning practices have direct programme implications. In most health programmes, quality of planning practices have direct programme implications. In most health programmes, quality of care is assessed not only from observations of technical expertise, but according to considerations of time, efforts made to explain to patients and sensitivity shown towards them. Usually, it will be necessary to establish a basis for changes to be measured over a period of time as programme inputs begin to operate. Another relatively simple, frequently applied system of measurement involves the use of service statistics. Programme success is measured in terms of family planning acceptors, including those sterilized and current users of contraceptives, according to method. These data are recorded and reported from the peripheral level for analysis, interpretation and feedback by the central or district levels. Reporting of acceptors—new and old—is in itself of limited value. The determination of rates of continuing use may require special sample surveys, but it provides much more meaningful intermediate indicators of programme effectiveness. It is also important to report acceptors and continuing users in relation to patient characteristics, such as age, number of living children, interval since last birth, previous contraceptive use and other such information. Analysis of these data is important

<sup>49</sup> See "Research on the biomedical aspects of fertility regulation and on the operational aspects of family planning programmes"; *Population Debate*, vol. II, part eight.

<sup>50</sup> World Health Organization, *Family Planning in Health Services*, loc. cit.

to programme evaluation because the results indicate who is being covered and—more important—when compared with the target population, who is not covered. More effective programming often can be achieved by analysis and study of these data in relation to programme objectives.

123. Family planning and health services may also be evaluated through determination of changes in the awareness, knowledge, attitudes and practices of persons exposed to the programme.

124. The most difficult phase of the evaluation is the determination of the effects of family planning and health services on the over-all health and fertility status of a population. Health benefits are the most difficult to determine since they are influenced by so many circumstances. Measurements of changes in fertility following the introduction of family planning may be obtained from registration of births, where these are completely reported. The practice of registration of births is a critical consideration when planning the evaluation of family planning and maternal and child health services. Changes in fertility among those at high risk of maternal, infant and child mortality and morbidity, as outlined in the first section of this paper, could also be assessed, to some degree, from birth and death records. Changes in the incidence of hazardous and unqualified abortions are of special interest.

125. Trends in maternal, peri-natal and infant mortality and morbidity rates, by cause, and possibly the previously noted adverse health effects of poor pregnancy spacing and large family size may also be measured.

126. Changes in any of the above-mentioned rates after implementation of family planning and health services may reflect the effectiveness of the programme. However, where population groups or social and environmental conditions are also undergoing change, comparison groups and refined controls are necessary to provide results which will satisfy rigorous scientific requirements.

127. The stages of evaluation described above refer to the effectiveness or benefits of a family planning programme. Measurement of cost efficiency is an important component of evaluation. The determination of the costs of a programme requires various accounting procedures to relate the costs of resources to those of operation. The relating of costs to services utilized, effects on reproductive performance, or health status achieved, yields measurements of programme efficiency. Different countries consider evaluation as an important component of the programme and are making efforts, with varying degrees of success, to have a component of systematic evaluation built into their ongoing programmes.

#### SUMMARY AND CONCLUSIONS

128. This paper has focused principally on the health benefits of family planning, and their realization

through provision of health services including family planning.

129. Evidence is presented which supports the conviction that increasing family size, particularly with closely spaced pregnancies, is associated with higher maternal, foetal, neo-natal and post-neo-natal mortality and morbidity; higher low birth-weight rates and their sequelae; increasing incidence of infectious diseases in parents and children; poorer growth—both height and weight—among pre-school and school children; relatively poor intellectual development among children; and increased prevalence of certain diseases among parents. Under current conditions, children and parents in well-spaced smaller families appear to enjoy better health status. Although emphasis has been placed upon the health benefits of spaced pregnancies and limiting family size, family planning in health services also properly encompasses a concern for infertility and sub-fertility.

130. This résumé of the knowledge to date should be considered in the light of the following implications for policy development and in relation to the requirements of health services and family planning and of programme planning.

131. The achievement of well-spaced smaller families for all socio-economic groups should result, first of all, in better survival rates and health for mothers and children, and for families in general, throughout the world. Mothers in good health whose nutritional status is adequate and has not been depleted through frequent childbearing are less likely to deliver infants at risk as the result of low birth weight. Where maternal malnutrition and anaemia are prevalent, health and socio-economic conditions marginal and health services not well developed, the adverse effects of frequent pregnancies are much greater and more common.

132. Other potential health benefits of a regulated family size and child spacing operate in a less direct fashion, but may also be reflected in lower death rates and less disease and disability. Overcrowding and its concomitants will be much less serious and parents will have more food, resources, energy and time to offer to each child. This will result in less malnutrition and impaired growth and development of their children, with greater resistance to childhood infectious diseases, especially where maternal and child health services, including family planning, can be made available. Children may be better cared for, with less exposure to accident situations.

133. Parents should be less susceptible to certain chronic diseases and smaller family size may promote their better mental health and marital adjustment. They will be more likely to continue their own development as individuals, particularly mothers, who being less depleted and less exhausted will be less likely to neglect their children and themselves. They should be able to breast-feed for a longer period, and interest in infant health care and family planning should increase. The economic benefits of fertility regulation will ultimately

make higher educational aspirations for children more achievable. No less important to attaining these aspirations will be the improved intellectual development resulting from greater stimulation in early childhood as a consequence of the better physical and mental health of the parents.

134. The rationale and advantages of integrating family planning with maternal and child care and other family and community health measures have been outlined in some detail in this paper. A broad maternity-centred approach to family planning which concentrates on the provision of maternal and child health care, including family planning, is gaining wide acceptance in urban hospital settings and gradually is being adapted to rural areas.

135. Since the establishment of the first national family planning programmes in the early 1950s, there has been a considerable increase in the number of countries adopting policies favouring or supporting family planning activities. It is estimated that more than four fifths of the population in developing areas live in countries that favour family planning. In developing countries, the growth of family planning programmes in the context of health services is especially related to coverage for rural areas. Organization and administration, of course, vary from country to country. Whatever type of system of programme delivery is selected, there are a number of common conditions that influence its effectiveness, including the degree of confidence people have in the health services, the availability of resources and quality of care provided and the commitment of health service personnel to their work. Mass communications have proved useful in some countries, but their ultimate effectiveness is greatly dependent upon meaningful personal contacts.

136. To bring about the benefits of family planning in a given society, health workers and health services should help couples on the basis of the individual benefits for the family, individual goals, individual plans, their particular felt needs and the cultural values of their society. Sensitivity to needs will remain a prime consideration for health services providing maternal and child health and family planning care. For harassed parents, burdened with the many health problems commonly found in developing countries, the offered advice and care may be impossible to take up and therefore may be more guilt-producing than they are helpful. With better spaced, smaller families, recommended nutritional, immunization, environmental and other health practices may achieve new relevance and be more effective. Post-partum amenorrhoea, breast-feeding and weaning practices are factors of major importance in fertility regulation and infant and childhood survival. Traditions affecting the age at marriage, the value attached to large families and the birth of sons, and attitudes of particular persons in village communities, including traditional birth attendants and community opinion leaders, must be carefully considered in programme planning and implementation.

137. The world shortage of health manpower represents a serious obstacle to the provision of health services, including family planning. Health manpower development often proceeds without the attention to type, qualification, number and availability of personnel that is a prerequisite of rational programme planning and implementation. Special attention is given in this paper to education and training of physicians, nurses, educators and administrators, health educators and health auxiliaries, including trained midwives, in all aspects of family health including maternal and child health and family planning, as well as to the introduction of training to give administrative and managerial expertise. Training of traditional birth attendants and other indigenous practitioners who can support measures for family planning and maternal and child care are also discussed. Lastly, careful consideration is given to the role of workers in other sectors, such as public administrators, social workers, teachers, community development workers and domestic economists.

138. Development and strengthening of services for the provision of health care, including maternal and child health and family planning, to the rural areas is the challenge that most of the developing countries are facing at the present time. Efforts are being made for the best utilization of existing skills and resources while development of further manpower and other resources continues. There is active interest among national and international bodies in the study of health service structure and functioning designed to introduce changes that can improve efficiency and effectiveness of health services. Use of managerial expertise to improve the quality of the care provided is an example of the efforts that are being made which improve coverage and utilization of health services.

139. If parents are to be motivated to plan their families, they require assurance that the children, in whom they invest so much, will survive and will grow up to be healthy and productive. Parents also require help in maintaining their own health. It appears clear that family planning is an important means of improving health. It is also increasingly clear that improvements in health can make an important contribution to family planning. This interaction carries the obvious policy implications that long-range integration of family planning and health is theoretically sound, is administratively practical and efficient and will produce greater impact upon the individual, the family and society.

## COMMUNICATION IN SUPPORT OF POPULATION/FAMILY PLANNING AND DEVELOPMENT

### *United Nations Educational, Scientific and Cultural Organization*

1. Communication is an expression of human society; it is a fundamental characteristic of human beings to communicate. Communication is indeed necessary for learning, for transfer of experience, for inquiry, for dialogue and debate and for bringing about change. The role of communication is vital, particularly in the context of bringing about change of attitudes and behaviour. In this task, communication efforts are based upon the existing values and norms, while at the same time purporting to change them through the voluntary efforts of the people themselves.

2. Communication has a number of implications for development and communication strategies have to be included in any development-oriented activity—an activity which seeks to change human or social behaviour towards a better quality of life in a given period of time.

3. The application of communication techniques for the solution of diverse problems shows many correspondences of theme and approach. It is likely that, if methodologies are developed for the educational applications of media, the reinforcement of literacy programmes, the promotion of family planning, health and welfare campaigns or the prevention of drug abuse, the broad outlines of these methodologies will be similar and mutually supportive, and will use the same tools, often in the same environment and with the same audiences.

4. Consequently, a number of general principles have emerged. Among positions that have now gained general credibility are the interdependence of media, necessary linkages between mass and interpersonal communication, the need for integrated planning in both production and utilization, and the reconciliation of media strategies with country capabilities, traditions and practices.

5. Most important of all, perhaps, is agreement that the evolution of communication strategies requires a degree of co-ordinated planning and phasing which is equal to, and runs parallel with, the planning of development in general—in a sequence which begins with the identification of needs, the pin-pointing of resources and the study of audiences, and proceeds from the results of this analysis to a detailed plan of operations which is capable of modification after systematic evaluation and feedback.

6. Experience has shown, moreover, that the same elements are involved in all applied communication

fields—the need to devise programmes that are equally relevant at national, subnational and local community levels, the importance of treating subgroups within communities as distinct entities with distinctive problems, the need to orient media practitioners towards development objectives and vice versa, and an overriding need to integrate various development endeavours.

7. Moreover, experience gained in numerous family planning programmes has clearly demonstrated the need for integration of family planning communication with other aspects of development communication and for the maximization and optimum use of resources, including expertise, institutions, agencies, projects and programmes in all communication sectors. It has also become abundantly clear that communication has to be treated as a continuum and not in isolated project terms.

8. The emphasis upon integration is by no means confined to the communication sphere; it is increasingly stressed in all development programmes in which the interests and disciplines of separate ministries and separate agencies are involved. There is, therefore, a great need to link population control to agricultural improvement, economic development, health and social welfare.

9. Integration is particularly essential in view of the limitations of the mass media. In most countries of the world outside of Western Europe and North America, radio and television are directly controlled and State operated, and the Governments have the power to use or not to use them for family planning purposes. The press and the film, though largely privately operated, reach very small parts of the public in developing countries because of illiteracy and the small number of cinemas and cinema attendances. In developing countries, even radio has limited reach. Forty countries in Africa and 20 in Asia have less than 10 radio receivers for every 100 people. As for television, 2 countries in Latin America have more than 10 receivers per 100 people and 20 in Asia have less than 10; although television now exists in 24 countries of Africa there are less than 3 receivers per 100 people in any of them.

#### INTEGRATION OF FAMILY PLANNING AND DEVELOPMENTAL MESSAGES

10. Although a considerable body of knowledge about social and economic development programmes

existed at the time family planning programmes began to be designed, there were no models to be copied and, indeed, the application of lessons learned in other programmes were often counterproductive. A case in point was the attempt to apply the model of diffusion of innovations from agricultural experience to family planning. It was ultimately discovered that the sensitive nature of practices to be communicated in family planning simply did not fit the same pattern as in agriculture where practices are an open subject of universal interest and new farming techniques could be spread relatively easily.

11. Family planning, sexual behaviour, pregnancy and birth are not, in most societies, subjects of uninhibited public discussion. Never before had a development programme depended so heavily upon communication to influence personal decision in matters so private and intimate. It is possible to demonstrate within weeks the personal benefits of improved seed, fertilizer and easy credit, yet even these need the help of massive public information programmes. The long-range personal and economic benefits of relinquishing ingrained traditional reproductive behaviour in order to control fertility present a far greater challenge to those who would use mass media and interpersonal communication to speed this change.

12. International assistance agencies were quick to offer their services to planners and administrators in developing countries seeking to design and implement family planning programmes. However, unlike the situation in agriculture, health and other developmental fields, these agencies brought no backlog of experience—only a sense of urgency, experts from related fields and substantial amounts of funds.

13. Typically, because family planning has been largely confined to health programmes, foreign assistance has made possible and often encouraged the formation of separate information and education units within the health infrastructure. In India, for example, although production of materials and broadcasting of family planning messages are handled in other ministries, the development of strategy and the allocation of resources is administered by a unit within the Ministry of Health and Family Planning.

14. It is clear that family planning communication programmes have to be designed to meet situations which exist in any given country. One country can talk openly about birth control and human reproduction. Another country will have to approach the subject through family health, the welfare of women, a better life for children etc. There is room for both approaches, but the dual approach can be a brake on the effectiveness of communication.

15. All this calls for an entirely new approach to communication, an approach in which the strategy involves an integration of developmental messages and media and above all, proper research into what people really think about family planning as it affects them individually.

16. A paper prepared by the United Nations Educational, Scientific and Cultural Organization (UNESCO), for the Second Asian Population Conference, recognizes the need for communication activities directly related to family planning, but calls for integration with other developmental issues over time:

“Not merely has there to be an integrated communication approach at all levels of activity for planning to execution and evaluation but also in terms of messages because family planning messages in isolation cannot have meaning without their being an integral part of appeals directed toward attainment by the people of their personal aspirations and community goals. Thus, while UNESCO recognizes that in the face of a problem so gigantic as that of population growth communication programmes directly related to it have to be started, yet after the initial phase integration with communication programmes for economic and social development has to take place because, over a long period of time, family planning messages *per se* would have either to compete against other messages or become part of them.”<sup>1</sup>

17. Family planning communicators typically wish to go directly to people with messages calling for action which they cannot be expected to accept apart from larger considerations of family welfare—such as making a living, educating the children or having a son to carry on the name.

18. It seems logical to assume that other developmental programmes cannot be expected to disseminate specific family planning messages unless those messages also relate to the goals of the programme involved. In a total development communication concept, each sector will have need to develop messages within its subject area, but based on the need for family limitation.

19. Developmental workers are not paid for distributing family planning leaflets or organizing meetings to discuss family planning. In general, they will not be evaluated for their effectiveness in performing these functions. One goal of an integrated development programme in which family planning is a part should be to build population and family planning concepts into the education and training of other developmental workers in such a way that they are more effective in their primary assigned tasks. The extent to which that can be done is a test of whether family planning can and should be integrated into other development efforts in any given country.

20. The differences between education and communication derive largely from the attempts to organize the processes within society and the different institutions involved in those efforts.

<sup>1</sup> “Review and assessment of major policies and programmes in communication services” (POP/APC.2/BP/29), background paper prepared by the Secretariat of UNESCO for the Second Asian Population Conference, Tokyo, 1-13 November 1972.

21. Saunders reinforces the common role of education and communication with a statement of five objectives for family planning communication:

"The *information* component of family planning communications will be directed toward individuals, groups or publics both within the family planning organization and outside it . . . The distinction between informational and *educational* is not very sharp . . . perhaps the basis of any distinction lies in the extent to which communications for education attempt not only to change knowledge, but to some extent also seek to change persons—to teach skills, to build habits, to establish new patterns of belief or behavior.

"*Motivational* communications will be those that aim to influence behavior indirectly by trying to change perceptions of wants to needs or by establishing a connection between family planning practice and the gratification of existing wants.

"*Legitimation*—creating a climate of opinion in which talk about sex and contraception is not considered furtive, embarrassing, shameful or 'dirty', but rather is viewed as commonplace and matter-of-fact, a climate in which contraceptive practice is accepted as being both respectable and proper.

"*Reinforcement*—for new knowledge and attitudes and reassurance about changed behavior. Decision makers need to know that in supporting family planning they have made wise and politically rewarding choices; users need to be reassured—that they are right in continuing usage; staff members of family planning programmes need encouragement and support and the assurance that they are performing satisfactorily."<sup>2</sup>

22. The skill which development communicators must master is the skill of properly combining the strengths of mass media and extension education. Interpersonal channels are invaluable as means of promoting maximum interaction and immediate feedback, both of which establish an atmosphere where attitude change is possible. Mass media, on the other hand, have the advantage of rapidly spreading information of high accuracy even though the message flows in only one direction. Mass media are more likely to be important in increasing knowledge and ideas, while interpersonal communication is more likely to cause attitude change.

23. The important implication, however, for population communicators is that mass media provide access to the interpersonal and group networks through which attitude change can be accomplished. The very fact that mass-media exposure is less in developing countries makes them a more significant influence in rural societies. Those who have access to mass media are

accorded status by those who do not. The very nature of the media contributes to the legitimacy of the messages that emanate from them.

24. In the integration of mass media and interpersonal channels, the change agent becomes a key factor. Communication strategy must devise a system in which the change agent serves as the "linker" between mass media message, dissemination of information and group and interpersonal networks for attitude change and discussion of alternatives.

#### ROLE OF CHANGE AGENTS IN COMMUNICATION

25. Communication has been simply described as the art of developing common understanding among people. The change agent exemplifies this art since he interprets the discoveries of research to those who need and can use them and he feeds back the needs of the people to those who are in a position to contribute to those needs.

26. The change agent is the mediating factor between the broad policy-oriented messages, which must emanate from central sources and lend themselves to dissemination through mass media, and the individual needs, interests and concerns of people, which are nearly always conveyed through interpersonal channels. The change agent contributes to the development of a media system not only by providing the essential feedback, but by organizing for local reception and processing of developmental messages.

27. The process of social and economic development is a process of human development, for people are the target as well as the essential variable in development. Communication, being a two-way process, provides for participation at whatever stage of enlightenment the individuals composing a society find themselves. Change agents are key factors in both the communication development processes since they are instruments for getting facts to the people upon which decisions can be based.

28. Some of the change agents dealing with the concerns of people are social workers, field-workers attached to development departments for health, social services and other community development projects; and those already attached to rural programmes or to literacy and adult education extension projects of both government and private agencies.

29. Educationists, agricultural extension workers, municipal workers and government employees also have a role to play. They are the people and the agencies who most often come into contact with local people, the particular audience which the general programme is trying to reach. If there is to be co-operation among development workers at the grass-roots levels, then there must be adequate and co-ordinated planning at the outset.

30. Just as there is a need for family planning and other development programmers to work together, there is need for integrated family planning and devel-

<sup>2</sup>L. Saunders, "Family planning communications in the context of national development: communications for information and motivation in family planning", paper prepared for the United Nations Economic Commission for Asia and the Far East, Working Group on Communications Aspects of Family Planning Programmes, September 1967.

opment communication. Much of the impact of a family planning communication project is derived from its relevance to other development projects, and family planning communicators need to draw upon other development areas for the promotion of family planning goals and practices.

31. Family planning communication has thus to be linked to the extension framework for health, education, social welfare, literacy programmes, farming information, industrial development and housing schemes; and it is only by planning for integration from the central planning level right through to the practice in the field that real interrelationship can be achieved and sustained.

32. Whether the extension network is composed of family planning communication workers, field-workers attached to other development projects, or both, the ideal situation is one where all personnel are welded into a comprehensive programme for co-operation, so that they become more than the disparate units of a large number of central projects.

33. Whatever the arrangements for such co-operation may be, it is up to the family planning agency to use these relationships as comprehensively as possible and to establish contacts with and involve other development workers.

34. Studies show that although the mass media can be powerful persuaders, most people decide to act after discussion with friends, family and neighbours. Thus, though the information gathered through the media may be convincing and thought-provoking, only a very small proportion of people change their behaviour or accept change, without reference to their cultural and social groups, within which there are people who carry greater weight and are more persuasive than others and set the pace for change.

35. As most people accept new attitudes and change their behaviour once these are approved by their social and cultural groups, the importance of interpersonal communication and the need for direct contact by the communicators with influential group members is crucial. If the mass media are to be effective in developing new attitudes, they need the support of village headmen, leaders of community organizations, opinion leaders, midwives, indigenous medical practitioners and heads of families.

36. In order that these locally influential people may play as full a role as possible in support of the media, a comprehensive scheme to bring them into the communication network needs to be devised.

37. Opinion leaders should be identified and brought together in a meeting with other influential members of the community at an early stage to ensure their co-operation with the local family planning communication programme.

38. The following four-step strategy for achieving this objective could be followed:

(a) Provide the opinion leaders with the information necessary for a full understanding of the reasons for family planning, including its relationship to national and particularly local development;

(b) Involve them in the preview of radio and television programmes;

(c) Invite their suggestions for local activities;

(d) Invite them to open discussions about family planning in the community, whether formally or informally.

39. Once the local leaders realize the value of their co-operation they may also be able to pin-point the kinds of resistance which are likely to be met and suggest ways and means to overcome them.

40. The planned and systematic use of communication strategy composed of mass media and field-work helps to telescope change and ease difficulties of development. The prerequisites of such planned and systematic use are, first, that the media be supported by extension services and other traditional methods of communication; and, secondly, that development programming and development messages be realistically planned and co-ordinated.

#### DEVELOPMENT OF FAMILY PLANNING COMMUNICATION STRATEGY

41. In order to describe the actual and potential contributions of communication to family planning and population activities, it is necessary to view side by side, first, the emergence of communication as an increasingly distinct area of social science and in terms of the rapidly expanding media involved; and, secondly, the progress of family planning from its early confinement to individual initiative through later voluntary group action to the relatively recent governmental programmes typical of many developing countries. It is significant that the large national programmes, beginning with India in 1952, have largely developed during a time of rapid expansion of mass communication media, i.e., television, facsimile and satellite communication. It has also been largely in the past 30 years that scientific study has been directed to the process and effects of mass communication. The development of major theories about them reached its greatest intensity during the 1940s and 1950s.

42. During the following decade, a wide variety of approaches to the application of communication were introduced in a number of countries or areas. Examples included the Indian mass communication campaign characterized by the widespread use of the "four faces" poster and the inverted red triangle accompanied by the simple message, "Two or three, that's enough"; the Salvadorian PATER campaign, the principle message of which was "Have only the children for whom you can be a responsible parent"—that is, by providing adequate food, housing, education and religious upbringing; Hong Kong, where over 60 per cent of the women have their babies at hospitals or clinics and

over 80 per cent bring them to such facilities for examinations; and the Republic of Korea, where well-trained field-workers make home visits, arrange community meetings and exhibits and distribute both informative and educational materials and contraceptive supplies. It is clear from these examples that these two distinct approaches have either laid emphasis on mass media alone, as in India and El Salvador, or basically on extension work, as in Hong Kong and the Republic of Korea.

43. By the late 1960s, several factors focused attention on communication as an undeveloped resource in population and family planning. These factors included unsatisfactory acceptance rates among women of reproductive age, under-utilization of services available, lack of continuation of methods once they were adopted, and the spread of rumors based on isolated, often false reports of experiences with contraceptive methods.

44. A conference sponsored by the United Nations Economic Commission for Asia and the Far East (ECAFE) at Singapore in 1967, devoted to discussing the communications aspects of family planning programmes, developed a means of classifying communication approaches or strategy in family planning. Three different stages were identified:

“(a) Voluntary agencies are solely responsible for conducting family planning with no official recognition or government support;

“(b) Family planning is recognized tacitly but with lack of official policy;

“(c) Family planning is a full-fledged government policy.”<sup>3</sup>

This classification system was used by Schramm<sup>4</sup> during his world-wide survey of communication in family planning. The survey showed that the first priority in any campaign consists of leaders, those who have the responsibility for national policy or for building voluntary support. Here, the preferred media are personal conversations, letters or reports on the population problem. Later, as clinical resources become available, the audience shifts to medical and paramedical personnel, and the channels will include training courses, seminars and manuals, supplemented by material for distribution describing the services. When it becomes possible to carry the programme to the people, the emphasis shifts to field-workers who must have training resources and text materials along with demonstration and educational materials. Once a national policy is established, mass media can be utilized first to inform the “ready” people and then the less informed and hesitant. After the “ready” audience has been reached, the acceptor rates begin to drop off and the time has come to think of special groups and special tactics. Campaigns that not only inform but persuade are

<sup>3</sup> *Communications in Family Planning: Report of a Working Group* (United Nations publication, Sales No. E.68.II.F.17), para. 203.

<sup>4</sup> W. Schramm, *Communication in Family Planning, Reports on Population/Family Planning, No. 7* (New York, Population Council, 1971), p. 10.

needed for such people as are interested and approve of family planning but never go to the clinic, or those who use contraceptives but discontinue, or men and young people who have been neglected in information campaigns.

45. It is well known that in the initial phases of a programme the number of acceptors goes up, but as time passes more and more efforts are needed to convince those who have not yet accepted for various reasons. It is at this stage, known as the “post-plateau period”, that family planning information campaigns and strategies face a challenge. “Inasmuch as a number of countries are now reaching a plateau of acceptance, communication is being called on to shoulder more and more responsibility for the success of programs.”<sup>5</sup>

46. The classification suggested by the ECAFE working group in 1967 is still a useful system because it helps suggest how the various communication media can and should be built into campaigns. As pointed out,<sup>6</sup> television and radio are not usually readily available to voluntary organizations which are moving cautiously into programmes of social change where undue publicity might arouse apprehension and even hostility. At the first stage, word of mouth, group meetings and personal contact are important.

47. At the second stage, however, it may no longer be necessary to be so cautious, so use of the news media can be encouraged. Here, displays, signs, exhibits and the like are appropriate. Field-workers are often used to visit homes, clinics and hospitals to interest potential users and answer their questions.

48. At the third stage, where a national policy fully supports family planning, a comprehensive public information and motivational programme is called for. Usually, mass media can be freely used in combination with group and personal approaches. It probably will always be true, however, that use of mass media will vary according to how long the policy has been in effect, the extent of modernization and current events, particularly those affecting cultural and racial minorities.

49. From the guidelines suggested above, one can then gain a generalized picture of the communication strategy being followed in countries or areas by their position in the table given below:

<i>Official policy</i>	<i>Support, but no policy</i>
Bangladesh	Afghanistan
Barbados	Bolivia
Colombia	Botswana
Dominican Republic	Chile
Egypt	Costa Rica
Fiji	Cuba
Ghana	Dahomey
India	Democratic Republic of
Indonesia	Viet-Nam
Iran	Ecuador
Jamaica	El Salvador
Kenya	Gambia

<sup>5</sup> *Ibid.*, p. 2.

<sup>6</sup> *Ibid.*, p. 10-11.

*Official policy*

Malaysia  
 Mauritius  
 Mexico  
 Morocco  
 Nepal  
 Pakistan  
 Philippines  
 Puerto Rico  
 Republic of Korea  
 Singapore  
 Sri Lanka  
 Thailand

 Madagascar  
 Mali

People's Democratic Republic of Korea  
 Peru  
 Saudi Arabia  
 Senegal  
 Syrian Arab Republic  
 Upper Volta  
 Yemen  
 Zaire

50. It is unlikely that the 1970s will see a repetition of the rush by Governments to declare policies favouring family planning as they did in the previous decade. This is not to say that the trend will not continue; indeed, the action by Mexico, a major Roman Catholic country, in declaring a national policy effective 1 January 1973, suggests that more Latin American countries might eventually follow suit. It is more likely, however, that most countries will simply choose to tolerate or support family planning without taking a policy stand.

51. Given this assumption, there is need for a new means by which to classify the population communication efforts of countries, one which stresses the development of over-all national strategy rather than tactics and activities. Under a suggested scheme for such a classification, the countries with national family planning programmes would be classified as follows:

A. Countries with autonomous family planning co-ordinating bodies:

Indonesia  
 Malaysia  
 Philippines

B. Countries in which the communication component of family planning programmes is carried out within the Ministry of Health:

Chile	Jamaica
Colombia	Mauritius
Costa Rica	Morocco
Dominican Republic	Nepal
Ecuador	Nicaragua
Egypt	Pakistan
El Salvador	Singapore
Fiji	Thailand
Guatemala	Tunisia
Honduras	Turkey
India	Uganda
Iran	

C. Countries or areas in which the family planning communication programme is carried out outside the Ministry of Health:

Ghana  
 Hong Kong  
 Republic of Korea

52. Massive foreign assistance has often resulted in confused objectives and restricted opportunity to develop long-term plans. Often, the bulk of research has been initiated and conducted by external persons and institutions, further resulting in confounding decisions on priorities. A number of countries have begun to solve this problem by establishing national co-ordinating bodies which, though they vary in practice, generally seek to develop common objectives, maximize the effectiveness of foreign aid and mobilize internal resources. In terms of communication strategy development, these national bodies are among the most significant factors to come on the scene in the 1970s.

53. By operating at the policy level and because they transcend any given ministry, they are able to integrate all appropriate government units and communication channels for the promotion of family planning objectives. They likewise provide an effective interface with private organizations.

*Considerations in implementing communication strategies*

54. The foregoing review shows the steps taken in various countries or areas for the development of structures for the implementation of communication strategies for family planning and development.

55. Once a Government decides upon the organization it needs, in accordance with its administrative traditions and strategies for national development, the basic considerations in implementing communication programmes need to be taken into consideration.

56. Needless to say, a communication programme for the promotion of development goals must be timed to suit the availability of services and the level of awareness of the audience.

57. Programmes urging people to make use of family planning facilities may do more harm than good if services cannot cope with the demand created by a media campaign. A television programme describing the benefits of family planning is unlikely to be acceptable if contraceptives are not readily available. The communication programme must be timed to provide the kind of information required when it is needed and when the extension services necessary to make the limitation of family size practicable are available. There is another reason for the deliberate planning of the media programme. As well as catering for the level of awareness of the population (and of different sections of the population), programmers need to make the best use of resources. They need to draw up realistic budgets and to develop those aspects of the mass media which are most effective. For instance, if television is available

to only a few city areas or to middle class homes, it may be best to make use of radio and print media only, or radio alone.

58. A communication programme that is designed to assist the development process must therefore fulfil the following criteria:

(a) It must be timed to tie in with the development programme as a whole;

(b) It must make the best use of media resources;

(c) It must suit the level of awareness of the audience.

59. Such a communication programme is required to inform people of changes brought about by development, to create an awareness of the need for change and an acceptance of change itself. Development, when the term is applied to the country, or to the individual, means change: change in life-style; change in attitudes; change in behaviour.

60. The role of the media in development communication is to ease the problems brought about by change and to encourage people to develop favourable attitudes to the new life-style which is being offered. Ultimately, the communication programmes seek to bring about modifications in behaviour which will accelerate the acceptance of the new way of life which development has brought about.

61. For developing a media strategy, a number of useful models are available which set out the processes which individuals pass through before they accept a new idea, attitude or set of behaviour. The first of these, drawn up by sociologists, categorizes the diffusion process (which leads to widespread acceptance of change) into five stages:

(a) *Awareness*: the individual is introduced to the idea for the first time; that is, an innovation, a development or an idea is introduced, and the individual is made aware of the existence of the development;

(b) *Interest*: the interest of the individual is aroused and he seeks further information about it;

(c) *Evaluation*: the individual, armed with further information about the "new" object, subject or method, assesses its relevance to himself, purely on theoretical grounds;

(d) *Trial*: the individual tests the "new" area for himself;

(e) *Adoption (or acceptance)*: the new idea, method or object is accepted by the individual and his behaviour changes accordingly.

62. In this case, all that has to be done is to devise a media strategy that fosters awareness, provides more information when interest is shown, shows the relevance of the innovation to the individual and directs people to places where the new methods can be tried and ultimately adopted.

63. However, it is difficult to categorize sections of the population in this way. There will be people who adopt a new idea because it is new, those who go on

evaluating and those who are interested and then lose interest. In any social or cultural setting there will be those who set the pace for change, those who come in a little later and those who join at the very end. However, most people go through stages of acceptance which approximate those described, even though the length of time it takes for them to accept innovation may differ.

64. Apart from the diffusion process, the communication strategy for the acceptance of innovation can also be based on a list of measures which can be taken by Governments to encourage acceptance of development goals. In the area of family planning, these may be:

(a) Measures that change circumstances (housing restrictions based on family size, compulsory education, taxation for large families);

(b) Measures that may change the perceived relationship of family size and birth spacing to existing goals, values and circumstances (making known the fact that large families will be unable to reap the benefits of development programmes, making known the relationship between maternal health and family size);

(c) Measures that promote changes in goals and values (improvements to the status of women, equal educational opportunities, social security provision);

(d) Measures that promote changes in birth-control methods (new methods of contraception and increased availability of contraceptive services).

65. The development of a media strategy based either on the "diffusion" model or on the "measures" will help to organize programming and to identify audience groups. However, in either case, the two elements among others that the strategy should include are population education and the use of folk media.

#### *Population education*

66. An important consideration in developing a communication strategy is the role of population education, which is increasingly being promoted among educators and population policy planners as a means of preparing the younger generation for a more informed approach to population and family planning matters. Such education may be classified into three areas: sex education; education for family living; and population awareness.

67. The objectives of population education are to give the learner an insight into the totality of issues connected with population, including the nature, measurement, causes, determinants and consequences of population growth at family, community, national and world levels, as well as the possibilities of planning family size and population growth.

68. The first major international conference convened by UNESCO to consider population and family education (Bangkok, 1970) considered four areas of concern: (a) introduction of potential content; (b) defi-

inition/objectives of population education; (c) preparation of curricula materials; (d) issues relevant to implementation.

69. The workshop developed one of the first and perhaps the most succinct definitions of what population education should be expected to achieve:

"Population education is an education programme which provides for a study of the population situation in the family, community, nation and world, with the purpose of developing in the students rational and responsible attitudes and behavior toward that situation."<sup>7</sup>

70. The rapid development of interest and participation in population education, particularly in Asia, along with a parallel interest in non-formal or non-school education on the part of population communication personnel, has caused each group to focus on what the interfaces should be.

71. It appears certain that population education in educational programmes outside schools will become increasingly important in the future. Instruction will need to come from a wide variety of related interests, including medical doctors, nurses, public health workers, co-operative workers, community development staff, literacy programme personnel and armed forces staff.

72. From the point of view of an immediate influence on reproductive behaviour, the target group that is most crucial for a population education programme consists of out-of-school youths and adults who are on the threshold of, or in the midst of, their reproductive years. While it must be recognized that they are most elusive to reach, it is essential that they should be reached, and a comprehensive programme of communication and population education has to take account of them, not only now, but in the future as well. Even after population education has been established at the school level, the problem of drop-outs from schools will continue to be such that many, not reached through school programmes, will have to be reached through communication programmes for out-of-school youths and adults. Moreover, even in the case of those who have been reached through school programmes, it may be necessary to ensure a strengthening and reinforcement of their awareness of the insight into population issues in the years of adult life when personal decisions have to be taken about reproductive behaviour.

#### *Indigenous media*

73. Yet another important element which should not be lost sight of in developing communication strategies is the organized use of folk media. Recently, more attention has been given to traditional means of communication for social and health education. Those in charge agree that these methods can be of value if

they and their cultural setting are well understood by communicators.

74. Traditional media come from the people and antecede the mass media. Their appeal has historically been both functional and aesthetic. They have always served to entertain, educate and reinforce existing ideas or ideologies or to change existing values or attitudes. They tend to invite audience participation and, beyond informing, they can inspire people.

75. Being close to the people at the local level, these channels retain the capacity to be used in the service of social concerns as determined by local, provincial or national authorities. In addition, they tend to be relevant to the people in the sense that they are conventionally acceptable. They are also abundantly present in areas where mass media technology has not been fully or effectively developed to capture sustained interest at the local or even at the provincial and national levels. Costs of supporting traditional forms are minimal.

76. Limitations in the use of such forms lie in overloading the channels with too many messages of an instructional nature. However, little is known about such limitations. Concern must also be given to the possibility of distorting the original meaning and purpose of traditional media. Some evidence indicates that the puppeteers of Indonesian *Wayang Kulit* cannot risk the chance of losing their credibility with villagers by introducing family planning messages. It may, in this case, mean training an entirely new group of puppeteers for the purpose.

77. One of the four meetings of international experts convened by UNESCO in 1972 dealt with the integrated use of folk media and mass media in family planning and communication programmes.<sup>8</sup> The meeting recognized that both the mass media and folk media had developed their own styles and forms and that, while the former could extend the size of the audience of the folk artist, the latter had the great advantage of enriching and diversifying the content of the mass media.

78. It was observed that communication programmes had previously concentrated on the utilization of the field-workers of health and agriculture programmes for extension of the family planning message. It was emphasized that while that should continue, folk media should be added as extended channels for such workers, which would enhance innovative approaches and capitalize on trusted folk media and folk performers for family planning.

79. The meeting concluded that communication strategy embodying the co-ordinated use of both types of media would result in the creation of a climate for acceptance and better realization of the concept of family planning and of services, as well as that for other kinds of activity in the field of population.

<sup>7</sup> UNESCO, "Population and family education", report of an Asian Regional Workshop, Regional Office for Education in Asia, Bangkok, 1961.

<sup>8</sup> UNESCO, Experts Meeting on the Integrated Use of Folk Media and Mass Media and Family Planning Communication Programmes, London, 20-24 November 1972.

80. Steps need to be taken for the organized use of folk media in national family planning communication programmes. Folk media, being based in local communities, have the vitality and potentiality for serving as the extension arms of the mass media. Also, when used carefully for motivational purposes in communication programmes for family planning and development purposes, they could contribute also to cultural development.

#### TRAINING, RESEARCH AND EVALUATION

81. Training essentially meets needs that education and experience cannot adequately provide. It resembles both education and experience, but is different from either. The primary goal of training is to produce changes in knowledge, in attitude or in behaviour. Institutions that engage in training can make it more effective by recognizing its unique requirements and opportunities.

82. Training has, since the beginning of organized family planning programmes, received attention as a major determinant of success. Since such programmes have been generally under the direction of medical personnel, much of the early training consisted of instruction in clinical aspects of contraception and human reproduction. Subsequently, as field-workers came into the picture, training became broader based and began to deal with the complex of subjects that make up family planning.

83. The most common practice in developing countries is to have a system of training institutes, usually featuring a national training centre, state training centres and often regional centres dealing with the range of concerns for which programmes are responsible. The functions of a national centre may include co-ordination of the national training programmes, developing basic curricula for use in training different categories of personnel, training trainers, training special groups, providing advisory services to regional or provincial centres, preparing training aids, serving as a clearing-house on training information, evaluating training programmes, conducting research to evolve more effective methods of training and organizing seminars and workshops for improving the competence of trainers.

84. Regional training centres assume the responsibility for training personnel within their geographical areas. Typically, their faculties spend time in the field, consulting with and guiding field personnel, testing job descriptions, developing curricula, modifying curricula, evaluating training in terms of job performance, organizing refresher courses on specialized aspects and conducting research.

85. Family planning training institutions are largely inadequate to meet the current needs of programmes which place high priority on information, education and communication activities at all levels and among all personnel. Sweeney states the problem plainly as it

relates to the communication training needs of programmes:

“One of the parts of family planning programmes that causes me concern is the training of communicators, particularly field workers. Field workers are generally trained by services personnel or by people who come from the services part of the programme. Let me draw an analogy. Your local automobile dealer has a services department and a sales department. Imagine the conversation you would have with the salesman who has been trained by the services manager. In no time at all you would be on a dolly under the automobile looking at the engineering and then standing in awe as the services-trained salesman lifts the hood and carefully explains all the working parts. Personally, I would rather know what the automobile could do for me in daily life.”<sup>9</sup>

86. Communication training is often thought of as having application only to those workers whose job titles specifically commit them to tasks involving public information or informal education, often described as motivation. Thus, those staff members who deal with mass media and those field-workers whose duties involve persuading people to accept new practices are seen as communicators and therefore as subjects for communication training. A more enlightened view is that every category of staff at various levels should receive communication training. Although the content and methods of such training have already been specified by UNESCO,<sup>10</sup> what remains to be done is to lay down the criteria and standards for institutions which could undertake such training.

87. Estimates of the number of studies in population communication vary widely but it is fair to say the total extent of such research is not known. This is emphasized by the fact that much social science and media research is applicable to population and family planning but requires that someone go to the bother of searching it out and suggesting appropriate applications.

88. A general short-coming of population communication studies is that they often do not deal with strategy or—if they do—it is not projectable to the whole of the area, whether it be province, region or country.

89. A meeting of experts on research in family planning communication<sup>11</sup> identified nine areas, which, in terms of priority, are as follows:

(a) *Research in the adoption process of family planning practices*: it was hoped that research in this area would help answer the question of why, in many

<sup>9</sup> W. O. Sweeney, “A blueprint for programme planning for population communication”, paper prepared for a Work-Planning Conference, University of Chicago, Community Family Study Center, 16-17 December 1971.

<sup>10</sup> UNESCO, Experts Meeting on Training of Family Planning Communicators, Honolulu, 9-13 October 1972.

<sup>11</sup> UNESCO, “Research in family planning”, Experts Meeting on Research in Family Planning Communication, Davao City, Philippines, 24-28 October 1972.

locations, there is widespread knowledge and favourable attitudes, yet low acceptance, which research might also help describe the similarities and differences between diffusion and adoption practices in family planning and other innovations such as in agriculture;

(b) *Communication strategies for improving continuation rates*: the research area should deal with the difficult communication problem of rumours and it will likewise contribute directly to the development of strategy;

(c) *Designing and testing more effective family planning message strategies*: this area should deal with the content of messages delivered through the widest possible variety of media, socio-linguistic considerations, style or treatment of messages, and the co-ordination of mass media and interpersonal approaches;

(d) *Integration of family planning with other developmental programmes*: this area would help answer the questions whether family planning goals are best met by building a separate infrastructure or by utilizing existing channels, audiences and sources, and it would explore the ways in which family planning messages can be integrated into those of education, agriculture etc.;

(e) *Communication strategies with opinion leaders*: research in this area would probe the role of the influentials at all levels of society in diffusing family planning innovations and it would help to determine the relationship between mass media and opinion leaders, giving attention to the role of incentives, and also exploring the possibility that opinion leadership may be decreased when family planning field staff overly concentrate their activities on their leaders;

(f) *Information acquisition and processing behaviour*: studies are needed that document how audiences receive information and how it is processed by individuals, all against the social psychological background of the culture;

(g) *Communication effectiveness of family planning personnel*: the most successful national programmes have stressed a large group of well-trained field-workers; yet, there is little research on the communication role of such staff and while local conditions will vary, research is needed on the relative communication effectiveness of family planning personnel with regard to recruitment, selection, training, supervision, targets, motivation, perception and reward systems;

(h) *Communication aspects of population education*: answers are needed to the question of how much stress should be placed on the possibilities absorbed by school and non-school education programmes, little being known about the most effective ways of reaching out-of-school youth;

(i) *Communication components supporting innovative approaches*: many countries are experiencing plateaux in numbers of new acceptors, as well as having increasing numbers of discontinuances; here, incentives and possible increased use of commercial marketing

and research facilities are possible areas of investigation.

90. Action research is of particular importance. Action research is carried out while the programme is under way, and the results are fed into communication channels as quickly as possible.

91. As a whole range of media approaches is likely to be involved in a multimedia approach to family planning communication, there is an urgent need for research into the comparative effectiveness of different kinds of approach.

92. The need for taking into account social and cultural factors when devising media approaches is vital. Research would be needed to analyse the cultural factors which might work for or against the acceptance of family planning in the local context. Family planning communication may attempt to strengthen motives for small families and to weaken those for large families. For mounting an effective communication programme, the need is to know what these motives are and which approach to motivation and information would bring about a change in attitudes; knowledge of and about the target audience and its attitude to family size is needed. In order to use media to change these attitudes, one needs to know which media are available to the target audience, which programmes are listened to most and by whom, what styles of presentation are most effective and most popular, and which media are most credible. Knowledge is also needed as to the kind of exposure the communication materials require and how frequently the messages have to be aired if they are to lower resistance.

93. Once the communication programme has been mounted, there is a continuing need for research into the effectiveness of particular media approaches in persuading target groups, and to ascertain whether these approaches themselves are informative, colourful and convincing enough.

94. Another aspect of research in family planning communication is the transferability of the findings. There have been a great number of communication projects, but very few provide guidelines for the development of programmes in other areas and country situations. Research material should be collated and presented in such a way that it can become a permanent record and a reference for communicators and development workers in other projects. The way in which research data are presented is important. Valuable information should be presented in such a way as to be meaningful to professional, influence and political groups, for it may affect the way in which they treat the idea of family planning communication and allocate resources for it.

95. Family planning communication programmes are designed to produce attitude changes and to influence behaviour in groups of people who may or may not be receptive to change. The success of this rather intangible aim can only be evaluated through measure-

ment of the impact of the programmes which are then related to the resources expended. Measurement is not easy, but one cannot give up simply because the variables of interest are hard to quantify. The challenge becomes one of finding reasonable indicators or surrogate variables which can serve as approximations of the variables of real interest.

96. Family planning communication is a two-way process. Family planners have information for the audience and the audience has information for them. Communication programmes that forget this principle could easily degenerate into mere propaganda, and audiences quickly tire of propaganda.<sup>12</sup> A good evaluation programme is, therefore, essential to a good communication programme. It provides the basis for both control and learning: control in the sense that the communication programme can be modified on the basis of the feedback obtained; learning in the sense that it will be possible to transfer experience between programmes. If such experience is not documented through a formalized evaluation procedure, the danger is that a subsequent programme will be planned without taking into account the results of any predecessor. People in the field are often too busy implementing the communication programme to worry about evaluation. This implies that special steps must be taken to ensure that responsibility and resources shall be provided for this important function.

97. The following elements are always necessary for evaluation:

(a) Perform environmental analysis to identify opportunities for action;

(b) Set goals and priorities (goals defined for the communication programme as a whole);

(c) Define these goals into operationally meaningful objectives and at the same time determine the inter-relationships between such objectives;

(d) Isolate and analyse the critical decisions and operations which are necessary to carry out the operational objectives;

(e) Choose and describe the appropriate control variables which are necessary for monitoring decisions and operations;

(f) Define operationally meaningful measurements to generate the appropriate reports;

(g) Design an information system for:

(i) Data gathering;

(ii) Data recording, storing and transforming;

(iii) Report and information generation, with a special emphasis on generating and transmitting on a continuous basis, including information to managers, and taking over all the repetitive aspects of managerial planning and control, so that those in charge of imple-

mentation can get out of "fire-fighting" and get down to the real business of planning.

98. Planning and control of a communications programme is done at different hierarchical levels. The principal linkages between decision-making levels need to be made explicit in order to show the main information flows.

99. The main connecting link is through control variables and objectives. The control variables identified on the higher level will be the objectives on the lower level and so on, down the line. The linkages between higher and lower levels have to be maintained both through direct contact and through a formalized information and planning system. It is important that objectives are set in a co-operative mode and not assigned arbitrarily, if people on a lower level are to feel committed to their achievement.

100. Evaluation is linked to the programme's specific objectives and attempts to discover how far those objectives have been reached and how effective the techniques for reaching those objectives have been. To be meaningful, it must be continuous and carried out in a scientifically reliable way and family planning communication programmes should have the necessary expertise for the purpose. Particular attention needs to be paid to training field-workers in evaluation methods. Social scientists working in development programmes can be of assistance in setting up training programmes.

101. The involvement of marketing research organizations in evaluation should not be overlooked. Questions on media use can be added to the questionnaires whenever an appropriate marketing survey is being mounted. Personnel from commercial research organizations and advertising firms are often valuable in the preparation of evaluation programmes and may be involved from the inception of a promotional idea.

#### ORGANIZATION AND MANAGEMENT

102. The organizational problem for family planning and development communication programmes is twofold:

(a) The organization and administration of an overall family planning and development strategy, bringing in all agencies concerned with the development process; for example, health, education, family planning, town planning, transportation and sanitation, communication, rural development and industrial development may all be the responsibility of separate and independent agencies, or may be off-shoots of a larger, more powerful, single agency;

(b) The specific planning for the media through channels which may be Government-owned or private organizations, including film enterprises, television channels, newspapers and magazines, radio stations and the various agencies concerned with the production of tapes, slides and cassettes.

103. Family planning itself is often a function of the Ministry of Health, or of a larger unit dealing with

<sup>12</sup> *Family Planning Community Education Programme, Manual* (Indonesian Planned Parenthood Association, May 1972), p. 11.1.

social welfare. In other instances, family planning is carried out by a specially constituted department or agency, which may be statutory, voluntary or a combination of both. In this case, the agency involved may be a new Ministry or a group of Ministries or even a central planning unit.

104. The kind of relationships that can be forged between family planning and other developmental projects are, to some extent, dictated by the kind of administrative arrangements which already exist.

105. As for media organization, the simplest situation is where all the media are controlled and financed by the Government. But there are enormous ramifications possible in the organization of private media channels, which may be controlled by separate commercial groups. Some co-operation may be established between media organizations and other agencies, such as education departments; but this kind of relationship is likely to be limited and extremely specialized.

106. In other cases, there may be a mass media department at a central level which has censorship and some financial control, but which is not directly responsible for media outlets.

107. Since family planning is a highly complex aspect of development, it needs sustained and concentrated effort for the dissemination of its message. Because family planning communication has its own particular aims and goals, and has specific requirements and methods, the responsibility for it cannot be spread too widely. Where each development department has its own family planning programme, family planning is likely to become a secondary consideration and may even be lost sight of as each development area pursues its own goals.

108. What is required, then, is a combination of two elements, at different levels of operation. At the centre, there needs to be an over-all development policy-making body which is responsible for the co-ordination of the development programme as a whole. This agency must recognize the social and economic importance of population growth rates as they relate to the total development programme. It must also be aware of, and be able to foster, the interrelationships which exist, and are to exist, between the family planning programme and other development areas.

109. The second element is the specialist agency, concerned with the development of a family planning programme alone, but which is able to draw upon and bring together the appropriate resources in other agencies which are related to the family planning programme.

110. While the specific nature of the administration of communication activities in the family planning programme will vary from country to country, the essential principle is that the application of communication to family planning—or any other development programme—is a specialized operation and should be

under the direction of communication specialists. Though these specialists should necessarily be under the direction of over-all programme administrators, they should serve the role of advisers to those administrators as well as be in charge of planning and conducting communication activities. It is recognized that few developing countries will have many communication specialists—those who combine knowledge and experience in the media with behavioural science background and education. National programmes will necessarily have to rely on the best talent available from media agencies, on the one hand, and from institutions dealing with the social sciences, on the other.

111. Unless the head of the communication unit is given equal status with that of the head of services, it is unlikely that communication support will ever be given the attention it must have in the future. There is no reason to believe that programmes administered by health and medical personnel will have built in the behavioural dynamics necessary to reach programme goals.

112. Too often, the communication units of national programmes have been satisfied to deal in mass communication rather than comprehensive communication support. Specialists added to these units have often been deputed by broadcasting operations, newspapers or other public information agencies. Few examples exist where a staff of public information specialists work side by side with specialists in informal education to design and produce messages and materials for all channels available in the country. Generally lacking also are personnel who understand and appreciate innovative methods, such as mass mailing, advertising, market research and other methods common to the commercial world.

113. Bogue<sup>13</sup> recently called for central communication units with internal structures which would include: (a) planning and creativity; (b) production; (c) research and evaluation. Under the production unit would be a provision for dealing with the public media, a mass mailing unit to reach selected audiences directly and activities related to education in schools, adult education and literacy programmes and other channels.

114. The world-wide situation concerning administration of information, education and communication programmes is not optimistic. It is generally agreed that of the some 40 countries with official programmes, less than 10 have a communication unit at the national level which is equal in status to the clinic services unit. Equally serious is the situation that prevails even more generally, in which communication training is under the planning and direction of non-communication personnel. Given these circumstances, it is difficult to bring communication effectively to bear on the crucial needs of programmes.

<sup>13</sup>D. J. Bogue, "Report of the Conference on the Communication Support Outlook for Population Programmes in the 1970's", University of Chicago, 16-17 December 1970.

## BARRIERS TO IMPLEMENTATION OF FAMILY PLANNING COMMUNICATION PROGRAMMES

115. Twenty years of organized national family planning programmes have provided sufficient experience and revealed major barriers to their successful implementation. Programmes that have recently been initiated or that are going to be launched could take special note of these barriers and plan accordingly. These barriers are as follows:

(a) Family planning and population programmes have been advocated mainly in terms of fertility behaviour and demographic objectives and little or no action has been taken to advocate them in the context of human rights, the rights of the child or status of women;

(b) Lack of commitment by responsible public officials to family planning, as a concept or as an essential national programme, too often derives not from an understanding and appreciation of the implications of rapid population growth for the accomplishment of national goals, but from narrow fear of loss of political influence, so that even though 24 countries have declared national policies and 23 more have unofficially supported family planning activities, these policies and positions have too rarely been strongly supported by political leaders in power, the result being that family planning programmes generally receive low priority, and little government funding, and their personnel remain limited in number;

(c) Family planning has almost universally been defined as a health activity, and the involvement and participation of other development agents has yet to receive due attention and to have their role clearly defined in the implementation of family planning programmes;

(d) Unwillingness to attempt innovative approaches, so that although contraception has been known and practised for centuries and fertility has decreased in western countries in the absence of family planning programmes, most programmes in the developing world fail to recognize that a substantial proportion of their people have to want fewer children, as well as to have access to the appropriate knowledge and means; and the conviction that few children are preferable to many is not widely held in a number of developing countries, although neither is it absent in any.

116. The idea of demand creation or, as sometimes described, a marketing approach to family planning based on shared preference for small families, is not well developed. In general, family planning programmes have not recognized the value of utilizing the private and commercial sectors, have not evaluated the advantages of incentive and disincentive schemes and have not begun to use the modern management tools which can significantly improve over-all planning, administration and supervision.

117. Only recently has attention begun to be focused on the factor that many feel has been largely missing in adequately linking family planning and popu-

lation programmes to national development and improving acceptance rates. This factor is the application of communication, in its broadest interpretation, to population and family planning programmes.

118. It is not surprising that models for such application were not available at the time Governments began giving major attention to fertility control. They have taken considerable time to develop. Applications of communication to agricultural development, for example, have been more rapidly adopted.

119. As in all aspects of family planning programmes, there are major barriers to the successful application of communication. For example, the information, education and communication components of family planning programmes have not been adequately funded and staffed to permit them to fulfil their potential of support. This lack has resulted in communication programmes that are insufficiently planned, too small in scope and often inappropriate in content and mode of presentation.

120. Further, while the training of personnel to fill the growing needs for communication talent and skills, both for developing country programmes and among agencies extending assistance to those programmes, is inadequate, unco-ordinated and poorly funded, little effort has been made to encourage field-based training or to upgrade institutions at national level for the purpose.

121. There is an absence of research. Training of research personnel and utilization of research in most country programmes are health-based, with insufficient involvement of other agencies or ministries connected with development.

122. The development of national (public) programmes has restricted rather than promoted the utilization of private commercial methods and resources. The great majority of contraceptive users in the developed world and an estimated 40 per cent of contraceptors in the developing world obtain their supplies through non-clinical outlets; yet, these resources are not being exploited in developing countries.

123. Communication strategies have not always taken account of the limited accessibility of media to rural masses in developing countries or of the great potential of field-work or of community channels of communication.

124. Family planning communication programmes have not been planned with or integrated into communication efforts connected with other developmental activities.

125. The growing number and variety of international assistance efforts is often unco-ordinated, resulting in confusion at country levels. The types of assistance available and the mode of access to them is not well understood. The aid-giving agencies themselves differ as to the best methods for utilizing available assistance in the most effective ways.

126. Communication technology is expanding dramatically; yet, the major benefactors are the developed rather than the developing countries. New technology has in many cases proved its cost-effectiveness, yet is resisted on the basis of the costly initial investment.

#### RECOMMENDATIONS FOR ACTION

127. A broader interpretation of population programmes and policies than one merely in terms of fertility behaviour or demographic objectives is called for and communication efforts should be intensified to set them against the background of human rights of the child and the status of women and in terms of development.

128. Research and subsequent training should be directed towards discovering the means of effectively combining the advantages of mass media with the inherent strengths of interpersonal communication for more adequate support of family planning and population programmes.

129. Any development of a world-wide population/family planning institute or centre should make allowance for adequate attention to research, training and service in the application of communication to programmes.

130. Active support and encouragement should be given to efforts to identify, process and disseminate research results which are relevant to family planning programmes. This process would include rewriting and otherwise putting such results into forms that administrators can readily use. Likewise, it includes capitalizing on systems developed by programmes which have been successful in utilizing research results to alter programmes.

131. Systematic review and comparison of communication activities and developments in family planning should be sponsored to learn what is effective under which conditions and at what cost.

132. Encouragement and support should be given to multidisciplinary research, which goes beyond most KAP studies and reveals conditions conducive to high and low fertility against a backdrop of response to communication. International agencies, in particular, should encourage and support study of family planning communication in connexion with the delivery of contraceptive services. This would include free offers, coupon systems, mass mailing, kits for newly-weds and other innovations.

133. Communication specialists and researchers should be encouraged to engage in family planning as an area of study and application.

134. Studies need to be conducted to determine the most effective use of change agents or mediators between mass media and local audiences.

135. Training facilities need to be developed at national levels for integrated use of communication for family planning and development. Assistance is particularly called for in developing the philosophy and the practice of placing communication training under the direction and implementation of communication specialists.

136. Considering the paucity of trainers, on the one hand, and of trained personnel, on the other, an international reservoir of advisers and consultants in the application of communication to family planning and population planning programmes should be developed.

137. Manpower development being of high priority in development programmes, and especially in the implementation of family planning programmes, criteria need to be developed by UNESCO for accreditation of institutions at various levels for undertaking training of communication personnel, if necessary providing assistance to upgrade such institutions. Efforts need to be concentrated not only in assisting in the training of communicators for family planning and development programmes, but more specifically to enhance national manpower resources for research, training and evaluation.

138. Particular attention needs to be paid to developing administrative and management systems which will ensure effective application of communication based on sound management as well as communication principles.

139. New and innovative approaches to the application of communication should be encouraged at the national level. Among the innovative approaches for development and implementation of communication strategies, attention may be focused on folk media and on experimentation with new technology with a view to adapting them to the needs of developing countries.

140. A network of institutions and agencies in the field of population education needs to be developed in the context of the total educational reform and as part of communication work within those sections of the communities not covered by formal institutions.

141. In order that national programmes may develop expeditiously, knowledge and experience, specifically in the field of communication materials, should be exchanged between countries. For this purpose, efforts should be made to ensure the free flow of materials through international agencies.

## ORGANIZATION AND ADMINISTRATION OF FAMILY PLANNING PROGRAMMES

### *United Nations Secretariat\**

1. The purpose of this paper is to present a comparative overview of the national organization and administration of family planning programmes. Reference is made to the main functions to be performed in family planning programmes, alternative organizational arrangements for carrying them out, the major problems encountered in organization and administration, attempted solutions, lessons learned and priority areas for future action.

2. An organized family planning programme is only one aspect of national population policy. Rapid population changes create new social needs and problems and they place greater demands upon government to administer new programmes or modify old ones. This paper is concerned only with nationally organized family planning programmes, i.e., with those deliberate efforts by Governments to provide birth control services for use on a voluntary basis (individual freedom of choice based on education and knowledge) to a target population, to the end of lowered and/or controlled fertility (among other objectives, maternal health, child health, reduced resort to non-medically induced abortion, individual well-being, economic development and human rights).

3. Family planning, although an old social practice, was not publicly advocated until the late nineteenth century, and then only by private groups. A few countries introduced family planning programmes in the early 1950s. Within the past 10 years, it has been officially adopted in a number of countries. Over two thirds of the world population live in countries whose Governments support organized family planning programmes, although the regional differences in official acceptance vary greatly.<sup>1</sup>

4. Organized family planning requires a high level of user participation. Any successful family planning effort must be understood and accepted by the people and be based on public trust and confidence. It cannot be solely dictated or legislated. Family planning is such a multifaceted, personal and intimate subject that its practice can only occur on an individual voluntary basis.

5. Nationally organized family planning activities, at the current stage of birth-control technology, require an extraordinarily high level of organizational and administrative skill. Few other programmes need the same degree of intensity of public contact and interaction. Except for sterilization, the users of contraceptive and birth-control services must frequently interact with the "providers". In some situations, it may be almost on a monthly basis with the purchase or procurement of contraceptives at local outlet(s). In other situations, it may be for a longer period, from six to twelve months, with a visit to the intra-uterine device (IUD) clinic. While the technology of birth contraception and prevention leaves much to be desired, the technology, if properly used, is effective. It requires, in most instances, the establishment of a frequent and regularized pattern of interaction between the "providers" and the "users", which takes time to establish and requires a distinct programme identity and institutionalized social patterns.

6. A principal obstacle everywhere to the development of successful official family planning programmes lies in the area of organization and administration. Where there has been public indifference, it usually has been because of inadequate public educational efforts and poorly organized services. The challenge for planners and administrators is to work out effective means for delivery of this technology and service to the public. While considerable progress to that end has been made, much remains to be done in almost all countries. There is need to examine comparative experience and to apply the lessons learned.

#### ORGANIZATIONAL AND ADMINISTRATIVE DIMENSIONS OF NATIONAL FAMILY PLANNING PROGRAMMES

7. Increasingly, it is being recognized that unique sets of factors—cultural, demographic, socio-economic, concerning knowledge and technology, and organizational—force one to put aside preconceived notions of the way in which family planning programmes should be organized and administered in one region in contrast to another (see annex). What works well in Pakistan may not work well in Colombia and not at all in Morocco. Nevertheless, there are a number of well-understood dimensions of factors that affect the organization and administration of any national family planning programme. There are also basic and tested principles which are useful in assisting administrators

\* Public Administration Division of the Department of Economic and Social Affairs.

<sup>1</sup> See Dorothy Nortman, *Population and Family Planning Programmes: A Factbook*, Reports on Population/Family Planning, No. 2, 4th ed. (New York, Population Council, 1972).

in planning, organizing, and administering their programme in a more effective manner.

*Main factors affecting specific form of organization and administration*

8. Basically, two kinds of factors affect the specific form of organization and administration of family planning programmes. First, there are those which planners and administrators must accept as relatively inflexible (fixed, absolute or mandatory) in character. Secondly, there are those which planners and administrators have the capacity to modify in varying degrees; but in day-to-day operations, these factors are just about as inflexible as the first kind. The former constitute largely organizational factors and the latter administrative factors, although there is not always a clear and precise differentiation.

*Organizational factors*

9. Five basic organizational factors and/or requirements, which also, to some extent but not entirely so, function as constraints, have been singled out: (a) programme design must be related to the capacity to use available science and technology; (b) a high level of administrative-management specificity is required; (c) well-defined authority relationships are mandatory; (d) relationships of programme operations to stages of fertility change are inconclusive; and (e) programme must be based on voluntarism.

*Need to relate programme design to the capacity to use available science and technology*

10. The capacity to use available science and technology in family planning varies substantially from country to country. Increasing this capacity in a country is often a difficult process and takes considerable time.<sup>2</sup> Each national family planning programme must be uniquely designed to fit its capacity to use available contraceptive science and technology, and, at the same time, to be sufficiently flexible to put into effect new scientific and technological developments which, in the foreseeable future, may become accessible. The adoption of new contraceptive technology, in most instances, will often involve changes in the administrative organization of the programme.

*Need for high level of management specificity*

11. Family planning programmes require an unusually high degree of management specificity and operational control. The basic problem is how to deliver consistently suitable "packages" of complex services to a highly differentiated clientele who are influenced by a number of factors over which the administrators have little control. Family planning programmes are very much affected by changes in their operating environments and their programme usefulness depends upon

quick response to differing situations and new social needs and demands. Information is needed to enable family planning administrators to make timely organizational and programme changes.

*Well-defined authority relationships mandatory*

12. Because of the personal and intimate nature of family planning and the large numbers of organizations and jurisdictions often involved in family planning programmes, authority (the administrative capacity to act) must be explicitly defined, widely understood and carefully applied.

*Relationship of programme operations to stages of fertility change inconclusive*

13. The relationship of organized family planning programmes to change in fertility rates is insufficiently understood. Birth control is only one of the means for reducing fertility rates. Social patterns and discipline, such as postponed marriage, increased celibacy, and changed mortality rates also have their effects. The theories concerning these and related reasons for fertility changes are weak and views of scholars conflict. Most of the family planning programmes have been in operation for too short a period to allow determination of their measurable impact on fertility rates. Nevertheless, the possibilities for examining and understanding the relationship between family planning effort and rates of fertility change have greatly increased as a consequence of the steadily expanding number of national family planning programmes. Over 30 Governments have initiated national family planning programmes as a means to reduce the rate of national population growth. The results will be known only after a period of a decade or so. In the meantime, there is need for patience and constant review.<sup>3</sup>

*Programme based on user voluntarism*

14. Family planning programmes demand an extraordinarily high level of "voluntarism", which over time, in most cases, evolves into a regularized pattern of contact between the users and the providers of contraceptive services. This has proved to be a very difficult set of relationships to develop and maintain.

15. In some countries, family planning programmes at first experienced marked success and had the appearance of widespread public acceptance. That success, however, was short-lived, as evidenced by a sharp "erosion of voluntarism". Such initial successes in birth-control programmes were illusory because those who were prepared to practice birth control readily volunteered. Subsequent progress was much more difficult.

<sup>3</sup> For further details, see *Measures, Policies and Programmes Affecting Fertility, With Particular Reference to National Family Planning Programmes*, Population Studies, No. 51 (United Nations publication, Sales No. E.72.XIII.2), pp. 4-16.

### Administrative factors

16. Three factors profoundly influence the basic administrative processes: (a) nature of the programme purpose(s); (b) extent of administrative integration and sectoral allocation of services; and (c) degree of consistency in amounts of resource inputs.

### Nature of programme purposes

17. The purposes of a national family planning programme profoundly affect its basic organizational structure and its administrative practices. The purposes giving rise to organized family planning vary from country to country and may include some or all of the following: (a) the protection of the human rights of women in their childbearing years; (b) the protection of health, particularly of women and children; (c) the reduction of the incidence of clandestine and illegal abortion; (d) the alleviation of poverty and promotion of social welfare; and (e) the reduction of population growth.

### Extent of administrative integration and sectoral allocation of services

18. Administration of family planning requires substantial programme integration at the higher levels while still permitting, at the same time, considerable operational flexibility at the local provider-user level. Satisfactory arrangements for meeting this administrative requirement have not been fully developed. This has been the case even in small, compact countries or areas, such as those of Singapore and Hong Kong, as well as where there has been only one organization, such as the health department, primarily responsible for the delivery of a simple package of family planning services.

19. Basic to this problem is the Government's policy as to the role and pattern of each sector in the country

in the delivery of family planning and supporting services. In some countries, these services are placed primarily in the government sector; in others, in the voluntary associations, local authorities, and the private sector; and in still others, in a combination of these sectoral possibilities. As yet, there has not emerged a common pattern of relationships between these sectoral and multifunctional components that can serve as a guide for administrative design and action.

### Degree of consistency in amounts of resource inputs

20. Resource inputs must be consistent with the highly regularized operational patterns required for family planning programmes. The need for sufficient financial resources at the right time has been one of the major operational constraints.

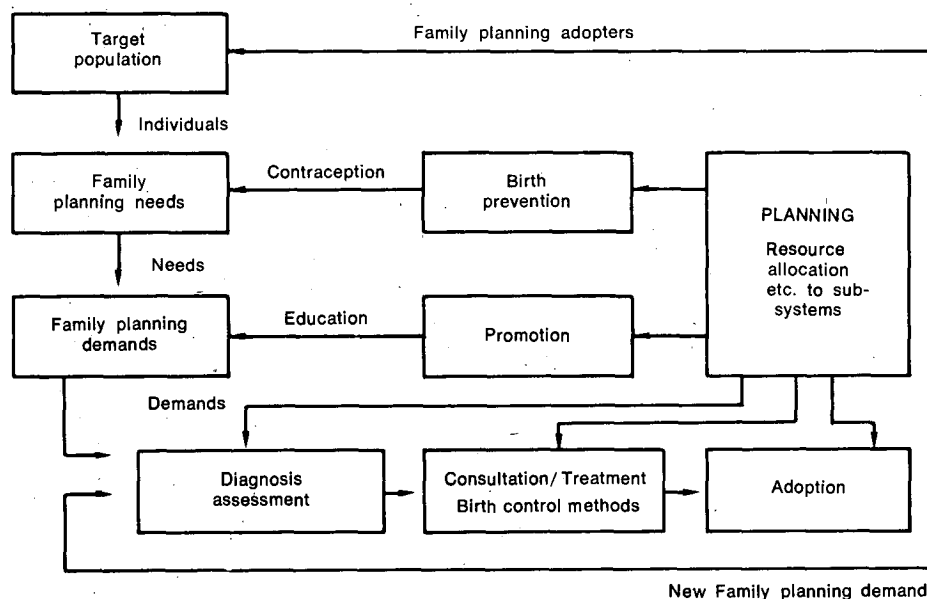

### Bases for family planning programme design and analyses

21. The bases for family planning programme design and analyses are discussed under the following headings: (a) the systems analysis method; (b) organizational requirements for family planning programme effectiveness; (c) practical population family planning policy; and (d) administrative improvement and development programmes.

### The systems analysis method

22. Family planning administration can probably best be understood and compared in systems terms. This involves conceptualization of family planning within a "holistic" framework, as shown in the figure given below. Too often, programmes in the past suffered from preoccupation with one or another particular element, component or approach and from attempts to secure "quick" results instead of building solid systems.

Model of family planning system

23. Family planning may be viewed as a complex system in which scarce resources are combined to achieve specific social goals. The complexity of this process is indicated in the annex, which lists and classifies into five broad categories the principal factors or elements affecting the development of family planning programmes. Administration is the principal process by which the elements of these five categories are harmoniously integrated to achieve the social goals of the family planning programme.

#### *Organizational requirements for family planning programme effectiveness*

24. Sound family planning programmes will include the following features: (a) a clear definition of policies, objectives, and functions; (b) adequate leadership and organizational arrangements for co-ordination, including performance standards for participating agencies; (c) justifiable allocation of resources to operational functions and units; (d) systematic method of operations through different levels of Governments and administration; (e) liaison arrangements with related governmental and non-governmental, national and international agencies; and (f) field units for delivering services and information to acceptors or users of contraceptive and other birth-prevention measures. To meet these requirements, a centre for planning and direction is necessary which provides a framework for administrative action and issues administrative guidelines for achieving programme goals.

#### *Practical population/family planning policy*

25. Population/family planning policy needs an explicit statement to make clear whether its objective is to facilitate family planning, to foster population control or both. While family planning tries to make it possible for parents to have the number of children they want, population control attempts to modify the family's social environment so that parents will want fewer children. Both approaches are often necessary and interrelated; and, in the administration of family planning programmes, should be concurrently considered. The question is basically one of timing programme modification in relation to changing social needs and the administrative capability of a country to meet them.

26. Thus, planners and administrators of national family planning must periodically seek an answer to the following multifaceted question in order to secure a sense of programme purpose and direction: whether their programme should include essentially, but not exclusively, measures of: (a) direct fertility control (birth prevention); (b) direct fertility and mortality (health or death) control; (c) direct social structural changes which affect fertility and mortality. The first two programmes treat essentially the social symptoms and the last the social causes of differing fertility and mortality rates.

27. Only after a realistic answer to this question is made may planners and administrators deal in constructive terms with the following basic but critical aspects of any national family planning effort: (a) develop a practical family planning policy; (b) design a viable organizational structure; and (c) initiate sound administrative practices for delivering a specific package of services to the people.

#### *Administrative improvement and development programmes*

28. The design and administration of family planning programmes must take into account: (a) current administrative infrastructure of the country; and (b) its administrative and development capabilities.<sup>4</sup> Planning and development administration activities directly and indirectly affect the organization and administration of sectoral and multifunctional programmes such as family planning. Successful family planning programmes are most frequently found in countries that also have effective public administration and development programmes.

29. In a number of countries, the central planning agency performs a central role in allocating resources for sectoral and multifunctional programme development and provides a major organizational base for the development of effective family planning administration. The agency also serves as an administrative vehicle for canalizing external donor assistance and facilitating the establishment of communication with national and international bodies interested in family planning.

30. Problems of internal administrative-management found in family planning programmes, such as personnel, budgeting, accounting and supply, frequently cut across the entire government operation; and they can often only be effectively resolved within an organizational context much broader than a single operational programme such as family planning. The base for strengthening family planning programmes is greatly enhanced in those countries which have in operation effective administrative-management improvement programmes, such as organization and methods and programme analysis and evaluation, and schools and institutes of administration and management.

#### **WORKING RELATIONSHIPS OF THE ADMINISTRATIVE COMPONENTS**

##### *An overview of the framework of analysis*

31. National family planning programmes are analysed in this section within an administrative-management systems framework consisting of: (a) planning; (b) operations; and (c) programme evaluation.

32. Planning is at first concerned with whether there is a need or demand for the programme and, subsequently, with its extent and how it will be met by

<sup>4</sup> See *Appraising Administrative Capability for Development* (United Nations publication, Sales No. E.69.II.H.2).

policies, programmes and strategies. *Operations* relate to the implementation of programme activities, including its structural features (intraorganizational, inter-agency and intergovernmental relationships), co-ordination and areas of programme conflict, stress and tension. The major activities of the programme in the terms of organizational process, direction, control and supervision are included along with the inventory of programme resources and how they are organized and employed. Programme evaluation concerns mainly the assessment of programme activities and the measurement of programme outputs, effectiveness, efficiency and efficacy. This systems framework may help high-level policy-makers and administrators to: (a) have a comprehensive view of their programmes; (b) identify internal and external constraints which hamper their programmes' effectiveness; and (c) initiate corrective measures.

#### *Programme planning*

33. Four general categories are discussed: (a) need and demand for national family planning services; (b) nature and scope of programme policies; (c) character of programme goals and objectives; and (d) composition of programme plans, strategies and tactics.

#### *Need and demand for the programme*

34. As a family planning programme matures and develops, the needs that are formulated into demands must increasingly be a result of a collaborative process between the providers and the users of services. New forms of public participation in the administrative processes will be required which may lead to the use of new birth-prevention technologies, different administrative practices and expanded organization. These related facets must, in turn, be built into a long-term development plan.

#### *Nature and scope of programme policies*

35. Well-designed and articulated public policy is the "substance" or "gravity" which keeps the structural components and their elements integrated together and the programme moving towards fulfilling the society's "real" programme purposes. The policy formation and re-formation processes in most Governments are weak and have only recently begun to receive the attention they deserve.

36. A national population/family planning policy should clearly prescribe guidelines for administrative action, but should be sufficiently adaptable to permit a high degree of programme innovation at differing stages of programme development. Increased concern is being given to the "necessity of formulating population policies and programmes as integral parts of the social and economic development process".<sup>5</sup>

<sup>5</sup> First paragraph of the "Declaration of Population Strategy for Development", adopted at the Second Asian Population Conference.

37. Discussion on policy issues too frequently centres on the professed long-rang objectives. More analysis needs to be given to public policy as comprising essentially the laws, regulations and allocation of financial resources of a country over time. A more accurate description of the policies of a country is usually secured from its budget than any other source, as it often shows disparities between professed objectives and actual priorities.

#### *Character of programme goals and objectives*

38. Few aspects of family planning programmes are faced with so many problems as the determination of organizational goals and objectives. In administrative usage, goals are defined as objectives expressed in the terms of one or more specific dimensions, such as the quantity and quality of production, or costs per unit of output. Because family planning programmes are exceedingly complex, goal conflict among participating organizations is common and the definition of clear and precise goals is at times difficult. Further, there are many conceptual difficulties in formulating realistic programme goals. Goals are mixed products of value judgments as well as hard facts. There are goals of ends and goals of means or a peculiar combination of both, and within all these, a series of subgoals (purposes, objectives, targets, aims) may be found.

39. Through the introduction of new management methods and procedures and improved administrative evaluation, significant progress is being made in strengthening the administrative process for identifying and setting realistic goals.

#### *Composition of programme plans, strategies and tactics*

40. Much attention has been given to the importance of plans and planning in the development of family planning programmes. However, no aspect of administration of these programmes has proven to be so difficult. The framing of plans as administrative instruments for programme implementation and evaluation of family planning efforts has not progressed to the extent desired.

41. Because of the peculiar nature of family planning activities and services, modern practices of administrative programme planning can readily be applied. Realistic programme goals can be determined and a course or courses of action planned for their achievement. Broadly speaking, this will require the development of two basic types of plans, single-use plans and standing plans. Single-use plans lay out a course of action to fit a specific situation and are "used-up" when the goal is achieved, whereas standing plans are designed to be used over and over again. Once this kind of administrative planning is more extensively employed in family planning programmes, some of the implementation problems so often mentioned will be resolved.

#### *Programme operations*

42. In terms of programme operations, the structural elements of any family planning programme may

be analysed and appraised within three system-components or relationships.<sup>6</sup> In broad terms, these relationships break down into the "means" and the "ways" by which family planning services are provided:

(a) The instrumental component consists of programme elements that directly relate to the target population. Included are: (i) kinds and extent of the birth-prevention technologies and measures; (ii) pattern and content of information/communication; and (iii) kind and extent of social support, especially as found in the local community or region;

(b) The direction/control component consists of programme elements that build, direct and co-ordinate the instrumental elements. Included are: (i) nature and location of the centre of direction; (ii) quality and extent of top leadership; (iii) quality and extent of supervision; (iv) nature of programme operational rules; and (v) nature and quality of evaluation services;

(c) The support component consists of those elements which strengthen and sustain the direction/control component. Included are: (i) kinds and quality of personnel; (ii) quality and extent of education/training; (iii) kind and amount of inputs, namely financial, over time; (iv) reliability in supply and distribution of contraceptives; and (v) quality and use of research.

43. To analyse further programme operations, attention is given first to the ways—direction/control and social support components—and, secondly, to the means—instrumental component—by which family planning services are provided to the public.

#### *Elements of administrative direction/control*

##### *Centre of direction*

44. In the system of public management of a country, including in some areas its large subdivisions which operate as semi-autonomous or autonomous units, a national programme of the complexity and importance of family planning requires that a centre of direction be established. Whatever the form of the family planning programme, the centre should be set up as high as possible in the government administrative system and placed under an administrator who has clear-cut and adequate authority and responsibility to carry out public policy and who is held responsible to the duly constituted executive authority of the Government. The exact location will depend upon the political and administrative circumstances in each country. It may be located in the Ministry of Health, as it is in many countries, in the Ministry of Planning, as in a few countries, or in the Ministry of Population and Employment, as in France. The centre, to be effective, should be located at a sufficiently high level to make close consultation and co-ordination with other ministries and top agencies

politically and administratively possible. It should be strategically located vis-à-vis the "cluster" of national planning financing and management improvement agencies so that the programme can receive the necessary policy and administrative support.

##### *Top leadership*

45. The importance of the quality of top leadership is becoming increasingly recognized. New and emerging problems demand larger and more complex social systems and innovative approaches for their solution. Suggested is the need for a peculiar and unique kind of leadership. What is often required, and particularly at the initial stages, is a person who is able to stimulate others to a high level of performance and is willing himself to try new approaches, especially to adapt the programme to differing and changing circumstances.

##### *Supervision*

46. In any organization, the development of effective supervision is one of the most difficult administrative tasks. It is the people at the lowest levels of the organization who carry out the burden of performance. They are the "doers", the ones who get the job done. The most difficult, and yet the most important, position in any organization is that of the line supervisor: the person who bridges the gap between the lowest level of management and the workers. In family planning, this is the point of actual delivery of the contraceptive and educational services to the public. The field staff must often become to some extent multi-purpose workers in order to enhance their acceptability and efficiency when working with people. Thus, there may exist a tendency for them to perform services and skills beyond their training capabilities and job assignments, which gives rise to problems of reporting to higher authority, expertise to carry out the specialized activities and related matters.

##### *Operational rules and procedures*

47. Because of the uniqueness and newness of national family planning, the legal base for the programme is still being developed. New family planning programmes often raise legal questions which usually take considerable time to resolve. For example, whether a wife can use contraceptive measures or secure an abortion without first securing consent of her husband; or whether family planning services can be provided to unmarried female teen-agers. Such problems have consequences for the formulation and application of suitable operational rules and procedures. Furthermore, programmes have not been in operation long enough to develop their own unique sets of administrative operational rules and procedures. To initiate the effort quickly, administrators have often had to work within the existing governmental rules, regulations and procedures, which have often handicapped programme operations. This has invariably been the case in the areas of personnel and financial administration, and particularly in

<sup>6</sup> This conceptual framework, although modified substantially, is derived from an article by Moye W. Freymann, "Organizational structure in family planning programs", in Bernard Berelson and others, *Family Planning and Population Programs: A Review of World Development* (Chicago, University of Chicago Press, 1966), pp. 321-334.

those countries with a tradition of strong Ministries of Finance. The introduction of a financial incentive programme, for example, will require major changes in the financial procedures of most countries.

#### *Evaluation*

48. Evaluation as employed in family planning means many different things and serves many different purposes and interests. As a concept, it is not well developed, in spite of the great attention which it has received. Four basic types of evaluation are usually identified: (a) those for analysing programme development; (b) those for assessing administrative performance; (c) those for appraising clinic operations; and (d) those for assessing demographic situations. Increasingly, it is being recognized that these types of evaluation also represent differing aspects of the overall organization and administration of family planning programmes.

49. Sophisticated techniques and methodologies of administrative systems analysis are currently being employed to a greater extent to identify operational problems, seek solutions and remove administrative obstacles. As a consequence, new and improved management systems and practices are being developed in such areas as: (a) improving the flow of information to and from central and local authorities and offices; (b) designing systems for supply and storage of contraceptives; (c) determining the geographical location of field clinics and operations; (d) measuring motivational effects of mass media on target populations; (e) isolating operational costs of system components; and (f) establishing benefit/cost and cost-effectiveness of programme activities. The major weakness of evaluation is found in its broader area of programme or socio-economic assessment, a topic which is discussed below.

#### *Elements of administrative support*

50. The term "elements of administrative support" includes only those activities which feed into and sustain the control function.

#### *Personnel*

51. Considerable attention has been given to the staffing requirements of national family planning programmes. Manning tables have been developed which include personnel requirements from the highest to the lowest organizational levels. Increased consideration is being given to manpower capabilities in individual countries. Studies have been made as to the requisite manpower requirements to deliver a particular package of family planning services, for example, within a maternity and child care model. Only slight attention has been given to the unique personnel administration requirements of family planning programmes. Since family planning is a new social programme, this raises a number of personnel questions concerning such basic matters as: (a) recruitment; (b) testing and examination; (c) training; (d) promotion; (e) performance evaluation;

(f) career patterns; and (g) fringe benefits. In some countries, family planning programmes have been hurriedly put together. Officers have been deputed to the programme from the established services and others recruited outside of the normal civil service procedures. This practice has caused personnel problems which have not been easily resolved, because of differences in salary and other benefits and related aspects. Since by far the largest single programme cost is for personnel, from 65 to 85 per cent or more, the importance of sound personnel administration is clearly evident and requires increased attention.

#### *Training and education*

52. Training and educational requirements for national family planning probably exceed those of any other government programme of the social type. The requirements must be analysed in both specific and broad categories, and they encompass a wide range of programme activities. In general, they should include two broad groups of persons: the operational staff, and the target population or clientele. There appears to have been a tendency on the parts of some officials and planners in operational positions to underestimate the ability of societies with high rates of illiteracy to understand, accept and use contraceptive measures, and to over-specify the educational qualifications and skill levels of persons needed to deliver at the field-level family planning services. The bulk of the family planning services in several countries with high illiteracy rates have been provided by field-workers with only 10 or so years of formal education and one year of training. Nevertheless, these programmes have been well accepted by the target populations.

53. Approaches and kinds of national educational services to be provided to target population family planning programmes are still in their formative stages. It is difficult to identify any common programmes and trends except with the possibility of greater emphasis being given to mass communication and education.<sup>7</sup>

54. Investments in educating and training family planning operational personnel have been sizable, but little study has been given to the relationship of various levels of technical and managerial skill and knowledge to programme "pay-offs". This aspect requires constant administrative review in order to prepare "key" people to meet new and different programme requirements. In some countries, educational and training programmes are confronted with human relations problems. Training as a concept and as a career process is not well understood.

55. United Nations surveys have repeatedly emphasized the need for administrative-management training, particularly in the areas of human relations,

<sup>7</sup> For more details, see United Nations Educational, Scientific and Cultural Organization, "Population and education", *Population Debate*, vol. I, part four; and *idem*, "Communication in support of population/family planning and development", *Population Debate*, vol. II, part eight.

supervisory practices and systems analysis. This includes the training of new managers as well as the retraining of mid-career and technical personnel. The development of managerial talent is an exceedingly complex process, which is not fully understood. Nevertheless, over the past 25 years, considerable progress has been made. In almost every country, special training programmes have been initiated, professional training societies established, and schools and institutes of administration developed. These new institutions can play a more important role in developing managerial talent and strengthening national administrative capabilities.

#### *Finance*

56. The United Nations Fund for Population Activities (UNFPA) has estimated that it would be necessary for developing countries, if they are to carry out reasonably complete family planning programmes on a broad national basis, to spend \$0.65 *per capita* per annum. This figure increases to \$1.00 if the costs of educational, motivational and evaluation activities are included. These costs, in relative terms, are not small when translated into their percentage of the national budget, which is about 5 per cent and is roughly equivalent to the current size of the national health budgets.<sup>8</sup>

57. More research, however, is needed on costs and benefits of family planning programmes. These estimates are primarily based on the costs of establishing and administering a discrete and separate organizational system for delivering family planning services, with heavy emphasis on a model of field clinics. This approach, in the short run, may be rather costly for a number of countries where it is not only necessary to build organizational infrastructure and carry out a major motivational campaign, but where related health services are unavailable also to establish a separate delivery system. Thus, in the initial stages of a programme, more attention should be paid to programme effectiveness (gaining and keeping acceptors) and development of administrative capability rather than to achieving low costs per acceptor. As family planning practices are adopted throughout target populations and programme services are institutionalized in diverse organizational systems (education, health, agricultural extension, welfare), the programme's operational cost per user should (in time) substantially decline. Family planning is a somewhat unique programme in that throughout its development process the need for a large, centralized and discrete organizational system becomes, over time, less important as its services are becoming institutionalized in the structure of government and society. This process will affect profoundly the organization of the programme and in turn its administration.

<sup>8</sup> International Bank for Reconstruction and Development, *Population Planning, A Sector Working Paper* (Washington, D.C., 1972), pp. 22-24; and Bernard Berelson, "The present state of family planning programmes", *Studies in Family Planning*, No. 57 (September 1970), and later numbers.

58. In the area of financial administration, some of the most difficult problems of public administration arise. The financial management aspects of family planning programmes are peculiarly complex and difficult. Nearly every conceivable planning, budgeting and accounting type of problem emerges because of the nature and complexity of the issues, e.g., centralized *versus* decentralized spending authority, charge for *versus* free services and conditional *versus* non-conditional grants-in-aid to voluntary bodies and local authorities.

59. In spite of its importance and complexity, there is no evidence that systematic attention has been given to this problem. High-level surveys emphasize the need for improved financial management procedures and operations, but this emphasis does not appear to have resulted in concrete studies or follow-up management improvement efforts.

#### *Supply and distribution of contraceptives*

60. Maintaining a reliable supply and distribution of contraceptive products has proved to be a difficult problem in many countries. Steps needed to assure the widespread availability of current and prospective contraceptive devices include alternative administrative supply and delivery systems, setting of standards and testing procedures, administration of patents and licensing, maintenance of a clearing-house for production information and the provision for technical and financial assistance to local production and distribution agencies. The advantages and disadvantages of private commercial concerns and channels for production and distribution of contraceptives require further investigation. The role of public administration to facilitate this activity is crucial. Its role both as a regulating authority and as a provider of direct services needs further examination.

#### *Research*

61. In recent years, there has been literally a research "explosion". Family planning literature is expanding rapidly and is becoming more complex as more disciplines and countries become involved. This situation has given rise to a number of administrative problems. Country programmes must now make judicious but crucial choices as to the kind of research they should pursue. Some observers feel that research in the biomedical area should be conducted essentially by those countries which have advanced research technology and can muster substantial resources. Research in social and behavioural sciences, demography, administrative programming and management has to be given increased importance by all countries. The relationship of the causal factors affecting changes in fertility has received considerable attention. New knowledge and understanding in this area will have a direct bearing on national population policies and the organization and administration of country family planning programmes.

62. A major problem consists of appraising the usefulness of this burgeoning research and putting its findings into operational practice. This task will require new and unique management information systems and decision-making centres. United Nations studies have recommended the establishment of national multidisciplinary research centres and have concluded that considerable technical assistance will be required for this purpose. A "knotty" problem is the management of multidisciplinary research programmes, because of the large number and complex nature of the disciplines involved.

63. The data and information base for undertaking family planning research and analysis is weak. Major organizational and administrative improvements will be necessary on both the national and the international levels to correct this situation, although increasing emphasis is being given to strengthening national statistical agencies and the quality of data and information.

#### *Elements of administrative instrumentation*

64. The effectiveness of a family planning programme is determined by the variety and quality of its instrumental elements, the suitability of the mix to the local situation and the manner in which they are delivered. This comprises the technologies which may be employed (the birth-prevention devices and their methods) and the use of institutions and their influence, relationships, patterns and measures. In other words, the elements of instrumentation consist of the "means" and the "ways" in which they are put together in achieving family planning goals. A social institution may be just as instrumental in terms of results (for example, increased education or the employment of women) as a contraceptive device.

#### *Services*

65. A family planning programme that employs the full range of feasible birth-control devices and measures will have a much different organizational arrangement than one that relies on only one or several. A basic problem in organizational design is the matching of birth-control technology with the target population's education, skill, facilities and preferences. A simple continuum runs technology—administration—people. A government policy may call for use of a wide variety of birth-control technologies, but neither it nor the private sectors may have the delivery capability and the target population the absorptive capacity for such a full range of services.

66. Successful family planning efforts invariably have employed several birth-control technologies and institutional measures. A few countries at first placed primary emphasis upon only one technology (usually the IUD) delivered by one institutional network (usually the national health service), which did not meet with much success. Experience shows that a variety of technologies and suitable institutional delivery systems is

required to meet social preferences, health needs and policy objectives.

#### *Information/communication*

67. These two items are treated together, although in a family planning programme they could comprise separate subjects. Communication is one area in which considerable success has been achieved. Nevertheless, major gaps exist. The use of mass media and other forms of communication is often ineffective and far from being fully utilized. The knowledge and use of communication channels, especially traditional ones, requires further investigation. There is a need to sharpen techniques for information use in the countries with culturally heterogeneous populations, especially those where literacy is low and mass communication facilities are limited.<sup>9</sup>

#### *Social support*

68. Family planning programmes represent a virtually unprecedented attempt at deliberate social change of very great magnitude. The points of opposition to change are also the ones of potential social support: political organizations; bureaucracies; religious hierarchies; *élite* groups; traditional cultural bearers; and new emerging business and urban elements. The knowledge and the capacity of mobilizing social support for family planning remain possibly the least developed of all the organization and administration facets. Community interest groups and relevant social organizations in many countries have scarcely been investigated. Only few studies have been made on the instrumental aspects of social institutions in family planning.

#### *Programme evaluation*

69. The methods of evaluating national family planning within programme terms are not very well developed. Programme evaluation has received a great deal of attention, but the methodologies remain unsatisfactory and the results inconclusive. This situation is due to a variety of reasons, not all of which are technical and methodological, and most of them are not unique to family planning. The basic problem is that programme evaluation serves several, if not many, purposes and interests, and suitable administrative arrangements have not been developed for their constructive resolution.

70. A planner in a central planning agency views a family planning programme much differently than its top administrator. The planner is constantly trying to maximize public expenditures and usually in terms of economic efficiency, e.g., whether the "pay-off" in family planning is as great as that in agriculture. A responsible top administrator is primarily interested in only his programme: finding enough resources to get

<sup>9</sup> For more details, see United Nations Educational, Scientific and Cultural Organization, "Communication in support of population/family planning and development", *Population Debate*, vol. II, part eight.

the job done in an efficient and economic manner. As a consequence, a widening gap exists between the planners and the administrators of public programmes.

71. Evaluation of public investment in social programmes is very difficult and especially so in family planning programmes, since their objective is essentially that of preventing some things from happening (e.g., unexpected pregnancy and, in some cases, unwanted birth), and it is extremely difficult to ascertain, measure and cost these social events.

72. Another concern has been the comparative evaluation of performance between programmes administered by public organizations and by voluntary associations. This exercise has often been futile because of substantial differences in the purposes and services between the public and the voluntary programmes and the nature and extent of their services rendered to target populations. Frequently, the public family planning programme delivers a complex package of health and birth contraceptive services, whereas the voluntary association delivers only contraceptive services. Comparative evaluation of these two different kinds of packages of services is extremely difficult, although it is one that family planning planners and administrators must often face.

73. The measurement and evaluation of programme success against some predetermined performance goals have also proved difficult. Success is frequently as much a product of favourable external factors over which administrators have no or only slight control (geographical boundaries, legal, economic, political, psychological, physiological, demographic) as of internal factors over which they may have substantial control. As yet, there has never been developed a satisfactory framework for differentiating between the effects of external and internal factors on programme performance.

74. With increasing attention being given to internal constraints and factors and their effects on programme operations (policies, goals and objectives, resources, activities, organization, information), steady progress is being made in improving the quality of internal evaluation of planning programmes. Internal evaluation is being emphasized as a continuous process and designed to provide administrators with a practical "tool" for assessing their programme performance, identifying strengths and weaknesses, and defining measures to effect needed changes. Progress in this area will undoubtedly set the stage for assessment and evaluation in the larger programme area.

#### CONCLUSIONS AND ACTION PROPOSALS

75. The purposes, type and extent of national family planning programmes required in each country will vary widely, depending particularly upon their demographic situations, national objectives, economic and social development and administrative system and capability. A major requirement for the successful for-

mulation and implementation of family planning programmes in all cases is the availability of requisite organizational and administrative capabilities. Governments interested in providing family planning services to large target populations will have to give increased attention to this problem (see paras. 5-6).

#### *Problem areas*

76. Major problem areas requiring attention in the organization and administration of national family planning programmes are discussed below.

#### *Organizational arrangements for policy development and co-ordination*

77. There is need to establish and to maintain the vitality of organizational arrangements at the highest level for the formulation and co-ordination of population and family planning policies in order to guide national efforts in these fields and to ensure their compatibility with other national policies and programmes. In view of the far-reaching implications of population trends and policies for national development, the goals and objectives as well as the action programmes in the population and national development fields need close co-ordination (see paras. 17-19 and 24-27).

#### *Programme planning, operations and evaluation*

78. The participation in family planning activities by a large number of organizations and levels of government and, to varying degrees, non-governmental voluntary and commercial agencies calls for a clear locus of responsibility for comprehensive programme planning, specification of operations, setting of standards and establishment of review and evaluation procedures. A strategic element in the success of national family planning programmes may be the ability of administrators to foster interorganizational networks and to achieve co-ordination in their activities in pursuit of national policy goals (see paras. 31, 33 and 42).

#### *Delivery systems*

79. The organization of delivery systems for family planning services requires systematic analysis and constant review to maintain their effectiveness. Among the pertinent questions meriting study are: (a) the organizational and administrative requisites for different types of delivery systems based on use of different technologies; and (b) the cost-effectiveness of different packages of services as well as technology "mixes" in different types of circumstances (see paras. 63-67).

#### *Use of modern management techniques*

80. The effectiveness of national family planning and population programmes can be increased through the sound use of modern management techniques. The application of systems analysis, for example, will more precisely identify organizational and administrative problems, missing components and co-ordination needs. Management information systems, PERT and network techniques, used judiciously, have considerable potential for enhancing programme effectiveness. National

and international institutions concerned with management training and development programmes can play a major role in the training of family planning personnel in the application of these techniques (see paras. 22-23 and 48-49).

#### *Personnel administration*

81. The most serious administrative problems in national family planning efforts are found in the personnel area. Finding capable technical and managerial personnel and training, motivating and keeping them in the programme are especially difficult tasks. Action-oriented surveys are required to define precisely the problems and needs in personnel administration, including: (a) estimation and long-range projection of personnel requirements and training needs to staff programmes; (b) adaptation of the personnel system to attract the requisite personnel; and (c) development of guides for recruitment and training of persons to staff management and supervisory positions throughout the family planning programme (see paras. 51-54).

#### *Financial administration*

82. National family planning programmes have unique financial administration requirements, since their task is to deliver a variety of complex packages of services and contraceptive products directly to target populations through various channels. Systems of accounting, budgeting and auditing designed to support management processes of complex national family planning require further study. Guidelines need to be developed in such problem areas of financial systems design as: (a) managing economic incentive programmes; (b) charging for and distributing contraceptive services and products; (c) decentralizing financial authority to the lower organizational levels to provide needed flexibility in programme mix and speed of action; and (d) developing financial data and information to support programme planning, operations and evaluation (see paras. 55-58).

#### *Programme performance*

83. Intensive study is necessary to identify those factors affecting high level programme performance which the administrator can affect. The development of realistic performance standards and methods for measuring performance in various activities and at various levels should be encouraged. Criteria for appraisal are especially meaningful when inputs are directly related to outputs. In some countries increased attention may be necessary to strengthen the data bases (collection, compilation, and reporting) required to provide the "feedback" information that planners and administrators need to keep programmes dynamic and effective. (See paragraphs 59-60, 62-67 and 65-70.)

#### *Adaptation of national family planning administration to new knowledge and technology*

84. The knowledge and technology bases for family planning programmes are rapidly expanding. Attention

should be given to methods of assessing immediate and potential impacts of rapidly changing knowledge and technology on the administration of family planning programmes. The latter should be so designed that it can readily adapt and put to use new knowledge and technologies. (See paragraphs 10-56 and 60-62.)

#### *Proposals for international support of national action*

85. National efforts to establish and strengthen family planning programmes should be supported through international and regional action-oriented research, training and advisory services and other technical co-operation activities on administrative and management aspects of such programmes. The following are illustrative of the activities that would be especially helpful to Governments:

(a) *Organizational arrangements.* Development of guidelines on alternative arrangements for organization and administration of family planning and other population programmes under different circumstances and programme objectives;

(b) *Performance standards.* Development of guidelines for establishing national performance standards and measurement methods under alternative forms of organization and delivery systems;

(c) *Modern management methods.* Formulation of guides for use of modern management techniques, including management information systems, PERT and other administrative technologies in the administration of family planning programmes;

(d) *Manpower projections and training needs.* Development of methods for estimating and projecting manpower and training needs in family planning and other population programmes;

(e) *Training materials and training of trainers.* Preparation of materials for the training of managerial and supervisory personnel in family planning programmes and conduct of courses for the training of trainers in this field;

(f) *Seminars for senior personnel.* Conduct of seminars for senior administrators and those engaged in administrative planning on population dynamics and their impact on governmental services;

(g) *Organization and management specialists.* Inclusion of organization and management specialists in technical co-operation projects in family planning and related population fields and encouragement of co-operation between technical co-operation projects in public administration and those in family planning and other population activities at the national level.

86. The type of activities suggested above can be carried out through existing organizations in the United Nations system and through use of regional and sub-regional public administration institutions that are receiving assistance from the United Nations Development Programme. These institutions can play a particularly meaningful role by developing training guidelines and prototype management development courses for use

by national institutions and agencies. It is urged that the network of intergovernmental and non-governmental organizations for the improvement of public

administration develop the capability to support national efforts to improve the administration of family planning programmes.

## ANNEX

### Factors affecting the organization and development of family planning programmes

#### *Physical input factors*

1. Non-human physical inputs:
  - (a) Birth control devices and technologies
  - (b) Facilities and structures
  - (c) Vehicles and transportation means (animals, jeeps etc.)
  - (d) Tools and equipment
  - (e) Fuel and power other than human
2. Human physical inputs
  - (a) Professional labour
  - (b) Semi-professional skilled labour
  - (c) Non-professional skilled labour

#### *Economic factors*

1. "Out-reach" processes which bring together at specific transaction points the "providers" and the "users" of family planning services on a regular basis
2. Facilities and processes for the supply and distribution of inputs, including employment programmes, credit, finance etc.
3. Input prices, including interest and discount rates
4. Product prices, including the estimated cost of prevented births, individual and community health, new social advantages and freedom
5. Taxes, subsidies and related economic measures—incentives and disincentives

#### *Organizational factors*

1. Social/family institutional patterns—nuclear to extended etc.
2. Political system as a basis for decision-making
3. General government structure, services and policies for:
  - (a) Co-ordinating diverse health, welfare and related input use
  - (b) Health, welfare, education and social services—private and government health clinics, rural health clinics, co-operative health programmes, family planning associations

(c) Local government and authorities—including in some cases highly deconcentrated/decentralized government operations

(d) Diffusion of knowledge, i.e., adult education classes, women's and youth clubs etc.

4. Voluntary organizations—civic, welfare, health, family planning etc.
5. Business and industrial organizations, with a reaching market centre

#### *Cultural and motivational factors (essentially demand factors)*

1. Integration of family planning institutional organization, practices and values within the culture and society of the country
2. Public administration factors, structure, values, mode of operation of the bureaucracy—receptivity to family planning values etc.
3. Social structures, cultural values, and psychological propensity (achievement levels) etc.
4. Processes of socio-cultural change, barriers and motivation in the innovative sequences, functional harmony or disharmony in society as its constituent parts change; included are the political values and capacity to resolve social conflict and articulate new social goals and programmes
5. Felt needs for family planning—by clientele, geographical area, population characteristics etc.

#### *Knowledge factors*

1. Organization of basic and applied research—general and particular/population and family planning
2. Diffusion of relevant knowledge, such as:
  - (a) Technical knowledge of birth prevention to: (i) "users" and (ii) "providers"
  - (b) Economic and social knowledge, i.e., improved health practices, family management, cost of child-rearing, educational expenses, alternative female employment opportunities
  - (c) Policy, i.e., national development, population, politics, public administration, planning
  - (d) General education, i.e., literacy, elementary and adult education, mass communication

# THE MANAGEMENT PROBLEM IN NATIONAL FAMILY PLANNING PROGRAMMES

## *World Bank*

1. The world is still in the early stages of developing official family planning programmes. It has taken decades of private pioneering and public discussion to reach the point where many Governments have now become convinced that family planning programmes are needed to improve the economic and social welfare of their populations. Within another decade or two, perhaps half the Governments of the world will be offering family planning services as a routine public service designed to influence the size and growth of the populations. Many of these Governments will also be experimenting with adjustments in the structure of social rules and incentives to lower fertility. The current period (i.e., the decades of the 1960s and the 1970s) is therefore a watershed in which a major new government function is being recognized and new structures and programmes are being established to carry it out.

2. This paper focuses on the problem of management in national family planning programmes. The first section reviews what is meant by "the management problem"; the second summarizes the various ways in which the World Bank has tried to deal with the problem in six specific projects. A brief conclusion points to where responsibility for the management problem ultimately lies.

### MANAGEMENT AND THE EVALUATION OF ITS PERFORMANCE

#### *Definition of management*

3. Many things must happen in order to establish new national family planning structures and programmes. Political leadership (which need not be visible or vocal) is obviously a prerequisite of a government decision to move into this new field of activity. Once the key political decisions have been made, policies must be articulated which provide guidance to those charged with working out enabling laws and decrees, organizational structures and staffing levels and budgets. A key factor in devising these new systems and getting them into motion is "management", a somewhat vague and elastic term that can explain everything or nothing.

4. In a strict sense, the management of national population or family planning agencies should be defined as the small group of people that includes only the chief executive and his senior associates. The number is never more than 10-12 people and is more commonly three or four, among whom the chief execu-

tive is always the key figure. These people are the key decision-makers and morale-builders upon whom nearly everything else depends. Management, of course, is not autonomous. It must operate within the broad terms of reference set by law and top political instructions. However, almost all the important initiatives that occur, or fail to occur, in a programme reflect the energy and wisdom of this small central group. Good management makes the structure operate effectively and deserves credit when this happens; bad management often underlies poor performance and ought to be replaced. In practice, it is rarely easy to judge whether systems are working well or poorly and hence to say how well management is performing its job.

5. It is too much to claim that good management alone makes all the difference. In arriving at judgements on the quality of management in any industry one must be careful not to give management credit or blame for results that may be determined as much by environmental considerations as by actions within management control. All one can say is that it is management which determines how much an organization makes of its opportunities. Thus, management is always important, but it may not always be the critical variable in determining system performance. There are many industries where non-management problems are typically critical to industry performance—e.g., research and development activities in the pharmaceutical or electronics industries, the pressure of technological change in air transport, natural risks in mining, the heavy capital requirements of the steel and chemical fertilizer industries, or labour and trade union problems in coal-mining and port operations. In the family planning "industry", however, management is invariably a key problem and is usually the principal cause of programme success or failure. It is true, as a prominent leader in the field once remarked, that "good management is no substitute for a sound strategy". However, since strategies are made by managements, good management is a Government's best assurance of a sound strategy.

6. The definition of "management" given in paragraph 4 is narrower than the full set of problems that are the concern of this paper. Use is made of the elasticity of the term to include within "management" not only the personal qualities of the top administrators, but the organizational arrangements and the procedures through which management exercises its directing and controlling functions. By "organizational arrangements"

is meant both the position of the family planning organization within the general structure of government, as well as its internal organization into departments, divisions and sections. By "procedures" is meant the routine activities which govern the operation, analysis and control of the organizational functioning, e.g., the budgeting and accounting system, procurement arrangements and the system for collecting and organizing data to measure the performance of the family planning programme (sometimes referred to as the management-information-and-evaluation system (MIES)). Thus, the term "management" is used to refer loosely to the means through which family planning programmes are carried out and controlled. Excluded by this definition are the programmes themselves, i.e., what management does in pursuit of its demographic and family planning objectives. In short, the concern here is not with management's problems, but with the problem of management; not with problems that must be dealt with, but the means for dealing with them.

#### *Rise of interest in management problems associated with family planning*

7. In the rapid development of population policies and institutions during the past decade, the top priority has been to get new organizations established and functioning or to carry through the rapid scaling-up of activities already being conducted, primarily by the private voluntary associations. Since about 1970, however, a new concern for the management factor in family planning has begun to be heard.

8. One of the earliest international meetings to consider this subject was the Workshop on the Administrative Aspects of Family Planning Programmes in Asia<sup>1</sup> organized by the United Nations Economic Commission for Asia and the Far East (ECAFE) and the United Nations Development Programme (UNDP), with technical assistance from the Population Council, and held at Bangkok in 1966. In 1970, the Population Council launched two modest experimental projects on family planning management by contracting out to the Institute of Public Administration in New York the task of reviewing family planning administration in nine developing countries. The Population Conferences held at Bellagio, Italy, in 1969 and 1971 both included organization and administration on their agendas. At the 1971 meeting, the United Nations Fund for Population Activities (UNFPA) submitted a broad 10-page review of the state of organization and administration of family planning programmes around the world. The UNFPA also proposed an ambitious series of studies, costing nearly \$6 million and extending over five years, which would try to get at the determinants of programme effectiveness and efficiency by "studying organization and administration of family planning programmes" and which would include the development

of a "training programme in management techniques for family planning administrators". (No action was taken on this proposal by the conferees.)

9. In 1971, the Ford Foundation began a somewhat more ambitious effort to inventory the management problems of both private and public family planning organizations in a number of developing countries in Latin America and in Asia. (The Ford Foundation assistance in Latin America was directed almost exclusively to helping the voluntary associations which have recently undergone very rapid expansion and which, in some countries, are being integrated into new government programmes.) In June 1972, the Ford Foundation organized a conference on the management problems of family planning programmes which assembled at Elsinore, Denmark, all Ford Foundation field representatives plus a small number of invited guests.<sup>2</sup> The ECAFE has continued its earlier interest in management problems by sponsoring a series of country studies, which one hopes will shortly be published. In 1972, UNFPA held a workshop in the United States of America on population programme administration, which was attended by representatives from nearly 20 developing countries.<sup>3</sup> The World Bank, which first began lending for population projects in 1970, has put organizational and managerial problems near the top of its concerns when it appraises project applications. Lastly, a growing interest in management problems is being shown by many government leaders in developing countries.

#### *Efficiency not first aim of management*

10. It should not be assumed that there is complete agreement on what the aims of good management should be or that these aims should be constant over a period of time. At the Conference at Elsinore in 1972, the senior Ford Foundation officer present expressed his view that at the current stage of programme development in most countries "effectiveness is more important than efficiency". By this he meant that it was more important to judge programmes and their managements by the success achieved in gaining and keeping acceptors than by their success in achieving low costs per acceptor. Governments and managements that worry about costs before learning how to recruit large numbers of acceptors are "penny wise, pound foolish". Concern for efficiency (or the input-output relationship between costs and effectiveness) should be secondary for a few years until the scale of organization and the order of magnitude of programme costs needed to achieve desired results become known. Only then will

<sup>2</sup> Selected papers prepared for the conference were subsequently published under the title *Readings on Family Planning and Population Program Management*. (Available without charge from the Ford Foundation, 320 East 43rd St., New York, N.Y.).

<sup>3</sup> *Population Programme Administration: A Summary of Shared Experience*, report of an International Workshop, July 1972, sponsored by the United Nations Fund for Population Activities and the Carolina Population Center and Department of Health Administration, Chapel Hill, North Carolina.

<sup>1</sup> See *Administrative Aspects of Family Planning Programmes*, Asian Population Studies Series, No. 1 (United Nations publication, Sales No. E.66.II.F.10).

it become appropriate to think of "fine-tuning" the system by worrying about cost-effectiveness questions. If "efficiency-mindedness" (usually injected by external donors or academics) gains too strong a hearing at too early a stage, action and experimentation will probably be inhibited.

11. The priority of results over costs in the early years of a programme carries an implication about the type of people who should be placed in charge at this stage. They should be *entrepreneurs* first and trained managers second. There is a world of difference between the two. The qualities of the *entrepreneur*—raw energy, imagination, drive and the ability to overcome bureaucratic obstacles without forfeiting credibility—are far more important than the kind of technical knowledge about sound operating procedures and methods and the concern for comparing costs and results that are the hallmarks of the professional manager. Ideally, one hopes that a new family planning programme could combine entrepreneurial and managerial talents in the top management group—and indeed they will always be present in some proportions. The only question is which set of managerial qualities dominates, sets the pace and defines management's "style".

#### *Judging performance*

12. The top administrators of family planning programmes need to know how well their programme is going and people outside the organization need to have some basis for appraising management's effectiveness. The tests used are essentially the same. During the earliest years of a programme (the first one or two years), relatively little weight should be given to quantitative measures of "output" (i.e., acceptors, continuation rates or couple-years of protection). The top priority in the early period is setting up the organization, framing a programme and setting things in motion. The most important quantitative measures at this stage would be measures of inputs, such as progress in filling authorized positions, success in getting the supply pipeline filled, increasing the number of clinics at which services are made available and the numbers of training sessions held and of people who have attended. A top manager with a good sense of public relations, one who wishes to build local and external support for his programme, will prepare periodic reports on these matters if he is reasonably proud of what he has been able to accomplish. Although input data will be more indicative of performance during the initial period, output data must be collected and published from the beginning.

13. Any family planning programme needs a set of well designed, regularly collected and regularly published service statistics. These statistics provide initial indications of results achieved. They should show the numbers of new and continuing acceptors, by methods used, the locations and types of service units used etc.<sup>4</sup>

<sup>4</sup> There is considerable room for judgement as to what statistics a family planning programme ought to include.

Statistics of acceptors recorded in government clinics will need to be supplemented by statistics of participation in the private sector; such private services are usually composed of services dispensed through the clinics of voluntary associations plus supplies bought from pharmacies or other retail outlets. (Voluntary agencies are normally incorporated within the Government's own statistical reporting system, while the sales of contraceptives through retail outlets can only be reported regularly if the Government has a trade monopoly; otherwise, occasional sample surveys must be relied on or inferences drawn from import statistics.)

14. A programme without easily available (normally published) service statistics is almost never a well-managed programme. Four of the nine countries which have borrowed money from the Bank Group for population projects did not have such statistics when the loans were made. It is part of the task of institution-building to assist managements to overcome such short-comings.

15. It does not follow, of course, that a programme is well managed simply because it is able to publish service statistics, even if their quality is reasonably good. What counts is the trend of figures over time. Such figures tend to follow a fairly typical pattern, i.e., a rapid build-up of acceptors in the first few years as the programme at first makes services available to those who are already motivated, followed by a plateau as the programme faces the problems of educating, motivating and servicing groups who may know nothing of modern means of fertility control and whose (rural) lives may be governed by traditional value-systems that put a high value on large families. There may be several reasons why a programme is unable to push the acceptor rate beyond 8-12 per cent of eligible couples—the range at which the plateau phenomenon usually appears. Government policy may be weak, socio-economic conditions may make progress unusually difficult or management may simply not be very effective in mounting the programme extensions and innovations necessary to keep the trend-line on an upward path. Fair judgements on programme and managerial performance require detailed knowledge of local circumstances and people. The same need to go behind routine statistics is true of judgements of industrial or other types of revenue-producing activities, where the apparent simplicity and objectivity of financial reports is frequently misleading. The service statistics of a family planning programme show nearly as much about programme performance as do the financial statements of commercial enterprises. Thus, when read with knowledge and care, they deserve to be taken seriously as a first approximation measure

Several organizations have published recommended statistical programmes; three of the best known are those of the Population Council, of the Center for Research on Human Reproduction at Columbia University (largely the work of Samuel Wishik and Jack Reynolds); and of Donald Bogue, who directs the Communications Workshop at the University of Chicago. The International Planned Parenthood Federation (IPPF) in London has distributed suggested statistical forms to its many private affiliates.

of performance, though they always need to be supplemented by more subjective evidence and by special surveys. The most important subjective information is first-hand impressions of the energy, imagination and authority of a programme's top management group; the most important survey data are trends in age-specific fertility among acceptors and non-acceptors. National and external observers frequently make such qualitative judgements. Unfortunately, trends in age-specific fertility are rarely available and are almost never in a form that allow them to be linked to family planning activities.

#### *Measures of efficiency*

16. Everything said so far measures performance by an "effectiveness" standard, without regard to costs. To measure "efficiency" requires a comparison of inputs and outputs. Such measures can be constructed from either a cost/benefit or a cost/effectiveness perspective. The former assumes an ability to put economic values on births averted; the latter does not attempt to derive such values and uses number of births averted or some other non-monetary measure of programme output, e.g., acceptors or couple-years of protection. Cost/effectiveness tests provide clearer measures of efficiency than cost/benefit or rate-of-return tests because they avoid use of benefit estimates, which are not closely dependent upon the efficiency with which resources are being used. If the value of an averted birth is high, this could give high benefit/cost ratios even to inefficient, high-cost programmes.

17. Benefit/cost tests are more appropriate as one means of justifying population projects in comparison with other sectors than for measuring the efficiency of a project or of management. The World Bank, building on work begun by others, has done enough work on the measurement of costs and benefits of population projects to be convinced that this use of resources is highly profitable to a country. A simple sensitivity analysis shows that such projects remain very attractive, compared with other development projects, even if the values actually realized are below reasonable expectations. Nevertheless, the Bank does not report cost/benefit measures in most of its own project reports, mainly because it recognizes that questions of methodology will distract attention from the economic and social attractiveness of population projects in most countries. To convince people that particular population projects are economically attractive, the Bank relies primarily on the fact that population projects offer countries a much cheaper way of increasing *per capita* incomes than any other form of expenditure (this is, of course, a cost/effectiveness rather than a rate-of-return approach). This approach provides a very crude, though telling, form of project justification.

18. For purposes of programme supervision and control, management will be much more interested in cost/effectiveness measures which state the cost of adding one new acceptor or of providing one couple-

year of protection. The Population Council and, more recently, the International Planned Parenthood Federation (IPPF), have both made important contributions to the establishment of initial cost standards. The Bank expects some of its borrowers to generate cost/effectiveness data in the course of carrying out some of its projects, but the projects being assisted are at too early a stage of establishment to yield useful data yet. There is no question that every well-run programme must eventually become concerned with the cost at which results are being achieved. This will require careful handling of cost and output data if results are to mean much. On the cost side, there are many joint costs involved; on the side of results, "new acceptors" mean little unless one knows something about drop-out rates and, ultimately, about the number of births averted.

19. It is worth noting that the foregoing discussion of efficiency and cost/effectiveness and cost/benefit (profitability) tests apply equally to any other sector of an economy, i.e., they do not reflect any particular characteristics of family planning programme.

#### WORLD BANK EXPERIENCE

20. The World Bank puts great emphasis on helping its borrowers establish effective organizations to run national family planning programmes. The Bank's distinctive mode of giving assistance—the project—is the vehicle used by the Bank to secure this objective. Three principal steps are involved. The first step involves first-hand analysis of the organization and management problems in the borrower's family planning agency. This analysis always involves one or more field missions, each lasting about four weeks. Such field missions (which invariably involve consultations with any other external donors with knowledge of the borrower's programme) lead to the identification of key problems and, eventually, to the proposal for needed actions. The second step involves building into the projects certain organizational arrangements and programme activities which the Bank and the borrower agree are necessary and feasible. The third step involves persistent follow-up of the projects, over periods of from three to six years, to do whatever is possible to ensure project success. The Bank uses—perhaps unwisely—the term "loan supervision" to describe these activities. Such activities include, for example, helping the borrowers to establish agreed accounting, reporting and control procedures; working out reasonable changes in project details; on request, assisting the borrower to recruit technical assistance; and seeing that specific agreements reached during negotiations are in fact carried out. On occasion, specific institution-building or management improvement changes are made conditions of a loan, i.e., the borrower agrees to carry them out before he is entitled to draw down the loan. The characteristic Bank/borrower relationship after loan signing is one of assisting the borrower in overcoming problems, not of policing the letter of the legal agreements. Project

supervision or follow-up is extremely costly to the Bank in time and money, but it has high priority in the work of Bank staff to assure realization of project objectives.

21. There now follows a review of six of the World Bank's population projects to identify some of the institution-building provisions that have been used to try to strengthen management (the projects are taken up chronologically). Some of the arrangements have worked well; others have worked not so well and were it possible to do the project over again, some things would probably have been done differently.

#### *Jamaica*

22. The project in Jamaica was the first project of the World Bank in the field of population activities. Before agreeing to proceed, the Bank persuaded the Government that an effective National Family Planning Board (NFPB) would need a firmer, clearer legislative charter. The Government was urged to consider three main organizational points which the Bank felt would be important for subsequent managerial effectiveness:

(a) A new statute was needed giving the national family planning programme a clear, permanent legal foundation and describing the new agency's authority over a specific list of functions;

(b) The size and membership of the new National Family Planning (advisory) Board should assure a sufficiently wide and balanced set of interests to achieve understanding and support for the (executive) Board's work;

(c) The national family planning executive agency should be headed by a person whose principal qualification was that of an effective administrator; whether he was a medical doctor should be a distinctly secondary consideration. Furthermore, the chief executive should be given enough independence of his Board to allow him to build a strong management team and effectively to control his staff.

23. The Government agreed with these points and they were incorporated in the new statute. Passage of the statute and appointment of the Board and of the chief executive officer had to be accomplished before the Government was entitled to draw money under the loan. The loan agreement itself committed the National Family Planning Board to do three things which it was hoped would eventually improve the effectiveness of family planning services:

(a) The Board committed itself to do two "management studies". The first was a study of the utilization of the 35-40 family planning clinics in the Kingston metropolitan area. The second study outlined the distribution of family planning functions among the various medical and paramedical occupations involved in providing service in the programme. The aim was to identify possibilities for allocating to less highly trained people certain tasks in a system where a heavy "brain-drain" has made medical doctors and nurses scarce.

Both of these studies were directed by the same person, a Jamaican medical doctor attached to the University of the West Indies;

(b) The second explicit management component was a provision that within one year NFPB would engage the services of a full-time training director, either expatriate or local (a local director has now been engaged);

(c) Thirdly, a provision was agreed that during each of the three years of the project execution period, the entire national programme would be reviewed by a three-man team of expatriate experts appointed by the Government. This provides a degree of "public accountability", which it is hoped will be constructive and healthy and which should assist the Board in identifying areas needing special attention during the next year or two. Knowledge that this "friendly external pressure" is inevitable should cause programme management to perform a little better.

#### *Tunisia*

24. The second World Bank project, that in Tunisia, involved more intensive concern for management problems than in the case of Jamaica. Improved management practices were needed over a broad range of functions. The best way of getting control over these functions within a reasonable time appeared to be through the services of a management consulting firm. Terms of reference for a management study were agreed upon with the borrower (the cost of the study was about 3 per cent of the total project cost). After acceptance of their recommendations by the Government, the consultants were to assist the Government in implementing the new systems. A French firm was subsequently engaged, and the Government is now in process of implementing the firm's main recommendations, which have been broadly accepted.

25. One important management problem in Tunisia was completely unforeseen. It arose from a problem faced by many new family planning agencies. Such agencies always have the delicate problem of trying to attract good men to agencies that are new and untested. Men of the calibre needed almost always have good posts somewhere else in the Government. To recruit them to new family planning agencies frequently requires giving the agency a position of privilege with respect to pay and perquisites, at least for senior professional staff. Every Government has a few such islands of preference, which necessarily involve delicate problems. In Tunisia, the family planning organization was originally given a privileged salary structure, which allowed it to build up a promising staff. Because this arrangement caused difficulties in the agency's relations with the Ministry of Health, the Government suddenly withdrew the advantages enjoyed by the family planning agency and brought its salary structure in line with that of the Ministry. As a result, nearly a third of the family planning headquarters staff resigned within the next five months and the programme slowed to a walk. Because of the relationship established by the loan agreement,

the Bank was able to help the Government overcome this problem in a way that seems to have restored the ability of the population agency to recruit and hold good management and senior staff.

### *Indonesia*

26. The project in Indonesia is the largest project to date of the World Bank. It is a \$32 million, five-year project which is being financed jointly by the Bank's soft-loan affiliate, the International Development Association (IDA) and UNFPA. The project includes a wide range of "software" activities and "hardware" facilities, concentrated at Jakarta, in East Java and in Bali. It would have been unthinkable to organize and carry out a programme of this size and complexity without paying a great deal of attention to management questions. (Indonesia is still in the fairly early stages of building up a strong public administration.) The development of the project permitted the Government to work out, with intense Bank and UNFPA involvement, the basic structure of an expanded national family planning organization. The solution adopted was to create an agency entirely outside the Ministry of Health. This agency was given planning, programming, financial and evaluation control over all family planning activities. It was not, however, given responsibility for programme execution, which was left to the regular line ministries, of which the Ministry of Health was the most important. An interministerial Advisory Council was established to assure co-ordination among the various ministries expected to make inputs to the programme. The Chairman of the National Family Planning Co-ordinating Board (NFPCB) is chairman of this Council. He reports directly and frequently to the President of Indonesia, a fact which greatly strengthens his authority vis-à-vis other ministries. (The same arrangement would probably be impossible in a parliamentary system with ministerial responsibility in which all ministers, including the Prime Minister, are equally responsible to a legislature, not to a single official with centralized executive authority.) At the provincial and district levels, responsibility for the family planning programme has been given to the chief civil official of the area, to whom the NFPCB representatives report (just as the Chairman of the National Board reports to the President). On the basis of one year's experience, the system appears to be working well.

27. In addition to giving an improved organizational structure to the national programme, the IDA/UNFPA project provides these additional management supports:

(a) At the summit, three expatriate advisers were attached to NFPCB, at first for a two-year period only. The foreign advisers—who are welcomed by the Board's senior staff—provide experience in programme planning and execution. Needless to say, such management help is expensive—the fact that half the cost will be covered by the UNFPA grant contribution will help greatly to make such expensive help acceptable;

(b) Within the management structure of NFPCB, the credit agreement required the reorganization of NFPCB, including the establishment of a new post of Deputy Chairman, before the Government was entitled to use any funds from the credit; an outstanding person, with wide experience in university and public administration, was subsequently appointed;

(c) To oversee the large construction programme and to assist NFPCB in setting up its accounting system, the credit agreement requires the Board to engage a qualified firm of management consultants. This solution was adopted after considerable debate as to whether individual advisers might not do the job just as well at considerably lower cost. It was decided they could not, and the Indonesians accepted this judgement;

(d) Lastly, a strong management contribution will inevitably flow from the 38 man-years of expatriate technical assistance which will be funded by the credit. Much of this technical assistance will be provided by the United Nations Children's Fund (UNICEF), the United Nations Educational, Scientific and Cultural Organization (UNESCO) and the Population Council. (The World Health Organization (WHO) is also providing important help, but under funds from outside the project.) What is called "technical assistance" will, in fact, provide "management assistance" at the level where these technical inputs are contributed—e.g., the role of WHO in helping the Ministry of Health extend the hospital post-partum programme; the help extended by UNICEF in identifying the specific types of vehicles needed, in procuring these vehicles and in organizing fleet-control and vehicle-maintenance activities; the help extended by UNESCO in organizing and carrying out a programme of population education; and the role of the Population Council in organizing and monitoring a field post-partum demonstration project.

28. From this summary description of the Indonesia project, it should be clear that the Government has requested, and IDA and UNFPA have agreed, that achieving the needed level of management skills would require a rather substantial injection of technical assistance.

### *India*

29. The fourth example of the approach of the World Bank<sup>5</sup> to the management problem comes from India, a country with a very well-developed public administration. Two distinguishing features of the Indian family planning programme are its age and the slow growth of acceptors in recent years, particularly in relation to the substantial increase in the costs of the programme. Although many dedicated and wise people have been working on the Indian population problem for several years, there are few ideas, and less agreement, about what needs to be done to recruit significantly larger numbers of acceptors.

<sup>5</sup> The project in India is being jointly financed by the International Development Association and the Swedish International Development Authority.

30. The response of the World Bank to this situation was to try neither to diagnose what was wrong nor to try to persuade the Indian Government to do what was needed. What ultimately emerged after more than a year of discussions between the Bank and the Government of India is a large-scale experiment in applied social science. In two very different states, Mysore and Uttar Pradesh, two separate population centres will be established. Each will assemble a professional staff of 25-30 demographers, statisticians, economists, sociologists and others from whatever disciplines their directors and their advisers believe would be useful. The directors—the “managements” of these two key institutions—are key people and the Bank has insisted they be given a senior status. Each centre is to be supported by technical assistance contracts to be signed with separate (Indian) academic institutions with experience in operational research. Thus, some well-established academic resources will provide support to two brand-new applied research organizations. Managing a five-year social science research and development effort is the essential task of the directors of the two new population centres. The purpose is to try to find out what no one in India today appears to know with any confidence: the combinations and intensities of programme inputs that will give the best results and the method that will achieve a much higher level of family planning acceptance and continuation than has so far been achieved. Unlike Indonesia, there is no input whatsoever of expatriate management or technical assistance, in view of the high quality of available Indian talent in the fields of population and management.

#### *Malaysia*

31. The five-year Malaysian project, co-financed by the World Bank and UNFPA, gives attention to some half a dozen management problems. Structurally, the Government agreed to appoint a Deputy Director of the National Family Planning Board (NFPB), a move designed to strengthen top management; to appoint maternal and child health/family planning (MCH/FP) officers in all 11 states covered by the project so as to set up centres for family planning administration at the state level, and to appoint an expatriate MCH/FP adviser to assist with the integration of the originally separate family planning service activities into the maternal and child health services of the Ministry of Health. There were also important agreements covering managerial procedures. For example, the Government agreed to appoint a management consulting firm to study and make recommendations on the administrative and other procedures used by NFPB and the Ministry. It also agreed to tighten up its programming activities by preparing a three-year plan of action designed to extend family planning services to 90 per cent of the population by 1975 and a longer term five-year plan covering the period 1976-1980. Some of these activities may well have been undertaken without the presence of a World Bank/UNFPA project, but the problems

touched by these managerial changes probably receive more explicit attention and are taken with somewhat greater seriousness as a result of their incorporation into an agreement with external donors. These agreed steps for management improvement will be followed up by periodic reports and by field visits to see what progress is being made, i.e., by applying good management follow-up practices to the implementation of the agreement.

#### *Iran*

32. The \$16.5 million loan to Iran, approved in May 1973, is almost wholly devoted to extending the health infrastructure, including a large number of training facilities. About 1.5 per cent of the loan is set aside to conduct a management study of the Government's family planning programme. For the World Bank and for several of the borrower's representatives, the management study is perhaps a more important part of the project than the bricks and mortar component. Iranian authorities are concerned about the location of a national population agency in the over-all government structure, the internal organization of such a body and its operating procedures. Consequently, an outside management consulting firm will study the problems and make recommendations for solutions for the Government. An attempt is being made to involve the management firm in the process of assisting in implementing its recommendations in order to minimize the danger that the study would become just another study that gathers dust on some forgotten shelf. The Government and the Bank expect the study to rationalize an organizational structure that was set up long before anyone could foresee the scale of the expanded programme which the Government is now trying to develop.

#### *The use of management consultants*

33. The World Bank and its borrowers have agreed to make use of management consulting firms in four of the nine projects<sup>6</sup> negotiated so far (individual management advisers were agreed on in two other cases). The firms engaged are not always or even usually specialists in family planning or even in health; their primary expertise is in the analysis of organization and management problems and in proposing ways of dealing with them. Funding agencies can make an important contribution to the establishment of sound family planning programmes if they insist that Governments give special attention to management problems, suggest (where appropriate) the use of consulting firms and assist Governments in selecting qualified firms.

#### CONCLUSION

34. This review began by emphasizing that “management”, strictly defined, means the quality of key people in an organization. This definition was con-

<sup>6</sup> That is, the six projects reviewed above, plus projects in Egypt, Kenya, and Trinidad and Tobago.

sidered too narrow for operational analysis and the elasticity of the term was invoked to extend the discussion to problems of organizational structure, administrative procedures, and the evaluation of system performance. But even when one considers these impersonal aspects of family planning programmes, all issues affecting how well they work or how they might be improved come back to people. It is the people who count; the men (or women) who make all the difference are the top managers in any national programme.

35. Nevertheless, the problem of management does not have its source in the quality of a programme's top

management. To reach the ultimate source, one must climb the last step—to the top level of the political leadership of a country. If Presidents or Prime Ministers take population problems seriously, family planning programmes will tend to get better managers than if political leaders give population a low priority. As population problems do not have political interest groups to press their claims on political leaders, the amount of attention that the latter give to these problems depends chiefly upon the spread of awareness among the opinion-leaders in any country and upon the incorporation of population concerns among the leading ideas of the ruling thought of a country.

## FAMILY PLANNING PROGRAMMES AND FERTILITY IN THE COUNTRIES OF THE ECAFE REGION\*

*Economic Commission for Asia and the Far East\*\**

1. By the end of 1972, 31 countries were either members or associate members of the United Nations Economic Commission for Asia and the Far East (ECAFE). They covered a land area of 30 million km<sup>2</sup> from Iran in the west to Japan in the east and from Mongolia in the north to Australia and New Zealand in the south. The total population of these countries for 1972 was estimated to be 2 thousand million, 55 per cent of the total world population. During the 1960s, the population of the region had been growing at an annual rate of 2.2 per cent; and had that rate persisted, the population would have doubled by the year 2004. The net additions to the population of the ECAFE region during this century alone would thus exceed, under the current rates of growth, the population of the whole world that existed in 1925. Considering the current staggering size of the population and the appalling potential for future increase, the population problem of the world is essentially that of the ECAFE region.<sup>1</sup>

2. The problem is caused, in part, by the prevalence of high fertility rates in an era of declining death rates in the developing countries of the region. The prospects of further declines in infant and child mortality, coupled with a relatively young age distribution, portends an increasing proportion of men and women in the reproductive ages in the coming generation.

3. Although the region as a whole is beset by the population problem, there are considerable variations among the individual countries or areas in terms of population size and growth, socio-economic conditions and development. As for growth rates, the range of variation is indicated by the Philippines, with an annual growth rate of 3.4 per cent, at one extreme, and Japan, with 1.2 per cent, at the other. Similarly, on the economic front, Australia, Japan, and New Zealand have *per capita* incomes of over \$1,500 per annum; Iran, Mongolia, Hong Kong and Singapore are in the range \$400-800; and the remaining countries, constituting

over 90 per cent of the population, have less than an estimated \$400. (Figures for China were, however, not available.) In addition, the first group of countries is growing economically at rates much faster than the developing countries. As a consequence, the economic gaps between the developed and developing countries are widening every year. The region as a whole, though sprinkled with a few developed countries with slow rates of population growth, is characterized by teeming millions living in abject poverty and increasing at rates unprecedented in history. Whatever gains the developing countries would have achieved on the economic and social fronts because of planned development are eroded continuously because of rapid population growth. Indications are that conditions will deteriorate further in the near future if only because of the growing pressure of the population.

### FAMILY PLANNING POLICY AND GOALS

4. Many of the Governments of countries or areas of the region are well aware of the problems caused by accelerated rates of population growth and have formulated policies and programmes to curtail these growth rates. Some of them have been pioneers in this direction, especially in the formulation of national family planning programmes designed to reduce the fertility levels of the population. During the 1960s, 24 out of the 31 countries or areas of the region had an official population policy backed by a national programme of family planning or supported voluntary efforts in family planning. Of these, 14 countries had population policies with national programmes and 10 others supported family planning efforts of voluntary organizations though they had no national governmental policies and programmes. Table 1 presents the list of such countries classified according to their current trends in fertility. Almost all the developing countries covering over 90 per cent of the region's population have population policies and family planning activities. The reasons cited by these countries for the adoption of family planning (or planned childbirth) as a national policy are oriented towards the economic betterment of the people, though improvement of the health of mothers and children and social development are also included as motives in some instances.

5. Many of the developing countries with official policies and programmes of family planning have stip-

TABLE 1. MEMBER COUNTRIES OR AREAS IN THE ECAFE REGION CLASSIFIED ACCORDING TO FERTILITY LEVEL AND POSITION OF THEIR GOVERNMENTS ON FAMILY PLANNING, AS OF 1971

Fertility level	Position of the Government on family planning		
	Stated policy with programme <sup>a</sup>	No stated policy, but the Government supports or permits activities	No stated policy or Government-supported activity
Low		Australia Japan New Zealand	
Declining	Fiji (1962) Malaysia (1966) Republic of Korea (1961) Singapore (1965) Sri Lanka (1965)	Hong Kong	
High	India (1952) Indonesia (1968) Iran (1967) Nepal (1966) Pakistan (1960) Philippines (1970) Thailand (1970) Tonga (1969) Western Samoa (1971)	Afghanistan British Solomon Islands Cook Islands Laos Papua New Guinea Republic of Viet-Nam	Bhutan Brunei Burma Khmer Republic Mongolia Nauru

<sup>a</sup> Figures in parentheses indicate year of policy formulation regarding population or family planning.

ulated demographic goals in terms of specific reductions in population growth rates or crude birth rates. There are 12 such countries, and their stated demographic goals as indicated in recent official documents are given in table 2. These demographic goals have been set by planners and economists in order to achieve substantial improvements in economic growth at the national macro-levels, in the first place. The balancing of the average individual preferences for family size with the national specifications of crude birth rates or growth rates has rarely been attempted. Recent knowledge, attitude and practice of family planning (KAP) surveys, however, indicate that average family sizes desired by individuals in the developing countries of the region are higher than those consistent with the demographic goals of the national family planning programmes. Even the realization of the stipulated national demographic goals in these countries would yield very high rates of population growth. Realization of the current levels of the desired family size of individual couples will certainly cause comparatively much higher rates of growth. It is also crucial to remember that the current fertility levels or the achieved family sizes are themselves higher than those stated to be desired by the families.

6. The demographic goals vary widely among the countries in their scope and trends. Some countries, such as India and Malaysia, specify the desired demographic levels at different future points of time; while other countries, such as Nepal, have defined their goals without a specific time limit. While the specification of demographic goals in terms of crude birth rates can be made independent of assumptions of future mortality

trends, specification of rates of population increase requires assumptions of both fertility and mortality trends. Out of 12 countries with demographic goals, six countries have stated these in terms of rates of population growth with or without birth-rate specifications, while the rest have stated their goal solely in terms of reduction in crude birth rates.

7. Most of the developing countries in the region with demographic goals have annual family planning targets specified in terms of number of acceptors to be recruited by the programme over a five-year period or over longer intervals of time. Such family planning targets have been specified in terms of the total number of acceptors to be recruited by the programme, either irrespective of the type of method or specifically for each type of method. These targets usually form a part of the five-year development plans and are intended to be consistent with demographic goals. However, it is sometimes seen that the realization of family planning targets, usually set by programme administrators with an eye on feasibility, fall short of specified demographic requirements in terms of reductions in crude birth rates or population growth rates.

8. Table 3 provides information on family planning targets recently stipulated by selected countries in the ECAFE region for which official data are available. It is found that with regard to the proportionate allocation of targets to various contraceptive methods, targets for sterilization are highest in India, for intra-uterine devices (IUD) in the Republic of Korea, and for oral pills in Thailand. Some countries, such as Indonesia, Malaysia and the Philippines, have set targets for the total number of acceptors to be recruited

TABLE 2. DEMOGRAPHIC GOALS OF NATIONAL FAMILY PLANNING PROGRAMMES  
IN SELECTED COUNTRIES OF THE ECAFE REGION

Country	Item	Level <sup>a</sup>
Fiji	CBR	From an estimated CBR of 31 in 1968 to 25 by 1975 by protecting 35 per cent of women of reproductive age (1968)
Hong Kong	CBR	Maintain CBR at 20 through 1976 (1969 by Family Planning Association but supported by the Government)
India	CBR	From an estimated 39 in 1968 to 32 by 1973/74 and 25 by 1978-1979
Indonesia	CBR	Decrease level unspecified
Iran	NI	From 3 per cent in 1967 to 2 per cent (year unspecified)
Malaysia	(NI (CBR	Decrease to 2 per cent by 1985 ) From 38 in 1965 to 32 by 1975 and 26 in 1985 )
Nepal	NI	Decrease to 2 per cent (year unspecified)
Pakistan	CBR	From 41 to 43 in 1970 to 33.2 in 1975
Philippines	NI	Reduction from an estimated over 3.1 per cent in 1971 to 2.5 per cent in 1976 (1971)
Republic of Korea	NI	Decrease to 2 per cent by December 1971 and 1.5 per cent by 1976
Singapore	CBR	From 22.1 in 1971 to 18 in 1975 (1972)
Sri Lanka	CBR	25 by 1975 (1968)
Thailand	(NI (CBR	To 2.5 per cent by 1976 ) From an estimated 41 in 1972 to 33 in 1976 ) (1972)

SOURCE: Data compiled from United Nations Economic Commission for Asia and the Far East, country reports for "Comparative study of service statistics system for evaluation of family planning programmes", Bangkok, 1973.

Note. CBR = crude birth rate.

NI = rate of natural increase.

<sup>a</sup> Targets as of 1970 unless otherwise specified.

by the programme without specifying the number to be recruited for various family planning methods, but oral pills have found the maximum acceptance within these countries. The annual targets set for the period from 1969 to 1976 for the number of acceptors of any method to be recruited by the programme range from about 5 per 1,000 population in Nepal to 40 per 1,000 population in the Republic of Korea.

#### FAMILY PLANNING PROGRAMME PATTERNS

9. Because programmes are implemented in accordance with their own policies and targets, family planning programmes in the ECAFE region vary widely in their organizational patterns, types of personnel involved, finances available, family planning methods advocated and targeted number of acceptors for recruitment into the programme. However, the basic operational objectives of the programmes in most of the countries remain the same, that is, the provision of necessary information and education to couples on the advantages of a small family and on the techniques of contraception; the fostering of group acceptance for small-family norms in the community; and the provision of contraceptive supplies and services to eligible couples in a socially and psychologically acceptable manner.

Variations in organizational patterns, in educational and contraceptive delivery systems and financial inputs into the programmes arise essentially because of politico-administrative considerations, the perceived priority of the population problem in relation to other problems and the socio-cultural variables in the population. Table 4 presents data on some of the organizational, financial and personnel aspects of the programmes in the countries of the region.

10. Organizationally, all family planning programmes are integrated with public health or medical services. However, the degree of integration varies with respect to the availability of a separate budget for family planning, the extent of autonomy enjoyed by the family planning board or organization and the proportion of unipurpose workers employed especially at the peripheral levels. The programmes are classified in three categories as high, medium and low, depending upon the intensity of integration with public health programmes. The "high" category countries, namely, Fiji, Nepal and Sri Lanka, usually have no separate family planning budgets (separate from maternal and child health services or public health services), no autonomous family planning organization and a very low proportion of unipurpose family planning workers.

SOURCES: Most data are drawn from United Nations Economic Commission for Asia and the Far East, country reports for "Comparison study of service statistics systems for evaluation of family planning programmes", Bangkok, 1973. Data for Iran and Pakistan, and on certain items for other countries, are taken from Dorothy Nortman, *Population and Family Planning Programs: A Factbook*, Reports on Population/Family Planning, No. 2, 4th ed. (New York, The Population Council, 1972).

<sup>a</sup> Including only those countries identified in table 1 as having a national population policy; excluding Bangladesh, Tonga and Western Samoa, for which data are unavailable.

<sup>b</sup> Based on 1971 health budget.

<sup>c</sup> Based on total expenditures in column 1.

<sup>d</sup> Classification based on existence of separate budget, level

of autonomy of the organization and proportion of unipurpose workers in family planning.

<sup>e</sup> Medical workers include part-time physicians.

<sup>f</sup> Excluding field personnel, e.g., field-workers, who perform family planning duties, due to their non-medical status.

<sup>g</sup> Involving the 1971 budget which estimates the contribution of a health-cum-family planning staff.

<sup>h</sup> Hong Kong programme is run by a voluntary association and therefore has a small number of physicians.

<sup>i</sup> Including foreign monetary inputs.

<sup>j</sup> 1968.

<sup>k</sup> Based on budgeted amounts because data on expenditures unavailable.

<sup>l</sup> Malaysia employs only eight full-time and 23 part-time physicians in its programme.

The "low" integration countries, such as Indonesia, Malaysia and the Philippines, have fully autonomous population and family planning boards, separate budgets and a very high proportion of unipurpose family planning workers. The "medium" integration countries are at intermediate levels in each of the three dimensions. The association between the extent of integration of family planning programmes with public health programmes and current fertility levels, rates of acceptance and use of contraception is in need of further investigation.

11. The numbers of medical and paramedical personnel employed in the programmes in relation to the population vary widely from country to country within the region. This is mostly due to differential proportions of part-time personnel, especially physicians, and other multipurpose workers involved in the family planning programmes.

12. The financial resources invested by national Governments in family planning programmes also vary widely and have increased sharply in all countries. For example, the *per capita* expenditure on governmental family planning programmes for the year 1971 ranged from 2.9 United States cents in Thailand to 26.6 in Fiji.

The expenditures on family planning in relation to expenditure on public health vary considerably among the countries. In addition to these real variations, differences also occur because of mixed costs, fixed capital and foreign investments in the programme. It appears that in developing countries, in general, the rate of increase in health or medical expenditures has been much less than in family planning programmes.

13. The cost per acceptor recruited by the programme in the year around 1971 ranged from \$2.71 in Thailand to \$15.80 in India. Part of the difference can be due to differences in the computation of costs, especially inclusion or otherwise of foreign assistance to the programme, but the differences are mostly attributable to the differing emphases on various family planning methods. For example, the cost of recruiting an acceptor for oral pills or the traditional method can be expected to be lower than the cost for IUD insertion, which in turn will be considerably less than the cost for sterilization. Since oral pills are the contraceptive method propagated in the programme for Thailand and sterilizations have found large-scale adoption in India, a major portion of cost per acceptor could be explained by the type of methods adopted.

## PROGRAMME ACHIEVEMENT

### *Acceptance and use*

14. The terms "acceptance", "acceptor", "use" and "user" of family planning methods have been used with varying definitions in different family planning programmes.<sup>2</sup> An Expert Group on Assessment of Acceptance and Use<sup>3</sup> has attempted to define acceptance and has distinguished between a "programme acceptor" and a "method acceptor" within a programme. The term "use" is viewed as being related to the prevalence of family planning practice in general or of the practice of a specific method at a particular point of time, and is a function of acceptance and continuity of use. With regard to IUD insertions or sterilizations, acceptance is synonymous with commencement of use. On the other hand, with regard to oral pills, condoms and other conventional or natural methods of contraception, acceptance cannot be equated with use; and the exact time of discontinuation of such methods by couples cannot be precisely specified as in the case of IUDs. Any comparison, therefore, of acceptance and use data with regard to different family planning methods will be defective from the beginning. Comparisons between countries also could be misleading.

15. Acceptance and use of family planning methods by couples could be from programme sources or from outside the programme, from voluntary organizations, private physicians and commercial channels. Acceptors and users outside the programme could have been motivated to do so by programme activities. There will always be a certain number of couples who substitute methods available from programme sources for their earlier contraceptive practices on considerations of cost, effectiveness of methods, etc. In these circumstances and those stated in paragraph 14, to evaluate the impact of a family planning programme just on the basis of the number of acceptors within the programme would be inappropriate. Any such analysis has to be supplemented by an analysis of levels and trends in contraceptive practices in the community as a whole irrespective of the source of such practice. Therefore, any interpretation of acceptor data has to be viewed with caution.

16. Table 5 provides data on current and cumulative number of acceptors of different family planning methods in selected countries of the ECAFE region for which data are available. The current figures mostly represent acceptances for 1971 or 1972, while the cumulative total is usually for a four- or five-year period prior to and including 1973. The years are specified in the annex. The acceptance rates for 1,000 population are also given for total acceptance as well as specifically

<sup>2</sup> *Evaluation of Family Planning Programmes*, Report of a Regional Seminar held at Bangkok, 24 November-12 December 1969, Asian Population Studies Series, No. 5 (United Nations publication, Sales No. E.70.II.F.20).

<sup>3</sup> *Assessment of Acceptance and Effectiveness of Family Planning Methods*, Report of an Expert Group, Asian Population Studies Series, No. 4 (United Nations publication, Sales No. E.69.II.F.15).

for each method. The data show considerable differences among countries with regard to current rates of new acceptances of any family planning method around the year 1971. Indonesia and Nepal have rates of less than 20 per 1,000 eligible women at one extreme, and Thailand and the Republic of Korea have rates of over 85 per 1,000 eligible women at the other extreme. Making a comparison by methods, India has the highest acceptance rate for sterilization, the Republic of Korea for IUD insertion, and Iran and Thailand for oral pills. If one compares current acceptance rates with the average annual acceptance rates for the previous five or six years, it is found that the acceptance rate for 1971/72 is much higher in the Philippines, Thailand and Indonesia than their average annual performance in earlier years (almost three to four times), and this is caused by phenomenal increases in the acceptors of oral pills. A large impetus to the family planning programmes in these three countries in the past few years has been provided through large-scale international assistance and support, national reorganization of family planning activities including additional national funding and the involvement of large numbers of full-time workers.

17. Contraceptive methods become effective only if they are practised over a considerable spell of the fertility period of a married woman. Continuation rates of contraceptive practices vary generally with methods and for the same method over countries, depending upon the motivations of couples and the nature of follow-up services rendered after acceptance. Continuation rates based on national samples of acceptors are not generally available. The data usually available are from special follow-up studies of a sample of acceptors, carried out in selected areas of the country concerned, which may be representative of the nation as a whole. Table 8 (see annex) provides a selection of continuation rates at the end of 12 and 24 months, wherever available for different methods of family planning, for selected countries of the region. Obviously, with regard to sterilization, the problem of continuation of the method does not arise and the method remains effective in preventing pregnancy during the entire duration of the marriage. With regard to other methods, it is found that the continuation rates vary among countries and between methods. Continuation rates for the IUD at the end of 12 months has been found to be as high as 93 per cent in a study in Indonesia and as low as 56 per cent in Pakistan. The median rate of continuation at the end of 12 months is found to be 70 per cent. For oral pills, the continuation rates are much lower, and the range is from 35 to 76 per cent at the end of 12 months with a median value of 60 per cent after the first year.

### *Proportion of contraceptive use within and outside the programme*

18. The proportion of eligible couples using contraception at any time is a function of the rates of

SOURCES: United Nations Economic Commission for Asia and the Far East, country reports for "Comparative study of service statistics systems for evaluation of family planning programmes", Bangkok, 1973; where specific data unavailable, Dorothy Nortman, *Population and Family Planning Programs: A Factbook*, Reports on Population/Family Planning, No. 2, 4th ed. (New York, The Population Council, 1972).

... Method not included in programme statistics regularly.

<sup>a</sup> Number of acceptors given in thousands and the acceptance rate per 1,000 married women in the reproductive ages (15-44) was given in parentheses.

<sup>b</sup> Cumulative since programme's inception.

<sup>c</sup> Average number of acceptors was cumulative total divided by years of operation.

<sup>d</sup> Female sterilizations only.

<sup>e</sup> Sterilizations applied for.

<sup>f</sup> Fiscal year ended on 31 March. Thus current figures were for 1 April 1971 to 31 March 1972.

<sup>g</sup> Nepalese fiscal year began in mid-July of one year and ended at mid-July of the next year.

<sup>h</sup> Vasectomies only.

<sup>i</sup> 1970 data, 1971 figures were unavailable.

<sup>j</sup> Reinsertions at six or more months after termination of original IUD were included in this figure.

<sup>k</sup> Cumulative since 1968 when oral pill was introduced as a programme method.

acceptance of methods in earlier years and the attrition or discontinuation of methods over a period of time. With low acceptance rates, if the continuation rates are high, the proportion using contraception can build up substantially as in the case of sterilization; and, conversely, even under high rates of acceptance with high rates of attrition, the proportion using contraception at any time can remain low, as in the case with oral pills in some countries. The proportion of eligible couples using contraception from programme sources around

1971 for different countries of the region is given in table 6, which also provides estimates of the proportion using contraception from all sources including non-programme ones.<sup>4</sup> It is seen from table 6 that there is a positive association between proportions of couples using contraception from programme and non-pro-

<sup>4</sup> Dorothy Nortman, *Population and Family Planning Programmes: A Factbook*, Reports on Population/Family Planning, No. 2, 4th ed. (New York, The Population Council, 1972).

programme sources, implying that in developing countries organized family planning programmes, at least in the first years, tend to supplement and promote contraceptive practice outside the programme. This finding runs against the belief entertained in some quarters that programme acceptors are essentially substitutors from non-programme sources.

#### Number of births averted due to the programme

19. Many estimates of births averted, using methods of varying complexity, have been made by various authors in countries of the ECAFE region, especially for IUDs and oral pills. Table 7 presents data on the estimates of "births averted" during the fiscal year 1971/72, for selected countries of the region as reported in official documents. Estimates for three coun-

tries of the cumulative number of births averted, because of the existence of a programme since the inception of the programme for different methods of contraception, are also provided in the same table. Since the techniques used and assumptions involved for arriving at these estimates have varied widely from country to country, any comparative interpretation of the estimates has to be undertaken with extreme caution.<sup>5</sup> Furthermore, it should be recognized that the births averted in any calendar year are realized over a number of years commencing the same calendar year, and hence the

<sup>5</sup> Any estimate of births averted by a programme essentially depends upon four factors: the number of couples accepting contraception by method; the rates of continuation of methods; the effectiveness of methods; and the potential fertility of the acceptors.

"births averted" estimates given in table 7 are justifiably credited to future years. From the table, it can be seen that the number of births averted because of the existence of programmes during 1971/72 range from 5,771 in Indonesia to 2.6 million in India. The cumulative number of births averted because of total programme performance since the inception of the programme range from 34,000 in Singapore to 10 million in India. The high estimate of births averted in India is due to a large number of sterilization operations carried out in that country since the inception of the programme.

TABLE 7. ESTIMATES OF BIRTHS AVERTED

#### IMPACT OF THE PROGRAMME ON FERTILITY

20. Measuring the impact of family planning programme achievement on fertility is at best a difficult endeavour, faced with numerous unsolved questions. The difficulties encountered in such an enterprise can be classified into three areas: conceptual, analytical and data-related. It is necessary to examine the nature of these problems briefly before presenting the available evidence concerning programme impact on fertility.

##### *Measurement problems*

21. First, levels and changes in human fertility are at the same time both causes and consequences of levels

and changes in the socio-economic structure. The origin of the cause is not always apparent. Although important, the family planning programme is just one of the multitude of socio-economic variables affecting fertility. As a consequence, when fertility levels do change in a population, it is difficult, if not impossible, to isolate the effects of programmes from those of other socio-economic changes occurring concomitantly in the community. It is also difficult to isolate the indirect effects of the programme from its direct effects.

22. Secondly, there are the analytical problems in the assessment of demographic impact, although these are interlinked with the data problems. Analytical techniques currently available are far from satisfactory and appear to be in their early stages of development. The fundamental problem appears to be the separation of the effects on fertility due to each of three major components, namely, unknown factors, known but uncontrollable (or immutable) factors and known and controllable factors. The effect of the first set of factors is generally assumed to be random after the consideration of all known factors. The known but immutable factors include "age-sex-marital status" distribution of the population, biological factors, education, occupational structure etc., which cannot be altered in the short run. The mutable factors include the family planning programme and such other major forces as can be manipulated by the Government and voluntary organizations for modifying fertility trends. The conventional statistical techniques such as analysis of variance, correlation and regression methods, though widely used in recent years, appear to have strong limitations in the analysis of human fertility, since the interactions of factors appear to be more significant and the unexplained component of variance is quite large.

23. Another difficulty surrounding the problem is the choosing of sensitive and reliable indexes of fertility capable of reflecting the impact of family planning programmes as early as possible. In recent years, various indexes of fertility and various methods of computing conventional fertility indexes from incomplete or deficient data have been proposed. However, there is a strong interaction between the quality of data and the nature of analytical methods and type of fertility index used in the analysis. Data of very poor quality and reliability cannot justify the application of complex analytical techniques utilizing many parameters of the population. From the analytical point of view, the identification of the factors influencing fertility and the estimation of the unknown or unexplainable portion of fertility, the time lag and the choice of appropriate fertility indexes appear to be some of the important problems. The data needed for such analysis can be obtained only through specially designed surveys.

24. Thirdly, there are the data problems. It is unfortunate that precisely in those countries in the developing world where the need for evaluating the impact of family planning programmes on fertility is greatest, the paucity of data needed for such an assessment is

most acutely felt. There are essentially four sources of data for any demographic evaluation of programmes: censuses; vital registration; family planning service statistics systems; and sample surveys. Censuses are usually taken every tenth year and collect information on only a few items. Similarly, the vital statistics systems in most of the developing countries still generate data that are too deficient in quality and coverage for any meaningful use by family planning programmes. In the meantime, information on levels and trends in fertility and factors contributing to changes therein are urgently needed for a variety of reasons, family planning evaluation being one of them. Sample surveys can usefully fill in this data gap.

25. The data collected through the family planning service statistics system relates to the number and characteristics of acceptors of family planning methods from within the programme. With data on past fertility of acceptors and rates of continuation of family planning methods, it is possible to work out to some extent the births averted by the programme using some of the recently developed techniques. However, the total impact of the programme on the fertility levels of the population as a whole can be studied only by examining the behaviour of both acceptors and non-acceptors, i.e., the community as a whole. Without prior knowledge of the extent and nature of pre-programme contraceptive practice by programme methods, it is impossible to assess the fertility impact of family planning programmes. The changes in the size and characteristics of the three groups—programme acceptors, non-programme acceptors and non-acceptors of family planning methods—over a period of time can only be studied by community surveys conducted at periodic intervals. Neither the data from service statistics systems nor those from follow-up surveys of acceptors are adequate to meet this need. The nature of the interrelationship between programme input and contraceptive acceptance on the one hand, and contraceptive practices and fertility changes on the other, cannot be fully investigated without studying the community as a whole or a random sample of it.

#### *Empirical findings on the assessment of programme impact on fertility*

26. Despite the difficulties mentioned earlier, attempts at assessing programme impact on fertility have not been lacking. Some of the findings from these attempts are examined below. The following questions appear related to such an examination:

(a) Whether such programme efforts (input) are related to programme acceptors (output), and whether such a relationship is influenced by the socio-economic conditions in the countries;

(b) To what extent such programme acceptors contributed to the fertility reduction;

(c) Whether the countries with a national family planning programme have actually had a declining trend in fertility over the years.

#### *Relationship between input and output (acceptance)*

27. In an extensive analysis of the relationship between acceptance rate and various administrative input measures undertaken by the programmes in 20 countries within the ECAFE region and outside, Lapham and Mauldin observed:

“... the higher acceptor-rates countries tend to have contraception readily and easily available in both the public and private sectors and they tend to carry out vigorous efforts to provide all couples with services; the lowest acceptor-rate countries fall almost entirely in the ‘partially’ category on these two criteria. The extensive use of field workers and mass media also show strong differences between the higher and lower acceptor-rate groups.”<sup>6</sup>

They also demonstrated that, in 1970, the acceptance and the use of contraception within the programme occurred under rather widely ranging social, economic and health conditions. Among many ecological factors considered for association with family planning practice, it was found that the percentage of married women in the reproductive age (MWRA) practising contraception was highly correlated with the percentage of population residing in urban areas.

#### *Programme acceptance and fertility*

28. After reviewing the findings of a real analysis of fertility changes with the number of acceptors, programme activity and other socio-economic characteristics in countries in the ECAFE region, one study observes:

“Multiple regression analysis of small areas indicates that areas with higher acceptance rates or more program activity tend to have larger decreases in fertility. Program effects appear to equal or exceed those of socio-economic change ... even where where modernization is rapid.

“... ”

“Studies using experimental and control areas have shown that the former tend to have greater fertility decline.

“... ”

“Geographic comparisons of fertility change, contrasting program areas with nonprogram areas of roughly equivalent character, have found larger fertility declines in the program areas. Because the two kinds of areas are not matched in any strict sense, the role of uncontrolled influences must be judiciously assessed; nevertheless, the results suggest program influence.

“... ”

“Attention to the relation between the timing of program activity and the appearance of unusual fer-

<sup>6</sup>R. J. Lapham and W. P. Mauldin, “National family planning programs: review and evaluation”, *Studies in Family Planning*, vol. 3, No. 3 (March 1972).

tility declines in an area suggests that programs have been causally related to fertility change.

“...  
“Matching of areas as units has indicated program effects.”<sup>7</sup>

29. Similarly, on the basis of a simple correlational analysis of levels of crude birth rate around 1970, in the countries of the ECAFE region and outside, with the proportion of contraceptive users from programme sources and all sources as well as with the cumulative number of acceptors, Potter and Rao<sup>8</sup> found correlation coefficients of the order of  $-.83$ ,  $-.76$  and  $-.60$ , respectively, indicating strong negative associations between fertility and level of cumulative acceptance and use of contraception. The same magnitude of association was also noticed between the crude rate of natural increase of population and cumulative rates of contraceptive acceptance and use.

30. The impact of the programme on the fertility of acceptors of family planning methods has been assessed, by matched comparisons of the fertility of acceptors with that of a control group (matched on the basis of various socio-economic characteristics as well as past fertility), by before-and-after comparisons of fertility of acceptors and by computer simulation. Matched comparisons have been made on the basis of group or individual characteristics. After reviewing the findings from a number of studies carried out in this manner, mostly in the countries of the ECAFE region, Ross and his associates make the following observations:

“Fertility declines among program acceptors are greater than among non-acceptors matched for other characteristics.

“Acceptors in family planning programs experience lower fertility after acceptance than before.

“Acceptors tend to have higher fertility rates before acceptance than the general population of married women.

“Acceptors in some programmes who have terminated the initial method or have become pregnant while using it have resorted to supplementary methods of contraception and to abortion to help keep their post-acceptance fertility low; some of the contraception is program-provided.”<sup>9</sup>

#### *Fertility trend over a period of time*

31. The data as shown in table 8 indicate the crude birth rates and percentage changes in these rates over different periods of time that could be attributed to changes in the age structure of the population, pro-

portion of women married and changes in marital fertility rates for Hong Kong, Malaysia, the Republic of Korea, Singapore and Sri Lanka, using techniques of standardization. Where substantial declines in fertility have been observed in the past decade, changes in marital fertility have accounted for anything between 0 per cent and 89 per cent of the changes in crude birth rates in different countries or areas for different periods of time. In the same country the contribution of change in marital fertility towards crude birth rate change has varied. For example, in Sri Lanka, during the years from 1953 to 1968, there was a seven-point decline in crude birth rate and almost all this decline was caused by structural changes in the age-marital distribution of the population. On the other hand, during the period 1968-1970, there was a decline of three points in the birth rate, and 89 per cent of this decline was caused by changes in marital fertility rates. In this connexion, it has been observed that the high proportions of contraceptive users, together with the large role of marital fertility declines in changing crude birth rates, suggest that contraceptive use, and often predominantly programme contraceptive use, has been important in effecting fertility decline in a variety of countries.<sup>10</sup> The role of induced abortion must also be recognized; its importance in relation to contraception varies by country. A study in the Republic of Korea indicated that, out of an over-all decline of about 30 per cent in the total fertility rate during the period 1960-1968, the component of age at marriage accounted for 12 per cent, the component of abortion for 6 per cent and the family planning component for 11 per cent.<sup>11</sup> Thus, the family planning programme was responsible for only one third of the decline in fertility.

32. Empirical evidence accumulated so far on the impact on fertility of family planning programmes indicates that family planning programmes and socio-economic development are an interacting process and that the effect of any one process cannot be assessed without considering the other. The programmes appear to have had a widely differing impact on the fertility levels in different countries. Apart from countries with younger programmes, such as Indonesia, the Philippines and Thailand, the countries with national programmes in operation for seven or eight years can be classified in two categories in terms of fertility trend: (a) those wherein significant trends of decline in birth rate and total fertility rates have been achieved, but where an incipient fertility decline was already evident at the time family planning programmes were introduced; and (b) those where no declining trend in fertility has yet been observed and where there was no incipient fertility decline at the time of introduction of the programme.

SOURCE: J. A. ROSS and others, *Findings from Family Planning Research*, Reports on Population/Family Planning, No. 12 (New York, The Population Council, 1972).

The Republic of Korea and Singapore are examples of the first group, while India and Pakistan are examples of the second. In those countries where there has been an incipient decline in fertility prior to the commencement of their programmes and where the rates of socio-economic development are high, family planning programmes have tended to accelerate the fertility decline.

33. The above described pattern of fertility trends and programme impact may suggest that fertility decline is associated with, if not caused by, the process of socio-economic development. This supports a proposition that "public family planning programs can be seen as an important and 'natural' part of the demographic mod-

ernization process. ... experience so far *has* shown demographic modernization, i.e. falling fertility, to be a concomitant of all-around modernization and economic development".<sup>12</sup>

#### SUMMARY

34. The past decade has witnessed the emergence of national family planning programmes in many countries of the ECAFE region, undertaken with the major objec-

<sup>12</sup>H. M. Raulet, "Family planning and population control in developing countries", *Demography*, vol. 7, No. 2 (May 1970).

tive of reducing the fertility rate or the population growth rate to predetermined levels considered optimal for economic development.

35. The operational objectives of these programmes are basically similar in that all programmes try to reach the general population in providing education and information on advantages of small family norms and techniques of contraception and in making available contraceptive services and supplies to the eligible couples in an acceptable manner. The implementation strategies for these programmes have, however, varied considerably.

36. The progress, in terms of acceptance, achieved by several of these programmes has been impressive. Effectiveness of the programmes reflecting impact on fertility has not, however, been precisely determined due to several measurement problems—conceptual, methodological and data-related. Broad analyses, how-

ever, indicate that high acceptance rates in certain programmes have been associated with a concomitant decline in fertility levels even after other demographic factors, such as age distribution and age at marriage, are taken into account.

37. Fertility reduction is greatly affected by the interaction between the programme efforts and other developmental efforts. In those countries where there has been a substantial decline in the fertility levels, there has been concomitantly rapid socio-economic development, indicated by increase in *per capita* income, literacy levels, employment of women and the proportion of non-agricultural population.

38. Significant decreases in fertility have also been observed in those countries where an incipient fertility decline was already in evidence at the time of the beginning of the national programmes.

## STATISTICAL AND HEALTH ASPECTS OF ABORTION

Christopher Tietze\*

1. This report presents a brief overview of data on induced abortion in the world today, primarily as they concern its demographic and public health impact.<sup>1</sup>

2. As used by the medical profession, the term "abortion" refers to the termination of a pregnancy before the foetus has attained viability, that is, before it is capable of independent extra-uterine life. According to tradition, viability, defined in terms of the duration of the pregnancy and/or foetal weight, is attained after 28 weeks of gestation, counting from the first day of the last normal menstrual period, corresponding to a foetal weight of approximately 1,000 grams. This definition was based on the observation that infants weighing less than 1,000 grams had little chance of survival and that the mortality of infants above 1,000 grams declined rapidly with increasing weight. In recent years, many medical textbooks have lowered gestational age at abortion from 28 weeks to 20 weeks, or less, corresponding to a foetal weight of 500 grams or less, because some of these tiny infants have, in fact, survived.

3. Abortions fall into two major categories—induced and spontaneous. Induced abortions are initiated voluntarily with the intention to terminate pregnancy. All other abortions are designated spontaneous, even if an external cause is involved. Induced abortions can be subdivided into those which are legal and those which are illegal, as defined by the laws of individual countries. In this report, unless otherwise noted, the term abortion refers to all induced abortions—legal or illegal.

4. Illegal abortions are frequently performed by unqualified persons under insanitary conditions, thus increasing the risk of infection and other complications. In most cases, the diagnosis requires information from the woman, members of her family or the abortionist. When such information is lacking, it is rarely possible, either clinically or at autopsy, to differentiate between induced and spontaneous abortion. Although the medical profession tends to consider septic abortions to be induced, many induced abortions show no signs or

symptoms of infection, whereas some spontaneous abortions do.

5. Most of the tables in this report are based on official statistics of legal abortions from countries where restrictive abortion laws have been replaced by liberal laws at various times since the late 1930s. In general, these laws provide for reporting to the health authorities of all abortions performed under the provisions of the statute; and in most of the countries, but not in all, national statistics are published periodically.<sup>2</sup>

6. Efforts to estimate the incidence of illegal abortion have been far from successful. Many respondents who are willing to be interviewed on their contraceptive practices will not talk about their experience with illegal, or even legal, abortion. The classic example of the unwillingness of interviewees to report their abortions is the Hungarian Fertility and Family Planning Study of 1966, conducted a decade after the legalization of abortion in that country, where the number of abortions reported by the respondents for the years 1960-1965 corresponded to 50-60 per cent of the number known to have been performed.<sup>3</sup>

7. The incidence of abortion can be assessed by relating the number of abortions to the number of women at risk and to the number of births or pregnancies. The types of information obtained by these two approaches are different but complementary. In this report, measures relating abortions to women (or to the total population) are termed rates, and those relating abortions to births or pregnancies are ratios.<sup>4</sup>

8. The importance of making a sharp distinction between abortion rates and abortion ratios is illustrated by the following example. Assume two countries, each with a population of 1 million, one with 45,000 live births and 9,000 abortions and the other with 15,000 live births and 6,000 abortions. The abortion rates are 9.0 and 6.0, respectively, per 1,000 population, whereas the abortion ratios are 200 and 400, respectively, per 1,000 live births. Thus, the country with the higher abortion rate has the lower abortion ratio, and vice

\* Associate Director, Biomedical Division, The Population Council, New York.

<sup>4</sup> *Spontaneous and Induced Abortion*, World Health Organization Technical Report Series, No. 461 (Geneva, 1970).

versa. From this example, it can also be inferred that a given abortion rate corresponds to a higher abortion ratio when the birth rate is low rather than when the birth rate is high.

#### ABORTION AND CONTRACEPTION

9. Because induced abortion and contraception serve a common objective—the prevention of unwanted births—a high positive correlation between abortion experience and contraceptive practice can be expected in populations in which some couples attempt to regulate the number and spacing of their children while others do not set any bounds to their reproductive capacity. In such populations, women who use contraception have higher abortion rates and ratios than the non-contraceptors. This apparent paradox is resolved if the comparison is limited to a population in which all couples are determined to avoid or to defer childbirth, but not all of whom practice contraception. In such a population, the abortion ratio will be very high because most unwanted pregnancies will be aborted. However, couples practicing contraception consistently and effectively experience fewer unwanted pregnancies and, therefore, a lower abortion rate than those who use contraception ineffectively or not at all.

10. Another aspect of the relationship between abortion and contraception concerns the question as to how many abortions are required to replace one birth. In reference to a given pregnancy, the answer is of course “one”, since a pregnancy can be terminated only once; but the answer is different when one considers either the life of a woman over a period of years or an entire population.

11. The interval between two successive conceptions can be divided into three components: the pregnancy itself; an anovulatory period following the pregnancy during which conception cannot occur; and an ovulatory period during which the monthly probability of conception is more than zero but less than one.

12. Induced abortion reduces the first two components because the duration of pregnancy is shortened from about nine months for a birth to about three months for an abortion. The subsequent anovulatory period is also shortened following an abortion compared with that following a birth, the magnitude of the difference depending upon the duration of breast-feeding. The average time required for conception during the ovulatory period is presumably not affected. With breast-feeding of moderate to long duration and without contraception, the second component is long in relation to the third, with the net effect that at least two abortions are required to avert one live birth. If contraception is practiced widely with even moderate effectiveness, the third component is extended in relation to the others, with the result that only slightly more than one abortion is required to avert one birth.<sup>5</sup>

<sup>5</sup> Abortion laws: a survey of current world legislation”,

Thus, it can be concluded that abortion alone is an inefficient method of fertility regulation and that it becomes progressively more efficient as the expanding use of contraception relegates its role to a backstop measure.

#### ABORTION POLICIES AND MEDICAL ATTITUDES

13. Almost one half of the world's people live in countries where abortion is either illegal in any circumstances or legal only to preserve the life of the pregnant woman. In more than 40 countries, the laws permit abortion on medical indications to preserve the woman's health, one half of which also recognize eugenic indications (genetic defects and/or intra-uterine damage to the foetus) and/or juridical indications (rape, incest etc.). In seven countries, termination of pregnancy may be authorized on social-medical grounds, i.e., to avoid a threat to the health of the woman (or, in the United Kingdom of Great Britain and Northern Ireland, to any existing children of her family), with a further provision that social factors may be given consideration when the threat to health is evaluated. Purely social indications, without reference to health, are accepted in six additional countries. Ten countries permit elective abortion, also referred to as abortion on request, either for all women (six countries) or for certain categories of women, defined in terms of age and/or parity (four countries). In most countries where abortion on request is permitted, it is limited to the first trimester of pregnancy and a medical indication is required thereafter.<sup>6</sup>

14. In many countries, the abortion laws are not strictly enforced, and in most countries, some abortions on medical grounds appear to be tolerated. In some countries with very restrictive laws, abortions can readily be obtained from physicians, without interference from the authorities. On the other hand, a liberal abortion law may not be implemented throughout a country, with the result that services are not available to many women seeking abortion.

15. Traditionally, physicians see themselves as the “guardians of life” and abortion as the destruction of life and, hence, incompatible with their proper function and with the hallowed Hippocratic Oath. In the past, many physicians considered abortion permissible only in those situations where continuation of the pregnancy constituted a serious threat to the woman's life which could not be averted in any other way. This attitude is still held by many physicians throughout the world and is the official position of the medical profession in many countries. However, some physicians in most countries and many physicians in some countries have come to accept a spectrum of indications for the termination

*International Digest of Health Legislation*, vol. 21, No. 3 (1970), pp. 437-512.

<sup>6</sup> H. P. David, Z. Alam and M. G. Kalis, *Abortion Legislation: A Summary International Classification* (Silver Spring, Md., American Institutes for Research/Transnational Family Research Institute, 1972); “Abortion laws: a survey of current world legislation”, *loc. cit.*

of pregnancy, ranging from a liberally interpreted medical indication, i.e., to avert deterioration of the woman's physical and/or mental health, rather than as a threat to her survival, and to social and humanitarian indications, including multiparity, rape and other situations of stress, especially if such indications can be defined in objective terms, rather than as the woman's subjective perception of her situation.

#### INCIDENCE OF ABORTION

16. Many scholars and other observers in the field have stated that induced abortion, in spite of strong condemnation by church, State and the medical profession, is, and has been for centuries, one of the most widely used methods of fertility regulation throughout the world. While this assessment cannot be established statistically, millions of women undoubtedly obtain abortions, legally or illegally each year, at their own initiative and, sometimes, at a substantial cost and/or risk to life and health. These women may be rich or poor, college-educated or illiterate, married or single, and of the most diverse ethnic, cultural and religious backgrounds.

17. In the United States of America, according to the National Fertility Study of 1970, almost 8 million unwanted or mistimed births occurred during the five years 1966-1970. During the same period, an estimated 5 million pregnancies were terminated by induced abortion, most of them illegally. It would appear then that abortion was the preferred solution for two fifths of the women having unplanned pregnancies.

18. Table 1 presents available data on the numbers of legal abortions, abortion rates per 1,000 women 15-44 years of age, and abortion ratios per 1,000 live births for selected areas during the period 1968-1972. The table does not include China and the Union of Soviet Socialist Republics. Fragmentary reports from the USSR suggest that the abortion rate and ratio in that country are higher than any of those shown in table 1.

19. As shown in table 1, numbers, rates and ratios of legal abortion increased rapidly in recent years in those countries where abortion laws have recently been liberalized, such as the United Kingdom and the United States, as they did in Sweden where the procedure has become more easily available without new legislation. In certain other countries, which have had a liberal abortion policy of many years, notably in Czechoslovakia, Hungary, Japan and Poland, numbers, rates and ratios remained stable or declined. (According to some Japanese scholars, the reporting of legal abortions in Japan is seriously incomplete.<sup>7</sup> However, there is no evidence that reporting deteriorated from 1968 to 1971.)

TABLE 1. NUMBER OF LEGAL ABORTIONS, ABORTION RATES AND ABORTION RATIOS: SELECTED AREAS, 1968-1972<sup>a</sup>

<sup>e</sup> Residents only.

<sup>f</sup> Reporting for the United States of America as a whole thought to be about 80 per cent complete.

20. As indicated previously, no satisfactory method yet exists for estimating the numbers of illegal abortions. However, a realistic appraisal of what is known

about human fecundity, spontaneous foetal loss, sexual and contraceptive behaviour and the efficacy of contraception as actually practised suggests strongly that no country has ever attained a low birth rate (15-20 per 1,000 population) without widespread recourse to induced abortion, legal or illegal. It is likely that rates and ratios of illegal abortions in countries with low birth rates and restrictive abortion laws are on a similar order of magnitude as rates and ratios of legal abortions in countries with comparable birth rates and liberal abortion laws.

21. There is considerable variation in the demographic characteristics of women seeking abortion. From recent statistics on legal abortion in countries with liberal abortion laws, three important indicators of the abortion pattern have been selected—the percentage of women under 20 years of age, the percentage of childless women and the percentage of unmarried women. Table 2 shows that each of these three measures was highest in Sweden, the United Kingdom and the United States of America.

22. In all countries for which statistics are available, the rate of legal abortions has increased more rapidly in recent years among women under 20 years than in any other age group. This apparently worldwide and rapid increase in legal abortions among very young women may reflect earlier maturation, changing patterns of sexual behaviour, growing acceptance of abortion as an alternative to forced motherhood, liberalization of abortion laws and of the attitudes and practices of the medical profession, or a combination of these and other factors.

23. Not unexpectedly, abortion ratios tend to be lowest among married women pregnant for the first time and to increase with increasing parity, although in some countries, the abortion ratio reaches its maximum among women with from two to four prior births, followed by a decline. The decline in abortion ratios at higher parities probably reflects a long-established small family norm because women who reject abortion for religious or other reasons are over-represented among women of high parity. The number of prior births at which the abortion ratio is highest corresponds to the number of children beyond which additional births are unacceptable to a substantial proportion of women.

24. One of the most important factors in the evaluation of morbidity and mortality associated with abortion is the duration of the pregnancy when it is terminated. The division lies between abortions in the first trimester and those in the second trimester, that is, between those performed at 12 weeks' gestation or earlier and those at 13 weeks or later. Although the second trimester extends to about 24 weeks' gestation, few abortions are performed after 20 weeks, even when not prohibited by law.

25. Among the six countries and New York City for which statistics on legal abortions by period of gestation are available for recent years (table 3), the

<sup>b</sup> Residents only.

proportions of second-trimester abortions were highest in England and Wales, Sweden and the United States. They were lowest in Czechoslovakia and Hungary, where, as elsewhere in Eastern Europe, second-trimester abortions are generally permitted only on medical indication.

26. The percentage of second-trimester abortions declined in all countries for which data are available,

most dramatically in Sweden. This trend probably reflects a growing awareness among women and among physicians that abortion is less dangerous early in pregnancy than later on and also the increasing availability of abortion services, at least in some countries.

27. Abortions in the second trimester occur most frequently among women of low socio-economic status, among mothers of large families and especially among the youngest women. The strong inverse association of period of gestation and woman's age probably reflects the inexperience of the very young in recognizing the symptoms of pregnancy, their unwillingness to accept the reality of their situation, their hesitation to confide in their parents and their ignorance about where to seek advice and help. Economic considerations and, in many places, regulations prohibiting surgery on minors without parental consent also contribute to delays in obtaining abortions.

#### ABORTION PROCEDURES

28. The methods currently used by physicians for the termination of pregnancy can be grouped under three headings: (a) instrumental evacuation by the vaginal route; (b) stimulation of uterine contractions; (c) major surgery.<sup>8</sup>

29. Vaginal evacuation is the procedure of choice for the termination of pregnancy in the first trimester. The classical method is customarily referred to as dilation and curettage (D and C). The procedure involves stretching the cervical canal by the insertion of a series

<sup>8</sup> S. Lewit, ed., "Abortion techniques and services", Proceedings of the Conference, New York, N.Y., 3-5 June 1971, sponsored by American Medical Women's Association [and others], *Excerpta Medica*, International Congress Series, No. 255 (1972).

of metal dilators, each slightly larger than the preceding one. When the canal has been sufficiently enlarged to permit the passage of instruments into the uterine cavity, the contents of the uterus are removed with a small forceps, following which all remaining placental tissue is scraped out with a sharp curette.

30. In recent years, D and C has been progressively replaced by vacuum aspiration or suction. This method involves dilation of the cervix, followed by the insertion into the uterus of a metal or plastic cannula. The cannula, which has a lateral opening near its end, is rotated to dislodge the embryo from the uterine wall and the fragments are then removed by a pump connected to the cannula by a flexible tube. This technique is simpler, quicker and less traumatic than D and C and the average loss of blood is substantially less.<sup>9</sup> Both the D and C and vacuum aspiration procedures are ordinarily carried out under general anaesthesia or under local anaesthesia by paracervical block.

31. During the second trimester of pregnancy, abortion is usually initiated by the stimulation of uterine contractions. In the United States, the preferred procedure involves the replacement of amniotic fluid by hypertonic salt solution. The uterus is tapped by means of a needle through the abdominal wall and the volume of fluid withdrawn is replaced by an equal or larger amount of saline, usually without use of anaesthesia. In general, the foetal heartbeat disappears within less than one hour, labour begins from 12 to 48 hours after the instillation, and the expulsion of foetus and placenta is completed a few hours later. Use of a hypertonic glucose solution in lieu of saline has been discontinued because of the greater risk of infection. In England, a solution of urea is currently being used successfully and appears to be replacing saline. Mechanical, rather than chemical, means are also used to stimulate uterine contractions, notably in Japan. The most recent additions to the armamentarium of stimulation of uterine contractions by intra-amniotic injection are the prostaglandins, applied in either single or repeated doses. The interval from injection to expulsion tends to be shorter with prostaglandins than with hypertonic saline.

32. The two major surgical procedures used for the termination of pregnancy are hysterotomy and hysterectomy. Hysterotomy is, in essence, a caesarean section at any stage of pregnancy before the foetus is viable. The uterus is usually approached by laparotomy, but up to the sixteenth week hysterotomy can also be performed by the vaginal route. Because hysterotomy leaves a scar in the uterine wall, resulting in weakened tissue and possible rupture of the uterus at a later delivery, it is usually combined with tubal sterilization. Hysterectomy is a sterilizing operation involving the removal of the uterus. It is often chosen when the objective is the removal of the uterus because of fibroid

<sup>9</sup> B. M. Beric and M. Kupresanin, "Vacuum aspiration, using peri-cervical block, for legal abortion as an outpatient procedure up to the 12th week of pregnancy", *Lancet*, vol. 1971 (II) (18 September 1971), pp. 619-620.

tumours, as well as the termination of the pregnancy. Some gynaecologists recommend hysterectomy in lieu of tubal sterilization in order to avoid later complications in an organ they consider non-functional. Hysterotomy and hysterectomy are usually performed under general anaesthesia.

33. Attempts by lay persons to induce abortion, including self-abortion, range from spells and incantations to a variety of ineffective and/or toxic medications, to grossly traumatizing procedures designed to damage or destroy the conceptus, leaving its expulsion to natural forces. The most widely used procedure is probably the insertion of a foreign body into the uterus.

34. National statistics on abortion procedures are available only for England and Wales and the United States of America. Since the late 1960s, the great majority of legal abortions have been accomplished by vaginal evacuation. The statistics for England and Wales show that D and C is preferred to suction, while in the United States, the opposite is true. However, in both countries, the use of suction has increased in relation to D and C.

35. Among methods other than vaginal evacuation, intra-amniotic instillation of hypertonic saline predominates in the United States. In England and Wales, a relatively large proportion of all legal abortions are performed by hysterotomy and the saline method is rarely used.

36. The period of gestation is of primary importance in determining the procedure for the termination of pregnancy. In the United States of America, virtually all first-trimester abortions are performed by vaginal evacuation, in most cases by suction. In England and Wales, a not insignificant, albeit declining, proportion is accomplished by hysterotomy. For abortion in the second trimester, the preferred procedure in the United States is the instillation of hypertonic saline solution, with relatively little use of vaginal evacuation and very little major surgery. In England and Wales, on the other hand, almost one half of all second-trimester abortions in 1968 were done by hysterotomy, declining to less than one fourth by 1971; with a corresponding increase in vaginal evacuation.

37. Legal abortions are performed in hospitals, clinics and doctors' offices or surgeries. The choice of premises and the duration of the hospitalization, if any, are determined by the period of gestation and the type of procedure to be used, applicable laws and regulations, traditions of the medical profession, availability of medical facilities and economic considerations. Recent experience accumulated in the United States and elsewhere has shown that overnight hospitalization is usually not required for uncomplicated first-trimester pregnancy terminations, the large majority of which are now performed in out-patient departments of hospitals or in specialized clinics outside of hospitals.<sup>10</sup>

<sup>10</sup> American Public Health Association, "AHPA recommended program guide for abortion services", *American Journal of Public Health*, vol. 63, No. 7 (July 1973), pp. 639-644.

In other countries, such as the United Kingdom, doctors and health authorities insist on in-patient care, which may lead to delays and high proportions of second-trimester abortions. Recent experience also shows that first-trimester abortions in women with pre-existing complication, who may or may not have a concurrent sterilization, and all second-trimester abortions should be in-patient procedures in hospitals.

#### COMPLICATIONS

38. Induced abortion, at any period of gestation, exposes the woman to a risk of medical and psychological complications which varies considerably, depending upon the circumstances in which the abortion is performed. The severity of complications also varies widely from minor complaints to the occasional fatal outcome.

39. Complications can be divided into two major categories—early, i.e., within 30 days after the abortion; and late, i.e., those occurring more than 30 days after the procedure. Early complications may be subdivided into those which are immediate, defined as occurring during or within three hours after the procedure, and those which are delayed, that is, developing later than three hours *post abortum* but still within 30 days.

40. Serious immediate complications are relatively rare when abortions are performed by well-trained operators in a medical environment. Such complications include perforation of the uterus by one of the instruments used in vaginal evacuation, sometimes combined with injury to the intestines or other organs; major haemorrhage; laceration of the cervix; disorders of the central nervous system and/or the kidneys resulting from hypertonic salt solution entering the blood-stream directly or by way of the peritoneal cavity and the untoward effects of general or local anaesthesia.

41. The most frequent delayed complications include retention of placental tissue resulting in post-abortum bleeding and pelvic infection which may lead to peritonitis and septicaemia, as well as to thrombophlebitis resulting in pulmonary embolism.

42. Known late complications or sequelae of induced abortion include an increased risk of premature birth and neo-natal mortality and perhaps, also, of spontaneous abortion in the second trimester in subsequent pregnancies, possibly due to a combination of damage to the cervix at the time of dilatation and of placental insufficiency resulting from too vigorous curettage, sensitization of Rh-negative women by red blood cells from a Rh-positive foetus, and endometriosis in the scar tissue following hysterotomy. Secondary sterility and ectopic pregnancy can be the late results of pelvic infection, following self-induced abortions or abortions induced by unskilled operators. The role of legal abortion in the aetiology of these conditions, and of placenta previa and dysmenorrhoea, has not been established, nor is reliable information available on psychological sequelae, if any.

43. Some authors, including some psychiatrists, have expressed the view that every abortion is a stressful experience involving major risks to mental health. Others have pointed out that most women undergoing abortion continue to lead essentially normal lives and that an adverse psychological reaction to an unwanted child may be far more common and more serious than to having an abortion. In a recent report, the World Health Organization Scientific Group on Spontaneous and Induced Abortion stated that there is no doubt that the termination of pregnancy may precipitate a serious psycho-neurotic or even psychotic reaction in a susceptible individual, but pointed out that emotional stress experienced by the woman may be more closely associated with such factors as the circumstances in which the abortion was performed, the period of gestation, the type of operation and the attitudes of the woman's family and of the professionals involved in the abortion.<sup>11</sup>

44. The most comprehensive investigation of early medical complications of legal abortion was undertaken in the United States of America under the Joint Program for the Study of Abortion (JPSA) during 1970/71 and involved 73,000 cases.<sup>12</sup> It is the only large-scale study that permits an assessment of variables determining levels of morbidity, such as age and parity, socio-economic and health status, period of gestation, operative procedure, concurrent sterilization and other factors.

45. Rates of total and major complications, obtained by JPSA, are shown in table 4. Major complications include unintended major surgery, haemorrhage requiring blood transfusions, three or more days of fever and several other categories associated with roughly comparable risks of death, prolonged illness or permanent functional impairment.

46. In analysing the complications of abortion, it is necessary to distinguish those directly associated with the termination of pregnancy from those associated with pre-existing disease or with surgical procedures undertaken for other purposes, such as the removal of a uterus because of fibroid tumours or the achievement of permanent sterility. For this reason, complication rates are shown not only for the aggregate of all patients, but for presumably healthy women subject only to the risks associated with the abortion procedure.

47. Complication rates in JPSA were computed separately for total patients and for local patients with follow-up. Follow-up was defined as any contact with the woman 10 or more days after the abortion. The complication rates for total patients represent the minimum estimate of the incidence of early complications, and the rates for local patients with follow-up, the maximum estimate.

SOURCE: C. Tietze and S. Lewit, "Joint Program for the Study of Abortion (JPSA): early medical complications of legal abortion", *Studies in Family Planning*, vol. 3, No. 6 (June 1972), pp. 97-122.

<sup>a</sup> Patients without pre-existing complications.

<sup>b</sup> Without tubal sterilization.

<sup>c</sup> With tubal sterilization.

<sup>d</sup> Aborted by suction.

48. As shown in table 4, the minimum estimate of the total complication rate, including all reported diagnoses and complaints, was 9.6 per 100 women and 13.1 per 100 local women with follow-up. Complication rates during the second trimester of pregnancy were from three to four times as high as comparable rates during the first trimester. The pattern was similar for major complications. The group of presumably healthy women, exposed to the risk of abortion only, consisted almost entirely of women aborted by suction in the first trimester and by saline in the second trimester. Compared with all patients, complication rates among these women were lower at each period of gestation.

49. Rates of total and of major complications were lowest for abortions by suction, followed in ascending order by D and C, instillation of hypertonic saline solution, hysterotomy and hysterectomy. With the exception of the earliest abortions, complication rates following suction increased with period of gestation and were more than twice as high at 15 weeks or more than at 7-8 weeks. The higher complication rates reported for the earliest abortions are attributed to the use of rigid cannulas for suction procedures during the period covered by JPSA, rather than the flexible models that came into general use after mid-1971. Conversely, complication rates with the saline method tended to decline with increasing duration of pregnancy.

50. For women aborted by suction, the risk of post-abort complications was considerably increased when a tubal sterilization was performed concurrently with the abortion.

51. Rates of total and major complications were much higher for non-private patients than for private patients at each period of gestation, but especially for abortions in the second trimester. The consistently higher complication rates for non-private patients, compared with private patients, may be due in part to their poorer health not reflected in recorded pre-existing conditions; in part to less adequate medical care during the abortion and/or hospitalization; and in part to inadequate after-care in their home environment.

52. In a group of hospitals participating in JPSA for a year, rates of total and major complications following abortion in the first trimester declined by approximately one half. This trend reflects a decline in the complication rates with abortions by suction, which made up the great bulk of all JPSA abortions and can be attributed to a rapid increase in experience and skill. There was no decrease in complication rates of abortions during the second trimester, mainly by the saline method, over the one-year period.

#### MORTALITY

53. The earliest data on mortality following legal abortion originated in northern Europe, where the first steps towards the liberalization of abortion laws were taken in the 1930s. The longest continuous series, that for Sweden, indicates a dramatic decline in mortality

over the past quarter of a century, from 252 per 100,000 legal abortions to 8 per 100,000, as shown in table 5.

54. In eastern Europe, Czechoslovakia and Hungary provide the most reliable national statistics on mortality following legal abortion. Levels of mortality in these

<sup>a</sup> Residents only.

countries have been far below those reported from northern Europe, but even these low levels have shown declines in recent years, reaching 2 per 100,000 in Czechoslovakia and 1 per 100,000 in Hungary, for the most recent available period.

55. In England and Wales, mortality associated with legal abortions in 1968-1969 (28 per 100,000) was almost as high as in Sweden in the late 1950s. By 1972, it had declined to 14 per 100,000.

56. In the United States of America, high levels of mortality from legal abortion prevailed during the period of restrictive legislation when a significant proportion of the women undergoing abortion suffered from pre-existing complications which made them poor risks for any type of surgery. In recent years, with abortion more easily available in several states, mortality ratios have declined to about 5 per 100,000 in California and in New York City. Preliminary data for the United States as a whole in 1972 suggest a further decline. One of the principal factors responsible for

the differences among countries in mortality association with legal abortion is the period of gestation at which pregnancies are terminated. As shown in table 6, mortality was three times higher in England and Wales following second-trimester abortion (31 per 100,000) than after termination in the first trimester (10 per 100,000).<sup>13</sup> The difference was even greater—17 per 100,000 compared with 2—in New York City.<sup>14</sup> The relatively high levels of mortality in Denmark, England and Wales, and Sweden correspond to high proportions of second-trimester abortions, while the much lower levels of mortality in the countries of eastern Europe reflect the predominance of first-trimester abortions in these countries.

<sup>a</sup> Two years ending 30 June 1972.

<sup>b</sup> Residents only.

<sup>c</sup> Vaginal hysterotomy, urea, paste etc. Rate not computed.

<sup>d</sup> Including women aborted in New York City who died elsewhere.

57. Duration of pregnancy is not the only factor determining the level of mortality. The much higher rates for both first- and second-trimester abortions reported from England, compared with New York City, also reflect the large number of hysterotomies and hysterectomies performed in that country.

58. A comparison of maternal mortality from complications of pregnancy, childbirth and the puerperium with mortality following legal abortion shows clearly that the risk to life associated with first-trimester abortion is far smaller than the risk incurred if the pregnancy is permitted to go to term, even in countries where mortality is low. Mortality with abortion in the second trimester is comparable to maternal mortality.

#### EFFECTS OF POLICY CHANGES

59. The final section of this report deals with the effects of changes in abortion policies on trends in the numbers of legal abortions, illegal abortions, total induced abortions and births. These effects are more readily predicted *a priori* than demonstrated in terms of empirical data. Shifts in abortion policy usually occur in a social climate that generates a broad spectrum of responses. However, in a given situation, it is difficult and often impossible to isolate the responses mediated by changes in abortion policy.

60. The only fully predictable result of change in abortion policy is its effect on the number of legal

abortions. Liberalization of policy is invariably followed by an increase. Conversely, adoption of a restrictive policy results in a decline.

61. Because of the hazards associated with illegal abortion, one would expect that liberalization of abortion laws and practices would tend to reduce the number of illegal procedures, especially when termination of pregnancy is authorized on broad social and economic indications. In fact, concern about a large number of illegal abortions, with the attendant risk to the life and health of women, is often the primary reason for adopting a more liberal abortion policy. However, because the numbers of illegal abortions either before or after the change of policy are not known, it is difficult to document the effects of liberalization on incidence of illegal abortion. One must rely on such indicators of the frequency of illegal abortions as the number of deaths attributed to abortion or the number of admissions to hospitals for after-care or for the treatment of complications. Each of these indicators may be modified by a variety of factors, of which abortion policy is only one. The number of deaths attributed to abortion may decline because of advances in the treatment of complications rather than because of any changes in the number of abortions or in the incidence of complications. The number of women admitted to hospitals may fail to decline because of an increase in the tendency to seek hospital care for all types of illnesses, including complications of abortion.

62. Moreover, the validity of the indicators may also be affected by changes in abortion policy. More deaths may be attributed to abortion because of controversies surrounding the change in policy, or more women may be willing to seek medical care or admission to hospitals because of changes in the climate of public opinion associated with a more liberal policy. In spite of these uncertainties, three generalizations are possible with regard to the effects of a liberalization of abortion policy.

63. Moderate extension of the indications for abortion involves a comparatively small proportion of pregnancies and, therefore, has little effect on the number of legal abortions.

64. Legal abortions at the request of the pregnant woman or on broadly interpreted social indications substantially reduce the frequency of illegal and/or self-induced abortions, as evidenced by rapidly declining numbers of deaths from abortion. In Czechoslovakia and Hungary, where liberal abortion policies were adopted in the 1950s, reported mortality from abortion declined by three quarters and one half, respectively, in the course of a few years. No such declines occurred over the same period in other European countries with restrictive legislation. More recently, mortality from abortion has declined in England and Wales and in New York City, after abortion policy had been liber-

alized. For New York, it has been estimated that about 70 per cent of the legal abortions involving city residents from mid-1970 to mid-1972 replaced illegal abortions.

65. Illegal and/or self-induced abortions have not disappeared, even in such countries as Hungary, where elective abortions have been available for more than a decade. This stubborn survival of practices detrimental to health probably reflects dissatisfaction with the manner in which the official abortion services are organized, especially with regard to the protection of privacy.

66. While a change to a more liberal abortion policy reduces the number of illegal abortions, a change to a more restrictive policy may increase it. In Romania, for example, the enactment of a restrictive abortion law in 1966 was followed by an increase in deaths due to abortion from 64 in 1965 to 315 in 1970.

67. The greater availability of legal abortions tends to increase the total numbers of induced abortions, because some pregnancies are aborted that otherwise would have been carried to term. However, owing to the decline in illegal abortions, the increment in the total number of induced abortions is smaller, absolutely and relatively, than the increment in the number of legal abortions.

68. Adoption of liberal abortion policies has been followed in a number of countries by declines in the birth rate. In some countries, these declines were perceived as contrary to the national interest and led to restrictive abortion legislation. It would be simplistic, however, to ascribe declines in birth rates entirely to changes in abortion policy. Levels and trends of birth rates are determined by broad social forces, the response to which is facilitated by a greater availability of abortion. Birth rates would probably have declined in the centrally planned economies of Eastern Europe in the 1960s and in the United States of America in the early 1970s, even without any changes in abortion policy. These declines would have been achieved by more widespread or more diligent use of contraception and by more frequent illegal abortions. It appears likely, however, that the decline in the birth rate would have been less marked if abortion laws had not been liberalized.

69. Restrictive legislation in Romania was followed by a sharp increase in the birth rate from 14.3 per 1,000 population in 1966 to a level of almost 40 per 1,000, computed on an annual basis, in September 1967. By 1971, the birth rate had dropped to 19.6 per 1,000, as the Romanian people discovered, or rediscovered, alternate means of fertility regulation, including illegal abortion.<sup>15</sup>

## ABORTO EN AMERICA LATINA: SITUACION EN ALGUNAS CAPITALES LATINOAMERICANAS SEGUN ENCUESTAS DEL CENTRO LATINOAMERICANO DE DEMOGRAFIA

### *Centro Latinoamericano de Demografía*

1. En el año 1967, el Centro Latinoamericano de Demografía (CELADE) inició<sup>1</sup> un Programa de Estudios comparativos sobre Aborto Inducido y Uso de Anticonceptivos en América Latina (PEAL), que abarcó cuatro capitales — Bogotá, Panamá, Lima y Buenos Aires — donde la investigación se desarrolló entre esa fecha y 1969.

2. Posteriormente, y mientras algunos organismos nacionales utilizaban los instrumentos del PEAL para proceder a investigaciones en sus propios países (el Instituto de Seguridad Social de Nicaragua, en Managua, y el Centro Nacional de Familia de Bolivia, en la Paz, Santa Cruz y Cochabamba), CELADE asesoró una encuesta en Asunción y otras cuatro ciudades del Paraguay (FEPA) en el año 1971, la cual tuvo por objetivos, además de conocer la incidencia del aborto, el de hacer el diagnóstico de la situación en lo referente al uso de anticonceptivos — y en particular a la cobertura de los programas de planificación familiar — con fines de evaluación ulterior. Con esta intención, se diseñaron instrumentos que, recogiendo la experiencia del PEAL, permitieron recolectar la información pertinente y analizar los datos en breve lapso de tiempo.

3. Con estas encuestas, y aunque en forma limitada en su profundidad (sin abordar complejos estudios de tipo sociológico, psicológico y de salud pública) y en su extensión geográfica, se dispuso de datos recientes sobre el problema del aborto inducido.

4. Anteriormente, y además de múltiples estudios realizados en hospitales de numerosas ciudades de la región, aplicados a muestras seleccionadas de mujeres con abortos, otros estudios se desarrollaron a nivel de la población en Santiago de Chile<sup>2</sup>, en Lima<sup>3</sup> y en diversas ciudades de Colombia<sup>4</sup>, entre otros.

<sup>1</sup> Con la colaboración de las siguientes instituciones nacionales: la Asociación Colombiana de Facultades de Medicina (ASCOFAME); la Cátedra de Obstetricia y Ginecología de la Facultad de Medicina de Panamá; el Centro de Población y Desarrollo del Perú; el Ministerio de Salud Pública de Argentina; y el aporte financiero del Population Council, tanto a CELADE como a los países.

<sup>4</sup> B. Lara, N. Lenis y G. Llanos, "Estudio sobre aborto en

5. En el presente trabajo que, además de dar una visión del pasado reciente y estudiar la tendencia del aborto, pretende detectar el efecto de la planificación familiar sobre su incidencia, sólo se usarán datos aportados por las encuestas PEAL en Bogotá (1968), Panamá (1969), Buenos Aires (1969) y Lima (1970)<sup>5</sup>, así como los de la encuesta FEPA en Asunción (1971)<sup>6</sup>.

6. Por razones de espacio se presentarán únicamente medidas relativas. Las cifras absolutas que generaron esas medidas aparecen en los trabajos de CELADE citados, y son las fuentes de todos los cuadros que aparecen en las páginas siguientes.

7. En las medidas que se presentan a continuación figuran en los numeradores los abortos totales, esto es, los espontáneos y los inducidos, y no aparecen los abortos inducidos o los espontáneos por separado. Ahora se verá por qué.

8. La experiencia de las investigaciones de CELADE, previas a los estudios del aborto mencionados, muestra en primer lugar que no se puede esperar que todas las mujeres declaren en una entrevista los abortos inducidos que tuvieron. En segundo lugar, se ha constatado que las mujeres interrogadas tienen una fuerte tendencia a declarar como abortos espontáneos los que fueron en realidad provocados. Esto es más frecuente en la medida que la "situación" hace temer una sanción social y penal. Es preferible en esta circunstancia — que es la imperante aunque con fuertes variaciones en toda Latinoamérica — preguntar por "pérdida", que suele tener una connotación espontánea e inevitable, para lo cual no existe reprobación alguna. En las "pérdidas" quedan englobados todos los abortos, los espontáneos y los inducidos.

9. Para poder apreciar la incidencia del aborto inducido, se fija arbitrariamente el porcentaje de embarazos que terminan en abortos espontáneos y se aplica

Cali, Candelaria, Manizales y Popayán, Colombia, 1966", *Primer Laboratorio Nacional de Planificación Familiar*, Popayán, Colombia, 1966.

<sup>5</sup> S. Gaslonde, "Análisis preliminar de algunos datos sobre abortos provenientes de encuestas en América Latina", Centro Latinoamericano de Demografía, Serie A, No. 118, Santiago, 1973.

<sup>6</sup> S. Gaslonde y E. Carrasco, "Una encuesta para evaluar la eficacia de los programas de planificación familiar", Centro Latinoamericano de Demografía, Serie A, No. 119, Santiago, 1973.

ese porcentaje al número observado de embarazos (suma de nacidos vivos, nacidos muertos y pérdidas) para conseguir el número de abortos espontáneos.

10. Luego se resta ese número de abortos espontáneos al número observado de abortos totales (pérdidas) y se obtiene así el número de abortos inducidos que figurará en la respectiva tasa.

11. El porcentaje de embarazos que terminan en abortos espontáneos varía según los autores. La División de Población de las Naciones Unidas, recogiendo la opinión de varios investigadores, lo fijaba en un 10 por ciento en una publicación del año 1954<sup>7</sup>. Más tarde, la Organización Mundial de la Salud<sup>8</sup> consideraba bajo ese porcentaje y lo estimaba entre 15 y 20 por ciento de los embarazos. En Hawai<sup>9</sup>, se estima en 22 por ciento, añadiendo que la mitad de los abortos espontáneos aparece entre la quinta y la octava semana. Otros autores dan porcentajes más moderados, entre 8 y 16 por ciento, advirtiendo que aumentan en la medida que se considera mujeres con abortos previos.

12. Ningún trabajo — a conocimiento del que escribo — estudia ese tópico en Latinoamérica. Se puede adelantar, sin embargo, que haciendo abstracción de los abortos espontáneos de las primeras semanas, los "micro-abortos" que las mujeres no declaran, los porcentajes parecen ser bajos. Entre las mujeres indígenas, en particular, sería bajísimo. Un estudio entre las mujeres mapuches de Chile<sup>10</sup>, realizado recientemente con muestras de mujeres que viven en su comunidad indígena y mapuches que viven en Santiago de Chile, arroja los porcentajes siguientes: abortos espontáneos por embarazos, 4,7 por ciento, y abortos inducidos, 0,4 por ciento, para un porcentaje de abortos totales en embarazos de 5,1 por ciento<sup>11</sup>. Otra investigación en La Paz, mencionada más arriba y aún inédita, constata bajísimos porcentajes de pérdidas entre las mujeres indígenas oriundas del Altiplano.

13. En las encuestas mencionadas de CELADE se fija el porcentaje de muerte fetal involuntaria (abortos espontáneos y mortinatos) en 10 por ciento. A sabidas que varía seguramente de país a país y, en cada país o localidad, según el nivel socioeconómico de las mujeres, en particular según su estado nutricional. Mientras no se disponga de estudios especializados que

aporten luz sobre el tópico, se mantiene ese porcentaje de 10 susceptible de ser modificado.

14. En última instancia, el fijar ese porcentaje a un nivel u otro no tendrá mayor importancia cuando se trata de comparar dos situaciones en el mismo lugar y en años diferentes, si se usa el mismo porcentaje en los dos casos, reduciéndose o anulándose así el posible error metodológico.

#### RESUMEN DEL PASADO EN DIVERSAS CAPITALES LATINOAMERICANAS

15. Para el estudio del pasado, se usan las medidas: Porcentaje de abortos (A) por embarazos (E) ( $\frac{A}{E} \cdot 100$ )  
Número medio de abortos por mujer (NF)  
que se expresará también en porcentaje ( $\frac{A}{NF} \cdot 100$ )  
por mayor comodidad de interpretación

Ambos se refieren a todos los abortos tenidos, tanto los espontáneos como los inducidos, desde el inicio de la vida reproductiva de la mujer hasta el día de la encuesta.

16. Se presentan los datos para observar diferencias en la práctica del aborto según: a) niveles de instrucción; b) niveles socioeconómicos; c) niveles de rapidez.

17. La edad de la mujer influye poco — como se verá — en las variaciones del porcentaje de abortos por embarazos ( $\frac{A}{E} \cdot 100$ ), pero sí influye en la medida de abortos por 100 mujeres ( $\frac{A}{NF} \cdot 100$ ), pues tiene, hasta cierto punto, un efecto acumulativo. Con la edad aumenta normalmente el tiempo de exposición al riesgo de embarazarse y, por consiguiente, de abortar. Los mayores porcentajes de abortos por mujeres habrán de verse en los grupos de edades más avanzados. Esto es bastante evidente en la probabilidad de haber tenido abortos espontáneos, pero no es tan obvio en la parte correspondiente a los abortos inducidos cuando esa práctica comenzó a intensificarse desde hace poco tiempo en el lugar y aún no tiene efecto acumulativo.

18. El estado conyugal permite observar grandes divergencias en las medidas del aborto.

19. El porcentaje de abortos por embarazos es netamente mayor en la categoría de solteras que para las otras categorías, las de casadas-convivientes, y las "otras" (las viudas, separadas y divorciadas), para quienes se contempla todo el pasado, el de su vida marital y, eventualmente, el de su vida sexual después de la separación o viudez.

20. La medida de abortos por mujeres, por el contrario, es mucho mayor en la categoría de casadas-convivientes que para la categoría de solteras. Esta constatación, como la anterior, es válida en todas las capitales, en todas las edades, y cualquiera que sea la

<sup>7</sup> *Foetal and Early Childhood Mortality*, vol. I, *The Statistics* (publicación de las Naciones Unidas, No. de venta 1954.IV.7), págs. 14 y 15.

<sup>8</sup> *Spontaneous and Induced Abortion*, Organización Mundial de la Salud, serie de informes, No. 461, Ginebra, 1970, pág. 20.

<sup>9</sup> F. French y J. M. Bierman, "Probabilities of fetal mortality", *Health*, R. 77 (1952).

<sup>10</sup> T. Monreal, "Fecundidad, aborto y nivel de vida en mujeres mapuches", *Revista Médica de Chile*, vol. 100, No. 10 (octubre de 1972).

<sup>11</sup> Entre las mapuches que viven en su comunidad. Entre las que viven en Santiago, los porcentajes fueron: abortos espontáneos, 13,2 por ciento; inducidos, 10,7 por ciento (y totales: 23,9 por ciento). Como no es probable una variación real de 4,7 a 13,2 por ciento de los espontáneos, se presume que muchos de ellos fueron, en realidad, inducidos, corroborando lo dicho más arriba.

variable (nivel de educación, estrato social, etc.) estudiada.

21. Es evidente que las solteras tienen un riesgo mayor de abortar que las casadas cuando se embarazan (y este riesgo lo mide el porcentaje  $\frac{A}{E} \cdot 100$ ). Pero como su riesgo de embarazarse es mucho menor, la incidencia del aborto (medido por el porcentaje  $\frac{A}{NF} \cdot 100$ ), que viene a ser el producto de los dos riesgos, resulta menor para las solteras que para las casadas. Los cuadros 1 y 2 permiten comprobarlo.

22. Las categorías contempladas al estudiar diferenciales en la práctica del aborto según niveles de educación y por estratos socioeconómicos no tienen la misma estructura por edades y estado conyugal. Existen diferencias a veces considerables. El caso más elocuente es el de la categoría "analfabetas"<sup>12</sup> en las que predominan las convivientes de edades altas (con historial cargado de hijos y abortos), a la inversa de lo que sucede en la categoría "universitaria".

23. Por estas razones los diferenciales para la medida abortos por mujer según niveles de educación y estratos socioeconómicos se examinarán, además, con la consiguiente tipificación por edad y estado conyugal. Pues si bien las diferencias observadas entre categorías corresponden a la realidad imperante en cada ciudad del estudio; el comportamiento de las mujeres de las diversas categorías, en igualdad de condiciones (de edad, de estado conyugal) puede no ser tan diferente como lo muestran las medidas observadas, lo que se comprobará más adelante.

<sup>12</sup> No estudiada aquí por el escaso número de observaciones en cada ciudad que en el mejor (en el peor, mejor dicho) de los casos no sobrepasa un 5 por ciento de la muestra, y no permite tipificación alguna.

### Medidas del aborto según niveles de instrucción

24. Según niveles de instrucción, el cuadro 1 muestra, para la medida abortos por embarazos, diferenciales en cada grupo de edades y en cada ciudad. Estos diferenciales son a veces poco o nada significativos y cuando lo son, tienen sentido diferente en cada ciudad y no permiten conclusiones válidas para el conjunto. En Lima, en el grupo 20-34 años, la probabilidad de abortar en caso de embarazo es mayor en el nivel primario, y en el grupo 35-49 años, lo es en el nivel universitario. En Bogotá sucede a la inversa. En Panamá, las mujeres de nivel secundario son las que más abortan cuando se embarazan, en ambos grupos de edades. En Buenos Aires, las del nivel universitario, en todas las edades, presentan medidas más altas, lo cual indicaría que la escala de valores que condiciona la actitud y el comportamiento de la mujer frente al aborto es diferente para el mismo nivel de instrucción en cada ciudad.

25. Las medidas abortos por mujeres de 15 a 49 años son, en cuatro capitales, más altas para las mujeres de nivel primario, y las más bajas para las de nivel universitario. En Buenos Aires el mayor porcentaje de abortos por mujeres se observa en el nivel universitario (cuadro 3).

26. La tipificación de las medidas, tomando como base la estructura por edades y estado conyugal de la muestra en cada capital<sup>13</sup>, no cambia los rasgos de los

<sup>13</sup> Se trata de tipificar para comparar diferentes niveles de educación en cada ciudad, es decir, de comparaciones "intraencuestas". Si se tratara de comparar el mismo nivel de educación en las diferentes ciudades, comparaciones "extraencuestas", la estructura tipo sería la estructura total de todas las muestras, obviamente.

CUADRO 1. MEDIDAS: ABORTOS (TOTALES) POR 100 EMBARAZOS ( $\frac{A}{E} \cdot 100$ ) Y ABORTOS (TOTALES) POR 100 MUJERES ( $\frac{A}{NF} \cdot 100$ ) POR GRANDES GRUPOS DE EDADES Y NIVELES DE INSTRUCCIÓN EN DIVERSAS CAPITALES LATINOAMERICANAS

Medida y nivel de instrucción	Bogotá		Lima		Panamá		Asunción		Buenos Aires	
	20-34	35-49	20-34	35-49	20-34	35-49	20-34	35-49	20-34	35-49

Nivel secundario	21,4	54,5	14,3	52,9	32,8	51,0	26,7	60,0	17,5	61,1
Nivel universitario	10,1	26,7	4,7	40,9	18,0	28,6	10,4	50,0	28,2	90,5

NOTAS: 1. Para el grupo de edades 15-19 años, el número de observaciones es insuficiente para tener valores estadísticos. Los valores de la medida  $\frac{A}{E} \cdot 100$  son sin embargo, los más

altos de los observados por grupos de edades (entre 18,5 y 42,8 por ciento), salvo en Bogotá.

2. No se incluyen las analfabetas por ser escasas en las muestras (menos del 5 por ciento de las mujeres).

CUADRO 2. MEDIDAS: ABORTOS POR 100 EMBARAZOS ( $\frac{A}{E} \cdot 100$ ) Y ABORTOS POR 100 MUJERES ( $\frac{A}{NF} \cdot 100$ ) SEGÚN ESTADO CIVIL Y NIVELES DE INSTRUCCIÓN, EN DIVERSAS CAPITALES LATINOAMERICANAS

Medidas y ciudades	Primario			Secundario			Universitario		
	Solteras	Casadas	Otras	Solteras	Casadas	Otras	Solteras	Casadas	Otras
$\frac{A}{E} \cdot 100$									
Bogotá	—	9,9	10,7	33,3	10,5	14,7	—	9,7	—
Lima	18,2	9,7	6,0	—	11,8	10,2	—	11,0	11,1
Panamá	26,3	11,3	11,1	72,2	15,4	12,4	57,1	11,5	10,8
Asunción	28,3	12,2	15,6	23,5	18,1	5,0	—	14,5	—
Buenos Aires	63,6	18,1	17,4	20,0	18,4	32,6	100,0	27,8	—
$\frac{A}{NF} \cdot 100$									
Bogotá	—	41,3	43,4	0,3	40,4	44,1	—	25,3	—
Lima	1,8	47,6	20,9	—	40,4	40,7	—	28,2	28,6
Panamá	4,2	54,4	35,8	4,8	44,7	37,7	3,8	29,6	22,2
Asunción	18,4	48,2	52,8	2,4	55,9	15,4	—	41,7	—
Buenos Aires	4,7	45,7	38,7	0,5	47,4	100,0	10,4	76,6	—

NOTA: En "casadas", se incluyen casadas y convivientes. En "otras", a las viudas, divorciadas y separadas.

niveles de instrucción. Se deprimen las medidas del nivel primario, en todas las ciudades, y se incrementan las del nivel universitario. Ocurre lo mismo que cuando se tipifica la medida "promedio de hijos por mujer" en el estudio de la fecundidad diferencial por niveles de instrucción a consecuencia de estructuras muy dife-

rentes. En el nivel primario, en efecto, el peso relativo de los grupos de mayor edad suele ser superior al peso de esos grupos en los otros niveles, y también es superior al porcentaje de uniones consensuales y de uniones inestables — precisamente las categorías que suelen tener más hijos y más abortos.

CUADRO 3. ABORTOS POR 100 MUJERES ( $\frac{A}{NF} \cdot 100$ ): MEDIDAS OBSERVADAS Y MEDIDAS TIPIFICADAS EN MUJERES DE 15 A 49 AÑOS Y SEGÚN NIVELES DE INSTRUCCIÓN, EN DIVERSAS CAPITALES LATINOAMERICANAS

Niveles de instrucción	Bogotá		Lima		Panamá		Asunción		Buenos Aires	
	Medida observada	Medida tipificada	Medida observada	Medida tipificada	Medida observada	Medida tipificada	Medida observada	Medida tipificada	Medida observada	Medida tipificada
Primario	30,9	28,9	33,5	27,9	35,9	31,9	37	36	36,1	31,4
Secundario	27,2	25,2	21,5	23,2	29,6	31,3	27	31	29,6	35,7
Universitario	10,8	17,8	12,6	17,8	20,4	20,5	16	20	42,7	64,4

#### Medidas del aborto según estratos socioeconómicos

27. El nivel socioeconómico especificado por la ocupación del jefe del hogar<sup>14</sup> no discrimina diferenciales muy marcados en lo que concierne a la medida de abortos por embarazos. (ver cuadro 4), salvo en Panamá, donde es significativamente superior en las mujeres jóvenes del estrato medio, y en Buenos Aires, para las mujeres del estrato alto.

<sup>14</sup> Las ocupaciones se agruparon de acuerdo a una lista obtenida de "Grandes grupos, subgrupos y grupos unitarios" de la Clasificación Internacional Uniforme de Ocupaciones de la Organización Internacional del Trabajo, Ginebra (tercera edición, 1965), de la siguiente manera: En el estrato alto, las ocupaciones caracterizadas por requerir preparación universitaria o equivalente, las actividades artísticas, gerenciales, etc. En el estrato medio, las ocupaciones no universitarias predominantemente no manuales como las de agentes, corredores, vendedores, oficinistas, mecánicos de precisión, etc. En el estrato bajo, las ocupaciones manuales no especializadas.

28. En cuanto al porcentaje de abortos por mujeres, la situación varía según la capital y el grupo de edades observados, sin permitir generalizaciones.

29. La tipificación de la medida abortos por mujeres de los estratos socioeconómicos no cambia substancialmente, como puede observarse en el cuadro 5, las medidas observadas, pues la estructura comparada de esos estratos es menos dispar que la estructura de los niveles de educación.

30. El efecto diferencial por niveles de educación parece ser mayor que por estrato socioeconómico<sup>15</sup>, en

<sup>15</sup> Al parecer, la mujer actúa de acuerdo a su propia escala de valores, influenciada por su nivel de instrucción, de preferencia a la escala de valores del medio socioeconómico donde está ubicada por la profesión u oficio del marido (que marca el estrato social).

CUADRO 4. MEDIDAS: ABORTOS POR EMBARAZOS ( $\frac{A}{E} \cdot 100$ ) Y ABORTOS POR MUJERES ( $\frac{A}{NF} \cdot 100$ ) SEGÚN ESTRATOS SOCIOECONÓMICOS Y POR GRANDES GRUPOS DE EDADES, EN CUATRO CAPITALES LATINOAMERICANAS

Medidas y estratos	Bogotá		Lima		Panamá		Buenos Aires	
	20-34	35-49	20-34	35-49	20-34	35-49	20-34	35-49
$\frac{A}{E} \cdot 100$								
Alto	9,4	10,3	11,4	15,4	12,7	12,4	23,0	23,4
Medio	10,3	12,0	7,9	9,4	20,8	14,0	14,7	17,8
Bajo	10,0	9,7	8,9	7,9	11,8	13,3	18,5	17,8
$\frac{A}{NF} \cdot 100$								
Alto	15,8	46,6	16,2	56,2	80,5	42,6	29,1	80,0
Medio	21,6	61,1	15,2	42,6	33,5	45,1	14,6	43,5
Bajo	26,8	50,6	23,0	45,9	31,2	57,5	23,7	44,6

CUADRO 5. ABORTOS POR 100 MUJERES ( $\frac{A}{NF} \cdot 100$ ); MEDIDAS OBSERVADAS Y MEDIDAS TÍPICADAS EN MUJERES DE 15 A 49 AÑOS Y SEGÚN ESTRATOS SOCIOECONÓMICOS, EN DIVERSAS CAPITALES LATINOAMERICANAS

Estratos	Bogotá		Lima		Panamá		Buenos Aires	
	Medida observada	Medida tipificada	Medida observada	Medida tipificada	Medida observada	Medida tipificada	Medida observada	Medida tipificada
Alto	23,6	21,1	28,1	28,2	24,9	20,5	46,3	46,3
Medio	29,1	27,5	22,8	22,4	32,4	33,2	27,6	28,2
Bajo	27,4	28,7	25,5	26,1	31,3	33,4	29,3	30,6

CUADRO 6. EFECTO DIFERENCIAL SEGÚN NIVEL DE INSTRUCCIÓN Y SEGÚN ESTADO SOCIOECONÓMICO EN RELACIÓN AL PORCENTAJE DE ABORTOS POR MUJERES

Efecto diferencial según:	Bogotá		Lima		Panamá		Buenos Aires	
	20-34	35-49	20-34	35-49	20-34	35-49	20-34	35-49
Nivel de instrucción	2,6	2,1	6,4	1,3	1,8	2,1	1,6	1,9
Estrato socioeconómico	1,7	1,3	1,5	1,3	1,6	1,4	2,0	1,8

NOTA: Las cifras (basadas en los cuadros 1 y 4) indican cuantas veces mayor fue la medida más alta en relación a la medida más baja en cada categoría de nivel de instrucción y estrato socioeconómico. Por ejemplo: en Bogotá, para el grupo de edades 20-34 años, las medidas  $\frac{A}{NF} \cdot 100$  fueron 15,8, 21,6 y 26,8 según estratos socioeconómicos. El poder diferencial fue:  $\frac{26,8}{15,8} = 1,7$ .

lo que a la práctica del aborto se refiere. El cuadro 6 marca un poder discriminatorio mayor por niveles de instrucción en todas las ciudades y grupos de edades, salvo en el grupo 20-34 años de Buenos Aires, donde parece tener mayor influencia el estrato socioeconómico que el nivel de educación.

#### Medidas del aborto según paridez

31. En este estudio se entiende por paridez el número de nacidos vivos tenidos por la entrevistada, y no el número de nacidos vivos y nacidos muertos tenidos, como propiamente se define la paridez.

32. La medida abortos por embarazos decrece en la medida que aumenta la paridez en todas las ciudades (ver cuadro 7), con fluctuaciones dentro de los límites del azar. Obviamente, a igualdad de exposición al riesgo, las mujeres con menor tendencia al aborto serán las que más nacidos vivos tienen.

33. La medida abortos por mujeres (cuadro 7) aumenta con la paridez como se podía esperar por la correlación directa existente entre la paridez y la edad de la mujer. Ese aumento es a veces muy brusco y sólo se explica por el incremento del aborto inducido a partir de cierta paridez. Por ejemplo: es característico

CUADRO 7. MEDIDAS: ABORTOS POR EMBARAZOS ( $\frac{A}{E} \cdot 100$ ) Y ABORTOS POR MUJERES ( $\frac{A}{NF} \cdot 100$ ) SEGÚN PARIDEZ EN CUATRO CAPITALES LATINOAMERICANAS

Paridez	Bogotá		Lima		Panamá		Buenos Aires	
	$\frac{A}{E}$	$\frac{A}{NF}$	$\frac{A}{E}$	$\frac{A}{NF}$	$\frac{A}{E}$	$\frac{A}{NF}$	$\frac{A}{E}$	$\frac{A}{NF}$
1 .....	17,4	21,3	19,0	25,9	23,6	32,4	24,0	33,3
2 .....	12,1	27,7	12,8	29,8	14,7	35,5	16,3	39,6
3 .....	9,2	30,7	11,8	40,6	11,7	40,5	23,6	93,5
4 .....	10,8	48,6	9,3	41,7	10,8	49,5	11,1	50,8
5 y más .....	9,1	66,3	7,8	56,8	9,8	72,2	12,4	87,3

el salto de la medida  $\frac{A}{NF} \cdot 100$  en Buenos Aires de 39,5 por ciento a 93,5 por ciento al pasar de paridez 2 a paridez 3, lo que indicaría el deseo de no sobrepasar allí los dos hijos, número óptimo, al parecer, para las parejas porteñas. Y, de hecho, según las encuestas de donde emanan los datos que aquí se presentan, dos de cada tres mujeres que han tenido por lo menos un hijo han alcanzado una paridez de 3 o la han superado en Bogotá y Lima, y sólo una de cada tres mujeres que han tenido un nacido vivo alcanza a tener 3 o más nacidos vivos en Buenos Aires.

34. Para la misma categoría de paridez, se observan más abortos por mujeres en los grupos de edades 35-49 años que en los grupos 20-34 años (con la sola excepción de Panamá, en la categoría de paridez 3-4) como aparece en el cuadro 8, lo cual muestra el papel del aborto para limitar la prole, cuando sobrevienen embarazos no deseados.

#### ESTUDIO DE LA TENDENCIA DEL ABORTO

35. Para conocer la tendencia del aborto en el pasado en las capitales estudiadas, se utilizan los datos aportados por la historia de embarazos de las entrevistadas, donde quedan consignados todos los acontecimientos (partos y abortos) con sus respectivas fechas de ocurrencia, a partir de los cuales se pueden calcular

las tasas de embarazos, de abortos y de fecundidad para los años anteriores y remontarse hasta 35 años antes de la fecha de la encuesta. Al retroceder en el tiempo disminuye el número de observaciones a la vez que van desapareciendo grupos de edades<sup>16</sup>, por una parte. Por otra, va pesando con mayor fuerza el factor

CUADRO 8. ABORTOS POR 100 MUJERES SEGÚN PARIDEZ Y GRANDES GRUPOS DE EDADES, EN CUATRO CAPITALES LATINOAMERICANAS

Ciudad	Grupos de edades	1	2	3-4	5 y más
Bogotá .....	20-34	22,3	25,9	35,6	45,2
	35-49	27,3	35,1	46,2	73,0
Lima .....	20-34	19,4	23,3	32,8	42,7
	35-49	35,1	42,9	48,6	59,6
Panamá .....	20-34	34,5	27,1	58,8	50,0
	35-49	42,1	49,4	36,7	76,2
Buenos Aires .....	20-34	19,8	38,6	79,6	60,0
	35-49	49,0	40,4	81,9	90,5

memoria a medida que se pregunta por acontecimientos más remotos, y más cuando de abortos se trata. Es bueno, por lo tanto, restringir el estudio al pasado reciente y no remontarse excesivamente hacia atrás (cuadro 9).

<sup>16</sup> Por ejemplo: las tasas de 15 años atrás serían sólo para mujeres de 15 a 34 años, partiendo de los datos proporcionados por las mujeres que tenían entre 30 y 49 años en el momento de la encuesta.

CUADRO 9. TASAS DE EMBARAZOS, DE ABORTOS POR EMBARAZOS, DE ABORTOS POR MUJERES Y DE FECUNDIDAD EN EL AÑO DEL ESTUDIO (TASAS PROMEDIO DE LOS 4 AÑOS ANTERIORES AL DEL ESTUDIO Y DEL PERÍODO ANTERIOR)

Tasas (por mil)	Bogotá			Lima			Panamá			Asunción			Buenos Aires		
	1	2	3	1	2	3	1	2	3	1	2	3	1	2	3
$\frac{E}{NF}$	197	143	119	172	161	142	154	144	138	171	139	148	104	88	99
$\frac{A}{E}$	98	115	147	80	123	227	118	165	192	115	192	283	190	217	188
$\frac{A}{NF}$	19	16	18	14	20	32	18	24	27	20	27	33	20	19	19
$\frac{NV}{NF}$	177	126	101	155	139	109	133	118	108	150	110	114	83	67	79

Simbología: E = embarazos  
A = abortos totales  
NF = mujeres  
NV = nacidos vivos

1 = años anteriores al último quinquenio  
2 = los 4 años anteriores al del estudio  
3 = año del estudio

36. En este trabajo se comparan tasas del año del estudio con promedios de las tasas de los cuatro años anteriores al estudio y éstos, a su vez, con los promedios de las tasas del quinquenio anterior al último.

A partir de las variaciones porcentuales así obtenidas, se calcula la variación promedio anual de las tasas para poder apreciar fácilmente los cambios ocurridos (cuadro 10).

CUADRO 10. VARIACIÓN PROMEDIO ANUAL DE LAS TASAS DE EMBARAZOS, ABORTOS POR EMBARAZOS, ABORTOS POR MUJERES Y FECUNDIDAD EN MUJERES DE 15 A 44 AÑOS, EN DIVERSAS CAPITALS LATINOAMERICANAS

	Bogotá	Lima	Panamá	Asunción	Buenos Aires
<i>1. La tasa de embarazos:</i>					
En los 5 años anteriores al último quinquenio	- 1,6	- 0,4	-0,3	-1,1	-0,9
En el último quinquenio	- 6,7	- 4,7	-1,7	+2,6	+5,0
<i>2. La tasa de abortos (totales) por embarazos:</i>					
En los 5 años anteriores al último quinquenio	+ 1,0	+ 3,2	+2,3	+3,9	+0,8
En el último quinquenio	+11,1	+33,8	+6,6	+6,4	-5,4
<i>3. La tasa de abortos (totales) por mujeres:</i>					
En los 5 años anteriores al último quinquenio	- 0,9	+ 2,5	+2,0	+2,0	-0,3
En el último quinquenio	+ 5,0	+24,0	+5,0	+7,4	0,0
<i>4. La tasa de fecundidad:</i>					
En los 5 años anteriores al último quinquenio	- 1,7	- 0,6	-0,7	-1,6	-1,1
En el último quinquenio	- 7,9	- 8,6	-3,4	+1,4	+6,9

37. Este cuadro indica, además de la variación promedio anual de otras medidas cuya utilidad aparecerá seguidamente, la variación promedio anual de las tasas de abortos.

38. La tasa de abortos por mujeres se ha incrementado en el último quinquenio en las capitales indicadas, salvo en Buenos Aires, donde no ha sufrido variación. El aumento es importante en Bogotá, Panamá y Asunción, y realmente más aún en Lima, donde un incremento de un 24 por ciento anual indica 120 por ciento de aumento en el quinquenio. La tendencia de esta tasa, la de mayor utilidad en salud pública puesto que indica la incidencia del aborto en la población, no puede dejar de preocupar a las autoridades del sector salud, ya que, además del problema que representa en aquellas capitales, hace sospechar lo que puede estar ocurriendo, aunque en menor grado, en el resto del territorio, o lo que ocurrirá, por obra del efecto de demostración que ejerce la capital sobre las otras ciudades en cada país. Es también lícito pensar que la misma tendencia existe en otras capitales latinoamericanas, salvo tal vez allí donde el fenómeno existe como práctica muy extendida desde antiguo.

39. Cabe destacar que se ha incrementado la tasa de abortos a pesar de la disminución de la tasa de embarazos en Bogotá, Lima y Panamá (ver cuadro 10). Esto es debido al fuerte aumento de la tasa de abortos por embarazos en estas ciudades, que ha compensado con creces la mengua relativa del universo en el que puede ocurrir el aborto, es decir, el de las embarazadas.

Es conveniente recalcar que el incremento del aborto es debido al aumento de los abortos provocados o inducidos, pues nada permite suponer un aumento de abortos espontáneos por embarazos en los últimos tiempos. Por el contrario, y entre las causas de abortos espontáneos, han desaparecido o menguado fuertemente algunas de ellas (infecciosas y parasitarias) que antaño tenían considerable importancia.

40. ¿En cuáles grupos de edades se ha incrementado más el aborto? El cuadro 11, donde se desglosa la variación promedio anual que aparece en el cuadro 10, muestra, para la medida abortos por mujeres, una diferencia muy significativa entre grandes grupos de edades.

41. Salvo en el caso de Lima, donde el incremento del aborto es debido a la participación de los grupos de edades más jóvenes (entre 20 y 34 años), en todas las otras ciudades (Bogotá, Panamá, Asunción y Buenos Aires) el incremento se observó exclusivamente en los grupos de mayor edad, entre 35 y 44 años. En esas ciudades, las mujeres jóvenes, por el contrario, han tenido una incidencia decreciente del aborto que, desde luego, no compensa el fuerte aumento observado en los grupos de mujeres de mayor edad. En Panamá, por ejemplo, la variación promedio es negativa en el grupo 20-34 años; la tasa de abortos por mujeres se deprime en un 4,3 por ciento cada año. Pero el fuerte incremento de 43,6 por ciento anual de la tasa en el grupo 35-44 años da como resultante un aumento para

CUADRO 11. VARIACIÓN PROMEDIO ANUAL DE LAS TASAS DE EMBARAZOS, ABORTOS POR EMBARAZOS, ABORTOS POR MUJERES Y FECUNDIDAD, EN MUJERES DE 20 A 44 AÑOS, POR GRANDES GRUPOS DE EDADES, EN DIVERSAS CAPITALES LATINOAMERICANAS

(Porcentaje)

Tasas de	Bogotá		Lima		Panamá		Asunción		Buenos Aires	
	20-34	35-44	20-34	35-44	20-34	35-44	20-34	35-44	20-34	35-44
<i>Embarazos</i>										
Años anteriores	-1,4	- 2,6	- 0,1	- 1,2	+1,3	- 2,5	-0,9	- 1,0	-0,4	-2,0
Ultimo quinquenio	-9,2	+ 3,4	- 1,4	-16,2	-4,0	+ 8,2	-0,2	- 5,8	+3,1	+9,5
<i>Abortos por embarazos</i>										
Años anteriores	+1,4	- 0,4	+ 2,2	+ 1,0	+2,1	+ 1,1	+3,0	+ 8,9	+0,6	-0,1
Ultimo quinquenio	+4,5	+31,1	+39,2	+12,4	0	+27,4	-9,8	+41,3	-7,2	-4,2
<i>Abortos por mujeres</i>										
Años anteriores	-0,4	- 2,9	+ 1,9	- 0,5	+4,0	- 2,1	+1,5	+ 6,5	+0,2	-2,0
Ultimo quinquenio	-4,8	+40,0	+36,8	- 8,0	-4,3	+43,6	-9,2	+27,4	-4,3	+2,7

las mujeres de todas las edades de 24 por ciento en promedio cada año durante el último quinquenio.

42. Los abortos por embarazos aumentan también fuertemente en todas las ciudades para el grupo 35-49 años, salvo en Buenos Aires. Incluso aumenta en Lima, donde la variación promedio anual es negativa en esas mujeres para la tasa abortos por mujeres, porque la fuerte disminución de los embarazos (-16,2 por ciento) no es compensada por el aumento de la tasa de abortos en embarazos (+12,4 por ciento). El aumento más notable de la tasa de abortos por embarazos se observa en las mujeres de 35 a 44 años en Asunción, donde la variación anual de +41,3 por ciento indica que se triplica la tasa en 5 años.

43. Se podría pensar que no es real el importante aumento de la incidencia del aborto señalado para las cuatro capitales estudiadas, y creer que es tan sólo aparente y debido a las omisiones de los abortos en el pasado, más importantes en la medida que se retrocede en el tiempo.

44. Esta sospecha es probablemente válida en lo que atañe a los años que preceden el último quinquenio. Por esta razón no se ha comentado la variación promedio anual existente entre el período anterior al último quinquenio y los cuatro años anteriores a la encuesta, que puede haber sido afectada por la falta de memoria de las entrevistadas.

45. Pero no debe temerse mayormente esta fuente de error cuando se compara a través de la variación promedio anual, los cuatro años anteriores con el año de la encuesta. Es poco probable que una mujer olvide algún aborto acaecido en el último quinquenio, a menos que haya tenido muchos de éstos en el lapso de tiempo<sup>17</sup>. Por el contrario existiría la tendencia, más acentuada en cuanto la circunstancia (la presión social y legal) es más marcada en contra del aborto, de omitir

<sup>17</sup> Que posiblemente no fueron abortos, entonces. Entre las mujeres que declaran muchos abortos (hasta 3 ó 4 cada año), se da frecuentemente el hecho que confunden simples retrasos menstruales con abortos, confusión que aprovechan algunos profesionales del aborto clandestino "liberando" a la mujer de algo que no tiene.

de preferencia los abortos más recientes, los del último año particularmente, para los cuales la interrogada teme una posible sanción. En este caso, que involucra la sinceridad de la entrevistada, la falta de confianza o de buena fe que deprimiría preferentemente la tasa del último año provocaría una subvaloración del incremento del aborto en el último quinquenio.

46. Otro argumento que se esgrime a veces y tiene que ver con la buena fe en las declaraciones, es el siguiente: en las tasas de los últimos años van figurando las mujeres más jóvenes, que posiblemente tienen menos inhibiciones en lo referente a la vida sexual y declaran con mayor franqueza los abortos tenidos, que las más "viejas" callarían. Este argumento pierde fuerza al constatar — como se ha visto — que ha sido precisamente en el grupo de edades 35-44 años donde el incremento ha sido mayor, con la señalada excepción de Lima. En esta última capital, es posible que haya tenido alguna influencia esta contingencia, aunque también es lícito pensar que se ha manifestado entre las mujeres jóvenes y en época reciente el deseo de espaciar o limitar los nacimientos, para lo cual han acudido preferentemente al aborto, mientras las más "viejas" apelaban a las prácticas anticonceptivas. Es bastante sugerente, en efecto, que se hayan deprimido en un 16,2 por ciento las tasas de embarazos en el grupo 35-44 (ver cuadro 11), mientras sólo lo hacían en un 1,4 por ciento en el grupo 20-34, y las variaciones en las tasas de embarazos, si otros fenómenos (tales como la variación en la edad de iniciación de relaciones sexuales, de la nupcialidad, etc.) no han cambiado substancialmente en un solo quinquenio, se deben obviamente a variaciones en el uso de anticonceptivos.

#### LA SITUACIÓN EN LAS CAPITALES ESTUDIADAS EN EL AÑO DEL ESTUDIO

47. El nivel de fecundidad observado en un lugar y en un año dado depende de múltiples factores relacionados con: la exposición al riesgo de tener relaciones sexuales; si se tiene relaciones sexuales, la exposición al riesgo de embarazarse; y la exposición al riesgo de parir cuando existe el embarazo.

48. Para investigar el papel de esos factores, se utilizan los datos aportados por la historia de la vida sexual de las entrevistadas en los doce meses que preceden a la fecha de la encuesta. Esta historia, incluida en los cuestionarios de CELADE con el nombre de "Cuadro de la vida sexual del último año", recolecta los datos necesarios para conocer la influencia relativa de las principales variables que contribuyen a fijar el nivel de la fecundidad observado: ausencia de relaciones sexuales por cualquier causa, práctica de la contracepción, práctica del aborto.

49. En el presente trabajo, que se ciñe exclusivamente al estudio del aborto, no se tomarán en cuenta las variables que condicionan la ausencia de relaciones sexuales, las cuales poco o nada pueden ser cambiadas en un programa de salud pública que pretenda combatir al aborto clandestino. Pero sí habrán de tomarse en cuenta las prácticas anticonceptivas de las mujeres, interrelacionadas — como se verá — con la incidencia del aborto.

50. Se estudiará seguidamente a) el efecto del aborto sobre la fecundidad; y b) el efecto de las prácticas anticonceptivas sobre el aborto.

*El efecto del aborto sobre la fecundidad en el año del estudio*

51. El cuadro 12 indica el efecto reductor de la mortalidad fetal sobre las tasas de embarazos en las capitales estudiadas. Este efecto reductor se calcula usando las tasas de embarazos y de fecundidad observadas. La tasa de fecundidad  $f$  es inferior a la tasa de embarazos  $e$  en la misma proporción que se incrementan las muertes fetales. El valor  $r$  del efecto reductor será:  $r = \frac{f}{e} - 1$ ; para mayor comodidad de interpretación, se expresa en porcentaje:  $r = \left(\frac{f}{e} - 1\right) \cdot 100$ <sup>18</sup>.

<sup>18</sup> Este porcentaje corresponde, con signo contrario, al de muertes fetales por embarazos. Dado que las muertes fetales

52. La mortalidad fetal incluye el aborto (mortalidad fetal temprana e intermedia) y la mortinatalidad (mortalidad fetal tardía). El efecto reductor calculado no es, pues, exclusivamente el efecto del aborto.

53. Sin embargo, y dado el hecho que la mortinatalidad es de escasa importancia (varía entre 0,6 y 1,3 por ciento de los embarazos en las ciudades del estudio), el efecto reductor calculado es fundamentalmente el efecto del aborto. Este efecto a su vez se compone del efecto del aborto espontáneo y del efecto del aborto inducido. Para poder evaluar exclusivamente el efecto del aborto inducido, se procede de la manera indicada en la introducción del presente trabajo, o sea, se restan 10 puntos (el 10 por ciento de los embarazos) a los efectos reductores calculados. Por ejemplo, el efecto reductor del aborto inducido en Asunción, según los datos del cuadro 12, sería:

- (a) En el grupo 20-34 años:  $17,3 - 10 = 7,3$  por ciento;
- (b) En el grupo 35-44 años:  $50,0 - 10 = 40,0$  por ciento.

54. Asimilando con fines prácticos el efecto reductor de la mortalidad fetal al efecto reductor del aborto, el cuadro 12 pone en evidencia, en todas las ciudades,

( $MF$ ) son los embarazos ( $E$ ) menos los nacidos vivos ( $NV$ ), o sea,  $MF = E - NV$ , entonces,

$$\frac{MF}{E} = \frac{E}{E} - \frac{NV}{E} = 1 - \frac{NV}{E}$$

y sustituyendo  $NV$  por  $f$  y  $E$  por  $e$ : muertes fetales por embarazos,  $\frac{MF}{E} = 1 - \frac{f}{e}$ , que viene a ser el valor  $r = \frac{f}{e} - 1$ , con signo contrario. Las medidas de la mortalidad fetal por embarazos (o sea los efectos reductores) del cuadro 12 discrepan de las correspondientes del cuadro 9, donde aparecen (por mil en vez de por cien) bajo las columnas 3 en cada ciudad, las tasas de abortos por embarazos ( $\frac{A}{E}$ ). Esto es debido a que se trata de períodos diferentes: en el cuadro 9 figura el último año calendario, en el cuadro 12 los doce meses antes de la encuesta. Por ejemplo, para Asunción, el último año calendario fue 1970, y el último año fue de julio de 1970 a junio de 1971.

CUADRO 12. EFECTO REDUCTOR DE LA MORTALIDAD FETAL EN EL AÑO DEL ESTUDIO, POR GRANDES GRUPOS DE EDADES, EN DIVERSAS CAPITALES LATINOAMERICANAS

Capitales	Grupos de edades	Tasas de embarazos	Tasas de fecundidad	Efecto reductor de la mortalidad fetal (en porcentaje)
Bogotá	20-34	161	139	-13,7
	35-44	76	55	-27,6
	15-49	110	93	-15,4
Lima	20-34	224	175	-21,9
	35-44	63	47	-35,4
	15-49	134	103	-23,1
Panamá	20-34	204	165	-19,1
	35-44	53	26	-50,9
	15-49	129	100	-22,5
Asunción	20-34	225	186	-17,3
	35-44	46	23	-50,0
	15-49	141	105	-25,5
Buenos Aires	20-34	153	127	-17,0
	35-44	52	35	-32,7
	15-49	86	69	-19,8

que ha sido mayor en el grupo 35-44 años que para el grupo de mujeres de 20 a 34 años<sup>19</sup>. En algunas capitales — Panamá, Asunción — la influencia del aborto sobre la fecundidad llega a ser importantísima en aquellas mujeres de 35 a 44 años y su efecto alcanza 40,9 y 40 por ciento respectivamente. En las otras capitales, sin llegar a esas cifras, no deja de ser importante.

#### *El efecto de las prácticas anticonceptivas sobre el aborto*

55. En los párrafos precedentes se ha señalado el incremento que ha sufrido recientemente la incidencia del aborto en las capitales latinoamericanas estudiadas, salvo en Buenos Aires, donde, según la encuesta allí realizada, no se incrementó, pero alcanza niveles importantes desde antaño.

56. Por otra parte, existen interrelaciones evidentes entre la incidencia del aborto y las prácticas anticonceptivas; se desarrolla una influencia recíproca cuyo sentido es necesario determinar para saber si se puede, o no se puede, contar con las medidas preventivas — las actividades anticonceptivas — para reducir el gran problema de salud pública (entre otros) que representa el aborto clandestino.

57. Algunos autores asocian el incremento del aborto al incremento de las actividades anticonceptivas, particularmente a las que desarrollan los programas de planificación familiar. Interpretan la variación concomitante constatada como una relación causal: las actividades de planificación familiar aumentarían la incidencia del aborto. Aportan, para transformar una correlación directa en relación de causa a efecto, unos argumentos subjetivos que no cabe discutir en este trabajo.

58. La influencia del uso de los anticonceptivos eficaces<sup>20</sup> sobre la incidencia del aborto sólo puede medirse comparando categorías de mujeres con relaciones sexuales de iguales condiciones (de edad, de fecundabilidad), en las que sólo varía el factor cuya influencia se desea conocer. Y así se procederá seguidamente, con los datos aportados por las encuestas en las capitales latinoamericanas.

59. Estos datos permiten comparar lo que ocurrió en el año que precedió la encuesta en las categorías de mujeres que usaron anticonceptivos eficaces, que usaron anticonceptivos menos eficaces (todos los no citados como eficaces), y que no usaron anticonceptivo alguno en sus relaciones sexuales<sup>21</sup>. Para cada categoría se

conoce el tiempo real de uso o no uso (medido en "mujer-mes") y los acontecimientos (partos, abortos) que se verificaron durante el año, en cada grupo quinquenal de edades.

60. Para conocer el efecto del uso de anticonceptivo sobre la tasa de abortos y sobre la tasa de fecundidad, no procede comparar categorías de mujeres que usan anticonceptivos con categorías de mujeres que no los usan, pues las mujeres con relaciones sexuales que no usan anticonceptivos, en su conjunto, tienen una probabilidad menor que aquéllas de quedar fecundadas<sup>22</sup>. Y, por lo tanto, el efecto de los anticonceptivos quedaría subestimado.

61. Por el contrario, la comparación entre categorías de mujeres que usan anticonceptivos eficaces, y mujeres que usan anticonceptivos menos eficaces, es válida. Las mujeres que usan anticonceptivos menos eficaces los usan porque se saben expuestas al riesgo de embarazarse, obviamente. Si no usan los anticonceptivos eficaces es, o bien porque no los conocen, o porque no tienen acceso a ellos, o porque desconfían de ellos por miedo al daño que presumen les pueda ocasionar, o por escrúpulos religiosos, según las principales razones invocadas por ellas, pero no es porque piensan estar poco expuestas al riesgo de embarazarse. En consecuencia, las dos categorías de mujeres son comparables y las tasas que se observen en cada una de ellas habrán de diferir exclusivamente por el distinto efecto de los anticonceptivos usados.

62. Por otra parte, la comparación es, además de válida, oportuna, pues es de suponer con alto grado de seguridad que si las mujeres que usan anticonceptivos (AC) eficaces no pudieran usarlos por cualquier razón, usarían AC menos eficaces y no es lógico pensar que no tomarían ninguna medida anticonceptiva en sus relaciones sexuales. Se puede calcular, entonces, cuáles hubieran sido las tasas si esas mujeres que usaron AC eficaces (en un programa o por su cuenta, durante el año del estudio) hubieran usado AC menos eficaces, y así proceder a la comparación que indicará el efecto del uso de AC eficaces sobre el aborto.

63. Para estimar esas tasas de una situación teórica, se calculan las probabilidades para cada mujer-mes con uso de AC menos eficaces, de tener un hijo nacido vivo y de tener un aborto, en cada grupo quinquenal de mujeres. Se aplican a las mujeres-mes con uso de AC eficaces esas probabilidades que se calcularon para las mujeres-mes con uso de AC menos eficaces, obteniendo así los nacidos vivos esperados y los abortos esperados, si las mujeres de la muestra que usaron AC eficaces hubieran usado AC menos eficaces.

<sup>19</sup> Aparentemente las cifras para Lima no concuerdan con las del cuadro 11, donde aparece el grupo 20-34 años con el mayor aumento promedio anual. Se trata de dos hechos diferentes: a pesar de que aumentó más en el grupo "joven" la práctica del aborto en los últimos años, el efecto de esa práctica sobre la fecundidad específica por grupos de edades sigue siendo mayor en el grupo de mujeres más viejas.

<sup>20</sup> O sea, del uso de los gestágenos (orales e inyectados), de los dispositivos intrauterinos, de la esterilización.

<sup>21</sup> Para más detalles sobre la técnica empleada, ver: S. Gaslonde y E. Carrasco, *op. cit.*, págs. 65 a 70 y 135 y siguientes.

<sup>22</sup> Pues si unas cuantas no usan anticonceptivos porque desean tener hijos, otras no los usan porque saben que no están expuestas al riesgo de embarazarse (las estériles) o están poco expuestas, por conocimiento empírico de su "subfecundabilidad". Aún así, las tasas de abortos que presentan esas mujeres son tres a cinco veces superiores a las que tienen las mujeres que usan anticonceptivos (eficaces y menos eficaces). Para demostración de la subfecundabilidad de las mujeres que no usan anticonceptivos, ver: S. Gaslonde, *op. cit.*, cap. VI, segunda parte.

64. La diferencia entre nacidos vivos esperados y nacidos vivos observados dará el número de nacidos vivos evitados por el uso de AC eficaces en la muestra de cada ciudad. De la misma manera, se obtendrá el número de abortos evitados.

65. Añadiendo los valores de nacidos vivos y abortos evitados a los numeradores de las correspondientes tasas de fecundidad y abortos por mujeres, se obtienen tasas estimadas que servirán para calibrar el efecto de los AC eficaces en cada ciudad del estudio (cuadro 14).

CUADRO 13. NACIDOS VIVOS Y ABORTOS TOTALES EVITADOS POR EL USO DE ANTICONCEPTIVOS EFICACES POR LAS MUJERES DE 15 A 49 AÑOS DE LAS MUESTRAS DE CUATRO CAPITALES LATINOAMERICANAS

Capitales	Nacidos vivos			Abortos totales		
	Esperados	Observados	Evitados	Esperados	Observados	Evitados
Bogotá	18,7	5	13,7	2	2	0
Lima	19,5	11	8,5	4,4	1	3,4
Panamá	65,1	31	34,1	21,3	7	14,3
Asunción	6,4	4	2,4	2,8	0	2,8

Nota: El bajo número de acontecimientos en las mujeres-mes con uso de AC eficaces y AC menos eficaces en Buenos Aires no permitió proceder a los cálculos para esa capital.

CUADRO 14. ESTIMACIONES DE TASAS DE FECUNDIDAD Y DE ABORTOS TOTALES POR MUJERES EN EL SUPUESTO DE QUE LAS MUJERES QUE USARON ANTICONCEPTIVOS EFICACES NO LOS HUBIERAN USADO

Capitales	Tasas de fecundidad		Tasas de abortos totales	
	Observada	Estimada	Observada	Estimada
Bogotá	93	102,6	16,2	5,2
Lima	103	109,5	30,2	32,8
Panamá	100	124,3	25,3	35,6
Asunción	114,5	115,7	33,3	34,7

Nota: Para Bogotá, Lima y Panamá, las muestras fueron aleatorias pero no autoponderadas, dándole la misma representación a los estratos socioeconómicos alto, medio y bajo. En consecuencia las tasas son aproximadas ya que los estratos bajos quedaron subrepresentados. Al ponderar por estratos, las diferencias hubieran sido ligeramente diferentes.

66. Las variaciones porcentuales entre las tasas estimadas y las tasas observadas dan la medida del efecto de los AC eficaces sobre el aborto. Este efecto aparece en el cuadro 15. Nulo en Bogotá, es apreciable en Asunción, donde la tasa de abortos totales hubiera sido un 4,2 por ciento mayor si las mujeres no hubieran usado AC eficaces, en Lima, donde la tasa hubiera sido un 8,6 por ciento, y llega a ser importantísimo en Panamá, donde los abortos serían un 40,7 por ciento más de los observados si las mujeres no usaran anticonceptivos eficaces.

67. En cuanto a las tasas de abortos inducidos, su incremento hubiera sido aún mayor que las tasas de abortos totales, para alcanzar el 54 por ciento más del observado en Panamá<sup>23</sup>.

68. Estos resultados permiten afirmar que no aumentó la incidencia del aborto en las ciudades estudiadas a consecuencia de las actividades de planificación familiar.

69. Por el contrario, las mujeres que usaron anticonceptivos eficaces — entre ellas las usuarias de los programas de planificación familiar —<sup>24</sup> tuvieron menos abortos que las mujeres que usaron anticonceptivos menos eficaces. Ambas categorías reunidas — las mujeres que usaron cualquier tipo de anticonceptivo, eficaz o menos eficaz — tuvieron, como ya se ha dicho, tasas de abortos muy inferiores a las tasas que presentaron en el último año las mujeres que no usaron anticonceptivo alguno en sus relaciones sexuales.

<sup>23</sup> Estos resultados están en relación con el porcentaje de mujeres que usan AC eficaces sobre el total de mujeres en edad fértil, en las ciudades estudiadas: 6,6 por ciento en Asunción, 9 por ciento en Lima y 23,9 por ciento en Panamá.

<sup>24</sup> En Asunción, la proporción de usuarias entre las mujeres que usan AC eficaces fue, el último año del estudio, del 74 por ciento (tres de cuatro mujeres). En las otras ciudades las encuestas no incluían preguntas que proporcionaran este dato.

CUADRO 15. VARIACIONES PORCENTUALES ENTRE TASAS OBSERVADAS Y TASAS ESTIMADAS EN EL SUPUESTO DEL CUADRO 14

	Bogotá	Lima	Panamá	Asunción <sup>a</sup>
Tasas de fecundidad	-10,3	- 6,3	-24,3	-1,0
Tasas de abortos por mujeres	0,0	- 8,6	-40,7	-4,2
Tasas de abortos inducidos por mujeres	0,0	10,7	-54,0	-6,5

<sup>a</sup> Los datos que figuran para Asunción son los de la capital y cuatro ciudades más (Ypacaraí, KaaKupé, Villarrica y Coronel Oviedo). Por lo tanto, la tasa de fecundidad observada difiere de la indicada en el cuadro 12.

70. Es necesario sin embargo hacer notar que, según las mismas encuestas, lo anterior es cierto en lo que a las tasas de abortos por mujeres se refiere, y no lo que es para las tasas de abortos por embarazos, que suelen ser más altas en las mujeres que no los usan, lo cual tiene una explicación lógica.

71. Tal parece que las prácticas anticonceptivas con medios eficaces, lo que equivale a decir en gran parte las actividades de planificación familiar, tuvieron un efecto mayor en relación a los objetivos de salud pública que apuntan a reducir la incidencia del aborto provocado, que lo tuvieron en relación a objetivos demográficos.

72. La planificación familiar actúa allí, al parecer y parcialmente, como sustituto del aborto entre las mujeres que otrora apelaban fundamentalmente a este medio para espaciar o limitar su prole, por lo cual se aprecia más su efecto sobre el aborto que sobre la fecundidad.

73. Si el lector retrocede, en su lectura, al cuadro 11 y observa lo que ocurrió en el último quinquenio en la variación promedio anual de la tasa de embarazos (variación que se debe fundamentalmente al efecto de las prácticas anticonceptivas), y en la variación promedio anual de la tasa de abortos por embarazos, hará la siguiente constatación:

EXTRACTO DEL CUADRO 11. VARIACIÓN PROMEDIO ANUAL DE LAS TASAS DE EMBARAZOS Y ABORTOS POR EMBARAZOS EN EL ÚLTIMO QUINQUENIO, EN DIVERSAS CAPITALES LATINOAMERICANAS

Tasas de:	Bogotá		Lima		Panamá		Asunción		Buenos Aires	
	20-34	35-44	20-34	35-44	20-34	35-44	20-34	35-44	20-34	35-44
Embarazos .....	-9,2	+ 3,4	- 1,4	-16,2	-4,0	+ 8,2	-0,2	- 5,8	+3,1	+9,5
Abortos por embarazos .....	+4,5	+31,1	+39,2	+12,4	0	+27,4	-9,8	+41,3	-7,2	-4,2

74. En cada ciudad se observa que la tasa de abortos por embarazos subió más en el grupo de edades en el cual se deprimió menos o no se deprimió la tasa de embarazos. En Bogotá, donde menguó la tasa de embarazos en el grupo 20-34 años y se observó mayor incremento del aborto en el otro grupo, el de 35-44 años, donde no mermó, sino aumentó la tasa de embarazos. Lo mismo se observa en Panamá. En Lima, el aborto aumentó más en el grupo 20-34, donde se deprime menos la tasa de embarazos.

75. En Buenos Aires, donde la tasa de embarazos aumenta en los dos grupos de edades y también en ambos grupos se deprime la tasa de abortos por embarazos, se observa que se deprime menos esta tasa en el grupo donde más aumenta aquélla.

76. Asunción es la excepción, pues allí en el mismo grupo 34-44 se observa la mayor depresión de la tasa de embarazos y, a la vez, un fuerte aumento de la tasa de abortos por embarazos (que decrece en el otro grupo).

#### CONCLUSIONES

77. En virtud de lo anterior, se pueden desprender las siguientes conclusiones:

1) En las capitales latinoamericanas estudiadas, salvo en Buenos Aires, se ha observado un aumento importante de la incidencia del aborto en el último quinquenio que precedió la fecha de la encuesta en cada una de ellas. También se ha incrementado en esas capitales el porcentaje de abortos por embarazos;

2) El incremento de la incidencia del aborto es mucho más importante entre las mujeres de mayor edad que para las mujeres más jóvenes (salvo en Lima, donde sucede lo contrario), lo cual señala que el uso de esa práctica es más para limitar que para espaciar los nacimientos;

3) Este incremento del aborto es frenado, o deja de observarse en los grupos de mujeres que, a través de las prácticas anticonceptivas fundamentalmente, han deprimido sus tasas de embarazos, lo cual viene a reforzar la impresión que las mujeres de las capitales estudiadas tienen el deseo creciente de limitar o espaciar su prole, por cualquier medio a su alcance;

4) La planificación familiar en las ciudades estudiadas ha tenido un claro efecto preventivo del aborto. La reducción de la incidencia del aborto entre las usuarias de los programas de planificación familiar ha sido mucho más notable que la reducción de la fecundidad.

## THE METHODOLOGY OF COST-BENEFIT ANALYSIS OF EXPENDITURES ON POPULATION CONTROL PROGRAMMES

Warren C. Robinson \*

1. Population growth is one of the dominant issues of the day. High rates of population growth prevail in populations making up some three fourths of the world and conservative projections indicate a doubling of world population by the year 2000. Not all responsible analysts are agreed on the severity of the "crisis" being created by these trends, but it does appear to be clear that a continuation of such rapid growth will lead to economic, social and political stresses and difficulties, particularly for the countries of the developing world—Africa, Asia and Latin America. Thus, it is not surprising that in recent years, Governments of countries throughout the world have demonstrated a growing interest in controlling future population growth. Some 50 countries have now adopted official policies and/or programmes designed to reduce further population increases.<sup>1</sup> Countries and organizations donors of foreign aid, both on a bilateral and on a multilateral basis, now devote a substantial share of their total development aid to programmes concerning population and family limitation. The World Health Organization (WHO), the United Nations Children's Fund (UNICEF) and other international groups, as well as many individual Governments and private philanthropic organizations, also offer project support. The total of such aid in all likelihood exceeds \$200 million annually now, and an even larger volume of resources is devoted to these programmes and projects out of local budgets by the Governments of the developing countries. Thus, population control programmes now represent a substantial use of the limited resources available to the developing world.<sup>2</sup>

2. As these programmes have grown in importance so, as one might expect, has the attention devoted to them by social scientists and analysts. "Evaluation" has become an important aspect of such programmes, just as "project appraisal" is for such infrastructure as roads or dams. A substantial literature has grown up on evaluation and it is not proposed to review that literature here.<sup>3</sup>

3. Instead, it is proposed to look more particularly at the problem of the economic studies of population control programmes as these have been developed, using the so-called "cost-benefit" and "cost-effectiveness" techniques. This paper reviews the conceptual framework underlying the techniques; the strengths and weaknesses of the techniques themselves and some of the most frequently voiced criticisms; and some of the applications of these techniques to actual programme data; lastly, some of the unsettled theoretical implications and practical problems arising from these approaches are discussed.

### THE LOGIC OF COST-BENEFIT ANALYSIS

4. Economic considerations are a major annoyance to programme administrators. "The budgetary constraint", the need to justify any proposed expenditure and requirements that detailed accounts and records be kept, all complicate life for administrators. Administrators of family-planning programmes are often especially resentful of any economic approach. To them their programmes have such obvious benefits for society that the Government should simply allocate whatever is required to reach the desired goal and not worry about minor matters of "efficiency".

5. This point of view, however plausible it appears at first glance, is wrong for two reasons. First, it ignores a fundamental truth well understood by politicians and taxpayers around the world: namely, that resources available to any organization or agency, even to society as a whole, are indeed limited and that these limited resources must be allocated among many competing possible uses. This scarcity and the consequent necessity for choice create an economic dimension in nearly all forms of human activity, and this is as true for public or quasi-public agencies engaged in social welfare programmes as it is for anyone else. Cost-benefit analysis is nothing more than a technique by which competing programmes or projects can be ranked in terms of the net benefits over cost that they will create for society. To deny the applicability of such principles to family planning programmes is to create strong suspicions in the minds of budget officers, ministers and legislators and seriously to jeopardize support for such programmes.

6. Secondly, it is short-sighted to be impatient with all matters economic and financial. Efficiency is usually

\* Adviser, The Population Council, Bangkok, Thailand.

<sup>3</sup> Jack Reynolds, "Evaluation of family planning performance: a critical review", *Demography*, vol. IX, No. 1 (February 1972).

a by-product of scarcity and even the most socially desirable programme should attempt to operate as efficiently as possible. Any programme administrator should be interested in getting as much output as possible from whatever inputs or resources are made available to him. The systematic effort to maximize the output per unit of input (or, conversely, to minimize the cost per unit of output) has come to be called "cost-effectiveness analysis" and can be a valuable tool for the administrator in evaluating the performance of family planning programmes.

7. Thus, cost-benefit and cost-effectiveness approaches are useful and necessary economic evaluation techniques for population control programmes. However, such economic approaches to evaluation are not intended to replace other approaches to evaluation. Evaluations of the clinical, socio-psychological or demographic impact of the family planning programme are also required and should be undertaken. The trick to making any evaluation really useful is so to structure the evaluation procedures that the information required is generated on a routine basis, quickly analysed, fed back into the decision-making apparatus and then stored so that it is cumulative and also easily retrievable. The problems associated with ensuring that an economic and budgetary evaluation shall conform to these guidelines are, in principle, no greater than for any other approach to evaluation.

8. The objective of cost-benefit analysis is to compare the costs that must be incurred in, say, the adoption of a particular investment project and the total benefits (or returns) that the project is expected to generate. Since, normally, an investment project involves a stream of benefits and costs over time, it is necessary in some way to make these streams comparable in the current time period, in order to compare the total cost and total benefits. In other words, the cost and benefit streams generated over the entire length of life of the project must be discounted back to the current time, in order to judge the current net benefit over cost.

9. The concept of discounting future economic magnitudes in order to make a current judgement is based on the economic assumption that consumption now is always preferred to consumption in the future. That is, given a choice, and with all other factors equal, a person will always prefer income (or goods) now to income (or goods) next year. Therefore, in order to compare future magnitudes to current magnitudes, the future magnitude must be reduced, or "discounted". The prevailing market rate of interest is a measure of the annual rate of return on savings (or non-consumption of current income). This rate of return induces people to save some of their current income (to postpone their consumption of it for one year). The interest rate is thus a measure of the inferiority of future goods in relation to current goods and can be used as the rate by which future benefits can be converted into current values.

10. Cost-benefit analysis is designed to compare the current value of all benefits that a project is expected to generate with the concomitant costs associated with the project, which are also expressed in terms of current value. The comparison can be made in the following way:<sup>4</sup>

Let  $C_1, C_2, \dots, C_n$  = the series of expected costs in years 1, 2, ...,  $n$ ;

$b_1, b_2, \dots, b_n$  = the series of expected benefits in years 1, 2, ...,  $n$ ;

$S$  = the scrap value of the project;

$i$  = the appropriate discount rate for annual compounding.

Then, if a particular project satisfies the inequality in such a way that

$$\frac{b_1}{(1+i)} + \frac{b_2}{(1+i)^2} + \dots + \frac{b_n + S}{(1+i)^n} > \frac{C_1}{(1+i)} + \frac{C_2}{(1+i)^2} + \dots + \frac{C_n}{(1+i)^n}$$

it is said that the benefits generated by the project exceed the costs of the project. (Alternatively, the stream of benefits could also be less than, or equal to, the associated costs, depending, of course, upon the actual values pertaining to a specific project.)

11. This process of discounting future benefits to the current time is an essential element of cost-benefit analysis in the usual sense of that term. The other important approach to estimating, for example, benefits of births prevented looks at projected future benefits in terms of *per capita* income with high *versus* low fertility using various sorts of economic growth models. These approaches are not cost-benefit approaches.<sup>5</sup>

12. The important result of cost-benefit analysis is the creation of a simple, straightforward decision rule: if benefits exceed costs, the project should be undertaken. Or alternatively, the project that shows the highest ratio of current benefits to costs should be chosen from the possible array of competing projects. This is why cost-benefit analysis has gained so much favour in recent years for analysing and comparing alternative investment projects.

13. It is clear, then, that the basic logic of cost-benefit analysis is straightforward and easy to grasp. In the application of the principle, however, a series of issues immediately arise that complicate actual analysis and may obviate much of the conceptual neatness of the technique. Cost-benefit analysis has been applied to a

number of actual country programme situations.<sup>6</sup> In all these cases, the net benefits of fertility reduction appear large and the use of government programmes to this end more than justified. Nevertheless, there are a number of important questions that can be asked concerning these findings, particularly about the evaluation of the benefits.

#### COST-EFFECTIVENESS AS AN ALTERNATIVE

14. Cost-effectiveness analysis avoids some of the possible pitfalls of the cost-benefit technique by assuming the benefits and then looking at the relationship between inputs, or costs, and project performance. In other words, this approach seeks the most effective, or least costly, means of achieving an explicit public sector objective, rather than, as with cost-benefit analysis, evaluating and comparing the social value of benefits and the social value of costs.<sup>7</sup>

15. As this type of technique takes as given a specific objective, the approach is much less ambitious than cost-benefit analysis. It cannot decide for or against a given project, and it cannot rank alternative projects.

16. This technique has been tried by numerous government agencies in recent years as the Planning-

Programming-Budgeting System (PPBS). Even more recently, the same approach has been utilized in the investigation of alternative programmes to achieve desired objectives in the area of population policy.

17. There are many obvious uses for such analysis in designing a programme. If, for example, given a certain family planning budget, the choice is between a high-volume concentration on urban areas or a more thinly spread programme affording national coverage, a proper estimation of the underlying economic relationships would make it possible to judge the costs per unit for the two strategies and thence the maximum programme output achievable by choosing the one strategy over the other.

18. Similarly, knowing the impact on the cost per unit of the choice of contraceptive devices or delivery systems would make it easy to minimize costs for any given programme volume by selecting the right "mix" of methods and systems.

19. Lastly, differences in cost per unit among various geographical or administrative units within a programme may be explicable in terms of differences in the socio-economic structure of the units—urbanization, transport and communications, literacy, income levels and so on. Where this is not the case, differences in unit costs may be indicators of differences in management efficiency and a clue as to how to tighten up the programme.

20. In fact, several programmes have employed the cost-effectiveness approach in recent years.<sup>8</sup>

#### PROBLEMS OF COST-BENEFIT ANALYSIS

##### *Measuring the benefits of reducing population growth*

21. Cost-benefit analysis has been employed in the evaluation of proposed investment projects and pro-

grammes in the field of natural resources for several decades. Indeed, the basic logic is that of traditional investment theories. The evaluation of the profitability of any proposed investment involves the estimation of future returns (value of outputs), the discounting of these future returns back to the current time (since resources must be committed to the investment in the current time) and lastly, the comparison of this current capitalized value of future returns to current known costs of undertaking the proposed investment.

22. The application of such cost-benefit analysis to social investment projects is rather more complicated since the returns (or benefits) are less straightforward than in the case of ordinary capital investment. The benefits may be such that no return in a monetary sense is ever realized by the investing agency, and, indeed, the most important benefits may be "spill-overs" or second-order benefits affecting persons or groups not directly involved in the programme.

23. At the micro-economic level, as Becker has suggested, the married couple, consciously or otherwise, "invests" in children and there is a trade-off with current consumption by the couple themselves or with some other type of asset.<sup>9</sup> In developed countries, the flow of future benefits from the current "purchase" of a child is largely subjective, non-monetary and intangible. However, in the developing world, where children are still viewed, rightly or wrongly, as economic assets because of their future earning potential to the family, the notion of a future stream of economic returns to the family is still quite meaningful. A rational family in such a situation, even with full knowledge and skill in the practice of family limitation, might still choose what would appear to outside observers a large number of children. This can, perhaps, be viewed by the couple as a special type of investment designed to create production in years to come at the expense of consumption today.

24. At the macro-economic level, the social costs of such micro-behaviour may, however, be substantial. One cost of higher rather than lower birth rates to society, it can be argued, is represented by the resources required to support the added population.<sup>10</sup> The social cost of a

birth is the extra output that such resources could have produced had they been employed in truly productive investment. Thus, the benefits of population control are social costs not incurred (or incremental output not lost) because birth rates are lowered. However, these gross benefits must be netted against the stream of future outputs that the higher rather than the lower birth rate would have produced. If the analysis is kept to the short run, say 20 years or less, preventing births today has only a minimal effect on output since it takes some 15 years for a birth cohort to reach the labour force ages. Even in the longer run, the often asserted doctrine of "zero marginal productivity" of labour can be invoked to support the argument that additional members of the labour force add nothing to output and thus that no future "returns" are being forgone by preventing births. Indeed, so long as additional workers over their entire lifetime are producing little above what is required for subsistence, then their net output (or net productivity) is zero and preventing their birth entails no loss of net output that could have been used for other purposes.

25. However, the doctrine of zero marginal productivity of labour remains debatable, to say the least. Empirical evidence is contradictory and a very significant share of informed opinion argues that agricultural technology and land use show considerable flexibility under population pressure.<sup>11</sup>

26. It is also frequently argued that preventing births will increase the ability of the economy to generate savings for capital formation. For so long as the marginal product per worker is below the average product per worker and both are falling, it is inescapably the case that reducing the number of workers will increase the average product (and income) per worker. To put it another way, if the optimum population (that is, a population level that, given the stock of the other factors, allows a maximization of the output per worker) has already been exceeded, any measures that prevent further population increases must result in income *per capita* higher than would have otherwise been the case. Coale and Hoover and others have argued that savings are a function of *per capita* income. Thus, decreasing population, even if total income remains unchanged, will increase aggregate savings.<sup>12</sup>

27. On this relationship also the evidence is weak and mixed.<sup>13</sup> There is, at least, no compelling statistical

(Continued on next page)

support for believing that reduced fertility automatically leads to increased savings. Indeed, some studies suggest that decreased fertility is accompanied by increased consumption of certain types of modern durables.<sup>14</sup>

28. These arguments focus on the relationship between *per capita* income and consumption. However, one can also argue that income in most developing countries, at least, is a family-related variable. If the birth rate falls, the size of family is reduced, and since total consumable income (or subsistence output) per family will not change in the short run at least, the consumption per family member rises. In other words, perhaps a falling birth rate does not "free" resources from consumption for investment but instead increases consumption *per capita* of the existing population. Now, since rising consumption *per capita* is likely to generate rising productivity per worker, the result may still be favourable to investment in the long run. Unfortunately, here too, the evidence is very scattered and weak. The relationship between consumption, nutrition and productivity is not yet well identified and is still intuitive rather than quantitative.<sup>15</sup>

29. Lastly, as is well known, a falling birth rate means a shift in the age distribution of the population such as to reduce the proportion of non-producers. It also appears a fair assumption that the requirements for many welfare (and social overhead) programmes are a direct function of the proportion of non-earners. Reducing the proportion of non-earners in the population will thus reduce the share of any given amount of the total social investment funds available which must go to: (a) relatively unproductive relief and social welfare programmes; (b) maintaining a constant social overhead investment *per capita*. With a lower birth rate and a relative reduction in non-earners, a larger proportion of any given investment funds available can go to directly productive investments in agriculture or industry and also to a rising *per capita* level of social overhead investment (education, health and so on) *per capita*.

30. This chain of reasoning is also suspect when it is examined closely;<sup>16</sup> and, in any case, is of little consequence in countries lacking any well-developed social welfare programmes.

31. Thus, the numerous studies that have been undertaken of the benefits of reducing fertility in developing societies (typically yielding estimates of from

two to three times the current *per capita* income) are based on some combination of the following assumptions: (a) the marginal productivity of labour is low and falling, so that persons born today will consume for their subsistence more than they will produce; (b) savings are a function of *per capita* income, not of aggregate income; and in consequence, other things being equal, the larger the population the smaller the savings; (c) the volume of social welfare services supplied by the Government—education, health, housing and so forth—is related to the size, growth rate and age distribution of the population in such a way that the higher the growth rate, the larger the absolute volume of such services that will be supplied; (d) technological change is in no way related to population growth or pressure, so that future improvements in economic efficiency will flow mainly from current levels of capital investment.

32. As has been indicated, the evidence on most of these points is at least mixed and it is not clear that these assumptions fit all countries of the developing world.

33. There is the further more purely philosophical assumption implicit in the evaluation of benefits that it is the current generation—those alive today—which is important. The discounting of future flows back to the current time makes this assumption.

34. Perhaps more importantly, this approach also assumes that the benefits that need to be accounted for are societal in nature and external to the procreating family units. Possibly the hidden assumption is really only that the internal benefits of family limitation are always positive and simply reinforce the external benefits. In fact, this need not be so.

#### *Micro- versus macro-benefits*

35. Most estimates of the costs of high fertility (and the benefits of reducing fertility) are derived from macro-economic models of the entire economy and fail to make the important distinction between the costs to the procreating couples themselves *versus* the "externalities" or costs to society at large. Thus, the net cost to society of a marginal birth measured in terms of the future requirements for education, health, capital equipment and food-stuffs may be high, but the immediate out-of-pocket costs to the family unit involved may be nil. And if any value is assigned to the child, either as a consumption good or as a productive asset, there may actually be a net benefit to the family even from a high parity-order birth. This may be illustrated with a matrix of all possible (imaginable) costs and benefits, micro and macro, as shown in the figure given below.

36. Let family *A* have an additional child. The benefits it receives are of the familiar three types first noted by Leibenstein: (1) the utility to be derived from the child as a consumptive good; (2) the utility to be derived from the child as a productive agent; (3) the utility derived from the prospective child as a potential source of security either in old age or otherwise.

**Costs and benefits of fertility allowing for external and internal effects**

	Family units					Society as a whole
	A	B	C	...	N	
<i>Benefits</i>						
(1) Direct consumptive pleasure						
(2) Increased output						
(3) Future security						
(4) Prestige and power						
<i>Costs</i>						
(1) Food, clothing and shelter						
(2) Education, health, etc.						
(3) Increased prices of some goods						
(4) Increased taxes to support transfer-welfare programmes						
(5) Density and crowding costs						
(6) Aesthetic considerations						

37. The external effects it causes will include an effect on future labour markets: the increased supply of labour will, other things being equal, lower wage rates, which would be a benefit to employers of labour and to suppliers of capital. (Clearly, it would be a negative effect for other labourers whose wages would also be affected.) These "externalities" are still micro and negative for some family units, positive for others.

38. The only completely macro-effect shown is one labelled "power and prestige", and this is indeed a nebulous one. Perhaps, it is properly considered an "externality" accruing to those nationalistic politicians and journalists who feel that power and prestige follow from sheer numbers and who are, therefore, delighted at the prospect of larger families.

39. Turning now to costs, the costs of direct expenditure on food, clothing and shelter are, it may be assumed, borne by family unit *A* in the illustration. Likewise, the less urgent but still desirable direct expenditure on health education and the like also probably fall on family *A*. However, to the extent that any transfers or publicly supported welfare programmes are operated to subsidize unit *A* for these direct expenses, an externality arises affecting many (but presumably not all) other micro-units. The increased numbers of people in unit *A* will also give rise to increased demand for certain goods—food certainly and other essentials—which, assuming rising marginal cost curves, can be produced only at higher prices. The result is that all consumers of these products—in the short run at least—are slightly worse off. However, the producers who benefit from the higher prices are slightly better off.

40. Also listed as a possible cost is the increased density and crowding that may arise as unit *A* increases in size. Streets, public transport and theatres are slightly more crowded than before, and the cost is borne by everyone using these facilities, in the form of increased time spent waiting, increased jostling and physical crowding and, perhaps, decreased efficiency of these services. Perhaps the closest thing yet found to a category that affects everyone negatively are these societal costs or true social externalities.

41. Lastly, an aesthetic cost is listed. Sheer numbers and sheer density cause pain to some people on non-material grounds. The aesthetic cost is important to many conservationists in the United States of America and other developed countries, and it holds good too many Asians who feel a horror of modern cities as contrasted to the traditional village life. (This is, perhaps, the logical counterpart of the "increased prestige" benefit.) Quantification eludes one here, but it at least is a possible cost to some groups.

42. The result of this discussion of costs and benefits is a picture of a situation in which several types of costs and benefits affect the micro-units making up the society in uneven, conflicting or partially offsetting ways. No easy answer emerges about who benefits or even whether net benefits do occur.<sup>17</sup>

### Summary

43. In the preceding section, some of the implicit assumptions have been indicated concerning the economic and social linkages and structures on which rests the typical effort to evaluate the benefits to society of fertility reduction programmes. These economic assumptions are employed in the absence of solid answers, country by country, to the straightforward question of whether or not population growth is associated with falling productivity, reduced savings and investment, increased non-productive welfare transfer and a general retardation of economic progress. Where there is such an association, external (or societal) benefits undoubtedly exist. There is, however, the additional problem of computing the internal (to the procreating couples) benefits (and costs) of reducing family size. These internal effects must then be netted against the external effects before any conclusion can be drawn about overall net benefits to society and its various members.

44. Lastly, all the approaches to the evaluation of benefit thus far suggested focus on the generation now alive. Should it be proposed that society as a whole, in an intergenerational as well as a cross-sectional sense, be the appropriate beneficiary, then the analysis becomes considerably more complicated.

#### PROBLEMS OF COST-EFFECTIVENESS ANALYSIS

45. As stated above, cost-effectiveness analysis is a special variation of cost-benefit analysis. By taking the benefits for granted, it avoids most of the problems reviewed under benefit evaluation. Its objective is to maximize programme output per unit of resource input; or, looking at the dual theorem, cost-effectiveness analysis is directed towards minimizing the cost per unit of output. It is, thus, more purely a management tool or an administrative control device. There are, however, numerous problems also inherent in this approach.

#### *The substitution problem*

46. Most fundamental in measuring programme output is the fact that a programme may in practice end up incorporating or substituting for a previously existing family planning effort by private households. The matter can be expressed in general terms as follows:

(a) In a typical population, some groups will be practising contraception even in the absence of any publicly supported programme. These groups may be using anything from relatively inefficient "folk" methods, such as *coitus interruptus*, to sophisticated biological and chemical methods, such as the pill, purchased through commercial channels. Thus, there will already be a "programme", but it will be a totally decentralized, unplanned programme whose effect on fertility will be unknown;

(b) When a public programme is launched, it almost certainly will have the effect of substituting for some of

this previous private effort. That is, the most likely candidates for intra-uterine devices or sterilization will be couples already practising contraception by less effective means. Similarly, couples using conventional methods will then be able to obtain supplies more cheaply through participation in the programme. The limitations of this process appear when the programme accomplishes no net increase in actual family planning effort—that is, when all the apparent programme output is simply substitution; or when the programme reaches an entirely different group and is entirely a net addition to previous family planning efforts—where, in other words, there is zero substitution. One may assume that the typical situation in a developing country will fall between these extremes. That is, even before the public programme begins, some groups will have below average fertility and, perhaps, over-all rates will have begun to fall, thanks to private efforts. The public programme then will substitute to some extent, but probably also will increase the contraceptive efficiency even of those who have practised contraception over a long period, as well as reaching some new groups. On both these scores, the impact of the programme will be to accelerate the fertility decline.

#### *Defining and measuring programme output*

47. The problem of what constitutes output for a family planning programme is related to, but not identical with, the problem of how to measure the success of a programme.

48. Output can be measured in terms of the specific units of the services generated by the programme—the number of intra-uterine devices inserted, of sterilizations performed and so on. In the terminology of economics, these are really intermediate goods supplied by the programme to the clients who then actually "produce" the true final output—births prevented. It is from this final output that the final benefits flow.

49. For the more purely clinical contraceptive methods—sterilizations and intra-uterine devices—the relationship between the intermediate output generated by the programme and the final output in terms of births averted can be ascertained rather accurately once age, parity, marital status, mortality expectations and retention rates for intra-uterine devices are known. However, for non-clinical methods—condoms, foam, oral contraceptives and others—the "use-efficiency" factor looms so large that, even if those data are known for couples employing the technique, the relationship of the intermediate to the final output is still difficult to estimate. Moreover, for most programmes, available statistics on conventional contraceptives refer to total supplies distributed or sold; and the other crucial elements—number of couples actually using these supplies and frequency of use per couple—are not known.

50. Thus, for evaluation purposes there is much to be said for using some measure of intermediate output rather than attempting to use a final output measure

such as births averted. Moreover, the substitution problem can be ignored if by "output" is meant the specific and narrow accomplishment by a programme of certain, specific quantitative objectives. These specific outputs of the programme are perhaps the most relevant, since the aim is to evaluate the efficiency of the administrative programme.

51. In fact, it is not necessary to choose between final and intermediate performance measures. Outputs for the cost-effectiveness analysis of family planning should be defined as those specific services or supplies generated that can be directly related to the inputs used in the process. These outputs will be intra-uterine devices inserted, sterilizations performed and so on. Using such disparate output measures, however, raises questions as to how to combine them into a single output index.

#### *The couple-years-of-protection index*

52. The concept of the couple-years-of-protection (CYP) index was developed by Samuel M. Wishik in connexion with the family-planning programme in Pakistan. This measure makes possible a comparison of performance even when the "mix" of the various methods differs from district to district.<sup>18</sup>

53. The method, to summarize it briefly, is to allow one couple-year of protection for: (a) every 12-month period lived by a fecund, currently married male or female who has been sterilized; (b) every intra-uterine device in place for one year; (c) each total of conventional (condoms, foam etc.) and oral contraceptives distributed which (given coital frequency) would be enough to provide contraceptive protection for one calendar year. The CYP index can then be computed for any geographical or administrative subunit for which data are available.

54. Thus, to illustrate, in Pakistan the achievement index (couple-years-of-protection) was computed as follows:

$$CYP_n = \frac{C_n}{100} + .0769 O_n + (V_n + TL_n) 7.5 + I_n 2.5$$

where:

*C* is total conventional contraceptives distributed;

*V* is vasectomies;

*TL* is tube ligations;

*O* is oral pill cycles distributed;

*I* is intra-uterine devices inserted.

55. The parameters assumed are: coital frequency of 100 per year; the average number of years an intra-

uterine device is retained by a married, fecund female (allowing for reinsertions) as 2.5; the average number of fecund years remaining to a woman before she dies, is widowed, or reaches menopause, after she or her husband has been sterilized is assumed to be 7.5 years; since it requires 13 cycles of oral pills per calendar year, the total of oral cycles distributed must be divided by 13 to reach "couple-years" and this is the same thing as multiplying by .0769.

56. This technique assumes that the use-effectiveness of intra-uterine devices is 100 per cent, just as when it is stated that 100 condoms or 13 oral cycles equal one couple-year of protection the same assumption of 100 per cent effectiveness is being made. The justification for such an assumption is, as indicated above, that the measure is of intermediate output, with this output then being filtered through "use-effectiveness" to reach the final output of births prevented. An alternative way of handling these non-clinical inputs is to relate the number of contraceptive units to the number of client couples using them. Thus, one female who resupplies herself with oral contraceptives on a regular basis for 12 months, or one male who purchases condoms regularly for the same period, would equal one couple-year of protection. Here, too, there is the implicit assumption of 100 per cent use-effectiveness.

57. The CYP index described above is a measure of the current achievement of the programme, including the achievement that will be realized in the future. It is not a measure of the current level of protection being afforded to the population (or prevalence in Wishik's terminology), which must take into account the carry-over of past achievement into the present as well as some part of the current achievement.

58. Current achievement measures changes in prevalence during the period in question, but it also includes changes in future prevalence as well. The relationship between prevalence and achievement may be seen conceptually as a matrix with the time of insertion, sterilization or contraceptive distribution along the vertical axis and the time during which the couple is protected along the horizontal axis. Summing row-wise gives the achievement in each year (row), while summing column-wise gives the prevalence of protection in each year (column). Thus, the achievement in year 1 would include elements of protection extended through years 1 to *n*, while prevalence in year 3 would include some part of the achievements of years 1-3. The achievement index suggested above measures future as well as current output and is thus more meaningful in assessing the cost per unit than a prevalence index, which would treat a sterilization as being the same "output" as supplying a couple for a year with condoms. On the other hand, since achievement is partially unrealized as yet, no easy comparison can be made with the total target population of the programme. However, CYP prevalence can be expressed as a proportion of couple-years at risk in the current year.

<sup>18</sup> Samuel M. Wishik, *The Couple-Year of Protection Index: A Method of Measuring Achievement and Prevalence of Contraceptive Protection*, Manuals for the Evaluation of Family Planning and Population Programs, No. 7 (New York, Columbia University, International Institute for the Study of Human Reproduction, 1973).

59. When data required for calculating couple-years of protection are not available, some even more simple index such as "clients" or "new acceptors" can also be used to approximate performance.

#### *Defining and measuring costs of population programmes*

60. The list of inputs to the family planning programme will, it appears clear, be a long and heterogeneous one: some of the time of highly skilled medical personnel or top government administrators, the services of a semi-skilled jeep driver, the production cost of intra-uterine devices, the incentive payment paid to field-workers and so on. There may also be resources flowing into the programme from foreign donors—governmental and private—which must be added to local expenditure. Similarly, the programme will typically include local private groups—family planning associations, for example, as well as official programme operations. The national family planning budget may not include funds that are raised and spent entirely at the provincial or local levels.<sup>19</sup>

61. In some countries, family planning is merely part of a more general maternal and child health or rural public health programme. In the latter case (and inevitably to some extent also in the former), "joint-cost" problems arise: when field-workers or clinics are concerned with family planning as well as general maternal and child health work, how much of the cost of such workers and clinics should be allocated to family planning alone?

62. Similar problems arise for administrative and other overhead expenditure which supports many programmes, only one of which concerns family planning. An especially difficult case is that of the handling of research and evaluation. Very frequently, expensive, highly sophisticated research projects are undertaken in conjunction with a family planning action programme. There are "spill-overs" for the programme; but the major output of the research spending may be a product called research, not a product called family planning, however the latter is measured.

63. There is no easy solution to such problems, and, very frequently, quite arbitrary allocations of such joint costs must be made. However, this is true of nearly all applications of programme-performance budgeting to public activities and the exercises prove useful even so.

64. What does appear clear is that it is essential to be able to construct a truly consolidated budget, covering all inputs of all kinds, from whatever sources. Where programmes are partially private and partially public or split among several private and/or public agencies, a separate budget (and also separate perfor-

mance figures) should be constructed for each. Generally speaking, such budgets will already exist, and it is only a question of pulling them together into a single, standard form. Even when the programme is of this "federal" sort, for over-all analytical and evaluative purposes, the exercise of summing up all the parts to arrive at a grand total consolidated budget for the entire programme effort will be useful.

65. Knowing the budget for family planning—the total funds and resources allocated or earmarked for the programme—is only the beginning. These funds may or may not all be spent in the given period. They may be spent quickly, early in the accounting period, or there may be a bunching of the actual payment of bills late in the period in which the liabilities are incurred. This is the familiar budgetary problem of disbursements *versus* accruals and it sets limits on the ability to deal with shorter periods—months, for example—rather than quarters or years. There is the related, but still different, problem which arises from the lag between programme expenditure (however figured, whether as cash or accrual) and actual accomplishment or performance. The pipeline for supplies or services may be long, and money spent today may generate output several months from now. In general, the concern is with units of input when these actually enter into or are used up by the programme and should take actual expenditure rather than authorizations or allocations.

66. The most commonly used distinction made among various types of cost in accounting analysis is "indirect" (or "fixed") *versus* "direct" (or "variable"). The former category is also called "overhead costs" and refers, in general, to costs that are not directly related to the level of programme activity or intensity. Such costs as rent, administrative salaries or capital equipment are relatively fixed, once the general scope and scale of the programme have been decided. Other costs, such as field expenses, contraceptive supplies or transport, vary as does the level of intensity and output of the programme.

67. In principle, all costs, indirect as well as direct, should be included in the total costs for analytical purposes. It should also be remembered that the distinction between indirect and direct is not the same as that between capital and current costs. Capital items—vehicles, buildings etc.—should be charged off over their estimated useful life and only a portion of this total debited to current costs. This is ordinary accounting procedure.

68. The list of all possible inputs or costs may be very long; but, in fact, most studies indicate that personnel costs represent the overwhelming share of the total—60-70 per cent in most cases.

69. Thus, total costs can frequently be rather closely approximated if the number of personnel of various job types used by the programme and the average wage-rate for each job type are known. Moreover, for some purposes, it is useful to express programme inputs in physical terms (man-hours, physician-days or clinic-

<sup>19</sup> John A. Ross, "Cost of family planning program", in Bernard Berelson and others, eds., *Family Planning and Population Programs* (Chicago, University of Chicago Press, 1965); W. C. Robinson and others, *op. cit.*; E. K. Hawkins and G. Zaidan, *The Treatment of Population in Bank Economic Work*, International Bank for Reconstruction and Development, Economics Department Working Paper No. 16 (Washington, D.C., 1968).

sessions) as well as in financial terms. Thus, ideally, the records should also show these units.

### Summary

70. Cost-effectiveness analysis avoids most of the problems arising from benefit evaluation. By using physical measures of programme performance—contraceptives distributed, acceptors, couple-years of protection—the output of the programme can be defined quite precisely. These measures are, in fact, intermediate compared with the final output of births prevented. But for programme evaluation an intermediate output may actually be a more accurate index of performance. It also avoids the substitution problem—the difficulty of separating births prevented solely by the programme from births that would have been prevented in any case. Programme outputs, as it is suggested they be defined here, would not have occurred without the programme.

71. There is a wide range of problems arising from the need to measure programme inputs accurately, including the “jointness” of some costs with those of other programmes. These problems, however, are, in principle, no more difficult to solve than similar problems arising in a cost-effectiveness analysis of any relatively complex social welfare programme. Care in the definition of concepts, accuracy and detail in the keeping of records, and an adequate storage and retrieval system go a long way towards solving these problems.

### GENERAL CONCLUSIONS

72. This paper has attempted a critical review of the cost-benefit framework of economic analysis as it has been applied to national population control programmes in developing countries. It is considered that the conclusions below are warranted after this review:

(a) The cost-benefit framework is nothing more than an adaptation of partial economic analysis to investment decisions involving a flow of returns over time. To reject in principle the applicability of such a framework to population programmes is equivalent to saying that such concepts as scarcity, conflicting aims and the need for choice, or the desire to maximize benefits, are not relevant. This would appear to be a strong statement;

(b) The conceptualization and quantification of the benefits pose the greatest problem for any cost-benefit analysis of population programmes. It now appears clear that some of the early attempts at quantification of the benefits or fertility reduction using differences in *per capita* income were greatly over-simplified. A full weighing of all the costs of population growth (that is, the benefits of preventing a birth or the apparent costs incurred if the birth is not prevented) would take into account the internalized net costs to the procreating couples and also the externalized net costs to society, both direct and indirect. Very few such complete analyses have been undertaken thus far. It appears to be clear that the over-all benefits to be expected from a successful population control scheme may be lower than currently estimated for some countries, while for others

they may be considerably higher. (One can even speculate that differences in the mass acceptability of such programmes among countries may reflect differences in the true social and family benefits to be created by the programmes.);

(c) Cost-effectiveness analysis is nothing more than a special type of cost-benefit analysis which assumes the benefits to be sufficient and then analyses the cost per unit of output, to obtain the optimum resource usage pattern. Cost-effectiveness analysis lends itself very well to linear programming techniques and is also logically an extension of simple economic analysis. It has been employed with some success as a programme evaluation device in several family planning programmes and, indeed, should be part of any well-managed public programme;

(d) The difficulties that arise with regard to the definition and measurement of both programme costs (or inputs) and programme performance (or outputs) are not as serious as those encountered in dealing with benefits and are manageable. One serious difficulty lies in separating the final effects (or output) of the programme on births from effects that might have occurred even without the programme (the so-called “substitution effect”). There is also the operational difficulty of selecting or constructing an index of performance or output that can be related to inputs. Various solutions have been developed, including the couple-years-of-protection index, which is a multiple-method weighted index, and also the use of several indexes simultaneously;

(e) Generally speaking, the greatest confusion, uncertainty and controversy rages around the benefits of reducing population growth (or the costs of such growth), and it appears that there will be no easy or final settlement of this debate in the near future. In many ways, this debate in the population/family planning sphere is only one aspect of the larger debate which continues to rage over the specification and quantification of a meaningful social and economic welfare function. When examined closely, nearly all public expenditure programmes are based on partial analysis and contain strong arbitrary elements. Population control programmes are new and still somewhat controversial, but their economic (or welfare-creating) justification, while imperfect, is probably at least as strong as that of any other field of programme action by the public sector.

# RESEARCH ON THE BIOMEDICAL ASPECTS OF FERTILITY REGULATION AND ON THE OPERATIONAL ASPECTS OF FAMILY PLANNING PROGRAMMES

## *World Health Organization*

1. Current trends in family planning can be interpreted with varying degrees of optimism or pessimism; nevertheless, the actual levels of practice remain far removed from the goals set by the programmes. Analysis of the cause of this relative failure is complicated by the interaction between social, economic, cultural, political and personal factors. However, problems that have emerged in most programmes centre around the availability of methods of birth control to meet a variety of personal needs and preferences, for continued and successful practice, the motivation of individuals to practice family planning and to utilize the services, and the adequacy of the approaches used to deliver family planning care.

2. This paper deals with one aspect of these problems, namely, the potential role of research and development in their solution. The necessity for such research has not gone unchallenged. It has been stated, for example, that available contraceptive technology has proved its success; all that is required is making it available on a wide enough scale. However, although every new advance in this technology has introduced family planning to additional groups in the population, it has still failed to meet the requirements of others. Moreover, despite these advances, the technology remains relatively crude, inconvenient and, for many methods, associated with unacceptable side-effects on health.

3. It has also been argued that family planning programmes can go forward, on a common-sense basis, without elaborate service research. Although any approach may meet with success in its initial stages since it can cater for segments of the community ready and eager for family planning, a programme not tailored to the over-all requirements of the community cannot succeed. Decisions on the approaches to be adopted require, at the very least, measurements and information derived from sensible studies and small experiments. Although such studies cannot dictate policy in any absolute sense, they will provide guidelines, eliminate options and indicate ranges of feasibility. It may be significant that, in successful family planning programmes, there has been a regular interaction from the very beginning between pragmatic service research and the programme.

## RESEARCH ON THE BIOMEDICAL ASPECTS OF FERTILITY REGULATION

### *Characteristics of methods of fertility regulation*

4. Methods of fertility regulation are viewed differently by biologists, clinicians, users and providers of services. The biologist tends to classify them according to the step of reproduction with which they interfere: the formation of eggs (ova), the coming together of egg and sperm, the imbedding of the fertilized egg in the womb (uterus) and the course of pregnancy. The primary concerns of the biologist and the clinician are to achieve a high degree of effectiveness in a method for regulating fertility and to avoid any risk to health entailed by its use.

5. The perspective of the individual man, woman or couple is somewhat different, although to them also effectiveness and safety are important. Choice of contraceptive may be largely determined for them by the circumstances surrounding its use: whether by the man or the woman; whether immediately before or after the sex act, or dissociated from it entirely; whether it involves drugs, devices or surgical interference; whether its effect is temporary, permanent or reversible. Social, cultural and moral considerations will all play a part in influencing use of specific methods. Cost may also be a determining factor, as well as ease of obtaining and source of the contraceptive. A method like the intra-uterine device (IUD) which involves an internal examination may be unacceptable to certain cultures.

6. User preferences should be the primary determinants of the provider's choice of methods for family planning programmes. The provider may, however, be limited by other constraints, such as lack of availability of trained staff required for management of certain methods (e.g. for IUDs or vasectomy), special facilities (e.g., for abortion), adequate channels of distribution (e.g., for condoms and pills) or funds (e.g., for purchase of foreign goods, such as pills). The selection of methods is likely to be subject to pressure from special groups, professional, commercial, religious or political. It will also be influenced by the characteristics of certain population groups, such as level of education, motivation for family planning, health and nutritional status.

7. One of the immediate implications of the multiple requirements outlined above is the need for a wide range

of contraceptive methods. The quest for an "ideal contraceptive" is based on the mistaken and simplistic assumption that any single method would be universally acceptable. The need for better methods of fertility regulation and hence for research should not obscure the contribution made to health and welfare by currently available agents. This contribution, in terms of the number of unwanted pregnancies avoided and the associated mortality and morbidity, considerably outweighs the risks from the use of current methods. On the basis of available data, the risk of death even in more developed countries from pregnancy and delivery is considerably higher than that associated with any method. Where maternal mortality rates are relatively high, as in many developing countries, the risk from birth control is even less significant in comparison with the risks associated with pregnancy. Mortality from illegally induced abortions far exceeds mortality from the use of contraceptive methods.

#### *Current research and development of methods of fertility regulation*

8. Current research and development follow two main approaches: to improve existing methods and to assess their suitability in different populations, and to develop new technology. Efforts to improve range from relatively small changes in dosages of drugs, or the shape and composition of IUDs, to more ambitious attempts at altering drugs and formulations to extend considerably their period of efficacy (e.g., the once-a-month pill) and providing new routes of administration (e.g., injectable preparations). The aims are to increase appeal of the method, simplify use, to decrease side-effects and increase efficacy, to ensure cultural acceptability and to keep manufacturing and distribution costs to a minimum. These same objectives have guided the search for new methods which, in addition, will fill the most obvious current gaps in contraceptive technology.

#### *Traditional behavioural and locally applied methods*

9. A simple and cheap method for the accurate prediction of ovulation would greatly improve the reliability of the rhythm method, which is based on abstinence from intercourse during the period when a woman might conceive. Relatively little attention is being given to developing the materials required (e.g., a substitute for the thermometer), in spite of the considerable advances made in understanding the biology of ovulation and the menstrual cycle.

10. The controlled induction by a drug of monthly release of the ovum from the ovary represents another approach to rhythm contraception. The recent isolation of additional hormones involved in the regulation of ovulation urgently requires to be applied towards this end.

11. For condoms, emphasis has been placed recently on presentation (e.g., colours) of the product, and on facilitating use by packaging pre-lubricated condoms.

An attempt to substitute plastic for latex in their composition has met with little success.

12. Some effort has gone into developing dissolving films for applying intra-vaginally spermicidal agents. One of the versions that is currently being tried out is a 2-inch square of film that can be either inserted manually into the vagina prior to intercourse, or carried into it by placing the film on the penis. Further study is required to determine its efficacy. It also suffers from the disadvantage of requiring continued motivation to fertility control.

13. To over-come this drawback, research is currently under way on vaginal rings that release anti-fertility drugs over an extended period. Such devices could be inserted and removed by the user, and their effectiveness could last for a period of a month, or even longer. Different drugs and plastic rings need to be studied. The action of the drugs might be to inhibit ovulation or to stop sperm from entering the uterus.

14. Closely related are early research and development efforts on intra-cervical contraceptive devices (ICDs). The aim is to produce a device that can be retained in the cervix for prolonged periods of time without blocking menstrual flow; and that will, by its physical properties, or if medicated, disrupt the movement of sperm through the canal.

15. ICDs and vaginal rings have the potential advantage over IUDs of requiring less skill for insertion.

#### *Intra-uterine devices*

16. Continued efforts are being expended to modify the size and shape of IUDs and the composition of their materials in order to increase their effectiveness, lower expulsion rates and to reduce associated pain and bleeding. Unfortunately, only very few of these devices are being studied in comparison with one another.

17. Another line of research and development in IUDs is to use them as carriers for chemical substances or drugs which exert the anti-fertility effect. The smaller size of these "second generation" IUDs, as compared with the devices currently in use that exert their effect through their mechanical properties, facilitates insertion and reduces the frequency and severity of side-effects. The most promising and best studied of these new devices is a T-shaped plastic IUD that carries a small quantity of copper.

18. Devices that release drugs in the uterus illustrate a current trend in contraceptive research. Increased emphasis is being placed on devising means of releasing drugs in minute quantities at a continuous rate as close as possible to the organ on which the drug acts. This local release reduces side-effects, since it permits the use of much smaller quantities of drugs and essentially restricts the drug to a single organ or tissue.

19. Research on these improved delivery systems for contraceptive methods is not limited to IUDs (see paras. 13 and 14 above). It requires a considerable development effort at the bio-engineering level, partic-

ularly with respect to evolving safe plastic materials and polymers that permit controlled release rates of drugs in the body.

#### *Oral contraceptives*

##### *Modification of "the pill"—combined preparations*

20. A variety of different quantities and combinations of hormonal steroids are included under the generic term "the pill". Dramatic reductions in the amounts of the substances have, without impairing the efficacy of the preparation, been achieved over the past 15 years: for example, the progestogenic component has been gradually reduced to a twentieth of the original dose. The reductions in the amount of the substances have been accompanied by a considerable decrease in side-effects. It has been established that the risk of thromboembolism is significantly less at lower oestrogen doses and the same applies to several of the minor side-effects. Current clinical research continues to assess the possibility of still further reductions in drug dosages. At the same time, investigations are focusing in greater detail on the side-effects that each of the components gives rise to, either individually or in combination.

##### *"Once-a-month" and "once-a-week" pills*

21. The advantages of a contraceptive that would only need to be taken 12 times a year continue to stimulate research. Several hormone-like preparations are known that are stored in body fat after ingestion and provide contraceptive effect through a slow release during 30 days. Clinical studies carried out to date in several countries have not shown any of these preparations to be promising with regard to effectiveness and freedom from unacceptable side-effects.

22. Research is also proceeding on a "once-a-week" progestogen pill.

##### *Injectable preparations and implants*

23. The main research efforts with the injectable contraceptive hormones have been directed towards extending the period of efficacy of Depo Provera from three months to six months by increasing the dose. The effectiveness of the six-month regimen seems to be a little lower than that of the three-month one, yet is associated with the same side-effects. Surprisingly little research is being carried out on other injectable compounds and on making their mode of administration easier.

24. Another approach to long-acting contraception is through the use of plastic capsules that can be inserted under the woman's skin to release hormones at low and constant rates. Effectiveness for a full year has been demonstrated in limited clinical studies. One of the further aims is to develop capsules that could release drugs over three or six years, or even longer periods. Removal of the capsule would require a minor local excision. Side-effects would depend upon whatever hormones or other drugs are used in the capsules.

#### *Post-coital pills*

25. A method of birth control that might be used after, rather than before, intercourse would meet the needs of certain persons: for instance, those whose relatively infrequent intercourse does not justify the use of "continuous" methods such as the pill or the IUD, or those who have inadvertently omitted to employ their usual contraceptive. High doses of oestrogens, administered within three days of intercourse, appear effective but are associated with disturbing side-effects, and the approach is unsatisfactory except in a rare emergency situation. A small number of other drugs are currently being examined as post-coital agents, but their mode of action remains to be determined.

#### *Induced abortion*

26. Research on improved methods of induced abortion derives from the recognition that this is, and is likely to continue to be, a widely used method of birth control in many societies, e.g., in cases of failure to use a contraceptive, or because of the lack of 100 per cent effectiveness of most contraceptives available. A completely different argument has recently been brought forward. It states that the safest and most effective approach to birth control may well consist in using methods of contraception (e.g., the diaphragm or condom) less effective than the modern methods (e.g., the pill and IUD), but free from their serious side-effects, and combining this with safe termination of those pregnancies which occur through failure of the method or its improper use (safe termination of pregnancy implies the availability of trained personnel and adequate facilities).

##### *Drug-induced abortion*

27. Recent research on prostaglandins is giving a considerable impetus to the development of drugs for the termination of pregnancy. Prostaglandins have, to date, shown some effectiveness in the termination of pregnancy during the third to sixth months (second trimester of pregnancy) by causing contractions of the uterus and expulsion of the foetus.

28. Since second-trimester abortions present increased health hazards, much greater efforts are being expended on exploring the use of prostaglandins for induction of abortion during the first trimester. A major objective is the development of a prostaglandin "pill" which might be taken either monthly on a regular basis, at the time of expected menstruation and without any attempt to find out whether pregnancy has occurred, or would be reserved as a "back-stopping" method for those months when menstruation was delayed and pregnancy suspected. Modified prostaglandins, so called "analogues", appear to be more effective than the naturally occurring substances and considerable research efforts are focusing upon them.

29. A number of other potential oral abortifacients have been studied, but abandoned either because they were toxic or caused malformations in the foetuses

which were not expelled. Research is also proceeding on the isolation of the active principle of the plants used for the interruption of pregnancy in folk medicine.

#### *Mechanically induced abortion*

30. Although mortality and morbidity associated with first-trimester termination of pregnancy by mechanical methods, in particular, vacuum aspiration, are low, too little attention is given to further improving the technology. The aim would be to evolve better instruments in order to minimize injury to maternal tissues, avoid infection and reduce blood loss. At the same time, the developing countries wanting to provide this method in their family planning programmes require design of equipment, e.g., pumps, that will be suited to different service settings, simple to use and maintain, and cheap.

#### *Sterilization*

##### *In women*

31. One of the main limitations to widespread access to surgical sterilization for women has been the need for hospital facilities and skilled medical personnel. Other deterrents to its use include the attendant pain and the scarring involved.

32. Instruments have been developed that permit occlusion of the oviduct by insertion through the vagina. This appears to shorten the period of convalescence and lessen the need for anaesthesia, and it has done away with external scars, although it still requires the introduction of an instrument into the abdominal cavity. Specialized medical skills are needed. For this reason, research has been directed to the instillation of chemicals and mechanical plugs through the uterus to occlude the oviduct. It involves developing simpler systems for the delivery of these materials, possibly by less highly skilled personnel. Some promising studies have been carried out in humans, but a great deal more work on the occluding materials and the permanence of the effect is required.

##### *In men*

33. The accent in research and development on male sterilization has been both on improving the reversibility of the procedure and on eliminating the need for surgery. Many approaches are being studied in experimental animals and man. Clips that constrict the spermatic tube and that can be easily removed have been designed, as have intravasal valves that can be operated manually or magnetically. Plugging devices of various shapes and materials, inserted in the lumen of the vas deferens, are being tested. To date, all these devices are associated with unacceptable side-effects, uncertainty about the results of prolonged use and technological difficulties.

#### *Contraceptive drugs for men*

34. Research and development of contraceptive drugs for men is receiving disproportionately little atten-

tion. Part of the reason may well be the fact that there are fewer steps in the male reproductive process susceptible to regulation: sperm production in the testis, sperm maturation and transport in the sperm ducts. To date, all drugs shown to inhibit sperm formation have been associated with undesirable side-effects, particularly on libido. To overcome the latter effect, the use of testosterone, the male hormone, in combination with other contraceptive agents is being explored in the form of pills, injections and implants under the skin.

35. Another approach is the search for compounds that interfere only with the maturation of sperm and not formation of sperm.

#### *Other approaches*

36. The idea of a vaccine that would immunize against the formation of ova or sperm, or against the initiation or maintenance of pregnancy itself, has for a long time held much appeal. Although this approach has met with some success in animals, the vaccine preparations have not been of sufficient purity to allow use in humans. The questions of reversibility, effects on other organ systems or long-term effects have so far remained unresolved. Recent advances in the isolation of purified proteins of the reproductive tract have renewed interest in the immunological approach.

37. The search for new methods is continuously being extended. For example, it was found, first in insects, then in mammals, that the smell of certain substances given off by one sex affected the reproductive processes and behaviour of the other. In rodents, for instance, ovulation and implantation can be inhibited by volatile substances released by some males. The ubiquity of these substances in the animal kingdom, including primates, is stimulating research on their application in the human.

#### *Steps in developing new methods*

##### *Characterization of methods*

38. Most drug development begins with little consideration of the acceptability of the measure to the person who is to use it. Solid consumer research has been lacking to define the attributes of the methods that affect their potential use in different socio-cultural and economic settings and towards which biopharmacological research should be directed. Among the major obstacles to this research is that there are very few scientists concerned with the biosocial aspects of fertility control and that the methodology for these studies is still in its infancy.

##### *Identification of reproductive processes amenable for control*

39. Having decided on the types of contraceptives to be developed, the next step in a systematic programme is to identify one or more events in male or female reproduction that would lend themselves to regulation by the method. Although considerable

advances have been made in the past 30 years in the understanding of major processes<sup>1</sup> of reproduction susceptible to fertility regulation, such understanding is still at a relatively rudimentary level about each of these processes, their relation one to the other and their interaction with other body systems. There are great gaps in knowledge of the structure, function and regulation of processes involved in reproduction, at the molecular level, in cells and tissues, and in the whole animal. It is noteworthy that even the mechanism of action of such well-established methods as the pill and IUDs remains poorly understood.

40. More scientists are needed and from many more disciplines than those currently engaged in this field. There continues to be a discrepancy between the amount of research carried out in animals and in man. The value of animal data is unquestioned and, indeed, animal studies require extension to previously unstudied species; but the difficulties of extrapolating the findings to man are such as also to justify a far greater research effort on the normal processes regulating reproduction in man.

41. A strategy issue, in achieving better understanding of reproductive processes amenable to control, centres on the relative merits of two possible approaches, namely, the conduct of such research within the framework of a goal-oriented contraceptive effort, such as is carried out in some pharmaceutical firms, or using the undirected approach characteristic of academic settings.

#### *Translating the biological intervention into its practical application*

42. Once possible areas susceptible to control have emerged from research, a number of steps have to be gone through before the product is ready for its first trial in human subjects: synthesis or isolation of a suitable chemical; screening for anti-fertility effectiveness in animals; toxicological and teratological studies in animals. While these tests are continuing, research will proceed on the formulation and tableting of the compounds, or the design of suitable devices.

#### *Evaluating the method in man*

43. This assessment (clinical trials) is generally divided into four phases that examine in turn different aspects of the method: gross tolerance; contraceptive effect and gross side-effects; contraceptive effectiveness and incidence of side-effects; and continuous surveillance for side-effects once the product is marketed. The numbers of patients involved in each of these trials becomes larger as they proceed through the four phases.

<sup>1</sup> The most important processes include the formation, maturation and transport of sperm; the transfer to, and migration of sperm in, the female genital tract; the formation, maturation, release and transport of eggs; the transformation, i.e., capacitation, of sperm in the genital tract, and fertilization; the transport of the fertilization ovum and its implantation; the development of the embryo and foetus.

44. As for all research involving human subjects, the provisions of the 1964 Declaration of Helsinki<sup>2</sup> on the protection of those involved, or similar national legislation, apply. A persistent problem is the need to follow all women participating in these trials for prescribed periods of time, even those who abandon the method. Efforts should also be made to study the fertility of subjects who have discontinued the method and even the growth and development of their offspring.

45. These clinical trials last about four or five years before widespread use is permitted. Throughout this period, longer term studies of toxicity in animals are likely to be required and they are usually continued to investigate chronic effects. Both clinical trials and the continued toxicology testing, depending upon the nature of the method, may entail expenditures of from \$10 million to \$15 million, for one product.

46. The requirements for contraceptive testing are considerably more stringent than for other therapeutic agents. This is usually justified on the basis that these methods are used mainly by healthy subjects without continued medical supervision, over long periods of time, who may wish for subsequent pregnancies and for whom alternate methods of contraception are available.

47. The magnitude of research needed to meet these requirements is having an increasingly negative effect on research and development of new contraceptive drugs. The decreased interest and activity in industry, for example, is attributed to the costs involved and the duration of testing, especially since the latter begins to approximate the period of patent exclusivity and thus the opportunities for higher returns on investments. Moreover, from the scientific viewpoint, the value, for example, of much of the animal testing for predicting the effects of the drugs in humans is far from established. Most of these requirements have been introduced during the past 10 years. The whole question of extrapolation of animal data to man requires much further study.

48. There are other intrinsic problems in evaluating new contraceptives: securing the voluntary participation of large numbers of subjects for study; the length of time before certain side-effects will appear; the numbers of persons required to demonstrate a cause-effect relationship for an increase in a rare side-effect; the difficulty of analysing the interaction between contraceptive agents and other drugs. Moreover, the dose determined for effectiveness in one population may be too high or too low in another, and unexpected side-effects occur in populations differing nutritionally. Such uncertainties could be resolved at an early stage of evaluation through the conduct of multicentred trials using the same research design. The pursuit of the

<sup>2</sup> For the text of the Declaration of Helsinki of the World Medical Association see Council for International Organization of Medical Science, *Round Tables*, No. 1, "Biomedical science and the dilemma of human experimentation", Round Table Conference organized by the World Health Organization and the United Nations Educational, Scientific and Cultural Organization at UNESCO House, Paris, in 1967 (Paris, 1968), annex C.

required research and development is also hampered by shortages of skilled personnel in some areas, such as experimental and clinical pharmacology, bio-engineering, clinical trials methodology and epidemiology.

49. Some consider that the insistence on absolute freedom from side-effects is unrealistic, in that any therapeutic agent is likely to be associated with side-effects. The question becomes one of relative risk in which the incidence of side-effects from a given method must be compared with risks from alternative methods or from unwanted pregnancy.

#### *Acceptability and marketing*

50. It is obvious that the acceptability and successful use of a method will depend upon many factors, including, to a large extent, the sources or services from which it may be obtained. This involves considerations of use in family planning programmes and operational questions that are dealt with in a later section of this paper. However, certain characteristics of products, such as their size, colour, taste and form, may considerably affect the acceptability of a method. Research on these attributes is carried out through marketing studies and constitutes the end stages of the development process.

#### *Organization of research on methods of fertility regulation*

51. Research and development on methods of fertility regulation are currently carried out in four settings: the pharmaceutical industry; universities; government and private research institutes; and various clinical facilities. The approaches taken to research by these different institutions vary considerably.

#### *The drug industry*

52. Research and development in the drug industry involves a highly organized and directed team effort towards the development of a specific product. This effort is self-supporting and of considerable scale. Attempts are made to monitor it carefully from stage to stage. Industry, however, in general has no facilities for clinical assessment and relies on clinicians in university and other hospitals and on private practitioners for the clinical trials, largely on an *ad hoc* basis. With the increasing requirement for long-term toxicological studies, industry has also begun to contract out this work to specialized concerns.

#### *Universities*

53. Research activity in this field constituted a very small part of the universities' total research until about 10 years ago. Even now, it is of small magnitude and is mainly concerned with reproductive biology *per se* with little attention to applications to fertility control. As in most undirected research, its course has been largely determined by the personal interests of the senior investigators. This quest for knowledge for its own sake has undoubtedly contributed greatly to understanding of

reproductive processes. Some medical schools have also been involved in clinical trials of birth-control methods and in other aspects of applied research. University research, in this field as in others, derives a large part of its support from government sources. Public pressure for more tangible and practical returns for the investment of its funds may well increase the proportion of applied research. This changed outlook has also led to recent attempts to bring scientists from different institutions in organized goal-oriented collaborative efforts. These multi-institution "task forces" are directing themselves to many of the steps involved in the development of methods. An attempt is made at the same time to foster collaboration between these task forces and industry. A parallel effort is to build up within a single academic institution a multidisciplinary group of scientists concerned with research in this field. An underlying assumption to this approach is that greater pay-off may be expected from a larger number of scientists, the "critical mass" concept.

54. Support is usually provided in the form of relatively short-term grants and contracts, usually for one or two years. Longer contracts may be given to special units, such as those supported by medical research councils. Chairs in reproduction have been established in a small number of universities.

#### *Government research institutions*

55. Contraceptive research and development is found mainly in three types of governmental institutions, those of national medical research councils, of national family planning programmes and of drug regulatory agencies. The first are very similar, in structure and scope, to academic institutions. The Indian Council of Medical Research, the National Institutes of Health of the United States of America and the Research Institute of the Mexican Social Security Scheme have such specialized programmes. They are predominantly interested in problems of general reproductive biology rather than contraceptive development.

56. This contrasts with the activities of the few institutions established to provide a biomedical research base for national family planning programmes. Here, the stress is on laboratory and clinical studies designed to assess the side-effects of the contraceptives used in the family planning programmes. Such institutions are being established, for example, in Pakistan and Iran. They may also carry out studies of the mode of action of new methods.

57. Lastly, in addition to quality control and testing, the research facilities of a few regulatory agencies are engaged in investigating different approaches to contraceptive toxicology.

#### *Private research institutes*

58. Some contraceptive research and development is carried out in private institutions. For example, the Biomedical Division of The Population Council (an organization in the United States of America supported

by private foundations and government contracts) has explored a number of ways of improving existing contraceptives and developing new ones. Much of the work on the contraceptive pill took place in another private biomedical institution, the Worcester Foundation for Experimental Biology, which also had an active research training programme in reproduction, as well as undertaking research in other fields.

59. Yet another type of private non-profit making institution has become active in the field. Such institutions use the management approach characteristic of industry and, under contract from government agencies, industry and private foundations, apply themselves to specific problems in contraceptive research and development.

#### *Clinical facilities*

60. A good deal of clinical trial work has been carried out in university and other hospitals, family planning clinics and by private practitioners, usually individually, and on occasion within the framework of professional societies. Many of these studies have been well planned and carefully supervised; but, in an appreciable number, efforts have been wasted through failure of the clinician to understand the principles of clinical research.

61. To improve the quality of this important phase of contraceptive development, support is being given to a network of clinical research groups in many countries that have agreed to collaborate in clinical trials using a common protocol. This procedure should prevent the confusion that has arisen in the past when a drug was often assessed through different study designs and it should also serve to indicate quickly the differences or similarities in the response of different populations to a given contraceptive.

#### RESEARCH ON THE OPERATIONAL ASPECTS OF FAMILY PLANNING IN HEALTH SERVICES

62. The operational aspects of family planning programmes relate to the system of services used to assist or encourage the practice of family planning. Family planning care is one of several basic services which can be made available in combination with health and other community services. The challenge for the health planner and administrator is, therefore, within the limits of his current and potential resources and the time available to him to provide an efficient service. The main operational components of a family planning programme are information, education and clinical services. As in all preventive health activities, information and education about family planning in general, and about specific birth control methods, play a paramount role. The clinical services consist in assisting choice of a suitable method, ensuring its successful use, allowing for changes in methods and, in the event of contraceptive failure, providing adequate management.

63. Operational research on family planning in health services can provide reliable data to aid policy

decision making, improve the efficiency of the service, identify local applications of new technology and assess the impact on family planning and health that the services produce.

64. The design and operation of a family planning programme in any one country will be strongly influenced by socio-cultural factors, the level of technology and the presence of infrastructures for information, education, health and commerce. Large-scale family planning services in developing countries represent an attempt to set up services that will reach a large proportion of the population in rural areas which have little in the way of the needed infrastructure. In all instances, however, and despite the fact that family planning represents a new type of social service, the application of fundamental principles of administration and good management will enhance the chances of putting together a successful family planning programme. This may not involve more at the planning stage than a sound approach to the determination of needs, the assessment of resources, the setting of realistic objectives and priorities, and the selection of a strategy oriented to community use of the services. At the implementation stage, it will require resources in terms of personnel and facilities, setting-up of supporting organizational structures and interlacing of family planning with other related activities. From the beginning, provision will be made for an evaluation component to monitor activities in order to suggest improvements and assess end-results.

65. The principles of operations research and systems analysis are currently being used to assist in the formulation and evaluation of family planning programmes. Research questions may arise at any of the steps involved in the setting-up of family planning programmes.

#### *Planning phase*

##### *Determination of needs*

66. The first step in designing a family planning programme consists in identifying the groups in the population in need of such care. Eligibility for family planning services will be based on such criteria as age or exposure to pregnancy. Certain categories may be considered high-risk groups from the health, economic or social point of view; for instance, the woman whose health would be endangered by a further pregnancy, the family that cannot bear the economic burden of an additional child, and the unmarried teen-ager in whom pregnancy would be socially disruptive. Much of the demographic, social, cultural, economic and health data required will have to be obtained by survey techniques.

67. At this stage, limited research studies may be helpful or essential to solve certain specific issues. It may be desirable, for instance, to quantify more precisely the risk involved in the birth of an additional child to families of a certain socio-economic level, or to mothers of a given parity. The extent of certain birth-

control practices, especially when illegal (for instance, abortion) can be ascertained only by specially designed epidemiological studies. The need of target population groups for education about family planning as a whole, as distinct from information on specific methods, may be determined by in-depth behavioural studies.

#### *Assessment of resources*

68. The assessment includes determination of manpower, facilities and administrative structures already engaged in family planning services and those which, with additional inputs, might become available. Categories of personnel or facilities, already engaged in closely related activities, may have a potential as resources for the family planning services (e.g., auxiliary nurses, maternity wards or pharmacies). Some operations research studies may be needed to determine the additional input required for their involvement in family planning activities and the likely effect on their previous functions.

#### *Setting objectives and priorities*

69. Once the assessment of needs has been carried out and resources evaluated, the setting of objectives becomes a policy matter which does not involve research. The objectives will refer to the establishment of different aspects of family planning services (e.g., manpower, clinics, contraceptive supplies) and to the effects expected from them (e.g., changes in attitudes to family planning, extent of family planning, improvements in health, reduction in birth rate).

70. It is in the selection of priorities and approaches to meet these objectives that research can play a part. Given the inevitable shortage of means, the administrator will have to choose between many alternatives: whether the programme should be directed, in the first place, partially or wholly to urban rather than rural populations; what proportion of the programme should be devoted to education and to clinical services; in a programme designed to reduce birth rates, whether priority should be given to older or younger couples; the amount of total resources that should go to training manpower and the amount to delivery of services; the stage of the programme at which coverage should be extended to additional communities.

71. A more rational basis for the decisions required can be provided through the use of a number of new analytical research tools. These tools permit taking into consideration the impact and interaction of several variables, such as estimated feasibility, the effectiveness of measures taken and the numbers of persons affected by them, cost and need. These same techniques may be valuable in the quantification of priorities, e.g., the number of abortions it is desired to prevent.

#### *Selection of approaches*

72. Epidemiological, behavioural and operations research will all have to play a part in the selection of approaches for the programme, e.g., the choice of birth-

control methods, the media for education, the settings for services, the personnel to provide clinical care and the integration of family planning care with other health activities.

73. A number of family planning programmes have run into considerable difficulties because they did not determine which birth-control methods were acceptable to the population. Little social science research has been conducted on the image and associations that people of different cultures have of different methods of birth control. These may often prove to have little relation to the true nature of the contraceptive agent, but this perception will, nevertheless, be a main determinant of its rate of adoption. Such research might eliminate some methods from current inclusion in the programme; more often, it will point to areas where an added education effort is required or where confusion of popular terminology is proving a handicap.

74. The selection of methods should be preceded by carefully conducted programme trials that focus on the implications for services of particular methods. For example, although the incidence and types of side-effects from a particular method will usually have been first determined in a hospital-based study, the importance and interpretation given to side-effects may vary greatly when the method is used on a wider basis in different populations. The extent to which even seemingly minor side-effects may influence continuation of use can be determined in such programme trials, which will also serve to define appropriate measures for their management. At the same time, these trials can address themselves to a whole series of problems that may affect the use of the method in the programme: types of personnel required for particular methods; the kind of instruction that will ensure successful use; the frequency of follow-up needed; and the best design for record-keeping.

75. At an early stage of the programme and before decisions for large-scale implementation are made, modest studies of the ways in which family planning may be combined with other health, social, educational or commercial activities will be helpful. Although certain activities, such as maternity care, would appear to be natural entry points for family planning, selected studies have shown that the combination with child care, nutritional activities or even disease control programmes provide other opportunities. In each community, the potential value for family planning education of the schools, the general store, social clubs and community development projects can be explored and brought into the health education programme.

76. Since the development of large-scale programmes, a major point of strategy that has been debated are the ways in which the private health sector should be involved. The data on which such decisions should be based are rarely available for the private sector from standard record sources. Pilot studies on the readiness of the public to use private clinics, mobile units, the health services of industry, general practitioners or the family planning clinics of voluntary

family planning associations will document the potential value of these several approaches.

#### *Implementation of programme*

77. When a strategy has emerged from the analysis of available information and the inputs from research, more complex pilot studies, bringing together the various elements entering into the programme, are most useful. Local situations vary so much that it is usually inadvisable to base programmes solely on experience in other countries or other cultures. A pilot project under realistic conditions permits rational programme development and eventually saves both time and money. Pilot studies have been criticized for their lack of replicability. This criticism is in part justified since, in many instances, insufficient attention is given to research design permitting comparisons and to collecting the necessary data to allow interpretation of findings.

78. Research may be needed to guide implementation of the programme within the constraints of the strategy and the available resources. The methods of operations research and systems analysis will serve to identify alternative approaches and ways of optimizing performance. A typical question that might be investigated is the responsibilities (e.g., for contacting women or for inserting devices, distributing pills, following up patients) and workloads to be given to different categories of manpower (e.g., doctor, nurse, auxiliary) in a health service to achieve a given family planning objective. The same activities and tasks in different countries may have to be performed by different categories of personnel and in different health service settings. Another type of problem that may call for operations research relates to the establishment of a system of supervision or of referral between outlying families providing basic health services, including family planning and central more specialized resources. Yet another focuses on the relative merits of bringing to the patients family planning care with other essential health services rather than waiting for individuals or couples to come to the health facilities. On a more narrow scale, even such routine procedures as appointment-making or directing the flow of women through a clinic can be considerably systematized when the results of time and motion studies become available.

79. There is also a need for research into the value to a family planning programme of monetary or other forms of incentives, whether provided to the client, or those providing services. Such incentives have been introduced in several large-scale family planning programmes and in some cases account for a substantial part of the budget.

80. One of the indirect benefits of operations research is that it necessitates statement of the outcome in measurable terms. One should recognize, however, that insistence on a quantitative approach may serve to mask the important role that the human element plays in providing family planning care.

#### *Evaluation of programme*

81. There has probably been greater insistence on evaluation of family planning programmes than of other health or social activities. This may be due to the newness of family planning programmes, their size and cost as well as to the interest of demographers in these programmes. This evaluation has tended to emphasize the outcome of a programme, e.g., numbers of persons "accepting" a particular method, or changes in birth rates. There has been a relative neglect of evaluation of the operational aspects of the programme, although it is becoming increasingly accepted that such evaluation should be built into the programme from the beginning.

82. The extent to which services are used can be ascertained through routine service statistics in which numbers and certain characteristics of users are recorded. Under-utilization of services or unexplained patterns of use may often only be understood following special studies. One of the major problems in family planning is discontinuation of use of a method and non-return for scheduled revisits. Studies of such "terminations" will help indicate where the causes lie: in the accessibility of the services; the timing of clinics; the inappropriate locations of a service; the cost of the service; the attitudes of personnel. The study may reveal that the causes are unrelated to the services or that terminators are obtaining family planning care elsewhere. Careful studies of utilization may also reveal a residue of unserved clientele for which different service approaches may have to be developed.

83. Another important contribution of research to evaluation is to help identify simpler indexes of the factors likely to be significant and to develop methods of quantifying them.

#### *Organization of operations research*

84. Compared with research on contraceptive technology, the resources available for research on family planning services are meagre. Only a few sociologists, psychologists, statisticians, demographers etc. have been involved in selected aspects, and only in a small number of countries. Unfortunately, extremely few epidemiologists, operations research experts or health service analysts have given attention to such research.

85. It has mainly been carried out in research units within government family planning programmes, by university departments and schools of public health, demographic institutes, institutions for rural and community development, private organizations working in the field of population and family planning, business schools and a small number of operations research firms.

#### A STRATEGY FOR RESEARCH

86. Clearly, many problems exist in family planning programmes that cannot be resolved except through research. The crucial issue then becomes one of develop-

ing an appropriate and realistic research strategy. Some of the considerations that enter into the development of research strategy may be illustrated for the two main areas of research covered in this paper.

#### *The importance of research*

87. A basic premise is the acceptance of the importance of research on methods of fertility regulation and the operational aspects of family planning services. The problems to which such research addresses itself not only are of immediate application to social development, but are intellectually challenging. The broad scope of the subject areas required has already been mentioned. It includes social research on the acceptability of methods of contraception, the many disciplines of reproductive biology and clinical pharmacology and the various techniques of epidemiology and operations research. These areas have not yet attained recognition as priorities by national science policy bodies, medical research councils and universities. Even industry, which a decade ago appeared to be expanding its programme of contraceptive development, is cutting back its expenditures.

#### *Reorientation towards the needs of developing countries*

88. A major reorientation of the whole area of research towards the specific needs of developing countries will also be required. So far, little attempt has been made to base programmes of research in contraception on methods suitable or acceptable in the social, cultural and economic settings of these countries. For example, in spite of the evident ease of handling long-acting injectable contraceptives and their apparent acceptability to many women, little interest is shown by the drug industry in improving the existing preparation or developing new compounds. In general, popularity of existing methods in developed countries and the current profits derived from their sales appear to have provided little incentive to industry for further research on new modalities such as contraceptive drugs for men or contraceptive vaccines.

89. It is quite evident that public funds will be needed to subsidize drug development and related research. One of the most economic uses to be made of existing expertise may be to bring into collaborative efforts scientists from universities, other research institutes and industry. The latter certainly has the best resources for certain stages of drug development. Financial arrangements can be made that will protect the use of public funds and meet the interests of these enterprises, as well as the interests of developing countries.

90. Research on the operational aspects of family planning in developing countries has similarly been restricted in magnitude and often has been hampered by the application of models derived to fit situations in developed countries.

91. It would appear that the only way to set up a programme of research reoriented to the needs of developing countries is through a concerted effort

involving collaboration on an international scale and the conduct of research in both developed and developing countries.

#### *Collaboration in research between developed and developing countries*

92. The most difficult part of any research is to ask the right question and this first step will be taken in the developing countries themselves. It will cover defining the properties of potential methods that make them acceptable to a particular population and identifying specific obstacles to the use of family planning services in a community. This information provides the basis for setting the priorities for national and collaborative programmes of research.

93. In contraceptive development, collaboration between developed and developing countries is essential, but will vary in degree at different stages of the research. In the short-term perspective, and while resources are limited, much of the early work on physiological processes and synthesis of compounds will be carried out in laboratories in developed countries. Any clinical assessment will have to be done in both types of countries simultaneously. This procedure should avoid the difficulties encountered with the "pill" in the past, when the compounds and doses determined as effective and safe for the women of developed countries were assumed to apply equally to women differing in size, weight, nutrition, ethnicity and disease pattern.

94. When the stage of programme use of a method has been reached, research in the developing country will be required to determine the service implications. For these studies, expertise and some of the management techniques from developed countries may be valuable. However, modification may be required of existing research instruments to fit conditions in which it may be difficult to collect data. At the same time, it may be necessary to establish in rural areas health service research groups that would study in depth and over several years the changes brought about at various levels of family planning and other health and social services. This longer term approach to operations research has seldom been attempted in developing countries.

95. In fact, a global programme of research on methods and on services is likely to include a mix of projects having different time-frames. Short-term projects will have a certain appeal, but it should be realized that their applicability may be somewhat limited. For methods, for instance, short-term research can only address itself to minor modifications in existing fertility regulating agents. Major changes or the development of new methods inevitably presuppose a longer term investment, high risks but potentially higher pay-offs in terms of acceptability and use. Similarly, for operational aspects of family planning, short-term research will, it is hoped, remove some blocks in current service structures, but a longer time-span will be required to elaborate new approaches appropriate to the urban or rural patterns of the developing countries.

### *Resources for research in developing countries*

96. A *sine qua non* for the world-wide research effort needed is the build-up of resources for research and technology in developing countries. This will redress the current gross imbalance in scientific expertise between developed and developing countries and will equip the latter to identify their own priorities, select and adapt technology from elsewhere and participate in the development of new techniques and approaches. Here again, a strong argument can be made for training, in the first instance, manpower that can address itself to research currently under way in developing countries—for example, clinical trials of contraceptive methods or studies of under-utilization of services. At the same time, however, a beginning should be made in training some scientists for more fundamental aspects of these problems while the facilities for such research are being developed. This will eventually lead, at a regional level at least, to the study of all aspects of local problems by talent so far untapped. These resources will also serve to enhance the quality of university education needed to produce more scientists and technologists who will carry out research on fertility control methods and family planning care. These objectives are simple to state, but difficult to achieve. They will require considerable efforts and reorientation in developed and developing countries in terms of long-term commitment of considerable funds, of manpower and in rethinking of existing structures for research.

#### *Funding for research*

##### *Biomedical aspects of fertility regulation*

97. Fairly accurate estimates are available of the annual over-all funds for support to contraceptive research and development, including reproductive biology. In 1972, they amounted to approximately \$50 million from industry, another \$50 million from research agencies and institutions in the United States of America and no more than \$25 million from other sources.<sup>3</sup> Although some countries have recently increased governmental contributions to contraceptive research, the total sum allocated in this area is dwarfed by the sum allocated to other forms of biomedical research. The major part of the government funds comes through the channel of the medical research councils, but technical assistance agencies of several countries also now devote part of their budget to this problem. Some funds are also channelled through multilateral sources such as the World Health Organization (WHO) and the United Nations Fund for Population Activities (UNFPA).

98. These increases may, to a certain extent, be neutralized by the gradual withdrawal of industry from this area of research, due to the alleged high commercial risk. To maintain the momentum of industry in certain countries, government funds have been made available in the form of limited research contracts. This

use of public money inevitably raises questions of patent rights. Some leaders in industry have urged more flexible royalty arrangements, whereby new products developed by government funds would be provided on a cost basis in the public sector and would allow a profit margin in the private sector. A few drug manufacturers have gone so far as to suggest programmes of shared risk between government and industry, especially for toxicological and clinical studies. The research potential of industry might also be tapped, through government subsidies, to develop so-called "non-commercial products", i.e. cheap, non-prescription drugs and devices, an area in which the drug industry is unlikely otherwise to show much interest.

##### *Operational aspects of family planning programmes*

99. There are no accurate estimates of annual expenditures on research in the operational aspects of family planning programmes, but it is unlikely to exceed \$10 million.

100. The funds needed for research on the operational aspects of family planning care will represent only a small proportion of the cost of these programmes. Unlike contraceptive development, its findings are likely to be limited to the local situation. Facilities for the handling of large amounts of information and for analysis of multiple variables will be needed for many, although by no means all, of these studies.

##### *Future funding requirements*

101. Feasibility studies have shown that, internationally, a considerable potential exists for an immediate expansion of research in both biomedical aspects of fertility regulation and the operational aspects of family planning programmes. In the longer term, the development and strengthening of research capacity within individual countries will also require additional funds on a continuing basis. A doubling of the actual level of funds for reproduction and family planning research, to about \$250 million per annum, would more completely take advantage of existing international talent, broaden the research base, provide a preliminary solution to at least some of the technological problems and permit some building up of national expertise. Continued funding over a 15-year period should be envisaged. Subsequent adjustments would be based on reassessment of needs, priorities and the enhanced capacity to undertake research.

102. Any strategy for research is very largely determined by the level of funding available, which will influence decisions concerning the mixes of directed and non-directed research, of short- and long-term pay-offs, of investment in research training, of directing efforts to male or to female contraception and of different methods. The over-all level of funding available will, in itself, be a reflection of the importance given by society to this problem, just as the development of effective antimalarial drugs or travelling to the moon reflected other priorities and led to those achievements.

<sup>3</sup> Figures for China are not available.

PROGRAMME OF RESEARCH OF THE WORLD  
HEALTH ORGANIZATION

103. For the sake of brevity, only those aspects of the WHO research programme in human reproduction which bear directly on the biomedical aspects of fertility regulation and on operations research on family planning programmes are described below, although many of its other research activities, for instance, studies on infertility or pregnancy, relate to them indirectly.

*New methods of birth control*

104. The strategy adopted in the WHO programme of research on new contraceptives, intensified in 1972, involves several considerations: the demand by member States for a variety of safe and effective methods within a reasonable period of time; the limitation of funds for such research; the intent to complement ongoing efforts supported by other agencies and by industry; the unique position of WHO in fostering collaboration between scientists and institutions in many countries.

105. This part of the WHO programme mobilizes existing expertise in this field and, given the need for sophisticated technology, involves scientists in many developed countries as well as in developing countries. It is funded through special donations, amounting in 1973 to \$6.4 million. At this stage, several goal-oriented collaborative research projects, directed to most of the areas described in earlier sections of this paper, have been initiated. These "task forces" in contraceptive research and development constitute a major approach in the programme and in some cases involve both industry and academic research institutions.

106. The need for extensive clinical trials of new contraceptive methods has already been described and has proved a major obstacle to development in this field. The WHO programme provides support to a network of clinical research groups in many countries that have agreed to collaborate in trials using common protocols. These multicentred trials should serve to indicate quickly the differences or similarities in the response of different populations to a given contraceptive and to avoid the confusion that has arisen in the past when a drug, such as the "pill", was assessed through different study designs.

107. Efforts have also been made to build up, within single institutions, multidisciplinary groups of scientists and to remedy, through research training, the shortage of skilled personnel in some areas, such as clinical pharmacology, bio-engineering and clinical trials methodology.

108. This whole programme of research in new methods is closely co-ordinated with the continuing and expanding WHO programme on other aspects of family planning described below.

*Effectiveness and safety of existing methods of fertility regulation in developing countries*

109. The modern methods of fertility control, especially the hormonal steroids and IUDs, have been developed and tested in women from more developed

countries. It has been assumed that the same dosage of these drugs or shape of the devices would be equally suited for women from less developed countries in spite of the fact that these women differ in body size, diet, child-bearing patterns, work habits and genetic constitution. Moreover, large numbers of them exhibit varying degrees of nutritional deficiencies and are prone to many infections and infestations. Lack of national research and expertise on these questions has held back authorities from making available a number of contraceptive modalities. This reluctance has been accentuated by the ambiguous and harmful effects found at times in some Western women.

110. The WHO programme is directed not only to supporting studies on these problems, but to establishing the relevant national expertise to carry out such studies on a continuing basis. Major programmes are under way in Egypt, India, Iran, Pakistan, Thailand and Turkey.

*Patterns of family formation and health*

111. Different patterns of family formation, in the sense of the timing and spacing of births and the total size of the family, are associated with different risks to the health of mothers and children and other members of the family. Studies carried out so far in developed countries have shown the considerably higher mortality and morbidity of older (over age 30) higher parity (over four) women and their offspring. This finding, in itself, constitutes a solid rationale for family planning. It is noteworthy that provision of family planning care for the high-risk groups will have a considerable impact on limiting population growth since they contribute up to 50 per cent of all births in less developed countries.

112. The associations between health and different patterns of family formation need to be examined in a variety of developing countries, in order to provide bench-marks for the family planning programme. Moreover, these studies serve to indicate causal relationships around which interventions by the family planning programme and related services may be made most effectively. A related area for investigation is the extent to which decisions concerning the practice of family formation are influenced by real or anticipated infant and child mortality, particularly in developing countries with high levels of such mortality.

113. As an illustration of WHO-supported research in this area, a collaborative study on relationships between family formation and health now involves Colombia, Egypt, India, Iran, Lebanon, Pakistan, Philippines, the Syrian Arab Republic and Turkey.

*Induced abortion*

114. Research on induced abortion represents a priority area both in settings where it is practised illegally and in the many countries that in recent years have legalized termination of pregnancy. In the former group, well-designed public health studies, by showing the magnitude of the practice and its associated mortality, morbidity and financial costs to government services, will serve as a basis for instituting family planning activities. Where abortion has been made

available, authorities have raised many questions, such as the relative merits of various methods for termination at different stages of pregnancy, the dangers if any of repeated abortion, the staff and facilities required for different methods and the interrelations between provision of abortion and use of contraceptive methods.

115. Between 1966 and 1970, a small number of studies were initiated by WHO, either focusing specifically on induced abortion, e.g., in Brazil and Czechoslovakia, or collecting data on abortion as part of a wider community study, e.g., in Peru and Senegal. The WHO has now initiated a series of carefully designed studies on the short- and long-term *sequelae* of different procedures for termination of pregnancy.

#### *Programme trials of methods of fertility control*

116. The inclusion of any method of fertility control in a national family planning programme should be preceded by carefully conducted programme trials. These trials permit an assessment of the reactions of the population to the method when used outside the carefully supervised setting of the clinical trial. At the same time, they bring into focus the implications for services of the method. The extent to which even seemingly minor side-effects may influence continuation of use can also be determined and feasible measures for their management defined. Moreover, these trials will address themselves to the specific service needs of the method. These may range anywhere from choosing the appropriate terminology to present the method in a given cultural setting, to selecting the types of personnel required for particular tasks involved in management, the kind of instruction that will ensure successful use, the frequency of follow-up needed and the best design for record-keeping.

117. The set-backs encountered in a number of family planning programmes can in part be traced to failure to conduct such programme trials. To provide, therefore, a sounder basis for family planning programmes, a programme of studies on this aspect is being organized. Some of this research will be done on a collaborative basis; the similarities and differences that should emerge might help in identifying generally applicable approaches as well as the distinctive requirements of particular situations.

#### *Family planning behaviour and practices*

118. The successful implementation of a family planning programme depends ultimately upon the extent and consistent use by individuals and couples of birth-planning practices. The factors that motivate them in this regard include social prescriptions on parenthood, cultural considerations affecting conjugal relationships and sexuality, and values attached to children. Base-line data on these factors obtained in research studies in different communities are essential to the development by health authorities of appropriate informational, educational and clinical services. The biosocial approach to such research provides health authorities engaged in family planning with the appropriate orientation for

reinforcing, or even changing, patterns of fertility control practices.

#### *Problems of organization and administration of family planning care*

119. In assisting Governments in developing family planning programmes, WHO has been faced repeatedly with the need to decide between alternative approaches. To avoid the set-backs caused by arbitrary decisions, some research is urgently needed, especially in view of the newness of family planning and in the face of considerable constraints in terms of availability of national staff and facilities. A variety of new analytical research tools, such as systems analysis, may be particularly useful in this regard.

120. The programme of research to be undertaken under this heading addresses itself to such questions as:

(a) The responsibilities (e.g., for contacting women, or for inserting contraceptive devices, distributing pills, following up patients) and workloads to be given to different categories of manpower (e.g., physician, nurse, auxiliary) in a health service to achieve a given family planning objective, though the same activities and tasks in different countries may have to be performed by different categories of personnel and in different health service settings;

(b) The integration of family planning functions and administrative structures with those required for other priority health activities, such as general maternity and child care: this aspect may be particularly important in the commonly encountered situation where only peripherally based auxiliaries are available to provide minimum comprehensive health care, including family planning;

(c) The establishment of a system of supervision or of referral between outlying facilities providing family planning and central more specialized resources;

(d) The merits of bringing to the patients the bulk of family planning services rather than waiting for individuals or couples to come to the traditional facilities;

(e) The readiness of the public to use private clinics, the health services of industry, general practitioners or the family planning clinics of voluntary family planning associations.

121. Pilot projects on these problems carried out under realistic conditions and at decision points eventually save both time and money.

122. Some support has been given by WHO to a study in rural India on the provision of family care in various combinations with health activities. The WHO also is becoming involved in a large-scale rural family planning/maternal and child health research project in Tunisia, and, in collaboration with the Population Council, in another similar project in the Philippines. It is also in the second year of a health planning research project, involving an entire province in Iran, that focuses on the place of family planning in the general health structure.

## NEW DEVELOPMENTS IN THE REGULATION OF HUMAN REPRODUCTION

Sheldon J. Segal\*

1. Methods of fertility control are available which can be highly effective in particular circumstances. Yet, for most parts of the world, the dawn of an era of effectively used contraception is still awaited. The status of research towards new methods which could hasten this event can best be viewed in the light of the recent past. Twenty years ago, clinical testing of an oral contraceptive had begun in the United States of America, Mexico and Puerto Rico. Within a few years, the original "Pincus Pill" was introduced and the search for competing products became a high priority for the commercial sector around the world. Apart from new versions and lower doses of the original "pill", contraceptives introduced since 1956 have been modern intra-uterine devices (IUDs), sequential pills, mini-pills, vaginal foams, coloured condoms and, in some countries, injectable progestins. In this list, only modern IUDs have taken a place alongside "the pill" as a major development, adopted by millions around the world. Both of these so-called "modern" methods, however, have limitations and disadvantages. Each requires an advanced health establishment to be used most effectively. The pill is associated with both troublesome minor side-effects and rare, but serious, major risks. IUDs, in general use, require insertion by a skilled health worker, are frequently not tolerated by women who begin using the method and also carry the risk of serious consequences in rare cases.

2. Beyond these issues, the success that couples achieve with current contraceptives is far below usual expectations. This is true even in those countries with conditions of literacy, health services, transportation and communications which would facilitate proper utilization of a method selected for use. In the United States, for example, where the rate of use of contraception is high, one third of couples using contraceptives have an unintended pregnancy within five years. This means that, for most couples depending upon reversible contraceptive methods for many years after the completion of the desired family size, it is just a matter of time before an unintended pregnancy can be expected. The limitations of contraceptive technology certainly contribute to the high legal abortion rate in many countries, when this choice is provided to women. In a sense, research towards improved contraceptive technology is a search for abortion-prevention therapy, as

well as an effort to provide more acceptable, effective and safe methods for the world's population.

3. Contraceptive development depends upon the understanding of physiological mechanisms concerned with conception, basic studies in animals and human subjects to establish effectiveness and safety factors and, ultimately, acceptability studies in various social and cultural circumstances. The total process is lengthy and complex, so that any new methods likely to emerge in the near future must currently be at some advanced stage in the development process. Certainly, some extent of testing in human subjects must have begun. Based on these criteria, the following "new" or "modified" contraceptives may be developed within from three to five years from now.

### METHODS IN CLINICAL TRIAL

#### *Methods for use by men*

#### *A combination-steroid method to arrest sperm production, based on oral, injectable or subdermal implant routes of administration*

4. Tests in men have established that it is possible to suppress sperm production while maintaining normal levels of plasma testosterone, and that this procedure is readily reversible. Demonstrating that this combination of results can be achieved is a major breakthrough equivalent, for example, to the first observations that ovulation suppression and acceptable bleeding patterns could be obtained with steroid combinations in women (leading subsequently to development of the pill). From here, work has to proceed in two directions: (1) applied research and development to select the best combinations of progestin and androgen among those now available and the best routes of administration; (2) basic study in animals and humans on various issues of safety and potential side-effects.

5. The type of reversible method that is a feasible outcome of this work is a biodegradable implant of androgen that would last one year or longer, supplemented by a weekly pill or a semi-annual injection of progestin. The possibility of a double-implant (androgen and progestin) method lasting a year or longer at a time is more uncertain, but not out of the question.

#### *Arrest of sperm production by tri-monthly injections*

6. At least three compounds have been tested in small numbers of men and have proved to suppress

\* Vice President, The Population Council, New York.

spermatogenesis. The potential problems are a loss of libido or development of gynecomastia when progestins are used and medical anxiety over metabolic disorders or cardio-vascular hazards when potent androgens are used. Yet, this approach is sufficiently promising to warrant the study of several synthetic steroids and their esters for spermatogenesis inhibition free of unacceptable side-effects.

*An anti-androgen to prevent epididymal sperm maturation, based on oral or subdermal implant routes of administration*

7. Tests in a limited number of men have been begun based on an observation made in rats given an anti-androgen by subdermal implant. In those studies, epididymal sperm failed to achieve the motility that normally occurs, and the animals were rendered infertile, without loss of libido. Although the subdermal implant route of administration would not be feasible in men to achieve systemic activity by way of the circulatory system, the possibility of local action by implants placed in the scrotum, contiguous with the epididymis, cannot be ruled out.

*Reversible vas occlusion*

8. Currently under clinical study are several removable clips that can be applied to the *vas deferens* through a small scrotal incision and at least two devices which, by a more complicated procedure, can be placed within the *vas*. One of these is a simple plug made of polyethylene, which is designed for subsequent surgical removal, if desired. The other is a micro-valve intended to be left permanently fixed within the *vas*, with a simple manipulation making it possible to place the valve in either an open or closed position, as desired. No fully satisfactory clip method has yet emerged; those tested thus far either fail to close the *vas* or cause necrosis of the underlying tissue. Plugs so far tested have the same disadvantages.

*Intra-vas device*

9. An effort to cause sperm necrosis or immotility by placement of a non-occlusive foreign body in the *vas deferens* has been tested clinically, with only partial success. In this first experiment, involving close to 1,000 volunteer subjects, surgical silk was suspended within the lumen of the *vas* and fixed loosely to the perivasal surface to facilitate subsequent removal. Now, experimenters are beginning trials with pharmacologically active intra-*vas* foreign bodies, including copper or zinc filaments. The effect in animals of these metal ions is to immobilize sperm or to cause head-tail separation. The first tests in men are based on observing these morphological characteristics of ejaculated spermatozoa. Even if these trials are successful, it will be some time before contraceptive effectiveness tests could begin, since difficult issues of teratology are involved when there is a possibility of partial damage to sperm.

*Methods for use by women*

*Long-term injectable progestin*

10. Two compounds have been sufficiently used to have been marketed as tri-monthly contraceptive injections in some countries. They work by suppressing peaks of luteinizing hormone release, thereby preventing ovulation. Bleeding patterns with each compound are erratic. Most women, after experiencing irregular bleeding at first, tend toward amenorrhoea. Each compound has important issues with regard to safety and reversibility still unresolved. With increasing level of use, these issues should be resolved within three years. Meanwhile, searches for other compounds that can be used safely as injectable contraceptives and for delivery systems that will provide slow and constant release of progestins from the site of injection are proceeding. One clinical trial has begun with a biodegradable inert carrier which is slowly hydrolyzed, thus releasing the loosely bound progestin molecules.

*Subdermal implants of progestin*

11. This new method of contraception has been proved effective for periods of at least one year and is in an advanced stage of product development. In its current form, the method requires the insertion and removal, under sterile conditions, of Silastic tubes or rods containing the anti-fertility hormone. Several progestins have been tested, but the optimal compound has not yet been selected. Meanwhile, clinical trials are proceeding with eight different compounds, involving the use of one to six implants. In addition, the first biodegradable implants have been developed and will probably be placed in clinical trial by 1974.

*Intra-vaginal ring containing progestin*

12. Comprehensive work has been completed to establish that the absorption of progestins through the vaginal mucosa can be used as the basis for ovulation suppression. The contraceptive effectiveness and acceptability of a product based on this principle are now being studied in field trials; three different progestins are under investigation. The compounds are incorporated into Silastic and moulded into the form of a ring, similar to the size and shape of the rim of a vaginal diaphragm. The ring can be inserted by a woman and left in place one month or longer. Studies are proceeding on the basis of leaving the ring in place for one month, for two months or for the entire interval between spontaneous bleeding periods. This new method is undergoing product development, with engineering and design modifications in progress to reduce cost and to standardize monthly steroid-release rates.

*Contraceptive bracelets containing progestins*

13. Absorption of steroids through the skin, a principle long employed for cosmetic purposes, is now being tested as the basis for contraception. The current preliminary tests in women involve the use of Silastic

as the carrier of progestin, in the form of a snugly fitting arm bracelet. The clinical tests are being carried out with three different compounds and with two different forms of Silastic bracelets. The work needed to develop the contraceptive bracelet is mainly of a product design nature and subsequent clinical testing. The principle of steroid administration by this route is sufficiently established. Feasibility for contraception depends upon a design of bracelet which will provide a sufficiently constant rate of absorption.

#### *New intra-uterine or intra-cervical contraceptive devices*

14. Limited or extensive trials are in progress with at least seven new types of intra-uterine devices and one that is designed to remain within the cervix. Several of these incorporate the principle of using the IUD as a carrier for an anti-fertility agent that acts locally in the uterine lumen (copper, progesterone or a non-steroidal agent). The "copper-carrying devices" are most advanced in testing and will be available generally by 1974. They are already on sale in several European countries; and one of them, the Copper T, is about to be introduced in India in a large-scale field programme. There are several versions of the Copper T under test. The one tested longest, the TCu 200, can be left in utero for at least two years, but probably not longer than four in order to maintain maximal effectiveness. This time limitation is overcome with newer models, which may also have a higher contraceptive effectiveness than the TCu 200. The other form of copper-carrying device (the Copper 7) probably performs similarly to the Copper T, although until now, this device has been designed and tested for replacement every year, thus making it less appealing for public sector use, particularly in developing countries. The progesterone-releasing IUD (also in the form of a T-shaped plastic device) has a similar limitation in effective time span. Current technology permits the device to release the hormone for approximately one year and this is the version that is being tested. The contraceptive effectiveness of this device has not yet been established. Although some women have used intra-uterine foreign bodies containing various non-steroidal anti-fertility agents, this experimentation is at an early stage. Neither the form of the carrier nor the precise chemical to be used for large-scale testing has been selected.

15. The hopes for improved performance of inert intra-uterine devices currently being tested are based on design modifications, the value of which can only be determined by extensive clinical trial. One modification is a three-dimensional form used years ago without having a distinctive performance record, but currently being tested for use specifically in the post-partum or post-abortion uterus. Another employs an accordion-pleated membrane designed to cover a relatively large area of the endometrium surface. Still another is Y-shaped, so as to locate in the uterine angles and impinge upon the utero-tubal ostia. The intra-cervical device under limited test is supposed to influence the

cervical mucus in a manner to prevent sperm penetration.

#### *Monthly pill or suppository to be used to induce menstruation*

16. The few compounds that have been tested as potential orally active luteolytic agents suppress the *corpus luteum* and bring about a menstrual discharge by eliminating the progesterone support required by the endometrium, and, therefore, the initial implantation site. One of these, aminoglutethamide, does suppress *corpus luteum* function, but not sufficiently to bring about the desired effect. This particular compound is not being tested further in women as a menses-inducer, but many of its analogues are being synthesized and screened in animals for possible clinical trial.

17. There was some hope that a naturally occurring prostaglandin, absorbed through a vaginal or rectal suppository, could act systemically to suppress the human *corpus luteum*. This use of prostaglandin F<sub>2α</sub> and E<sub>2</sub> has been studied without success, but there will be a continuing effort along these lines as prostaglandin analogues are synthesized.

18. Another experimental approach to menses induction in women is the use of synthetic progestins at the mid- or late-luteal phase of the cycle in order to suppress endogenous progesterone production with doses of a progestin which will not, itself, maintain a nascent placentation site. Four synthetic progestins were tested in women and found to cause reduction of *corpus luteum* function, but the effect was not sufficient to overcome the luteotropic action of chorionic gonadotropin. One compound is still being tested in this regimen.

19. The promise of a contraceptive method based on the principle of menses induction, whether or not a cycle has been fertile, warrants an investigative effort of the highest priority. In this approach could lie the solution to the problems of safety associated with continuous dosage forms of hormonal contraception; a solution that could yield near-perfect effectiveness. Not only should available compounds be tested, as will certainly occur, but special synthesis programmes should be undertaken to uncover compounds that could be used in this form of contraception.

#### *Monthly pill to cause ovulation suppression*

20. One combination of compounds has been tested on a monthly schedule of administration for suppressing ovulation. The steroids used are absorbed from the gastro-intestinal tract, stored in adipose tissue and released gradually over a month. The results, however, have been sufficiently disappointing that the sponsoring company dropped further product development in the United States of America, and the current limited distribution abroad will probably cease before long. No other compound is being tested on this basis currently, but a concerted search for an anti-ovulatory compound effective as a monthly pill would have good chances of success.

*Monthly pill, injection or suppository to regularize ovulation as a basis for improved "rhythm"*

21. One of the effective fertility drugs, which acts through the hypothalamus to induce ovulation, has been tested in normally ovulating women as a means to regularize ovulation in a predictable fashion. The objective of this study was to improve the contraceptive use of periodic abstinence by causing a precisely timed ovulation. This test was not successful since, with succeeding months of use, the interval between drug ingestion and ovulation increased in an unpredictable fashion.

22. Now that luteinizing hormone releasing hormone (LHRH) has been identified, isolated and even synthesized, the prospect of using this polypeptide for regularizing ovulation in normally cycling women has been put to clinical test. The few cases so far reported indicate the potential feasibility of the procedure and the issues that need further study have been identified. These issues include the potential for multiple ovulations, convenient mode of administration and consistency of response. There may now be a continuous process of synthesizing and testing of LRH analogues both for the purpose of inducing regularized ovulation and with the hope of developing antagonists that would cause acceptable patterns of anovulatory cycles for contraceptive purposes.

*Post-coital pill to be used regularly*

23. Although diethylstilbestrol is now available to reduce the chances of pregnancy following isolated mid-cycle exposure, the side-effects and disruption of the ovarian cycle are such as to make the procedure unacceptable for regular post-coital contraception. Two of the synthetic progestins have been tested experimentally as regularly used post-coital pills, but with poor effectiveness and considerable disruption of the bleeding pattern. One has been suggested as a possible "morning-after" pill and the other as a "minutes-after" pill.

24. Several compounds, related structurally to diethylstilbestrol, have post-coital anti-fertility activity in laboratory animals, and three of these have been tested without success in women. Others in this series are available for testing, and one is in a careful clinical trial in India. This type of compound has a potential for contraceptive activity that has not received adequate attention in the past.

*Pre-coital pill to alter the cervical mucus and prevent sperm penetration*

25. Progesterone induces thickening of the cervical mucus so that during the normal cycle, a natural barrier to sperm penetration exists during the post-ovulatory phase. At least two compounds with oral activity as synthetic progestins have been tested for selective effect on the cervical mucus at doses that would not influence other progestin-responsive tissues. At first, it was believed that one of these compounds could cause thickening of the cervical mucus in the pre-ovulatory

woman within two hours after taking a pill; but this proved to be an erratic response, not reliable for contraceptive purposes. Currently, no particular compound with the unique activity desired has been identified, but various trials with the conventional progestins taken before or near the time of coitus are proceeding.

*Weekly pill to disrupt endometrial development*

26. A synthetic progestin that can be taken weekly as an oral contraceptive is in the process of product development. It currently appears that the method will have a pregnancy rate similar to that of the "mini-pills" now available and will have a similar performance with respect to bleeding irregularities. Thus, the advantage, if any, will lie in the difference in schedule of administration.

*Chemical abortifacient*

27. The use of the naturally occurring prostaglandins or their synthetic analogues as first-trimester abortifacients has been studied extensively, but the disadvantages appear to outweigh the advantages. Further progress will depend upon the synthesis of new analogues which may be selectively more potent when acting on the myometrium than on other smooth muscle. Such studies will undoubtedly continue in the coming years, but the only immediate prospect for the application of the uterine-contracting activity of prostaglandins recently available in the United States is in place of the use of intra-amniotic saline or hysterotomy for mid-trimester termination of pregnancy, as a hospital procedure. No other chemical abortifacient is currently under overt investigation. It is believed that several of the cytotoxic agents used in cancer chemotherapy are either embryo-toxic or placentotoxic when given to women early in pregnancy. On this basis, methotrexate, available for treatment of choriocarcinoma, has earned a reputation as an effective chemical abortifacient but has not been subjected to controlled evaluation when used for this purpose. A careful evaluation of this compound or compounds with related activity could provide, within one or two years, an analysis of the risk/benefit ratio when used instead of surgical abortion.

*Chemical or electro-cautery sterilization*

28. Methods are now being tested, rather extensively, to cause closure of the tubal ostia by the transcervical approach. Instillation of an aqueous suspension of the chemical, quinacrine, is being studied by several groups. In addition, at least one sclerosing agent has been shown to be effective in a small series of cases. Particularly for situations in which hospital-bed space is limited, female sterilization as an out-patient procedure would result in greater use of this method for fertility limitation, although the irreversibility would still limit the appeal for young women of low parity. Also in an advanced stage of investigation is the use of trans-cervical cauterization of the tubal ostia with

the aid of hysteroscopic visualization. Indeed, this procedure is now sufficiently tested to be used by medical personnel with sufficient specialized training.

*Immunization of women with an antigenic component of chorionic gonadotropin*

29. Although considerable basic work is still required, there has been some preliminary, limited work involving volunteer subjects who have received purified human chorionic gonadotropin antigen as an inoculation designed to develop antibodies to the biologically active component or HCG. Ultimately, fragments of the molecule, readily synthesized, could be used in linkage with highly antigenic carrier molecules. Coordinate carriers would be those antigens widely used in public health immunization programmes. The purpose is to interfere with the essential early role of HCG as pregnancy attempts to become established, so that the expected menstruation will take place even in the event of a fertile cycle. A single inoculation presumably would last more or less indefinitely, but means of imparting reversibility to the procedure are feasible. For example, the effect of the immunization might be overcome by the use of exogenous progestins, in order to establish a pregnancy. There are problems associated with cross-reaction with pituitary luteinizing hormone and the possibility of immuno-complex diseases that need to be resolved before unlimited clinical application would be possible.

30. The procedures described above are the 19 experimental contraceptive procedures—14 for use by women, five by men—which had had some level of actual clinical trial by early 1974. If there are others, the work has been either too preliminary to have been reported in the scientific literature, too incomplete to warrant discussion or kept confidential for commercial product-development reasons. There are, in fact, a few compounds in the latter category not covered in this review, but they do not hold special promise for dramatic breakthroughs in contraception.

31. In any event, these 19 procedures are the major, if not only, prospects for new contraceptive methodology in the near future since they have already reached the stage of clinical investigation. Any potential method that has not yet had some degree of clinical trial is many years away from practical application, given the time needed to establish efficacy and safety.

32. The significance of the current items of applied contraceptive research is best put in perspective by realizing that those experimental methods which are most certain to succeed if development efforts continue are those most similar to existing methods and may, therefore, have least programmatic impact. Experimental methods that are most innovative and different, having the greatest likelihood of improving upon methods currently available, are less likely to survive the critical testing phases ahead. It would be foolhardy, indeed, to assume that the ultimate objectives in contraceptive research have now been identified and one

need only to proceed with goal-oriented work to achieve them. The continuous identification of new leads is, perhaps, the critical part of the over-all process of developing new contraceptives. The development of a flow of new ideas to serve as the basis for clinical trial depends heavily upon studies fundamental to a greater understanding of the normal reproductive process.

POTENTIAL METHODS OF THE FUTURE

33. From the lines of clinical research now in progress, as well as other research topics which have not yet reached the stage of clinical trial, it is possible to compile a list of potential methods to regulate fertility which have a realistic basis in terms of our present knowledge. Scientific breakthroughs could at any time render such a list obsolete or incomplete. This limitation notwithstanding, the list serves to reveal the possibilities most likely to become the contraceptive methodology of the future.

*Methods for use by women*

34. The potential methods for use by women include:

(a) *Once-a-month pill*. This is a modification in the manner of using estrogen-progestin combinations. The steroids used are absorbed from the gastro-intestinal tract, stored in body fat and released gradually over a month. One preparation was tested, but was discontinued because of irregular bleeding and low level of effectiveness. Other compounds that work in this manner are possible;

(b) *Once-a-month injection*. This is a modification in the manner of using estrogen-progestin combinations. Long-acting steroid esters are injected at a dose calibrated to last one month;

(c) *Once-a-month vaginal ring*. Preliminary trials have been completed. This procedure is based on anti-ovulatory action of a synthetic progestin released from a synthetic polymer and absorbed through the vaginal mucosa;

(d) *Long-term injection*. Extensively studied in clinical trial, this procedure is based on the anti-ovulatory action of a synthetic progestin without estrogen. Micro-crystallized suspensions of the steroid are injected in doses that will last three or six months;

(e) *Long-term implant*. Initial clinical studies are in progress; this procedure would provide chronic release of estrogen-progestin to suppress ovulation and menstruation;

(f) *Continuous low-dose progestin*. This method provides an anti-fertility effect without inhibiting ovulation or the normal endometrial cycle. The progestin can be given by various delivery systems:

(i) Pill or oil-filled capsule taken orally: commercial products are now available in many countries;

(ii) Subdermal implant: provides for continuous absorption from an elastomer at a constant rate. One

version now proved to work for one full year. Studies continuing to improve and simplify the method, and to prolong the life span of the implants. One category being tested lasts from one to four years; another type could last from seven to 10 years;

(iii) Removable vaginal ring: provides for continuous absorption, may act locally on cervical mucous glands or systemically to give the low-dose progestin anti-fertility effect;

(iv) Long-acting injection: requires the development of a preparation that would provide a depot effect that gives constant, low absorption below level that will affect pituitary or endometrium;

(v) Skin-contact absorption: requires the use of highly potent progestin, active at levels that could be absorbed through the skin—from a bracelet, for example, or by adding to a cosmetic or medication patch;

(vi) IUD-released: provides for continuous absorption and may act either locally in the uterus or systemically to give the low-dose progestin anti-fertility effect;

(g) Long-term luteotropin injection. This method requires a better understanding of the tropic control of the human *corpus luteum*. The purpose would be to lengthen the post-ovulatory phase of the cycle to perhaps 90 days so that a woman would have fewer ovulations per year, or to prolong post-partum amenorrhoea;

(h) Monthly oral preparation to cause luteolysis. Several compounds, active orally, have been claimed as having luteolytic activity in animals, and possibly in humans. Taken regularly, the drug would bring on menstruation regardless of whether the cycle had been fertile;

(i) Monthly injection to cause luteolysis. This would be an application of the proposed uterine luteolytic factor. If active in the human, it will probably require injection since preliminary work indicates a peptide structure. Objective would be as in method (h);

(j) Vaginal tampon to cause luteolysis or uterine contraction. This would be a method to apply substances, such as prostaglandins, that are not orally active. Used regularly, the method would bring menstruation regardless of whether the cycle had been fertile.

(k) Non-regular use of methods (i) or (j). A variation in the use of methods (i) or (j) would be to instruct the woman to do nothing for contraception, but on the infrequent occasion of a fertile cycle, as evidenced by a delay in menstruation, to use a luteolytic method;

(l) Once-a-month anti-progestational pill. This pill would be taken regularly at the time of the expected menses, to interfere with luteal maintenance of early decidua and to bring on endometrial sloughing regardless of whether the cycle had been fertile. Several compounds with a potential for this activity are available;

(m) Pre-coital progestins. At least one compound has been used which appears to cause a rapid change in

the cervical mucus, making it impossible for sperm to penetrate;

(n) Post-coital estrogen or anti-estrogen taken orally. This procedure is effective in preventing pregnancy following isolated exposures. Presumably, it influences the rate of ovum transport, but it could have other sites of action. Several compounds are active in animals and believed to be active in women;

(o) Post-coital anti-zygotic agent taken orally. Work is required to seek compounds that would appear in the tubal fluid at adequate concentration to be toxic to the zygote without manifesting general toxicity;

(p) Immunization with sperm antigens. The objective is to prevent deposited spermatozoa from achieving fertilizing capacity in the female tract. Success has been reported in animals; but considerable basic work, including safety studies, is needed before human trials are feasible;

(q) Injection of passively transferred antibodies to human chorionic gonadotropin (HCG). This procedure would be employed on the occasion of a missed period, during the time that HCG stimulation of the *corpus luteum* is required to maintain a nascent implantation. Animal studies establish the feasibility of the approach;

(r) Active immunization with HCG or portions of the molecule. Recent advances in understanding the chemistry of HCG make it feasible to use this molecule, or a fraction of it, perhaps linked to a carrier antigen, for active immunization. An immunized woman could have a pregnancy subsequently, by use of exogenous progestins;

(s) Improved methods to detect ovulation. This is feasible on the basis of simplification in the method to detect estrogen, progesterone or luteinizing hormone in urine, saliva or blood (finger-prick sample). A variety of ovulation-prediction possibilities are available for exploration;

(t) Reversible tubal occlusion. Instead of sectioning the fallopian tube, a removable plug or clip would be introduced, either trans-cervically or through an abdominal approach;

(u) Simplification of tubal ligation operation. Currently being tested by several surgeons, the tube is sectioned or electro-coagulated by an endoscopic instrument;

(v) Intra-uterine infusion of cytotoxins. Intra-uterine infusion of cytotoxins has been reported as a means of inducing sterility. The safety and permanency of the procedure need further study. The objective is to occlude the intra-mural portion of the fallopian tube;

(w) Sex determination at will by immunization with Y-sperm antigen. There is evidence that specific antigens from Y-sperm may be identifiable. If so, women could be immunized against this antigen in order to inactivate Y-sperm and assure female sex determination. No similar approach to male sex determination can now be envisaged.

(x) *Sex determination at will by artificial insemination.* There have been occasional claims of success in separating X- and Y-spermatozoa in an ejaculate by physical means (centrifugation, electrophoresis, sizing, column diffusion). By using only Y-bearing gametes in artificial insemination, male zygotes could be assured. No confirmed procedure has yet been established. However, new techniques for identifying Y chromosomes may stimulate research in this field.

#### *Methods for use by men*

35. Potential methods for use by men are as follows:

(a) *Oral use of progestin plus subdermal implant of androgen to suppress spermatogenesis.* Release of an androgen from a capsule of silicone rubber can be achieved in a low and constant rate for at least one year. This can provide a basis for maintaining levels of androgen therapy that may be medically acceptable, while suppressing spermatogenesis;

(b) *Periodic injection of long-acting androgen.* Testosterone enanthate or other esters can suppress sperm production while providing androgen replacement therapy. Depot injections can remain active for from three to six months;

(c) *Oral tablet of synthetic spermatogenesis inhibitor.* Several compounds that act directly on the testis to prevent spermatocyte maturation have been reported. In animals, some compounds require continuous administration, while others can be given for a few days each month. A non-toxic compound of this type is being sought;

(d) *Oral tablet to alter biochemical constitution of seminal fluid.* Although no specific compound has yet been identified that can influence fertility by this mechanism, the possibility of this type of action exists. The appearance of exogenously administered substances in seminal fluid has been reported;

(e) *Immunization with testis or sperm antigens.* This procedure can cause aspermatogenesis in animals. Purification of antigens, control over reversibility and mode of immunization remain as problems to be investigated for human application;

(f) *Reversible vas deferens occlusion.* The use of a liquid silicone rubber that vulcanizes into a pliable plug at body temperature has been attempted in animals. Plugs, clips and valves are being studied in men;

(g) *Reversible vas deferens ligation.* Procedures are being tested to modify the procedure for surgical vasoligation, in a manner that would improve prospects for reversibility;

#### *Methods for use by either men or women*

36. Potential methods for use by either men or women include:

(a) *Immunization with gonadotropin-releasing hormones.* The isolation of these substances, simple polypeptides, may provide a basis for specific LH or

FSH suppression so that gamete production in either the male or female could be prevented;

(b) *Immunization with enzymes specific for normal reproductive function.* There is evidence that specific iso-enzymes can be identified in gonadal or placental tissue. Although this work is at a preliminary stage of development, it could lead to a source of highly specific antigens;

(c) *Oral administration of chemical inhibitors of releasing hormone production.* Monamine oxidase inhibitors and other biological amines interfere with reproductive function in either male or female. These substances may act by interfering with the function of neuro-secretory cells in the central nervous system;

(d) *Immunization with purified gonadotropins.* In either male or female animals, gonadotropin antibody formation leads to the expected result of gonadotropin deficiency. In some animals, LH immunization prevents the maintenance of early pregnancy;

(e) *Oral administration of anti-gonadotropic drugs.* Several anti-gonadotropic agents, either synthetic chemicals or natural plant products, have been reported. Taken regularly, an active and safe preparation of this type could prevent sperm production in the male or interfere with reproductive function in the female in a number of ways;

(f) *Topical application of pheromones.* Laboratory experiments demonstrate that volatile agents produced by one animal can influence reproductive functions in another. The role of such substances in human reproductive physiology remains to be established.

#### CONCLUSION AND OVERVIEW

37. This extensive list of possible approaches to fertility regulation is based on current knowledge of the reproductive system. Most of these methods, however, require considerable work at a fundamental level before practical application would be possible. It is known, for example, that chemical and perhaps physical differences exist between the sperm carrying and X chromosome (resulting in female offspring) and those with a Y chromosome (resulting in male offspring). Yet, the application of this knowledge for predetermination of sex, if desired, would require many years of fundamental research to establish both feasibility and safety. Similarly, it is clear that the critical event of ovulation is heralded by major hormonal changes that can be measured by sophisticated laboratory procedures. The problem of how to convert this knowledge into a simple, practical method to assist women in predicting ovulation remains enigmatic. Elusive, also, have been the practical implications for fertility regulation of such fundamental discoveries as brain hormones which control egg maturation and release, the precise chemistry of gonad-stimulating hormone, the role of prostaglandins in the maintenance of ovarian function and the sequential process of sperm maturation culminating in capacitation. The advent of new knowledge concerning the biology of

reproduction has proceeded with phenomenal success during the past decade, but additional work of a fundamental nature is needed before these discoveries can be applied to the development of new methods of fertility regulation.

38. Meanwhile, applied contraceptive research, either for the improvement of existing methods or for the testing of entirely new possibilities, is proceeding at an unprecedented pace. Traditionally, product development in this field has been in the realm of the private sector. Now, there are several publicly supported programmes for the rapid development of new contraceptives. These programmes were developed because of the urgency of the need for simple, inexpensive, safe, effective and acceptable methods of fertility regulation throughout the world. They are designed with a view, primarily, towards the needs of low-income countries which cannot rely heavily on an advanced level of health services development.

39. Based on currently available knowledge, no fewer than 19 potential methods of contraception have reached some stage of clinical testing. This extent of activity in the testing of "new" or "modified" contraceptives is a welcome change from a few years ago when applied contraceptive research was chiefly the search for synthetic progestins that would compete favourably with the then-marketed birth-control pill, but would essentially duplicate the original method. From among the leads that are now known to be feasible and being tested, it is possible that before the end of the 1970s the contraceptive armamentarium will include an immunization method for women, a male pill supplemented by annual replacement of subdermal implants, annual subdermal implants for women, an optimal IUD, tri-monthly or semi-annual injections for women or men, a monthly pill to be taken at the end of each month to bring on a menses irrespective of whether the cycle has been fertile; and, ultimately, if even this list of choices does not result in "near-perfect" contraception, a safe and effective chemical abortifacient. Some of these methods, however, may ultimately be dropped for reasons of safety, lack of adequate effectiveness or insurmountable problems of product engineering. It is, however, possible to single out a few which have considerable promise and which, barring unforeseen difficulties, may emerge as important innovations in the next few years.

40. Subdermal implants of a medical-grade polymer which can release an anti-fertility hormone for prolonged periods of time have been tested since 1966. This appears now to be a method that can provide effective contraception for at least one year and, dependent upon the results of experiments already in progress, perhaps as long as four years. The disadvantages of the method are that the insertion of the implants under the skin is a clinical procedure requiring sterile techniques, and removal of the depleted capsules is required after the period of effectiveness. The major advantage is programmatic. A single clinic visit can

initiate a long period of effective contraception without the need for sustained motivation. Depending upon the results of experiments currently in progress, it may be possible for the method to be initiated immediately (within hours) after delivery of a child and calibrated to last the period of time selected as the desired birth interval. This prospect depends upon the effect of the method on the quantity and quality of maternal milk production, issues that are being studied.

41. Intra-uterine devices also have the advantage of a single procedure providing a long period of contraception. Their main disadvantages thus far have been high discontinuation rates (for reasons of discomfort or irregular bleeding primarily), unsuitability as a method for women who have never had children and border-line effectiveness for widespread acceptance. To a large measure, these disadvantages may be overcome by experimental models of a copper-bearing IUD being studied. This device is one of several experimental IUDs being studied in an effort to overcome the difficulties with devices currently in use.

42. The requirement for daily pill-taking probably contributes in large measure to the failure experienced with hormonal contraceptives in actual use. A simple means of delivering a contraceptive dose of hormone, without a daily pill schedule, is in an advanced stage of testing and will probably be available in the near future. This means entails the use of a vaginal ring made of a synthetic polymer containing a supply of the anti-fertility drug, which is released gradually and absorbed by the vaginal tissue. Another advantage of this method is that estrogenic compounds are eliminated, thus reducing the level of medical anxiety concerning safety. Other approaches to offering an alternative to daily pill-taking as a basis for hormonal contraception are the tri-monthly injections of progestins, a procedure which is growing in acceptance in spite of unresolved safety issues, and a weekly pill which is being developed for commercial distribution in the near future.

43. Beyond these few methods which warrant consideration in current programme planning, other experimental approaches to contraception currently under clinical investigation are further away from introduction, even if the studies prove to be successful. Methods based on today's basic research are even more distant, yet their pursuit is vitally necessary. Like many of the remaining problems of biomedical discovery confronting modern science, the hopes for significant revolutionary breakthrough rather than incremental advances in contraception lie in the progress of basic research. The reproductive process remains one of the least understood physiological systems, in spite of the major discoveries of recent years. As new knowledge has emerged, new opportunities for goal-oriented applied research have become evident. Nevertheless, those points in the reproductive process which would appear most vulnerable to specific, controlled interference are still being probed by fundamental scientists for fuller understanding.

**Part Nine**

**POPULATION POLICIES AND PROGRAMMES**

# POPULATION POLICIES AND PROGRAMMES

## *United Nations Secretariat\**

### BACKGROUND INFORMATION

1. The object of this paper is to present a summary of the world situation first with regard to population problems as perceived by Governments, and secondly with regard to policies formulated and implemented by them in order to resolve those perceived problems. The summary is intended principally for the use of delegations attending the World Population Conference. Consequently, a flexible format is adopted in the presentation of the findings. Following this introduction, the most important conclusions are presented in a section on selected findings. More detailed information is presented in the second section. Still further detail is presented in tables 1-24 in the annex.

2. The intention is to indicate how widespread is governmental concern with some of the most important problems associated with population. However, it is the intention neither to measure the intensity of governmental concern, nor to analyse the reasons for that concern and the extent of implementation of policies. Information in both sections is presented separately for six groups of problems and policies: population growth; morbidity and mortality; reproduction and family formation; population distribution and internal migration; international migration; and demographic structure. The order is that adopted in the draft World Population Plan of Action.

3. Notwithstanding the degree of generalization adopted for this purpose, preparatory work has been exhaustive. Thus, after population problems were identified under the above mentioned six headings, an intensive search of recent official documentation available to the United Nations (see para. 6) was made to determine for each country the Government's position with regard to each problem and the policies, if any, that each has formulated in response to it. The problems chosen for inclusion were those: (a) which affect, on the basis of Governments' opinions, at least a substantial minority of countries or a substantial proportion of the world population; and (b) those for which Governments' perceptions and policies could be reliably determined for almost all countries. At the current level of generalization, the findings may be treated with reasonable confidence as being a summary of the world situation in June 1974.

4. It is clear that the situation is subject to continuous change, in part as a result of the advent of further information, but largely as a result of fluctuations in the factors which influence problem perception and policy formulation, and modification of Governments' priorities with regard to population problems within the context of development. Therefore, it is intended to revise continuously the material presented in this paper.

5. All 148 States Members of the United Nations or of specialized agencies are included in this paper.<sup>1</sup> Of these, 135 are States Members of the United Nations, and 13 are members of one or more of the specialized agencies only. Their populations constitute 99 per cent of the estimated 1970 population of the world. Hence, reference to the total population of these countries is equated in the paper with world population.

### *Sources of information*

6. Information has been obtained primarily from an exhaustive collection and analysis of the official statements of Governments. Almost all have been published, or confirmed or transmitted to the Secretary-General of the United Nations within the past year. A principal source of information has been the reply of Governments to a United Nations inquiry concerning population and development, and an associated request for country statements and summary statements for the World Population Conference.<sup>2</sup> By the end of April 1974, 87 Governments had replied to one or more of these inquiries. Statements by Governments at regional population conferences,<sup>3</sup> at sessions of the Population Commission and the Economic Committee of the Economic and Social Council, and statements included in requests for assistance from the United Nations system have supplemented these primary sources. All replies

<sup>1</sup> Grenada and the Democratic Republic of Viet-Nam are the only two sovereign States not included as they are neither members of a specialized agency nor of the United Nations.

<sup>2</sup> Reply to the second inquiry on population growth and development, 1972-1973; country statement prepared for the World Population Conference, 1974; and reply to the request by the Director of the United Nations Population Division for a summary statement of Governments' positions on population policy.

<sup>3</sup> Country statements submitted to the African Population Conference, Accra, Ghana, 9-18 December 1971; the Second Asian Population Conference, Tokyo, Japan, 1-13 November 1972; and the First Regional Population Conference, Beirut, 18 February-1 March 1974.

\* Population Division of the Department of Economic and Social Affairs.

to United Nations inquiries on social progress<sup>4</sup> and the International Development Strategy,<sup>5</sup> all current development plans and analogous Government statements, all background documents prepared for the United Nations Development Programme (UNDP) country and intercountry programme proposals for the current period 1972-1976 and subsequently, and other Government statements have also been utilized. The only non-governmental sources used have been from several organizations with regard to national legislation on induced abortion and voluntary sterilization.<sup>6</sup>

7. The source of statistical information is the United Nations unless otherwise specified. Population projections are for the medium variant and are the most recent projections, prepared by the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat in March 1974. In some tables percentages do not add to the total because of rounding.

#### *Definitions<sup>7</sup>*

8. The definition of more developed countries used in this paper is that currently in use by the Population Division for the purpose of preparing projections which have been used in this and other background papers, in order to maintain comparability between the policy and projection components of the documentation for the World Population Conference. Thus, more developed countries include all countries within the "more developed areas" defined for projection purposes.

9. Regional distributions in the tables are made on the basis of membership in United Nations regional economic commissions, modified slightly by geographical location. Table 1 (see annex) lists countries by regional economic commission area as defined in this study.

#### SELECTED FINDINGS

10. In this section, the most important of the findings of the study are presented. The reader interested in more detailed information may wish to consult the following section, "Commentary on tables", and the tables given in the annex.

11. Of the 148 countries included in the study, Governments of 21 countries perceive their rates of national population growth to be "deficient"; 42 countries perceive them to be "excessive" and 85 countries perceive them to be "acceptable" (table 2).<sup>8</sup> However,

although less than 30 per cent of all countries perceive their population growth rates to be "excessive", these have a national population size that is much higher than average (table 3), and thus contain 57 per cent of world population and 81 per cent of the population of the less developed countries (table 2). Therefore, if population limitation policies in these countries are effective, they can have a considerable impact on the rate of world population growth and, more particularly, on the rate of population growth of the less developed countries. In fact, it has been estimated by the United Nations that if all countries which have formulated quantitative population growth targets (table 4)—whether these be to increase, decrease or maintain their rates of population growth—were to achieve their stated targets, the rate of growth of world population would be 1.7 per cent in 1985, instead of the United Nations projected rate of 1.9 per cent, and the rate of growth of the population of the less developed countries would be 2.0 per cent instead of the projected 2.3 per cent.

12. It should be noted that while all the countries that perceive their population growth rates to be "excessive" are less developed countries and have relatively high population growth rates, there are many other less developed countries that have high population growth rates but that consider those rates to be "acceptable" or even "deficient" (table 5). Furthermore, the proportions of less developed countries whose population growth rates are expected to increase in the coming few decades is actually lower in the "excessive" than in the "acceptable" or "deficient" categories, while the proportion of less developed countries whose rates of growth will remain unchanged or will decline is actually higher in the "excessive" than in the "acceptable" category (table 6). Thus, in general, concern with "excessive" trends does not coincide with high or rising rates of population growth; nor does a perception of "acceptable" or "deficient" trends coincide with moderate, low or declining rates of population growth.

13. Government policies directed towards affecting the fertility and international migration components of population growth do not necessarily correspond to Governments' perceptions of the acceptability of population growth rates (tables 7 and 9). First, while virtually all Governments that perceive national population growth rates to be "excessive" or "deficient" have formulated policies designed to influence one or both of these components of population growth, many of those which perceive national growth rates to be "acceptable" find them so because of the success of their policy intervention; thus, the "acceptable" category contains a number of countries that are actually implementing policies either to limit or to promote population growth and are, in this respect, similar to countries in the "excessive" and "deficient" categories, respectively. Furthermore, some countries undertake policies directed towards affecting fertility or international migration not for their effect on population

<sup>7</sup> Definitions of concepts used in the text and tables that follow are given in the appropriate parts of the following section.

<sup>8</sup> For exact definitions of these three perception categories, see paragraph 25.

growth, but to change these variables themselves. Nevertheless, most countries that are attempting to "limit" or "stimulate" fertility perceive their population growth rates to be "excessive" and "deficient" respectively. A similar degree of correspondence exists also with regard to countries that "encourage" emigration on the one hand, and the perception of "excessive" population growth rates on the other. However, such correspondence does not strongly exist with regard to countries that "discourage" emigration and "encourage" immigration.

14. An attempt is made in table 8 to group the population policies indicated in table 7 in terms of their potential effect on population growth rates. First, a "no intervention" category is defined as consisting of all countries that have no explicit policies to affect fertility rates, that "permit" emigration and that, as most countries of the world, "restrict" immigration, that is, those which have undertaken no specific measures to relax immigration laws so as to permit significant temporary or permanent immigration. Countries that are undertaking one or more policies that tend to "limit growth" or one or more policies that tend to "promote growth" are classified under these two categories, respectively; and countries that are undertaking policies that tend to do both (e.g., limit fertility and encourage immigration) are classified under a "contradictory" category. On the basis of this classification, it is found that 71 countries have policies with regard to fertility and international migration components of population growth that tend to promote population growth, 47 have policies that tend to limit population growth, 1 has "contradictory" policies and 29 are in the "no intervention" category (table 8). However, while 48 per cent of the countries have policies that would promote population growth and only 32 per cent have policies that would limit it, only 33 per cent of world population live in the former countries, while 57 per cent live in the latter. In fact, 79 per cent of the population of the less developed countries is in the latter category. It is interesting to note, furthermore, that the highest proportion of countries undertaking fertility and international migration policies that tend to promote population growth is in the regions of the United Nations Economic Commissions for Europe (ECE) and for Western Asia (ECWA), while the highest proportions undertaking policies that would limit population growth are in the region of the Economic Commission for Asia and the Far East (ECAFE).

15. Governments of all countries wish to increase the life expectancy at birth of their citizens as an integral part of the search for an improvement in their level of living and quality of life. An average life expectancy at birth of less than 50 years may be considered extremely low, even for less developed countries. Nevertheless, 50 countries, of which 34 are in Africa and 11 in Asia and the Far East, have expectation of life below 50 years (tables 10 and 11). It appears clear, therefore, why the Governments of many less devel-

oped countries, particularly in Africa, consider the rapid reduction of mortality levels to be one of the highest priority areas in their population and developmental policies.

16. Fifty-nine per cent of countries perceive their current rates or trends of national fertility to be "acceptable" and are, therefore, not intervening to change them; 28 per cent perceive them to be "excessive" and are explicitly intervening to limit them and 12 per cent perceive them to be "deficient" and are explicitly intervening to stimulate them (table 12). However, while only 28 per cent of countries are attempting to limit fertility, those countries contain 57 per cent of world population and 80 per cent of the population of the less developed countries. On the other hand, 78 per cent of the population of the more developed countries live where fertility rates are perceived by Governments to be "acceptable", and another 20 per cent where Governments perceive fertility rates to be "deficient". It is interesting to note that, among the five regions, the ECWA region has the largest proportion (92 per cent) of countries in the "acceptable" category, the ECAFE region has the largest proportion (62 per cent) in the "excessive" category and the ECE region has the highest proportion (26 per cent) in the "deficient" category. It is interesting also that there is little correspondence between the actual levels of fertility and Governments' perception of their acceptability. The average crude birth rate for the less developed countries is virtually the same in all perception categories; for the more developed countries, it is, in fact, slightly higher in the "deficient" than in the "excessive" category (table 13).

17. Four categories of Governments' attitudes towards the use of contraception and family planning services are identified: situations in which Governments "restrict", "accept", "support" or "sponsor" family planning services. These four categories reflect, in general terms, progressively higher degrees of involvement of Governments in the provision of family planning services.<sup>9</sup>

18. The most significant finding with regard to family planning is the fact that only in eight countries, containing 2 per cent of the world population, do Governments actively enforce laws designed to "restrict" in some way the production or distribution of contraceptives. In all other countries, Governments at least "accept" individual practice of contraception and the activities of either family planning organizations or local authorities. On the other hand, in 50 per cent of countries, containing 81 per cent of the world population, Governments themselves "sponsor" family planning services generally as an integral part of their public health services (table 14). It would appear, therefore, that governmental objection to family planning activities is limited and that a major function of international agencies in this field is to assist countries,

<sup>9</sup> For a definition of these four categories, see paragraph 52.

upon request, to strengthen their family planning services and to make the provision of these services more effective.

19. There appears to be only partial coincidence of Governments' perception of the acceptability of its fertility rates, on the one hand, and its degree of involvement in the provision of family planning services, on the other. As might be expected, 88 per cent of the Governments that perceive fertility rates in their countries to be "excessive" do, in fact, "sponsor" family planning services. However, it is notable that 50 per cent of those which perceive fertility rates to be "deficient" also "sponsor" family planning services. Furthermore, while all countries in the "excessive" perception category at least "accept" the family planning activities of either private organizations or local authorities, a large majority also does so in the other perception categories: 78 per cent among the "deficient" fertility category and 95 per cent in the "acceptable" fertility category (table 15). Consequently, it appears that while family planning services may be used as a means to reduce fertility, most Governments "accept", "support" or "sponsor" the provision of these services irrespective of their goals with regard to modification of fertility rates. Thus, the world situation appears, in general, not to contradict the proposition that the aim of family planning is to ensure that couples shall be able to exercise effectively their human right to determine freely and responsibly the number and spacing of their children.

20. As mentioned earlier, the four categories of Governments' attitudes towards the provision of family planning services may be considered roughly to reflect progressively higher degrees of governmental involvement. These four categories, therefore, may be assigned the numbers 0, 1, 2 and 3, respectively. The average number for a group of countries, which can vary from 0 to 3.0, may then roughly reflect the degree of involvement of the Governments of this group in the provision of family planning services. On the basis of this index, the average degree of involvement for the world as a whole is relatively high (2.1), that is, slightly greater than that for the "support" category. While there is little difference in the value of the index between more developed and less developed countries, there are significant variations among the different regions: the lowest degree of involvement (1.6) occurs in the African and Western Asian regions; and the highest (2.7) in the region of Asia and the Far East, where most Governments "sponsor" family planning activities. The value in the European and Latin American regions is close to the world average. It is interesting to note that two areas in which the degree of governmental involvement in family planning activities is highest are the region of Asia and the Far East and the subregion of Eastern Europe: the first area contains the highest proportion of countries attempting to limit fertility and the second the highest proportion of countries attempting to stimulate fertility.

21. About one half of Governments perceived the rate of population growth in metropolitan regions to be "excessive" and little variation exists in this respect between less developed and more developed countries or among the various regions of the world. Furthermore, the proportion of countries that perceive these rates to be "excessive" does not appear to increase significantly when the rates themselves increase. In other words, as in the case with perceptions of national population growth rates, high rates do not, in the perception of Governments, necessarily correspond to "excessive" rates (tables 17 and 18).

22. The information collected on population distribution and internal migration policies indicates that a large majority of Governments perceive the urbanization process in their countries to be a positive manifestation of development and modernization. Although very few Governments have policies to encourage internal migration into their metropolitan regions, 58 per cent have policies to divert internal migration flows away from metropolitan regions but into the urban centres of non-metropolitan regions. Only a very small number of Governments have explicit policies to discourage internal migration into all urban areas (table 19).<sup>10</sup>

23. The extent to which concern over a given population problem is widespread may be measured by the number of Governments expressing concern over that particular problem. On the basis of such a measurement, it is clear from a comparison of the data in tables 2 and 17 that concern over "excessive" population growth in metropolitan regions, which was expressed by 67 countries, is much more widespread than concern over "excessive" national population growth, which was expressed by only 42 countries. This is true for both more developed and less developed countries, though certainly to a lesser extent in the latter. It is also true for all regions except that of Asia and the Far East, in which concern over "excessive" population growth is more widespread. For the region of the United Nations Economic Commission for Europe, governmental concern over "deficient" rather than "excessive" population growth follows the concern over metropolitan growth.

24. Information collected with regard to governmental policies dealing with international migration suggests clearly that Governments are extremely concerned with this component of population growth, not only in terms of purely administrative control of movements into and out of their countries, but in relation to over-all size, growth and composition of their population and labour force. Fifty-two per cent of the countries "permit" or "encourage" permanent emigration and 66 per cent "permit" or "encourage" temporary emigration (tables 21 and 22).<sup>11</sup> On the other

<sup>10</sup> For definitions of internal migration policies, see paragraphs 62 and 63.

<sup>11</sup> For definitions of international migration policies, see paragraphs 77 and 81.

hand, 22 per cent of the countries "encourage" permanent immigration and 24 per cent "encourage" temporary immigration (tables 23 and 24). As might be expected, the large majority of countries that "encourage" immigration are in ECE and ECWA regions.

#### COMMENTARY ON TABLES

##### *Population growth*

##### *Definitions of categories of Governments' perceptions of population trends*

25. Three categories of Governments' perception of the acceptability of current levels or trends in rates of national population growth were identified:

(a) *Rates "excessive"*: in this category are included all countries whose Governments have indicated that current or expected rates of population growth were too high, thus necessitating appropriate policy intervention to limit them. All Governments in this category have actually formulated policies to limit fertility, to encourage net emigration, or both;

(b) *Rates "deficient"*: in this category are included all countries whose Governments have indicated that current or expected rates of population growth were too low, thus necessitating appropriate policy action to promote them. All Governments in this category have actually formulated policies either to stimulate fertility or to encourage net immigration, or both;

(c) *Rates "acceptable"*: in this category are included all countries whose Governments have indicated that current or expected rates of population growth are satisfactory, thus necessitating no further policy intervention. Some two thirds of these countries have no population growth policies. Some one third, however, find population growth rates satisfactory only as a result of their policy intervention. Still others may be undertaking fertility and international migration policies for purposes other than affecting population growth rates.

##### *Governments' perception of the acceptability of current levels or trends of national population growth rates (table 2)*

26. The Governments of 85 of the 148 countries included in this study perceive their national population growth rates to be "acceptable". In 1970, their populations constituted 37 per cent of the total. The Governments of 42 countries, containing 57 per cent of total population, perceive national population growth rates to be "excessive"; and the Governments of 21 countries, containing 7 per cent of total population, perceive rates to be "deficient".

27. Governments' perceptions of the acceptability of national population growth rates differ between more developed and less developed countries. For example:

(a) A higher proportion of Governments, and an even higher proportion of the populations, of more developed countries than of less developed countries perceives rates of population growth to be "acceptable";

(b) By far the largest proportion of more developed countries is in the "acceptable" category, and none is in the "excessive" category; in contrast, the smallest proportion of less developed countries is in the "deficient" category, the remainder being more equally distributed between the "acceptable" and the "excessive" categories;

(c) One of the greatest differences between more developed countries and less developed countries is that of the proportion of their populations in the "excessive" and "deficient" categories: none of the total population of more developed countries is resident in countries whose Governments perceive population growth rates to be "excessive", compared with 81 per cent of the total in the case of less developed countries: conversely, only 3 per cent of the population of less developed countries is resident in countries whose Governments perceive population growth rates to be "deficient", compared with 18 per cent of the total in more developed countries.

28. The proportion of countries in each of the three categories of Governments' perception of trends in rates of population growth differs considerably between regional economic commission areas. For example:

(a) The ECAFE region is the only one in which a majority of countries (62 per cent) is in the "excessive" growth category. The ECAFE region also has the lowest proportion of countries in the "acceptable" and the lowest but one in the "deficient" categories;

(b) The highest proportion in the "acceptable" category are found in the ECE and ECWA regions.

##### *Governments' perception of the acceptability of current levels or trends of national population growth rates, by size of estimated 1970 population (table 3)*

29. The average size of countries whose Governments perceive population growth to be "excessive" is substantially higher than those in the "acceptable" and "deficient" categories.

30. Although the 42 countries whose Governments perceive population growth rates to be "excessive" have sizes of total population which range from very small to very large, half have total populations of 10 million and over, and six have populations of over 50 million. In contrast, although only 24 per cent of those countries which perceive population growth rates to be "acceptable" have total populations over 10 million, 43 per cent of countries which perceive population growth rates to be "deficient" have populations of this size.

31. Of the countries that perceive population growth rates to be "deficient", 57 per cent have populations under 10 million. This proportion may be compared with 50 per cent for those countries which perceive rates to be "excessive" and 76 per cent for those countries which perceive rates to be "acceptable". Thus, although there is some tendency for countries with large total populations to perceive growth rates

to be "excessive", population size is clearly only one of several factors in the formulation by Governments of their perception of trends in population growth rates.

*Governments' perception of the acceptability of current levels or trends of national population growth rates, by state of specification of quantitative population growth targets (table 4)*

32. Twenty-five countries have quantitative targets to reduce population growth rates and six have targets to increase them. All countries in the former category are less developed and all except one of the countries in the latter category are more developed.

33. Although only 25 of the 42 less developed countries whose Governments perceive population growth rates to be "excessive" have set quantitative targets, these contain 92 per cent of the population in this perception category, 75 per cent of the population of less developed countries and 52 per cent of world population. On the other hand, the six countries in the "deficient" category which have set quantitative targets contain less than 2 per cent of world population. Furthermore, countries whose objective is to reduce their rates of population growth wish to reduce them significantly, while those whose objective is to increase their growth generally wish to do so only to a small extent. Consequently, it is estimated that if all countries that have population growth objectives—whether to increase, decrease or maintain current rates—achieve their targets, then the population growth rate in 1985 would be about 2 per cent for developing countries, compared with the projected 2.3 per cent for that year, and about 1.7 per cent for the world compared with the projected 1.9 per cent.

*Governments' perception of the acceptability of current levels or trends of national population growth rates by estimated average annual growth rate, 1970-1975 (table 5)*

34. The average of annual population growth rates during the period 1970-1975 showed little variation between perception categories, in both more developed countries and less developed countries. However, this relationship is qualified by the distribution by growth rate of countries within perception categories. Thus:

(a) Although all but one of the 42 countries in the "excessive" category do have population growth rates of over 1.5 per cent per annum and the majority of them have rates over 2.5 per cent, there are 55 countries in the "acceptable" category with rates of over 1.5 per cent, and there are nine countries in the "deficient" category with rates as high;

(b) Conversely, although 12 of the countries that have population growth rates under 1.5 per cent are in the "deficient" category, 30 are in the "acceptable" and one is in the "excessive" category. Therefore, "deficient" rates are not synonymous with low rates, nor "acceptable" with moderate, nor "excessive" with high rates.

*Governments' perception of the acceptability of current levels or trends of national population growth rates, by projected trend in growth rates, 1970-1985 (table 6)*

35. There is little relationship between Governments' perception of rates of national population growth, and projected future rates. Thus:

(a) Forty-four countries will have higher average growth rates in 1980-1985 than in 1970-1975; of these countries, 15 perceive these trends to be "excessive"; but 22 perceive trends to be acceptable, and 7 perceive them to be "deficient";<sup>12</sup>

(b) Fifteen countries will have lower growth rates in 1980-1985 than in 1970-1975; of these, 2 perceive trends to be "deficient", 7 perceive trends to be "acceptable" and 6 perceive them to be "excessive".<sup>13</sup>

36. Thus, trends that will result in higher growth rates are not considered by Governments to be synonymous with "excessive", trends that will result in lower growth rates are not synonymous with "deficient" and trends that will result in similar future rates are not synonymous with "acceptable" trends.

*Governments' perception of the acceptability of current levels or trends of national population growth rates, by policies with regard to fertility and international migration which have a potential effect upon national population growth rates (table 7)<sup>14</sup>*

37. Practically all countries that perceive their population growth rates to be "acceptable" do not have policies explicitly directed towards affecting fertility; practically all countries that perceive their rates of population growth to be "excessive" have policies explicitly designed to limit fertility; and the large majority of countries that perceive their population growth rates to be "deficient" have policies to stimulate fertility. No such close correspondence exists, however, between population growth perception categories and policies dealing with international migration. For example, many Governments that perceive their rates of population growth to be "acceptable" undertake international migration policies that tend to affect population growth rates positively or negatively. Nevertheless, of the 42 countries that perceive their rates of population growth to be "excessive", only 1 "encourages" immigration and only 1 "discourages" emigration. On the other hand, of the 21 countries that perceive their population growth rates to be "deficient", about one half "encourage" immigration and all but one "discourage" emigration.

<sup>12</sup> Average rate in 1980-1985 at least 0.3 percentage points higher than average rate in 1970-1975.

<sup>13</sup> Average rate in 1980-1985 at least 0.3 percentage points lower than average rate in 1970-1975.

<sup>14</sup> For exact definition of the policy categories used in table 7, see sections given below on reproduction and family formation and international migration.

*Potential effect of governmental policies with regard to fertility and international migration upon national population growth rates (table 8)*

*Definitions of potential effect*

38. Four groupings of policies directed towards affecting fertility and international migration are determined on the basis of their potential effect on population growth rates. First, there is a "no intervention" category that includes all countries that have no policies explicitly directed towards affecting fertility rates, that "permit" emigration and that "restrict" immigration in the sense that they have not relaxed immigration laws so as to encourage significant numbers to immigrate temporarily or permanently. A second category to "limit growth rates" contains all countries that "limit fertility", "permit" or "encourage" emigration and "restrict" immigration. A third category to "promote growth rates" consists of all countries that "stimulate" fertility, "permit" or "discourage" emigration and "restrict" or "encourage" immigration. The fourth category is "contradictory", where the potential effects of fertility and international migration policies on population growth are contradictory (e.g., "limit" fertility and "encourage" immigration).

39. On the basis of the foregoing classification, it is found that 20 per cent of the countries have no intervention policy, 32 per cent have fertility and international migration policies that tend to limit population growth, 48 per cent have policies that tend to promote population growth and less than 1 per cent have policies that are "contradictory".

40. While only 32 per cent of all countries have fertility and international migration policies that tend to "limit" population growth rates, those countries contain 57 per cent of world population and 79 per cent of the population of the less developed countries. On the other hand, while 48 per cent of countries have fertility and international migration policies that tend to "promote" population growth rates, those countries contain only 33 per cent of world population and 14 per cent of the population of less developed countries. Some 76 per cent of the population of the more developed countries live in countries that have fertility and international migration policies which tend to "promote" population growth rates and an additional 17 per cent live in countries in the "no intervention" category.

*Potential effect of government policies with regard to fertility and international migration upon national population growth rates by Governments' perception of the acceptability of current levels or trends of national population growth rates (table 9)*

41. A certain degree of correspondence exists between Governments' perception of the acceptability of population growth rates and the potential effect of their fertility and international migration policies on growth rates. Thus, virtually all countries in the "no intervention" category perceive their rates of popu-

lation growth to be "acceptable" and 39 of the 44 countries that are undertaking fertility and international migration policies that tend to limit population growth rates perceive these rates to be "excessive". However, 50 of the 61 countries that are undertaking fertility and international migration policies that tend to promote population growth rates perceive these rates to be "acceptable" (the remainder, as expected, perceive them to be "deficient").

*Morbidity and mortality*

*Estimated average life expectancy at birth, 1970-1975, and Governments' perception of the acceptability of current levels or trends of national population growth rates (tables 10 and 11)*

42. As might be expected, all Governments have formulated policies designed to reduce morbidity and mortality, and none has considered acceptable a policy of permitting survival rates to remain low in order to prevent further increases in rates of national population growth. A national average life expectancy at birth of less than 50 is used in this paper as an indicator that mortality remains excessively high. It is clear that, particularly in the region of the United Nations Economic Commission for Africa (ECA), but also in the ECAFE and ECWA regions, with 79, 38 and 25 per cent of constituent countries, respectively, having estimated average life expectancy below 50, high mortality remains a predominant population problem. In the region of the Economic Commission for Latin America (ECLA), only two countries have the same degree of mortality problem, and no country in the ECE has so severe a problem.

43. Those less developed countries which perceive their population growth rates to be "excessive" may have experienced greater declines in mortality than other less developed countries. This is indicated by the slightly higher average life expectancy of those less developed countries whose Governments perceive "excessive" rates (54 years) as compared with that of the less developed countries whose Governments perceive rates to be "acceptable" (49 years), and those which perceive rates to be "deficient" (48 years).

*Reproduction and family formation*

*Definitions of categories of*

*Governments' perceptions of fertility*

44. Three categories of governmental perception of current and prospective fertility rates may be identified: rates "acceptable"; rates "excessive"; and rates "deficient". These three categories are similar to those used with regard to acceptability of population growth rates (para. 24). However, since no country in the "acceptable" category has policies explicitly directed to modifying fertility rates, and virtually all countries in the other two categories have formulated explicit policies, these three perception categories correspond almost completely to three intervention categories of "inter-

vention undesirable", "intervention desirable to limit fertility" and "intervention desirable to stimulate fertility". Reference in the tables, therefore, is to combinations of these two corresponding sets of categories, namely, "rates acceptable, intervention undesirable", "rates excessive, intervention desirable to limit fertility" and "rates deficient, intervention desirable to stimulate fertility". For the sake of brevity, however, these three categories are referred to in the text as "acceptable", "excessive" and "deficient", respectively.

*Governments' perception of the acceptability of current levels or trends of average national fertility rates and perception of the desirability of intervention to modify fertility rates (table 12)*

45. The Governments of 88 of the 148 countries included in this study consider national fertility rates to be "acceptable". In 1970, their populations constituted 35 per cent of the total.

46. The Governments of 60 countries consider national fertility rates unacceptable and consider policy intervention to modify them to be necessary. In 1970, their populations constituted 65 per cent of the total. Two groups may be defined: (a) 42 countries, in which fertility rates are considered by Governments to be "excessive", and which contain 57 per cent of total population; (b) 18 countries in which fertility rates are considered "deficient" and which contain 8 per cent of total population.

47. Governments' perceptions of the acceptability of fertility rates differ between more developed and less developed countries. For example:

(a) While only one of the more developed countries considers fertility rates "excessive", 39 per cent of the less developed countries, containing 80 per cent of the total population of these countries, are in this category;

(b) While 26 per cent of the more developed countries, containing 20 per cent of their total population, consider their fertility rates "deficient", only 7 per cent of the less developed countries, containing only 1 per cent of their total population, are in this category;

(c) While 78 per cent of the total population of more developed countries are in countries whose Governments consider fertility rates to be "acceptable", 81 per cent of the total population of less developed countries are in countries whose Governments consider fertility rates unacceptable.

48. The proportion of constituent countries that have each of these three perceptions differs considerably among regional economic commission regions. For example:

(a) Only one country in the ECWA region and two in the ECE region consider their fertility "excessive", whereas 62 per cent of those in the ECAFE region do so;

(b) Of the countries that consider fertility rates "excessive", 43 per cent are in the ECAFE region and 33 per cent in the ECA region;

(c) At least two thirds of countries in all except the ECA and ECAFE regions consider fertility rates to be "acceptable": in the ECA region, only slightly more than half, and in the ECAFE region, only 31 per cent do so.

*Governments' perception of the acceptability of current levels or trends of average national fertility rates and perception of the desirability of intervention to modify fertility rates, by estimated crude birth rates, 1970-1975 (table 13)*

49. There is very little relationship between actual fertility, as measured by crude birth rates, and Governments' perception of fertility. The average crude birth rate is 12 for more developed countries that perceive fertility to be "acceptable", 17 for more developed countries that perceive it to be "deficient", and 15 for more developed countries that perceive it to be "excessive". For less developed countries, there is very little difference in the average crude birth rate for each of the three perception categories.

50. Of the 75 countries with crude birth rates of 40 and above, over half consider the trend to be "acceptable" rather than "excessive", while of the 35 with crude birth rates of less than 20, almost three quarters consider these to be "acceptable" rather than "deficient".

51. There are countries with crude birth rates of between 30 and 49 which perceive fertility rates to be "deficient": conversely, there are countries with crude birth rates of less than 30 which perceive these rates to be "excessive".

*Governments' policies with regard to their involvement in the provision of family planning services (table 14)*

52. Four categories of Governments' attitudes towards contraceptive use and family planning services are identified:

(a) Governments that "restrict" use by actively enforcing some restrictive laws or measures concerning the production or distribution of contraceptives;

(b) Governments that "accept" or rely upon the provision of family planning services by private organizations or local authorities, but that do not actively support such activities;

(c) Governments that actively "support" the programmes of private organizations and local authority activities or both, or that have implemented pilot programmes in government departments;

(d) Governments that themselves "sponsor" family planning activities as part of public health services.

53. The principal characteristics of the situation are as follows:

(a) In 50 per cent of the countries, containing 81 per cent of world population, the provision of information and materials required for the practice of modern methods of contraception is already an integral

part of national public services, particularly health services;

(b) In an additional 16 countries, with 6 per cent of world population, Governments directly support the activities of private organizations and local authorities in the provision of information and materials;

(c) In 50 countries, containing 11 per cent of world population, Governments accept or rely upon the provision of family planning services by private organizations or local authorities, but do not actively support such activities;

(d) In only eight countries, containing only 2 per cent of the world population, Governments enforce laws restricting aspects of the production or distribution of contraceptives.

*Governments' policies with regard to their involvement in the provision of family planning services by perception of the acceptability of current levels or trends of average national fertility rates and by perception of the desirability of intervention to modify fertility rates (table 15)*

54. It appears necessary to separate Governments' perception of the desirability of modifying national fertility rates from their attitude to the use of modern contraception by their populations, and the provision to them of family planning services. While 88 per cent of the Governments that consider fertility rates to be "excessive" directly "sponsor" family planning services, half of those which consider fertility rates "deficient" also directly "sponsor" family planning services, as do 32 per cent of those countries which consider fertility rates to be "acceptable".

55. Of the less developed countries whose Governments perceive fertility rates to be "excessive", 92 per cent "sponsor" or "support" family planning services. However, only a third of the less developed countries that perceive rates to be "acceptable", and only four of the seven less developed countries which perceive rates to be "deficient" either "sponsor" or "support" these services.

56. Two thirds of the less developed countries that perceive fertility rates to be "acceptable" give no direct support to local authority or private activities. A high proportion of these countries consider government involvement premature in view of the relatively limited diffusion of modern attitudes to fertility. However, in many of them, interest is growing in inclusion of family planning services within public health services for purposes of maternal and child health, and family welfare.

*Governments' policies with regard to induced abortion and voluntary sterilization by perception of the acceptability of current levels or trends of average national fertility rates and perception of the desirability of intervention to modify fertility rates (table 16)*

57. Induced abortion on the basis of medico-social and social indications, or upon request, is legal for

females without restriction as to the number of their children in 35 countries, 24 per cent of the total. However, in only seven countries, all but one in the ECAFE region, is induced abortion explicitly considered a means of fertility reduction. In five countries in the ECE region, whose Governments perceive fertility to be "deficient", the basis for permitting induced abortion to occur has been, within recent years, restricted significantly. However, medico-social and social indications remain admissible. In these and in 23 other countries, the explicit objective is the protection of maternal and child health, family welfare and the status of women, and thereby the avoidance of such problems as a high incidence of unwanted or abandoned children and high rates of maternal and infant mortality.

58. Voluntary sterilization is clearly legal in 24 countries, in 15 of which induced abortion on the basis of medico-social and social indications or upon request is also legal. In 10 countries that perceive fertility rates to be "excessive", an important, if not primary, objective of legalizing voluntary sterilization is to contribute to fertility reduction. In the other countries, the objectives are stated to be those of human welfare. In 116 countries, the legal situation is not clear; in only 8 countries is sterilization clearly illegal.

*Governments' policies with regard to sterility and sub-fecundity*

59. Information concerning Governments' perception of the problem of sterility and sub-fecundity is currently inadequate. Only five countries, all in the ECA region, have explicitly raised this problem in the framework of their population goals and policies. In these countries, a high incidence of sterility and sub-fecundity constitutes the primary reason for the perception by Governments that both fertility and population growth rates are "deficient". In two of these countries, the problem is severe in almost all regions; in the other three in some, but not all, regions. It is possible that proportions may be quite significant in other less developed countries, for which adequate data are not yet available.

60. In one of these five countries, a policy of substantial increase in attention to these problems within public health services has been implemented; and in a second, research into the problem is in progress. Family planning is perceived as one method of contributing to improved maternal health and family welfare, and hence to reduction of sterility and sub-fecundity.

*Governments' position with regard to provision of social benefits with the objective of influencing fertility rates*

61. Only 14 countries have explicitly stated that the benefits made available through their social security systems are in part at least designed to achieve a modification of fertility rates. All but three of these countries perceive current fertility rates to be "defi-

cient", and hope to bring about moderate increases as a result of subsidizing the costs of marriage, childbirth and child-rearing. In the remaining three countries, social benefits that discriminate against families with children above a specified number have been implemented to contribute to a reduction in fertility rates. All three countries perceive fertility rates to be "excessive" and have integrated family planning in national health services.

#### *Population distribution and internal migration*

#### *Definitions of categories of Governments' perceptions of population growth in metropolitan regions*

62. For the purposes of this paper, each country has been divided into the following functional regions: metropolitan; non-metropolitan; and unoccupied regions. Metropolitan regions have been defined for most countries as consisting of: (a) the urban centre which occupies a position of first order within the national urban system; and (b) its immediate (third-order) functional region. For a few countries, more than one such metropolitan region have been defined, either where several larger centres have experienced autonomous development because of very large distances separating principal urban centres, or because of incomplete integration into a unified national urban system of two or more historically separate territories and their respective urban systems. Not all countries have unoccupied regions. A few countries comprise only a metropolitan region. This is the case for four less developed countries and five more developed countries whose territorial size is so small (less than 1,000 km<sup>2</sup>) that the whole national territory is either within the immediate field of influence of the largest, "metropolitan", centre or is entirely occupied by the centre's built-up area. The urban populations in both metropolitan and non-metropolitan regions have been defined as that resident within urban centres which rank in the third and higher order within the national urban system.

63. Three categories of government perception of the acceptability of levels or trends of population growth rates in metropolitan regions are used: rates "acceptable"; rates "excessive"; and rates "deficient". These three categories are defined in a similar manner to the corresponding categories of acceptability of national population growth (para. 25). The policies of Governments are indicated separately in the tables.

#### *Governments' perception of the acceptability of current levels or trends of metropolitan region population growth rates (table 17)*

64. No Government perceives rates of population growth in the metropolitan regions to be deficient. Almost half of all countries, and slightly more than half of the countries included in table 17, perceive metropolitan growth to be "excessive". This proportion does not differ significantly between more developed and less developed countries, nor among the regional economic commission areas.

65. The proportion of the total population that is located in countries in the "excessive" category is 68 per cent. However, a major difference exists in this regard between more developed and less developed countries: only 34 per cent of the population of more developed countries lives in countries in the "excessive" category while 83 per cent of the population of less developed countries lives in countries in this category.

#### *Governments' perception of the acceptability of current levels or trends of metropolitan region population growth rates by perception of acceptability of current levels or trends of national population growth rates and by urbanization characteristics (table 18)*

66. There is only limited coincidence of Governments' perceptions of the acceptability of present levels or trends of metropolitan and national population growth rates: only 24 countries, all less developed countries, perceive both to be "excessive". Conversely, of the 72 countries included in table 18 which perceive national growth to be "acceptable", 31 perceive metropolitan growth to be "excessive", and of the 19 countries which perceive national growth to be "deficient", 12 perceive metropolitan growth to be "excessive" (9 countries for which information is insufficient, and 7 countries, whose entire territory is within their "metropolitan region", are excluded from this analysis).

67. For less developed countries, the proportion of countries which perceive metropolitan growth to be "excessive" increases as the proportion of the national population defined as urban increases: from 44 per cent for the 0-19 per cent urban category, to 53, 55 and 66 per cent for the three higher categories. No similar relationship occurs for more developed countries.

68. Although rates of urban population growth are not available for 34 countries, and although rates of metropolitan region growth are not necessarily the same as urban population growth rates, nevertheless it is noteworthy that, at least for the limited number of countries included, the proportion of both less developed countries and more developed countries which consider metropolitan region population growth to be "excessive" increases as the estimated rate of urban population growth increases, but this cannot *a priori* be considered statistically significant.

69. A higher proportion of countries in which a primate urban system exists (that is, for the purposes of this paper, where the metropolitan urban centre is more than 2.5 times the size of the second largest centre) perceive metropolitan growth to be "excessive": for less developed countries, 54 per cent compared with only 38 per cent for countries with a non-primate system, and for more developed countries 75 per cent compared with 21 per cent.

#### *Governments' policies with regard to redistribution of national population by Governments' perception of the acceptability of current levels or trends of*

*metropolitan region population growth rates and by urbanization characteristics (table 19)*

70. No detailed presentation of all aspects of Governments' policies with regard to population distribution and internal migration is attempted in this study, although the summary information is based upon detailed studies in progress.

71. The principal findings of this review of internal distribution policies are summarized as follows:

(a) Forty-seven countries, 36 per cent of the total, do not seek to divert internal migration from metropolitan regions;

(b) Seventy-six countries, 58 per cent of the total, permit migration from rural areas and small urban centres, but seek to divert this movement from metropolitan regions, either into a relatively small number of large secondary urban centres (in the case of 14 countries), or into a system of urban centres of varied size and function outside the metropolitan region (in the case of 62 countries);

(c) Only nine countries, 8 per cent of the total, seek to discourage migration from rural areas and small urban centres completely;

(d) The proportion of countries whose Governments do not seek to divert migration away from metropolitan regions is considerably higher: (i) in less developed countries than in more developed countries; (ii) in countries where metropolitan region growth is perceived to be "acceptable" than in those where it is perceived to be "excessive"; and (iii) where a metropolitan primate condition exists, rather than where a non-primate condition exists. It is highest for countries in which the urban proportion is still under 40 per cent;

(e) The proportion of countries whose Governments seek to divert migration from metropolitan regions into the urban system in the remainder of the country is considerably higher for more developed countries than for less developed countries, for countries which perceive metropolitan growth to be "excessive" than in those which consider it to be "acceptable", and for countries with a non-primate situation than for those with a primate situation. The proportion increases regularly as the urban proportion in the total population increases;

(f) Some countries that perceive metropolitan growth to be "excessive" have, nevertheless, not formulated policies designed to divert migration from those regions, whereas some countries that perceive metropolitan region growth to be "acceptable" have formulated policies designed to absorb a high proportion of potential rural out-migrants within urban centres in non-metropolitan regions.

*Policies with regard to non-sedentary pastoral populations (table 20)*

72. Non-sedentary populations include: (a) nomadic pastoral peoples; (b) shifting cultivators, hunters and gatherers; and (c) tinkers and craftsmen, such as

gypsies. However, the information reviewed in this section is restricted to policies with regard to non-sedentary pastoral nomadic populations located predominantly in the subtropical and temperate deserts of northern Africa and western Asia, and also in the Arctic regions of Europe and Asia.

73. Nomadic pastoral populations are located in 40 countries. In only 10 of these countries is it estimated that they constitute over 10 per cent of the total population. It is estimated that they constitute over 20 per cent of the total in only three countries.

74. Estimates of the total population involved are extremely tentative. However, it appears that nomadic pastoral populations constitute between 1.4 and 1.9 per cent of the world population, between 3.8 and 5.1 per cent of the population of the ECWA region, and between 4.2 and 5.4 per cent of the population of the ECA region. The total world nomadic pastoral population is estimated at between 40 million and 70 million, of which only between 1.5 million and 2.0 million are in the ECWA region, and between 14 million and 19 million in the ECA region.

75. Of the 29 countries for which information is sufficient, only 10 emphasize the provision of social services to the non-sedentary population rather than sedentarization.

*International migration*

*Definition of emigration and of categories of Governments' perceptions of the desirability of emigration*

76. It is recognized that all Governments exercise some degree of administrative control over nationals who wish to leave the country temporarily or permanently, ranging from an issue of a passport on request with very limited reservations, to substantial requirements concerning financial arrangements, and proof that the potential emigrant is not required within the country for occupational or other reasons. However, the principal interest in this paper is the perception which Governments have of international migration as a significant factor in the modification of national population size, growth and composition.

77. The following classification is used:

(a) *Emigration "permitted"*: Governments formulate no policies and implement no measures, whether direct or indirect, other than administrative controls of the simplest type, explicitly to influence individual decisions either to emigrate or to remain;

(b) *Emigration "encouraged"*: Governments formulate policies and implement measures, either direct or indirect, designed to make more probable than otherwise decisions by a significant proportion of the population to emigrate, and to make easier than otherwise the processes of emigration, including measures facilitating the travel of the individual from his home country, transportation to country of destination and settlement there;

(c) *Emigration "discouraged"*: Governments formulate policies and implement measures, in the form of either direct administrative control or indirect socio-economic policies, explicitly designed to make less probable than otherwise decisions by a significant proportion of the population to emigrate, and to make more difficult than otherwise the processes of emigration.

78. The classification adopted for this paper, and the allocation to categories of the countries included in the study, represents only an initial attempt at analysis of international migration as an integral part of national population policy. Permanent immigration includes all migrants who wish to remain permanently in the country of destination: they are largely, though not entirely, skilled and professional workers and are frequently accompanied by families. Temporary immigration includes all those who intend to return after a short period of time or after the completion of a given task in the country of destination: they are largely, although not entirely, semi-skilled and unskilled workers and are frequently not accompanied by families. It is expected that further work on the topic in progress at the United Nations will result in a much more refined classification system.

*Governments' perception of the desirability of intervention to modify current levels or trends of permanent emigration (table 21)*

79. Seventy-two countries "discourage" permanent emigration, 61 "permit" it and 15 "encourage" it. Both more developed and less developed countries have similarly small proportions in the "encouraged" category. However, whereas the proportion of more developed countries in the "discouraged" category is considerably less than that in the "permitted" category; the reverse is true of less developed countries.

*Governments' perception of the desirability of intervention to modify current levels or trends of temporary emigration (table 22)*

80. Higher proportions of countries are favourable to temporary emigration. Fifty-two countries "discourage" temporary emigration, 69 "permit" it, and 27 "encourage" it. Whereas almost a third of more developed countries "discourage" temporary emigration compared to almost two thirds which "permit" it, there is little difference in these proportions in the case of less developed countries.

*Definition of immigration and of categories of Governments' perceptions of the desirability of immigration*

81. Again it is recognized that all Governments exercise some degree of administrative control over individuals, citizens of other countries, and in some cases their own citizens, wishing to immigrate, either temporarily or permanently. Such controls range from

simple passport and routine residence permit controls, to substantial requirements relating to finance, occupational qualifications, political and other affiliation. The following twofold classification has been adopted:

(a) *Immigration "encouraged"*: Governments formulate policies and implement measures, either direct or indirect, designed to make more probable than otherwise decisions by a significant number of the populations of other countries to immigrate, and to make easier than otherwise the processes of immigration, including in some cases measures assisting transportation from country of origin, and in many cases, resettlement and integration with the population of the country of destination;

(b) *Immigration "restricted"*: all other countries.

*Governments' perception of the desirability of intervention to modify current levels or trends of permanent immigration (table 23)*

82. Some 116 countries "restrict" permanent immigration and 32 "encourage" it. The proportion of more developed countries that "restrict" permanent immigration is much less than that of less developed countries, but is, nevertheless, slightly more than half of all more developed countries.

83. The proportion of countries that "restrict" permanent immigration is equally high in the ECA, ECAFE and ECLA regions, and is lowest in the ECE and ECWA regions.

*Governments' perception of the desirability of intervention to modify current levels or trends of temporary immigration (table 24)*

84. Some 112 countries "restrict" temporary immigration and 36 "encourage" it. Compared with only 16 per cent of the less developed countries that do so, 45 per cent of more developed countries "encourage" temporary immigration.

85. The highest proportions of countries that "restrict" temporary immigration are in the ECA, ECAFE and ECLA regions. Proportions of countries that encourage temporary immigration are highest in the ECE and ECWA areas.

*Demographic structure*

86. Definitions of Governments' perceptions of problems associated with demographic structure and policies formulated by them in this regard are still under study.

SUMMARIZING TABLES

87. Tables 2-24 in the annex are intended to summarize the principal aspects of the world situation with regard to Governments' perceptions of population problems and Governments' policies designed to resolve perceived problems.

## ANNEX

TABLE 1. DISTRIBUTION OF COUNTRIES INCLUDED IN THE STUDY, BY AREA OF RESPONSIBILITY OF REGIONAL ECONOMIC COMMISSIONS

<i>Area of responsibility of the Economic Commission for</i>				
<i>Africa (ECA)</i>	<i>Asia and the Far East (ECAFE)</i>	<i>Latin America (ECLA)</i>	<i>Europe (ECE)</i>	<i>Western Asia (ECWA)</i>
Algeria	Afghanistan	Argentina	Albania	Bahrain
Botswana	Australia	Bahamas	Austria	Democratic Yemen
Burundi	Bangladesh <sup>a</sup>	Barbados	Belgium	Iraq
Central African Republic	Bhutan	Bolivia	Bulgaria	Jordan
Chad	Burma	Brazil	Byelorussian Soviet Socialist Republic	Kuwait
Congo	China	Chile	Canada	Lebanon
Dahomey	Democratic People's Republic of Korea <sup>a</sup>	Colombia	Cyprus	Oman
Egypt	Fiji	Costa Rica	Czechoslovakia	Qatar
Equatorial Guinea	India	Cuba	Denmark	Saudi Arabia
Ethiopia	Indonesia	Dominican Republic	Finland	Syrian Arab Republic
Gabon	Iran	Ecuador	France	United Arab Emirates
Gambia	Japan	El Salvador	German Democratic Republic	Yemen
Ghana	Khmer Republic	Guatemala	Germany, Federal Republic of	
Guinea	Laos	Guyana	Greece	
Guinea-Bissau <sup>a</sup>	Malaysia	Haiti	Holy See <sup>a</sup>	
Ivory Coast	Maldives	Honduras	Hungary	
Kenya	Maldive	Jamaica	Iceland	
Lesotho	Mongolia	Mexico	Ireland	
Liberia	Nauru <sup>a</sup>	Nicaragua	Israel	
Libyan Arab Republic	Nepal	Panama	Italy	
Madagascar	New Zealand	Paraguay	Liechtenstein <sup>a</sup>	
Malawi	Pakistan	Peru	Luxembourg	
Mali	Philippines	Trinidad and Tobago	Malta	
Mauritania	Republic of Korea <sup>a</sup>	Uruguay	Monaco <sup>a</sup>	
Mauritius	Republic of Viet-Nam <sup>a</sup>	Venezuela	Netherlands	
Morocco	Singapore		Norway	
Niger	Sri Lanka		Poland	
Nigeria	Thailand		Portugal	
Rwanda	Tonga <sup>a</sup>		Romania	
Senegal	Western Samoa <sup>a</sup>		San Marino <sup>a</sup>	
Sierra Leone			Spain	
Somalia			Sweden	
South Africa			Switzerland <sup>a</sup>	
Sudan			Turkey	
Swaziland			Ukrainian Soviet Socialist Republic	
Togo			Union of Soviet Socialist Republics	
Tunisia			United Kingdom of Great Britain and Northern Ireland	
Uganda			United States of America	
United Republic of Cameroon			Yugoslavia	
United Republic of Tanzania				
Upper Volta				
Zaire				
Zambia				

<sup>a</sup> Members of one or more specialized agencies but not of the United Nations.

TABLE 2. GOVERNMENTS' PERCEPTION OF THE ACCEPTABILITY OF CURRENT LEVELS OR TRENDS OF NATIONAL POPULATION GROWTH RATES, BY DEVELOPMENTAL STAGE AND REGIONAL ECONOMIC COMMISSION AREA OF RESPONSIBILITY

Developmental stage and regional economic commission area of responsibility	Governments' perception of the acceptability of current levels or trends of national population growth rates						Total
	Rates "acceptable"		Rates "excessive"		Rates "deficient"		
<i>Number and percentage of countries</i>							
More developed .....	31	(74)	—	(—)	11	(26)	42 (100)
Less developed .....	54	(51)	42	(40)	10	(9)	106 (100)

## POLITICAL IMPLICATIONS OF POPULATION DYNAMICS: A CRITICAL ASSESSMENT

Nazli Choucri \*

1. While it is generally recognized that excessive population growth places severe strains upon the environment, there is also some reason to believe that population levels and rates of increase may be important elements affecting national power, war and peace, and the nature of social and political organization. This paper attempts to evaluate existing evidence concerning the political implications of population dynamics, note areas of ambiguity and suggest possible avenues for further research.

### THE INTERDEPENDENCE OF POPULATION AND POLITICS

2. Many uncertainties remain concerning the precise nature of the population problem in the world today. However, it is clear that the world population is continuing to grow at an alarming pace, imposing increasing burdens upon available resources. From the historical record, it may be inferred that, at each stage of man's population growth, the resulting reverberations on government have necessitated readjustments and reassessments of governmental procedures.<sup>1</sup> Although the precise political implications of population dynamics are as yet far from clear, to the extent that the world population continues to grow as projected, further strains on political, social and economic institutions (at all levels) may be expected.<sup>2</sup>

3. Concern for the political implications of population variables has been expressed by many classical

political theorists, but the seeming ability of technology to invalidate the Malthusian dynamic accentuated a general inclination to overlook the political implications of demographic problems.<sup>3</sup> Only recently have political analysts turned their attention once more to the effects of added numbers. But the general tendency to date has been either to over-react to the seemingly overwhelming problems associated with population growth, attributing to it many of today's social, economic and political ills, or to under-react, by continuing to view politics as an autonomous phenomenon, divorced from its demographic and ecological context.<sup>4</sup> As a result, few studies exist which are addressed specifically to the relationship between population and politics.<sup>5</sup>

4. Much of the evidence concerning the political implications of population dynamics is still insufficient to provide any conclusive answers. The diversity of views<sup>6</sup> on the population question (including the Malthusian, Marxist, radical and more recent social science perspectives upon the causes and consequences of rapid population growth) render it all the more

Szabady, ed., *World Views of Population Problems* (Budapest, Akadémiai Kiadó, 1968), pp. 197-208; O. Harkavy, "Population growth: some economic problems", in W. E. Moran, Jr., ed., *Population Growth: Threat to Peace?* (New York, P. J. Kenedy and Sons, 1965), pp. 105-118.

<sup>6</sup> Illustrative works include N. W. Chamberlain, *Beyond Malthus: Population and Power* (New York, Basic Books, 1970); J. M. Stycos, "Population and population control in Latin America", *World Politics*, vol. 20, No. 1 (October 1967), pp. 66-82; W. Barclay, J. Enright and R. T. Reynolds, "Population control in the third world", *NACLA Newsletter*, vol. IV, No. 8 (December 1970) (for a radical perspective); T. G. Saunders, "Opposition to family planning in Latin America: the non-Marxist left", *West Coast South America Studies*, vol. XVII, No. 5 (1970); C. Culligan, "Punta del Este, 1961-1967: early dawn of a demographic awakening", *Population Bulletin*, vol. XXIII, No. 3 (June 1967), pp. 45-83.

imperative that the evidence relating population to politics be assessed critically. In the course of such assessments, the conventional bounds of demographic analysis should be broadened to take explicit cognizance of the resources and technology of a society, which place population in a societal perspective, and to highlight important differences between the implications of population variables in less developed States and those in advanced industrial societies. In both cases, however, the effects of population are mediated through a complex network of intervening processes, the nature of which is not yet well understood. Indeed, population factors often generate reverberating effects throughout the social system, which are generally very complex. Furthermore, these effects are often characterized by long time-lags, rarely becoming apparent in the short range. Any analysis must therefore acknowledge the importance of the time factor by seeking to identify the short- and long-range effects of population and the policies most appropriate to different time-frames.

5. The lack of reliable statistical data concerning demographic structure in many parts of the world makes assessment of the implications of population dynamics more difficult. There are also marked ambiguities and inconsistencies concerning the definition of "optimum" population. The basic question is "optimum" with respect to what. Since the economic optimum is not necessarily congruent with the military or political optimum, and since at the level beyond mere subsistence the optimum is culturally and sociologically defined, it is especially difficult to employ this notion with any degree of precision for analysis or for policy planning.<sup>7</sup>

6. The distinction between actual demographic conditions and their political implications, on the one hand, and the perception of these conditions by national political leaders, on the other, is always important.<sup>8</sup> Identifying the connexion between the subjective and the objective is a major challenge; but it would be a mistake to assume a necessary congruence between the two, or that one invariably leads to the other.<sup>9</sup> Any

relationship between population and politics will almost surely be complex.

#### POPULATION AND GOVERNANCE: SOME INSTITUTIONAL IMPLICATIONS

7. A recent survey<sup>10</sup> of prevailing arguments and assumptions with regard to the political implications of population dynamics concluded that:

(a) Added population generates demands for increases in housing, education, health services, and so forth;

(b) Resource constraints in less developed countries are such that those of the lowest socio-economic status will not be incorporated in governmental attempts to meet rising demands;

(c) Governmental institutions may be influenced by population change;

(d) Population policy will become an increasingly sensitive issue, particularly in multi-ethnic communities;

(e) Effects upon the labour force of added population could provide a mass base upon which political organizers might draw;

(f) Numbers affect a country's political culture and modes of political conduct;

(g) Governments might consciously exploit population as a political issue;

(h) The discourse concerning the development of population policies will invariably become more political than it has to date.

8. The burden of existing evidence suggests that the larger the population, the greater the number and nature of government services needed; but the precise relationship between size and government services is difficult to determine.<sup>11</sup> All other factors being equal, however, public services are strained once population exceeds a certain threshold in terms of level and rate of changes, although again, the precise nature of this threshold has never been demonstrated persuasively. The most dislocating effects appear to be in cases where rapid changes in population (either through natural increase or migration) place added demands upon governmental services, particularly when the resources available to the polity are not commensurate with the demands generated.

9. Such demands often influence legislative institutions. As increased numbers place added loads on government, performance may be affected, potentially generating citizen alienation. Shifts in the distribution of population also affect the kinds of problems Govern-

<sup>7</sup> See, for example, A. Sauvy, *General Theory of Population* (New York, Basic Books, 1969), pp. 16-65; D. J. Elazar, "Population growth and the federal system", in Commission on Population Growth and the American Future, *Governance and Population . . .*, vol. IV of the Commission's report, pp. 25-58; W. Petersen, *Population*, 2nd ed. (London, Macmillan, 1970), pp. 159-162; S. F. Singer, ed., *Is There an Optimum Level of Population?* (New York, McGraw-Hill, 1971); A. S. David and Huang Ching-ju, "Population theory and the concept of optimum population", *Socio-Economic Planning Sciences*, vol. 3 (1969), pp. 191-217.

<sup>8</sup> See R. L. Clinton and R. K. Godwin, *Research in the Politics of Population* (Lexington, Mass., D. C. Heath and Co., 1972); and R. L. Clinton, *Population and Politics: New Directions for Political Science Research* (Lexington, Mass., D. C. Heath and Co., 1973). For an early statement on the political implications of population dynamics, see K. Davis, "The political impact of new population trends", *Foreign Affairs*, vol. 36, No. 2 (January 1956), pp. 293-301.

<sup>9</sup> For an example, see H. E. Daly, "The population question in northeast Brazil: its economic and ideological dimensions", *Economic Development and Cultural Change*, vol. 18, No. 4, part I (July 1970), pp. 536-574.

<sup>10</sup> M. Weiner, "Political demography: an inquiry into the political consequences of population change", in *Rapid Population Growth: Consequences and Policy Implications* (Baltimore, Johns Hopkins Press, 1971), vol. II, especially pp. 607-613.

<sup>11</sup> See also the essays in Commission on Population Growth and the American Future, *Governance and Population: The Governmental Implications of Population Change*, vol. IV of the Commission's report (Washington, D.C., 1972).

ments face.<sup>12</sup> Inability to satisfy rising expectations is likely to lead to changes in governmental institutions. The way in which this change comes about or what the new structures will be like, however, is a matter for speculation. A recent study argues that representative institutions may be bypassed altogether.<sup>13</sup>

10. The effects of population change on costs of governance are equally hard to discern. Although rapid and consistently high changes invariably place strains on governmental capabilities—both financial and administrative—it is not plausible to assume a direct proportionate relationship between population increase and increase in governmental costs.<sup>14</sup> Often, the rate of increase in governmental cost, particularly at the local level, appears to be greater than the corresponding rate of increase in population. This relationship differs according to the types and extent of services provided to the community, the financial resources available to government and prevailing levels of knowledge and skills in the society.

11. Some efforts have been made to evaluate the financial costs of added population,<sup>15</sup> the effects of population upon education,<sup>16</sup> and the effects of added population upon economic performance and political development.<sup>17</sup> Yet, similar calculations do not yet exist for the implications of rapid increases in numbers—or changes in their composition or distribution—upon governmental services or upon economic sectors.

#### POPULATION SIZE AND NATIONAL POWER<sup>18</sup>

12. Political analysts generally argue that population size is a relevant factor in the over-all power calculus of a country; but there is, again, little empirical evidence indicating precisely how the size of the popu-

Heer, "Economic development and fertility", *Demography*, vol. 3, No. 2 (1966), pp. 423-444.

<sup>17</sup> M. Weiner, *loc. cit.*

<sup>18</sup> A synthesis of the literature on population and international power is found in N. Choucri, *Population Dynamics and International Violence: Propositions, Insights, and Evidence* (Cambridge, Mass., Massachusetts Institute of Technology, Center for International Studies, 1973); this section draws upon the analysis in pp. 51-85. See especially A. Wright, *A Study of War*, 2nd ed. (Chicago, University of Chicago Press, 1965); and H. J. Morgenthau, *Politics Among Nations: The Struggle for Power and Peace*, 4th ed. (New York, Alfred A. Knopf, 1967). See also J. A. Kahl and J. M. Stycos, "The philosophy of demographic policy in Latin America", *Studies in Comparative International Development*, vol. 1, No. 2 (1965), p. 1.

lation adds to or detracts from its over-all capabilities, economic or military. Those who argue for the simple number-power proposition do so on four grounds. The larger a society's human resources, the greater is the possibility of increasing its effective labour force; the larger the size of the military force, the greater are the probabilities that numbers will generate sentiments of nationalism and national cohesion; and the greater are development possibilities, particularly if economies of scale prevail. On face value, all four arguments appear plausible, but they are fraught with logical and empirical inconsistencies. The fact that an increase in numbers may be channelled into the labour force or the military, or result in economies of scale, or generate sentiments of national cohesion does not assure that this will occur. Other conditions must be present before such outcomes materialize. That international recognition is often accorded on a size principle simply adds to the complexities involved. There are also some obvious trade-offs between size as an asset and size as a liability, and between size as a constraint to economic development and size as a determinant of military capability. Because countries often increase their territory primarily through conquest, it may even be difficult to distinguish between size as a cause of power and size as its consequence.

13. In addition, the importance of such variables as national cohesion, technological capability, military effectiveness, the capacity to absorb military casualties and the development of human resources all condition the extent to which sheer size is critical. Trade-off calculations are invariably complex, leading to alternative solutions; it is not possible to assign a simple numerical value to population size so as to quantify power in social, economic and political terms. No one has yet devised a way of measuring power or power relations empirically. From a purely statistical point of view, however, population size does feature prominently as an indicator of national power in two ways: first, the size variable loads strongly on the power dimension in factor analysis; secondly, size tends to correlate positively and significantly with other measures of capability.<sup>19</sup>

14. Once technology is entered in the power calculus, any simple relation between population and power disappears. Technological advances have revolutionized the conduct of warfare and the expectations of the parties during the course of violence. The fact that technology can be imported and substantial changes in capability brought about in short order makes technology more critical than size in any power assessment, but also makes such calculations far more volatile. However, the advent of nuclear weapons has added a new dimension to the size factor; placing at risk population centres has become perhaps as valuable as placing at risk the opponent's men under arms. In these

<sup>19</sup> J. Sawyer, "Dimensions of nations: size, wealth, and politics", *American Journal of Sociology*, vol. 73, No. 2 (September 1967), pp. 145-172.

terms, population size again assumes military importance.

15. Differentials in population size and rate of change, in conjunction with differences in levels and growth rates of technology and resources, impose a particularly volatile element on international relations.<sup>20</sup> In the margin, size is important, but it is primarily in cases where States have approximately equal resources and technological capabilities that absolute numbers make a critical difference.

#### POPULATION DYNAMICS, POLITICAL INSTABILITY AND INTERNAL VIOLENCE

16. The sources of internal instability and violence are numerous and varied. Several attempts have been made to identify empirically the factors that increase propensities for internal conflict.<sup>21</sup> Political scientists generally view the inability of a Government to meet demands as an important source of political unrest. However, there is as yet no empirical evidence of a direct, statistically significant relationship between population variables and internal political instability. The weight of the systematic and cross-national evidence is, in fact, contrary to any inference that population pressures, or density, or the rate of population growth have any direct bearing upon internal instability or domestic violence. Many areas of the world that have a high population density, and many areas that are conventionally thought of as high-pressure regions, do not exhibit marked tendencies for political instability,<sup>22</sup> while many areas with roughly stable populations are quite unstable. Individual case studies where the relationship holds are not enough to prove a general law. However, population variables do tend to be part of the conflict-generating dynamics in societies which already exhibit high stress and strain<sup>23</sup> and where population changes aggravate existing tendencies for internal conflict. Since much of this evidence is based on a cross-national study of 84 contemporary countries for 1950-1960 and 1961-1965, the modest role of population variables in contributing to internal violence

<sup>20</sup> For an extension of these arguments and specific examples, see N. Choucri and R. C. North, "Dynamics of international conflict: some policy implications of population, resources, and technology", *World Politics*, supplement, vol. XXIV (1972), pp. 80-121.

<sup>21</sup> See, for example, H. D. Graham and T. R. Gurr, *Violence in America* (New York, Macmillan Co., 1969); T. R. Gurr, *The Conditions of Civil Violence*, Center for International Studies Monograph No. 28 (Princeton, N.J., Princeton University Press, 1967); and J. C. Davis, ed., *When Men Revolt and Why* (New York, The Free Press, 1971). For empirical studies of political instability and conflict behaviour, see R. Tanter, "Dimensions of conflict behaviour within and between nations, 1958-60", *Journal of Conflict Resolution*, vol. 10, No. 1 (March 1966), pp. 41-64. Many similar studies have been undertaken employing factor analysis as the basic methodology. None focus upon population variables *per se*. The one exception is noted below.

<sup>22</sup> See M. Weiner, *loc. cit.*, pp. 586-589.

<sup>23</sup> T. R. Gurr and H. Weil, "Population growth and political conflict: a correlational study of 84 nations", unpublished study, Northwestern University, April 1973.

might be attributed to the time-frame in question, to the aggregation of countries at such a high level or to a focus upon cross-national analysis.<sup>24</sup> Closer, more detailed, regional or national analyses might shed further light on these findings, particularly in cases where *prima facie* evidence suggests possible linkages from population to internal violence. The intervening linkages, however, are still to be determined.

17. On balance, therefore, the implications of population change for domestic instability and violence appear to be highly dependent upon the resources of a society and its ability to accommodate to new demands. It is also contingent upon the levels of knowledge and skills, the prevailing levels of technology and the nature of the political system. A politicized population makes greater demands upon its Government than one that is less so, with possibly destabilizing consequences.

#### POPULATION DISTRIBUTION: SOME CONSEQUENCES OF DENSITY AND PRESSURE

18. Aside from simplistic inferences with regard to the connexion between concentration (internal density or pressure), on the one hand, and violence, on the other, the existing evidence again points more to inconsistencies of inference than to many sound conclusions. Studies of animal behaviour suggest that drastic shifts within the social hierarchy in social habits and in patterns of interaction may result from increased density and/or pressure, and that conflict, aggression and overt violence are more prevalent under conditions of increased crowding. Further, these studies show that the greater the density, the more likely it is that outward expansion will take place.<sup>25</sup> However, evidence from the study of human societies is, although suggestive, as yet inconclusive. A recent analysis of Chicago (Illinois, United States of America) neighbourhoods indicates that rates of social pathologies (such as mental illness, mortality and delinquency) appear to be associated with population density,<sup>26</sup> but severe problems in measurement require that any inferences be made with caution. There are some arguments that high density with low resources and low technology is invariably destabilizing, but this has been challenged. Similar doubts exist concerning any direct link between population density and international violence.<sup>27</sup> None the less, in areas

<sup>24</sup> *Ibid.* For supporting evidence concerning the social preconditions for violence, see B. Wedge, "The case study of student political violence: Brazil, 1964, and Dominican Republic, 1965", *World Politics*, vol. XXI, No. 2 (January 1969), pp. 183-206.

<sup>25</sup> For a review of recent studies, see P. M. Driver, "Toward an ethology of human conflict: a review", *Journal of Conflict Resolution*, vol. XI, No. 3 (September 1967), pp. 361-374.

Klevansky and P. R. Ehrlich, "The effect of crowding on human task performance", *Journal of Applied Social Psychology*, vol. 1, No. 1 (1971), pp. 7-25.

<sup>27</sup> S. Bremer, J. D. Singer and U. Luterbacher, "Crowding and combat in animal and human societies: the European nations, 1816-1965", unpublished manuscript, University of Michigan, November 1971.

where populations place demands on their environments and where resources and technology are relatively unavailable, the propensities for conflict are certainly enhanced.

19. The elusive consideration of "felt" pressure has been raised by some scholars to explain the link between density (in spatial terms) or pressure (in terms of resources) and conflict behaviour. The arguments run as follows. In situations where the leadership or the politicized public perceives that pressures may be reduced through political action, this perception becomes critical in its own right, and empirical realities pale. Indeed, the social science literature abounds with debates about the importance of absolute deprivations, relative deprivations, rising expectations, lowered expectations and so forth, in terms of political implications and propensities for conflict and violence.<sup>28</sup> The relation of perceptions to realities is particularly elusive and there is no clear indication of the conditions under which felt pressures propel States towards conflictual behaviour in contrast to those situations in which actual pressures of numbers in relation to resources constitute the major determinants.

20. There is, however, some cross-national evidence which indicates that actual pressures are consistently related to both internal turmoil and measures of domestic rebellion and that pressure upon resources is positively related to internal conflict. Societies with high dependency ratios—large numbers of unproductive youth—are also the most unstable, but this relationship may, in large part, be spurious, both factors being positively correlated with economic development.<sup>29</sup>

21. In sum, although population density and population pressure do not appear to be direct contributors to violence at the international level, population pressure does emerge as one important determinant of internal violence. The evidence is still too general to allow for inferences with respect to any specific country, but broad patterns are discernible.<sup>30</sup>

#### POPULATION MOVEMENT: SOME CONSEQUENCES OF MIGRATION

22. The political implications of population movement have been given comparatively little attention to date. Historically, conflict between populations has generally been over land resources and the redistribution of territorial rights. Hence, when the movement of population across national boundaries violates established views on rights and territoriality, migration

<sup>28</sup> See, for example, T. R. Gurr, "Urban disorder: perspectives from the comparative study of civil strife", *American Behavioural Scientist*, vol. II, No. 4 (March-April 1968).

<sup>29</sup> T. R. Gurr and H. Weil, *op. cit.*, pp. 17-20.

<sup>30</sup> There are many studies examining the economic implications of population pressures, but rarely are the political consequences rendered explicit. One study in Africa is particularly worthy of note: T. E. Dow, Jr., "Population pressure in tropical Africa", *Current History*, vol. 60 (March 1971), pp. 136-141. The author indicates the ways in which an area that has not commonly been viewed as having a population problem appears to have a very serious one indeed.

becomes a variable of significant political importance. There are also political implications of movements from rural to urban areas, interurban migration and nomadic movements or migrations to the proverbial frontier;<sup>31</sup> but these have not been systematically examined.

23. The search for universally valid generalizations concerning the conditions and consequences of population movements has to date produced only marginal returns, as much of the data is situation-specific and time-bound, and there has been no effort systematically to compare the findings of diverse migration studies. However, this partial evidence does suggest that it is by changing the demographic profile of both host and source community that migration assumes political importance.<sup>32</sup> A lack of systematic data on who migrates, why and with what effect further hinders the clarification of these issues. The absence of a comprehensive theory of migration which takes into account the conditions of both the host community and the community of origin, the characteristics of the migrants and the alternative potential consequences, makes it difficult to evaluate the disparate evidence in more than general terms. In addition, the consequences of migration for the receiving community have been given greater attention than the consequences for the community of origin.

24. As the general tendency is for population movements to occur from less developed to more developed regions, an influx of less skilled, less affluent migrants into a community clearly can act to intensify demands for governmental services. This migration may occur both within a country and across national boundaries, and may be either temporary or permanent.

25. Rapid urban growth is a characteristic of countries experiencing turmoil and, specifically, of countries experiencing rebellion in Latin America, and countries with turmoil in Africa and Asia. A quantitative cross-national study indicates that it appears to have a moderately positive, although not statistically significant, correlation with measures of internal turmoil and rebellion.<sup>33</sup> These relationships are consistent, but they are not strong; nor is a causal relation established. The sheer number of newly urbanized people does not, in itself, contribute to the propensity for domestic violence. It is therefore important to look more closely at the evidence concerning the processes by which the movement of population to cities (as the major form of increased urbanization) results in political conflict.

<sup>31</sup> For an excellent survey of internal migration, see D. J. Bogue, "Internal migration", in P. M. Hauser and O. D. Duncan, eds., *The Study of Population: An Inventory and Appraisal* (Chicago, University of Chicago Press, 1959), pp. 486-509; also W. Petersen, *op. cit.*; D. Fleming and B. Bailyn, eds., *The Intellectual Migration, Europe and America, 1930-1960* (Cambridge, Mass., Harvard University Press, 1969).

<sup>32</sup> See M. Weiner, *loc. cit.*, pp. 601-605. For problems of integrating migrants, see R. C. Hanson and O. G. Simmons, "Differential experience paths of rural migrants to the city", *American Behavioral Scientists*, vol. 13, No. 2 (September/October 1969), pp. 14-35.

<sup>33</sup> T. R. Gurr and H. Weil, *op. cit.*, pp. 18-19.

26. Political scientists who are concerned with urbanization have long believed that rapid movement to the cities results in economic frustration among the migrant population, that difficulties in adjusting to urban conditions lead to an increased awareness of the role of government and to radical politicization among the migrants, and that in the case of the urban poor, this politicization results in an opposition to the political system. Urbanization theorists argue that such non-supportive attitudes tend to be translated into behaviour that results in political instability, but the validity of these theories is being increasingly questioned.<sup>34</sup>

27. Recent studies of population movement among the urban poor in Latin America suggest that the city is not necessarily a radicalizing influence; that there appear to be no differences among migrants and non-migrants on indexes of social conditions, political attitudes or behaviour patterns; and that there is no evidence that migrants in Latin America provide an invariable radical base from which political instability results.<sup>35</sup>

28. It also appears that the demands made upon Governments by the migrants tend to be for primary services and that these are not translated into broader social and economic demands for such things as education or employment opportunities.<sup>36</sup> Political support for the régime by the migrants is thus best predicted by their access to these basic services. Delivering such services amounts to an important pre-condition for their absorption into the urban community. In addition, when migrants succeed economically in relation to the local population, an indigenous reaction may set in and the local population may employ political methods for opposing the migrants.<sup>37</sup>

29. Urbanization as such tends to reinforce ethnic divisions and such divisions hinder the development of political participation and orderly political process. These divisions also result in the "fragmentation" of the social order by strengthening the differences between migrant and native.<sup>38</sup> It has also been suggested, how-

ever, that in the short run, the growth of cities dampens propensities for violence rather than increasing them. But this evidence is sketchy and time-bound.

30. The political implications of international migration are more readily discernible, in that great cultural and political clashes have resulted from the large-scale movement of populations across national boundaries. Often, however, international migration results in violent conflict. Countless examples of this phenomenon—most notably in the Middle East, South-East Asia and the South Asian subcontinent—point to the inherently destabilizing consequences of large-scale population movements.<sup>39</sup> This situation is accentuated when political boundaries do not coincide with ethnic boundaries—as is often the case in many areas of the world.

31. So, too, many local conflicts can be attributed to gradual (but sometimes also drastic) changes in the composition and size of the population due to movements. One study indicates a positive correlation exists between political violence and the percentage of refugees.<sup>40</sup> Although there are no statistical analyses of these relationships, a series of case studies of small conflict indicates that migration (forced or otherwise) appears to be an important determinant of overt violence.<sup>41</sup>

#### POLITICAL IMPLICATIONS OF POPULATION COMPOSITION

32. Population composition (age structure, socio-economic status, racial, ethnic and religious differences) often generates consequences with highly political implications; but, again, few attempts have been made to identify their separate effects. Although some scholars maintain that a youthful population provides some advantages in military terms which are not accorded to an older population, the composition of population by itself, as is the case for size, bears little upon over-all national power.

33. Age structure is also conventionally regarded as a factor in generating internal conflict. With due qualifications, the direct link is indeed substantiated. The higher the proportion of youthful population, and the greater its unemployment, the greater are the probabilities of dissatisfaction, instability and violence. A youthful population also places added strains upon the social services, while not contributing substantially to national production. There is circumstantial evidence

<sup>34</sup> See, for example, W. Kornhauser, *The Politics of Mass Society* (New York, The Free Press, 1959); and a review of relevant literature as presented in W. A. Cornelius, "Urbanization as an agent in Latin American political instability: the case of Mexico", *American Political Science Review*, vol. LXIII, No. 3 (September 1969), pp. 833-857.

<sup>35</sup> See, for example, W. A. Cornelius, *loc. cit.*; T. R. Gurr and H. Weil, *op. cit.*; and J. N. Nelson, *Migrants, Urban Poverty and Instability in Developing Nations*, Center for International Studies, Occasional Papers, No. 22 (Cambridge, Mass., Harvard University Press, 1969); J. N. Nelson, "The urban poor: disruption or political integration in third world cities?" *World Politics*, vol. XXII, No. 3 (April 1970), pp. 393-414.

<sup>36</sup> W. A. Cornelius, "The local urban community as an arena of political learning: the impact of residential context upon political attitudes and behavior among the migrant poor in Latin American cities", paper prepared for the Annual Meeting of the American Political Science Association, September 1972.

<sup>38</sup> A. E. Goodman, "The political implications of urban development in Southeast Asia: the 'fragment' hypothesis",

*Economic Development and Cultural Change*, vol. 20, No. 1 (October 1971), pp. 117-130.

<sup>39</sup> For a general statement, see C. P. Kindleberger, "Mass migration, then and now", *Foreign Affairs*, vol. 43, No. 4 (July 1965), pp. 644-658. One of many more detailed national analyses is found in S. J. Burki, "Social and economic determinants of political violence: a case study of the Punjab", *Middle East Journal*, vol. 25, No. 4 (Autumn 1971), pp. 465-480. See also M. Weiner, "Political demography: an inquiry into the political consequences of population change", *loc. cit.*

<sup>40</sup> S. J. Burki, *loc. cit.*, 1971.

<sup>41</sup> N. Choucri, "Population dynamics and local conflict: a cross-national analysis of population and war", Massachusetts Institute of Technology, Center for International Studies, 1973.

which indicates that a youthful population amounts to a contributing factor in many political and revolutionary movements.

34. A high proportion of youths in a population may tend to strain the mechanisms for socialization in societies, particularly when resources are inadequate to cope with large numbers being inducted into the social order, resulting in alienation which may become transformed into active opposition to the political system. There are some long time-delays involved, but strains may accumulate in society which contribute to eventual systemic change or over-all institutional transformations (again, the intervening sequence is difficult to establish).

35. It is commonly asserted that the more homogeneous a society is, the more stable it is likely to be, and the greater its capacities are for collective action. Political analysts tend to agree that political instability and violence are more likely to occur in situations where the cleavages in a society are reinforcing rather than cross-cutting: for example, where religious differences coincide with ethnic divisions, the propensities for political instability and violence are greater than when these characteristics are more randomly distributed.<sup>42</sup> The studies on migration mentioned above tend to reinforce these inferences and there are numerous illustrations of such situations. For example, students of Indian politics have long argued that one of the reasons for the seeming stability of the democratic process in India is that the lines of cleavage in society are cross-cutting. In Pakistan, by contrast, socio-economic and political cleavages were mutually reinforcing, thus contributing to the intensification of hostilities and eventually to violence.

36. Population composition may also provide important constraints upon which the political order is shaped.<sup>43</sup> The act of census-taking assumes political proportions where the political order is based upon recognized cleavages in the society and where any significant changes in relative populations might result in demands for similar adjustment in the political process. The case of Lebanon, where the census amounts to a major political issue, is illustrative of such considerations.

37. A recent study of the political implications of population composition in South Asia notes that the complex and asymmetrical character of the ethnic map of the area holds important consequences for war and peace. Each State in South Asia contains a number of ethnic groups which, in general, have a high cultural and political consciousness. Often, these ethnic divisions do not coincide with the political boundaries and the resulting strategic considerations become important

<sup>42</sup> See T. R. Gurr and H. Weil, *op. cit.*, pp. 18-21.

<sup>43</sup> For one illustration of the political implications of a heterogeneous population in terms of "in group-out group" propositions, see P. C. W. Gutkind, "Accommodation and conflict in an African pre-urban area", *Anthropologica*, vol. IV, No. 1 (1962), pp. 164-173. There are many such studies.

parameters for conflict in the area.<sup>44</sup> The manipulation of ethnic groups for political purposes is not uncommon in this area—or in other parts of the world—but there exists as yet no comprehensive study of the alternative political implications of ethnic divisions in conflict situations. Beyond these generalizations, however, there is little evidence concerning the precise political implications of population composition. To date, the overwhelming focus has been on the implications of numbers—their composition or their distribution still remains relatively unexamined.

#### FROM POPULATION TO WAR: TOWARDS SOME CAUSAL LINKAGES<sup>45</sup>

38. Although it is frequently argued that rapid population growth is a major cause of international instability and violence, the simple proposition that increased population results in international violence cannot be seriously entertained. From the available evidence it must be inferred that population dynamics do not appear to be direct causes of violent conflict either within or between countries.<sup>46</sup> The critical elements in any population/violence calculus might involve less population variables *per se* than the ways in which population combines with other factors to produce conflict. What those factors are and the way in which they interrelate constitute an area of inquiry which remains to be clarified.

39. In this context, the population variable must be viewed in three ways: as a parameter of a conflict situation, in the sense that it amounts to one of the characteristics which defines the antagonists; as a variable, in that changes in population produce commensurate (or disproportionate—as the case may be) changes in the situation at hand; or as a multiplier, in the sense that population characteristics may intensify existing cleavages and problems and render a situation less tolerable than might otherwise be the case. For purposes of analytical clarity, it is important to distinguish among these roles which population variables may assume.

40. A dynamic process linking population to war can be abstracted from the classical works on war and from recent empirical analyses.<sup>47</sup> First, there are internal consequences of added population—pressures on resources, dissatisfactions, unrest, lowered levels of living, relative deprivations and so forth. Secondly, there are the factors which allow internal dissatis-

<sup>44</sup> W. Conor, "Ethnology and the peace of South Asia", *World Politics*, vol. 22 (Spring 1969), pp. 51-86.

<sup>45</sup> This section is adapted from the author's previous research.

<sup>46</sup> See A. Wright, *op. cit.*, S. Bremer, J. D. Singer and U. Luterbacher, *op. cit.*; the essays in B. Russett, ed., *Peace, War, and Numbers* (Beverly Hills, California, Sage Publications, 1972); P. Renouvin and J. B. Duroselle, *Introduction to the History of International Relations* (New York, Frederick A. Praeger, 1967); for a central review, see N. Choucri, *op. cit.*

<sup>47</sup> These observations are based on N. Choucri, *op. cit.*, pp. 135-140.

factions to be translated into behavioural terms. These factors can be thought of as facilitators in terms of technological capability, military effectiveness, manpower, labour and so forth. Thirdly, there are those processes which relate States to each other and initiate dynamics that assume international characteristics. Such processes would be commercial rivalries, expansions, conquests and the like. Fourthly, there are factors which involve a comparative calculus on the part of at least one of the parties, i.e., differentials in capabilities, differentials in levels of living, differentials in population size and so forth. Fifthly, there are those international structural effects which are occasioned by international dynamics in conjunction with external relations, such as changes in power relations, redistributions of capabilities, changes in international alignments and the like. Sixthly, there are the explicit implications for conflict of these factors, in terms of provocation of one party by another, overt conflict and then armed violence.

41. In sum, population effects are mediated through a series of intervening linkages, and the initial conditions embedding population in the internal demographic, economic and political profile of a country become an important set of variables in this complex process.<sup>48</sup>

42. To these empirical realities must be added the perceptual factors which place a great element of uncertainty in this calculus. Perceptions of pressures, of differentials, of competitions, of change in the balance of power and so forth might not be congruent with actual situations. Feelings may assume a reality of their own. Unfortunately, little evidence exists concerning the ways in which population variables are perceived in different conflict situations, or how demographic considerations enter the military and strategic calculus of countries.

43. Reversing the causal sequence, some studies have been concerned with the effects of population upon the termination of war. An analysis of several wars indicated no evidence to support the general hypothesis of a fixed relationship between average casualties lost in battle and total population losses in wars; however, countries tend to try to surrender before they suffer population losses from about 3 to 6 per cent.<sup>49</sup> Population thus amounts to an ultimate constraint upon national behaviour and the conduct of war.<sup>50</sup> Population variables are therefore important in defining the parameters of permissible behaviour—what can and cannot be done in different circumstances—and these parameters are shaped as much by demo-

graphic conditions as by resource and technological conditions.<sup>51</sup> The greatest instabilities and propensities for war are to be found in situations where population pressures (or density, or over-population in relation to some particular referent) upon resource needs converge with the availability of military and other technologies to transform needs, demands and dissatisfactions into overt conflict and violence.

#### CONCLUSION: SOME POLITICAL CONSEQUENCES OF POPULATION DYNAMICS

44. The foregoing observations have pointed to some evidence—sometimes contradictory and always partial—concerning the relationship between population and politics. Several conclusions emerge:

(a) The political implications of population variables in any situation depend upon the resources of a society and its level of technology, knowledge and skills. Different populations make different demands upon their environment with differing consequences;<sup>52</sup>

(b) Rapid population growth invariably places added loads upon governmental capabilities and upon services performed and increases the cost of governance;

(c) Population pressures tend to intensify existing strains and stresses in society. Although there appears to be some direct relationship between population change and political instability, neither urbanization alone, nor crowding in cities, necessarily increases propensities for violence;

(d) Population composition often shapes the nature of the political process if the distribution of political privileges, rights and obligations is done according to attributable criteria, such as religion, race or ethnic group;

(e) A youthful population tends to strain the socialization mechanisms in society, particularly when resources are inadequate to cope with large numbers being inducted into the social order, often resulting in domestic conflict;

(f) Despite changing technology (and the importance of knowledge and skills), population size remains an important element in military calculations and therefore an ultimate factor in the ability to wage war;

<sup>51</sup> See N. Choucri, "In search of peace systems: Scandinavia and the Netherlands: 1870-1970", in B. Russett, *op. cit.*, pp. 239-274; and, for related evidence, R. J. Rummel, "U.S. foreign relations: conflict, cooperation, and attribute distances", in B. Russett, *op. cit.*, pp. 71-114; N. Choucri, M. Laird and D. Meadows, *Resource Scarcity and Foreign Policy: A Simulation Model of International Conflict* (Cambridge, Mass., Massachusetts Institute of Technology, Center for International Studies, March 1972), pp. 19-22.

<sup>52</sup> The role of technology in this calculus has never been examined systematically. For some related observations, see P. R. Ehrlich and J. P. Holdren, "Population and panaceas: a technological perspective", *Bioscience*, vol. 19, No. 1065 (December 1965), pp. 1065-1072; A. L. Austin and J. W. Brewer, "World population growth and related technical problems", Institute for Electrical Engineering, *SPECTRUM*, December 1970, pp. 43-54.

<sup>48</sup> A quantitative study of the origins of the First World War provides some support and illustration for these observations. See N. Choucri and R. C. North, *Nations in Conflict, Population, Lateral Pressure and War*.

<sup>49</sup> F. L. Klingberg, "Predicting the termination of war: battle casualties and population losses", *Journal of Conflict Resolution*, vol. X, No. 2 (June 1966), pp. 130-171.

<sup>50</sup> See also *Three Studies on War in Peace Reviews*; and S. Rosen, "War power and willingness to suffer", in B. Russett, ed., *op. cit.*, pp. 167-184.

(g) Internal migration does not necessarily lead to overt violence. By contrast, many international conflicts can be attributed to population movements across national boundaries;

(h) In some cases, population variables provide the roots of conflict; in others, they provide the context within which ongoing conflicts become routinized or take on new dimensions. Without explicit recognition of the demographic basis of a political conflict, imposed solutions may be of short duration.

#### POLICY QUESTIONS AND RECOMMENDATIONS FOR RESEARCH

45. In view of the inadequacies of the work undertaken to date, future research on population, politics and public policy should try to meet the following criteria: first, such research should be cross-national; secondly, it ought to be conducted over time, adopting a longitudinal perspective; thirdly, it must be scientific, that is, capable of falsification, replication and meeting acknowledged tenets of social science inquiry; fourthly, such research must be policy relevant, by identifying the manipulables in the social order, the costs of manipulation and the tools for implementing public policies; fifthly, it must be data-based, drawing upon existing files and developing novel observations when the required data are not available; and sixthly, the results must be communicable and amenable to evaluation and critical assessment.

46. Among the substantive issues to be examined in concerted and systematic fashion are the following:

(a) An assessment of cost of added population in terms of actual loads upon governmental capabilities and social services;

(b) An identification of the intervening factors, processes or sequences between population variables and negative social and political consequences, such as crime, conflict, violence and social disruption;

(c) A systematic monitoring of migratory trends in terms of who migrates, why, where and with what consequences upon the place of origin and the place of destination;

(d) A clarification of the process by which population movement takes place, in terms of opportunities, pressures or restrictions;

(e) An evaluation in cross-national context of the ways in which societies at different levels of socio-economic development are affected by added population;

(f) An identification of the different social policies which (implicitly or explicitly) affect population characteristics in different societies and an evaluation of potential inconsistencies among such policies;

(g) An assessment of the political and administrative requirements for the development of effective means of influencing the population characteristics in different societies;<sup>53</sup>

<sup>53</sup> For a general survey, see R. Elliott and others, "U.S.

(h) An evaluation of the effects of population variables upon political development;

(i) An identification of the effects of alternative population policies upon different sectors of society;

(j) A clarification of the types of systematic data and information needed to determine the extent to which different societies would be receptive to governmental policies designed explicitly to effect population characteristics.

47. Some critical imperatives for research purposes include long- and short-range studies and studies that reveal the long-run implications of decisions made in the short run.<sup>54</sup> Simple projective techniques are no longer adequate for the analysis of complex social systems.

48. Some of these questions can best be undertaken by the United Nations, and others by governmental or private institutions. In terms of the criteria cited above, the United Nations is best suited to engage in investigations that assume a global perspective, draw upon United Nations data files and are policy relevant by having direct bearing upon international policies towards population. Co-operation among national and international institutions is essential in the area of data collection and compilation and in the assessment of the results of research.

49. Another set of important data, which international organizations may provide, pertains to the ways in which Governments and national leaders perceive the demographic situation in their countries, their assessment of their own problems and their perspectives upon alternative approaches. A similarly critical consideration involves determining the degree of congruence between perceptions of the situation and the actual situation—as reflected in population trends and population structure. A third imperative involves an assessment of the extent to which existing national institutions and international agencies are appropriate for responding to problems generated by population trends.

50. The most important role for international organizations in this regard pertains to their clearing-house function. Translating scientific research results into an operational context amounts to a major challenge, a task that research groups in international organizations can serve better than any national or trans-national institution.

population growth and family planning: a review of the literature", in D. Callahan, ed., *The American Population Debate* (Garden City, N.Y., Doubleday Anchor Books, 1971), pp. 186-226. See also M. Stamper, *Population Policy in Development Planning: A Study of Seventy Less Developed Countries*, Reports on Population/Family Planning, No. 13 (New York, The Population Council, 1973); R. J. Lapham and W. P. Mauldin, "National family planning programs: review and evaluation", *Studies in Family Planning*, vol. 3, No. 3 (March 1972).

<sup>54</sup> There are, to date, almost no systematic attempts to evaluate the adaptive and problem-solving capabilities of political systems. This is an area in which research is needed over and above the orthodox literature in comparative politics as exemplified by Almond and Powell, *Comparative Politics: A Developmental Approach* (Boston, Little, Brown, 1966).

## LAW AND WORLD POPULATION

### *United Nations Fund for Population Activities*

1. Recognizing the important role which law plays in the population field, the United Nations Fund for Population Activities (UNFPA) has sponsored since 1971:

“a major study of law and population designed to clarify the impact of certain laws on population trends and to identify inconsistencies between existing legislation and government policy with regard to population. The research is intended to provide the basis for the development of guidelines for the revision and adaptation of legislation as required in support of population action programmes in the countries concerned.”<sup>1</sup>

2. The significance of the project to the Fund may be seen from the fact that it is the first project directly executed by the Fund rather than through the United Nations system of agencies. As such, the project is conducted not merely as “an academic study, but as a dynamic project which will have long-felt effects on the behaviour of countries that respect the ‘rule of law’”.<sup>2</sup> Accordingly, the Fund “would like to see the population factor formulated into policies and executed as operationally feasible programmes *in all countries if possible*”.<sup>3</sup> Members of the project staff were urged to take part meaningfully in the preparations at the national level for the World Population Conference and to make available their studies and findings for consideration by the time of the Conference. To this end, the Fund sponsored a Symposium on Law and Population on 26-31 May 1974 to serve as a “follow-up” to the study.<sup>4</sup> Jurists, social scientists and public health officials concerned with population laws throughout the world had an opportunity to exchange views and experiences and to explore the existence of common features in their countries’ legal systems related to population. In this light, it was considered that the Symposium might adopt recommendations of interest to the World Population Conference.

3. It is the purpose of this paper to show what population law is, why it is important to world population, and how it can contribute to the solution of the population problem.

#### POPULATION LAW AND ITS HISTORY

4. “Population law” may be defined as that body of the law which relates directly or indirectly to the population growth, distribution and those aspects of well-being affecting, as well as affected by, population size and distribution. By “law” is meant the constitutional, statutory, administrative and decisional, as well as the customary. “Law”, as used in this paper, embraces more than the governmental decisions or programmes that are “put into official form and translated into action”.<sup>5</sup> The relevancy of customary law is succinctly described by Ehrlich: “At the present as well as at any other time, the center of gravity of legal development lies not in legislation, nor in juridical science, nor in judicial science, but in society itself.” Again, he cautioned: “To embrace the whole variegated body of human activities in Legal Provisions is about as sensible as trying to catch a stream and hold it in a pond; the part that may be caught is no longer a living stream but a stagnant pool—and a great deal cannot be caught at all.”<sup>6</sup>

5. Not only does population law appear in different forms, but it covers many fields. Thus, in addition to laws directly concerned with fertility (contraception, sterilization and abortion), there are many more laws indirectly affecting fertility: obscenity; marriage age; polygamy; extended family; child allowances; old-age security; employment of women; child labour; housing; education (both general and sex education); medical practice; customs; taxes; migration; land tenure and inheritance.

6. Just as the impact of law upon the behaviour of the people varies from country to country and

and female heirs on equal footing,<sup>7</sup> the continued dominance of customary law in limiting succession to males only has exerted a pro-natalist effect. A family that already has several daughters will continue to want more children in the hope of producing a son, in order to keep property within the family. On the other hand, in countries where succession is, in fact, shared equally by sons and daughters, inheritance law would not loom large in population matters. For India, therefore, both the statutory and customary laws on inheritance need to be compiled and studied.

7. Since the population problem is multidimensional and the co-ordination of many fields is involved—a process which has heretofore been hampered by strict compartmentalization—the population problem can no longer be viewed solely as one of numbers or of census-taking, nor can the provision of contraceptives and family planning services be regarded as the sole solution of the population problem. (Even if the population problem should be reduced to one of over-population, which could be alleviated by contraceptives and family planning services, the creation of an effective demand is equally important.) Merely decreasing the rate of population growth is only one aspect of the problems associated with population.

8. Because of his training in the consideration of all sides of a problem, a lawyer can render invaluable services in the population field through the use and co-ordination of all branches of the law. So long as “law is an instrument of social policy”,<sup>8</sup> its potential as catalyst for social reform should be fully realized.<sup>9</sup>

9. From earliest times the law has been pro-natalist. The early codes dating back to Hammurabi and the Emperor Augustus already contained such provisions. Thomas Jefferson, in his draft for the Declaration of Independence, accused King George III as follows:

“[He] has endeavored to prevent the population of these states; for that purpose obstructing the laws for naturalization of foreigners; refusing to pass others to encourage their migrations hither; and raising the conditions of new appropriations of lands.”

Jefferson's draft was, in fact, incorporated into the final text of the Declaration.<sup>10</sup> These facts show the significance of population law in human history and it is noteworthy that, through almost all of this period, population growth has been regarded as desirable *per se*.

10. The conscious relating of law to population in the sense of emphasizing other than the mere favouring of growth is of comparatively recent origin. It has only

been since the Second World War that the desirability of growth has been questioned and that human rights and other considerations have entered the population picture.

11. Among the changing factors, the following may be mentioned:

(a) The precipitous fall of the death rate, particularly in the developing countries, together with the dramatic increase in the rate of population growth and with the growing realization on the part of most responsible people that this is occurring;

(b) The spread in the general understanding of the danger both to mothers and to children caused by malnutrition and the health hazard faced by large families in developing countries;

(c) The revolutionary change in the position of women in almost all developed countries, and increasingly in the developing countries, where women are gaining equality not only in political and economic life, but in domestic and sexual life, with the corollary that women should be free to decide for themselves whether or not to bear children;

(d) The increasing recognition of problems of unwanted children, including emotional disturbance, relationship to juvenile delinquency and their consequences upon the family and society;

(e) The widespread illegal abortions and the growing realization that contraception is preferable to abortion;

(f) The changing attitude towards morality and sex, with greater willingness to discuss openly such matters as contraception, voluntary sterilization, abortion and sex education;

(g) The development of new and more reliable contraceptives, such as the intra-uterine device (IUD) and the pills, and the relatively safe abortion operations;

(h) The concept of responsible parenthood, which has been accepted by all religions and ideologies;

(i) The emphasis through United Nations declarations, proclamations and conventions upon the various human rights principles, including that of family planning as a basic human right;

(j) The attainment of independence and self-determination by most countries, thus enabling them to review and reform their laws in light of their own needs and the human rights principles.

12. Despite these changes, only a low priority has been accorded to law compilation and reform, and population laws in most countries continue to reflect the prevailing values of earlier generations. In some countries, they still reflect the “legal imperialism” of the former colonial Powers, despite the advent of political independence and self-determination and despite the fact that even some of the former colonial Powers have already changed their own laws because of their incompatibility with human rights. Only in a few coun-

<sup>9</sup> L. T. Lee, “Law and family planning”, *Studies in Family Planning* (April 1971), p. 82 (originally a background paper prepared for the World Health Organization Expert Committee on Family Planning in Health Services, 24-30 November 1970).

<sup>10</sup> Cited in C. Means, “The constitutional aspects of a national population policy”, *Villanova Law Review*, vol. 15 (1970), p. 785.

tries has the law been changed so as to deal with contemporary social and economic conditions.

13. Lawyers themselves are partially to blame for this state of affairs. Directing themselves to the technical aspects of the law, both in their training and in their practice, they have, with but a few exceptions, been inactive regarding the challenge of the new problem. Moreover, being conservative as a profession, they have tended to avoid fields which, like population, are regarded as politically sensitive. In 1965, out of some 1,000 participants and observers at the United Nations World Population Conference at Belgrade, there was only one lawyer, and none of the hundreds of papers presented at the Conference dealt with the legal aspects of the population problem and family planning.

#### POPULATION AND HUMAN RIGHTS

14. While responding to the immediate challenges posed by the population problem, Population Law is concerned ultimately with human rights. Family planning, for example, should not be viewed as a goal in itself, but rather as a means to an end—opportunities for adequate food, health, clothing, shelter, education, work, recreation, old-age security etc.—all of them basic human rights which family planning effects.

15. Since 1966, four major events have lent particular urgency to the study of Population Law: the Declaration on Population by 12 Heads of State in 1966 (increased to 30 in 1967) that family planning is a basic human right;<sup>11</sup> the unanimous adoption in 1968 by the United Nations Conference on Human Rights of the Teheran Proclamation that family planning is a basic human right, and of a resolution that couples also have the right to be sufficiently instructed and informed on family planning;<sup>12</sup> the General Assembly Declaration on Social Progress and Development in 1969, containing a provision that the right to family planning includes not only the "knowledge", but also the "means necessary" for the exercise of this right;<sup>13</sup> and the unanimous agreement at the United Nations Symposium on Population and Human Rights held on 21-29 January 1974 in Amsterdam that among the essential elements of population assistance programmes offered to Governments by international organizations would be the compilation, review and reforms of their laws in the light of both population policy and human rights.<sup>14</sup>

#### *Status of human rights*

16. The question may be raised concerning the status of human rights, whether human rights are

<sup>11</sup> United Nations, *Population Newsletter* (April 1968), p. 44.

<sup>12</sup> For texts of the Teheran Proclamation on Human Rights and resolutions, see *Final Act of the International Conference on Human Rights* (United Nations publication, Sales No. E.68.XIV.2).

<sup>13</sup> Proclaimed by the General Assembly of the United Nations in resolution 2542 (XXIV) of 11 December 1969, annex, article 226.

<sup>14</sup> E/CONF.60/CBP/4, para. 150 (g).

imbued with a legal quality thus imposing legal responsibility upon States, or whether these are merely moral rights—hortatory in nature, but not legally binding. Since the role of the lawyer in population matters hinges very much upon the answer to this question, it is necessary to discuss this in some detail.

17. The status of human rights has traditionally been linked to the types of instruments into which they are incorporated. Thus, the answer to the question whether human rights are legally or only morally binding upon States usually hinges upon the fulfilment or nonfulfilment of the various requirements under the law of treaties. As is often the case, where human rights are dealt with in such instruments as declarations,<sup>15</sup> proclamations,<sup>16</sup> or unratified covenants,<sup>17</sup> they are considered morally, but not legally, binding. Only duly ratified conventions<sup>18</sup> are given legally binding effect and then only on the countries which ratified them. This treaty-oriented approach to human rights has been subscribed to by many jurists.<sup>19</sup>

<sup>15</sup> A/CONF.32/6, para. 365; and A/CONF.32/6/Add.1, para. 12, list the following "Declarations" on human rights adopted by the General Assembly up to and including 1967:

- Universal Declaration of Human Rights (1948);
- Declaration of the Rights of the Child (1959);
- Declaration on the Granting of Independence to Colonial Countries and Peoples (1960);
- United Nations Declaration on the Elimination of All Forms of Racial Discrimination (1963);
- Declaration on the Promotion among Youth of the Ideals of Peace, Mutual Respect and Understanding between Peoples (1965);
- Declaration on the Elimination of Discrimination against Women (1967).

A "Declaration" may be codified into a Convention which enters into force upon receiving a requisite number of ratifications, as in the case of the Declaration on the Elimination of All Forms of Racial Discrimination (1963), which was codified in General Assembly resolution 2106 (XX) of 1965 and entered into force in 1969; or it may be codified but lacks the requisite number of ratifications to enter into force, as in the case of the Universal Declaration of Human Rights, General Assembly resolution 217 A (III) of 10 December 1948, which was codified into two International Covenants in 1966 (see foot-note 17 below), but has not at the time of writing entered into force. A declaration may also stand alone, unaccompanied by codification, as is the case with the great majority of declarations cited above. For the complete language of declarations, proclamations and conventions adopted prior to 1973, see *Human Rights: A Compilation of International Instruments of the United Nations* (United Nations publication, Sales No. E.73.XIV.2). For a report on the status of multilateral agreements under United Nations auspices, see E/CN.4/907/Rev.7.

<sup>16</sup> See, for example, the Proclamation of Teheran.

<sup>17</sup> See, for example, the International Covenant on Economic, Social and Cultural Rights and the International Covenant on Civil and Political Rights, General Assembly resolution 2200 A (XXI) of 16 December 1966, annex.

<sup>18</sup> See, for example, the International Convention on the Elimination of All Forms of Racial Discrimination, General Assembly resolution 2106 A (XX), annex; the Convention on the Prevention and Punishment of the Crime of Genocide (General Assembly resolution 260 A (III) of 9 December 1948); the Supplementary Convention on the Abolition of Slavery, the Slave Trade and Institutions and Practices Similar to Slavery, United Nations, *Treaty Series*, vol. 266; and the Convention for the Suppression of the Traffic in Persons and of the Exploitation of the Prostitution of Others, General Assembly resolution 317 (IV).

<sup>19</sup> H. Kelsen, *Principles of International Law* (New York, Rinehart, 1952), pp. 144-145; E. Schwelb, "The influence of

(Continued on next page)

18. It is submitted, however, that human rights, to the extent that they have met the conditions prescribed below, are, *ipso facto*, legally binding upon States, regardless of the existence of a duly ratified treaty, for human rights, by definition, are "rights which attach to all human beings equally, whatever their nationality".<sup>20</sup> As such, the legal validity of their application cannot be rooted solely in a mere piece of paper signed and ratified by States.

19. By emphasizing the formal or procedural aspects of human rights treaties, the traditional approach appears to confuse the instruments stipulating human rights with the substantive human rights themselves. Rather, the analysis of the binding force of human rights must be approached also from their non-treaty sources: natural law; customary international law; and general principles of law as recognized by civilized countries. Each of these sources has contributed to the development of human rights. These sources of human rights are briefly discussed with special emphasis on the formation of customary international law in the light of developments in the twentieth century.

#### Natural law

20. Whether in their manifestation as "inherent rights", "fundamental freedoms", or "natural justice", human rights are synonymous with the law of nature. Except for those extreme positivists who would deny *in toto* the existence of natural law,<sup>21</sup> the latter is deemed to underlie both domestic legislation and international agreements, finding expression in such basic instruments as the Charter of the United Nations<sup>22</sup> and national constitutions.<sup>23</sup> Yet, even for these positivists, to the extent that human right-natural law has already

---

the Universal Declaration of Human Rights on international and national law", *American Society of International Law Proceedings* (New York, 1959), pp. 217-229; P. N. Drost, *Human Rights as Legal Rights: the Realization of Individual Human Rights in Positive International Law; General Discussion and Tentative Suggestions on an International System of Human Rights* (Leiden, Sijthoff, 1951), p. 32.

<sup>20</sup> Sir Humphrey Waldock, "Human rights in contemporary international law and the significance of the European convention", *International and Comparative Law Quarterly*, Supp. publication, No. 11 (1965), p. 3. Sir Humphrey Waldock went on record as stating that the constant and widespread recognition of the principles of the Universal Declaration of Human Rights "clothes it, in my opinion, in the character of customary law". *Idem.*, p. 15.

<sup>21</sup> See, for example, H. Kelsen, "The pure theory of law", *Law Quarterly Review*, vol. 51 (1935), p. 517; H. Kelsen, "The pure theory of law and analytical jurisprudence", *Harvard Law Review*, vol. 55 (1941), p. 44; H. Kelsen, *General Theory of Law and State*, translated by A. Wedberg (1949); H. Lauterpacht, *Modern Theories of Law* (1938), pp. 105-138; W. Ebenstein, *The Pure Theory of Law* (1945).

<sup>22</sup> Thus, the Charter of the United Nations makes seven references to human rights in addition to using such terms as "fundamental freedoms" and "inherent rights". An example of the latter provides that "nothing in the present Charter shall impair the *inherent right* of individual or collective self-defence". (Article 51, emphasis supplied.) The basic nature of the Charter is evidenced in Article 103, under which obligations under the Charter shall prevail over those demanded by any other international agreement, past or future.

<sup>23</sup> See, for example, United States of America, *Constitution*, amendments I-X, especially the due process clauses. See also the American Declaration of Independence of 1776, which

been incorporated into these basic laws, it is already binding upon States regardless, or even in spite of, a treaty.

#### Customary international law

21. The recent trend of codifying customary rules of international law into conventional international law<sup>24</sup> is reflected in recent attempts at codifying human rights into treaty form.<sup>25</sup> It should be noted, however, that in the absence of a binding treaty, the validity of international custom as the second source of international law in the criteria of the International Court of Justice<sup>26</sup> remains undiminished. Thus, those human rights based on international custom continue to be binding upon States, notwithstanding the latter's failure to ratify or adhere to such treaties.

22. The importance of custom-based human rights assumes growing proportions in light of the increasingly active involvement of the United Nations in the field of human rights.<sup>27</sup> That the United Nations has clear authority to discuss and make recommendations on human rights matters is specifically provided for in Articles 10, 13, 55 and 62 of the Charter. While it is not contended that all General Assembly resolutions have a legally binding effect upon Members of the United Nations, those resolutions which are declaratory of customary international law cannot detract from the pre-existing law, and through incorporation of that law may be cited as if they themselves have legally binding effect.<sup>28</sup> In addition, it is submitted that repeated and near-unanimous resolutions or declarations may achieve such an effect through accelerating the custom-generating process. Judge Tanaka describes well the working of such process:

---

contains the renowned passage: "We hold these truths to be self-evident, that all Men are created equal, that they are endowed by their Creator with certain *unalienable Rights*, that among these are Life, Liberty and the pursuit of Happiness". (Emphasis supplied.)

<sup>24</sup> L. T. Lee, "International Law Commission re-examined", *American Journal of International Law*, vol. 59 (1965), pp. 545-546.

<sup>25</sup> Examples of this practice are the codification of the Universal Declaration of Human Rights into the 1966 International Covenants on Economic, Social and Cultural Rights and on Civil and Political Rights, and the codification of the United Nations Declaration on the Elimination of All Forms of Racial Discrimination into the International Convention on the Elimination of All Forms of Racial Discrimination.

<sup>26</sup> Statute of the International Court of Justice, Art. 38, para. 1.

<sup>27</sup> For an excellent review of United Nations activity in the field of human rights, see J. Carey, *United Nations Protection of Civil and Political Rights* (Syracuse, N.Y., Syracuse University Press, 1970).

<sup>28</sup> Thus, Tunkin refers to the 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples as declaratory of customary international law. Operative paragraph 7 of the Declaration provides that "all States shall observe faithfully and strictly the provisions of the Charter of the United Nations, the Universal Declaration of Human Rights and the present Declaration...". See G. I. Tunkin, *Droit International Public: Problèmes Théoriques* (1965), p. 100 ff.; J. P. Humphrey, "Human rights and world law", working paper presented at the World Conference on World Peace Through Law, Abidjan, Ivory Coast, 26-31 August 1973.

"According to traditional international law, a general practice is the result of the repetition of individual acts of States constituting consensus in regard to a certain content of a rule of law. Such repetition of acts is an historical process extending over a long period of time . . . . The appearance of organizations such as the League of Nations and the United Nations, with their agencies and affiliated institutions, replacing an important part of the traditional individualistic method of international negotiation by the method of 'parliamentary diplomacy' . . . is bound to influence the mode of generation of customary international law. A State, instead of pronouncing its view to a few States directly concerned, has the opportunity, through the medium of an organization, to declare its position to all members of the organization and to know immediately their reaction on the same matter. In former days, practice, repetition and *opinion juris sive necessitatis*, which are the ingredients of customary law might be combined together in a very long and slow process extending over centuries. In the contemporary age of highly developed techniques of communication and information, the formation of a custom through the medium of international organization is greatly facilitated and accelerated; the establishment of such a custom would require no more than one generation or even far less than that. This is one of the examples of the transformation of law inevitably produced by change in the social substratum."<sup>29</sup>

23. The question of when the recommendation in a General Assembly resolution is transformed into a legally binding prescription would hinge upon the intent of the resolution, the extent of the consensus supporting it and the repeated endorsements it receives both in and out of the United Nations. Once completed, the metamorphosis would endow the General Assembly resolution with customary law obligations for States Members which would be as binding as if incorporated in a ratified treaty.<sup>30</sup>

24. As J. P. Humphrey noted:

"What is required is consensus. Time is not an essential element. There have, indeed, been some recent examples—for example, in the matter of the continental shelf and air space—of customary rules

which have come into being almost instantly; instant custom, if you will."<sup>31</sup>

25. Constantin A. Stavropoulos also aptly stated:

"The effect of a resolution may vary from case to case and even from State to State, but it seems undue conservatism to suggest that Assembly resolutions have not, in fact, become one of the principal means whereby international law is now moulded, especially in those instances . . . [as with] the Universal Declaration of Human Rights of 10 December 1948 . . . where the resolution has enjoyed the support of virtually all States Members, both at the time of its adoption and subsequently."<sup>32</sup>

#### *General principles of law*

26. Certain rights may be inferred from express rights by reasoning or applying by analogy the general principles of law—the third source of international law in the World Court's criteria.<sup>33</sup> Such inferred rights may in time ripen into express rights through the United Nations custom-generating process. Thus, although the right to family planning was not explicitly included in the Universal Declaration of Human Rights or the two 1966 International Covenants on Economic, Social and Cultural Rights and on Civil and Political Rights, such a right may be inferred from the rights to equality of the sexes, privacy, conscience, work, adequate standard of living, health and well-being (physical, mental and environmental), education (including that for the full development of the human personality) and freedom from hunger.<sup>34</sup> The right to family planning was subsequently incorporated in the Teheran Proclamation on Human Rights<sup>35</sup> and the United Nations Declaration on Social Progress and Development.<sup>36</sup> Likewise,

<sup>29</sup> J. P. Humphrey, *op. cit.*, p. 3.

<sup>30</sup> C. A. Stavropoulos, *The United Nations and the Development of International Law 1945-1970*, reprinted in United Nations document OPI/411 (1970). See also the following statement of Edvard Hambro, President of the twenty-fifth session of the United Nations General Assembly and a distinguished jurist in his own right: "The fact is that the wide and pervasive international acceptance of the Declaration allows us to state that it has become, or at least is becoming, international law." Address before the United Nations Association of the United States in New York, 10 November 1970.

<sup>31</sup> See foot-note 26 given above. Commenting on Oppenheim's interpretation of Article 38 (1) (c) as authorizing "the Court to apply the general principles of municipal jurisprudence, in particular of private law" (*International Law*, 8th ed. (1967), vol. I, p. 29), Brownlie stated: "What has happened is that international tribunals have employed elements of *legal reasoning* and private law analogies in order to make the law of nations a viable system for application in a judicial process." Brownlie, *Principles of Public International Law* (Oxford, Clarendon Press, 1966), p. 13 (emphasis supplied). See also W. Friedman, "The uses of 'general principles' in the development of international law", *American Journal of International Law* (1963), pp. 279 and 287; H. Lauterpacht, *Private Law Sources and Analogies of International Law* (London, Longmans, Green and Co., 1927).

<sup>33</sup> See foot-note 16, para. 16 and resolution XVIII of that Conference, entitled "Human rights aspects of family planning".

<sup>34</sup> General Assembly resolution 2436 (XXIII).

<sup>29</sup> *Southwest Africa Cases (Ethiopia v. South Africa, Liberia v. South Africa)*, Second Phase, [1966] I.C.J. 17, 291-92 (Judge Tanaka's dissenting opinion). In this case, Ethiopia and Liberia sought to establish non-discrimination as internationally binding on grounds of repeated resolutions and declarations of the General Assembly and other international organs. Without going into the merits of the issue, however, the Court dismissed the case on procedural grounds in that the applicant States failed to establish a "legal right or interest" in the subject-matter. Judge Tanaka dissented from the Court's holding on "legal right or interest" and proceeded to consider the question whether "resolutions and declarations of international organs can be recognized as a factor in the custom-generating process".

<sup>30</sup> D. G. Partan, *Population in the United Nations System: Developing the Legal Capacity and Programs of U.N. Agencies* (Leiden, A. W. Sijthoff, and Durham, N.C., Rule of Law Press, 1973), p. 34.

although the right to freedom from hunger was not specifically included in the Universal Declaration of Human Rights, it was later stipulated in the International Covenant on Economic, Social and Cultural Rights.<sup>37</sup>

27. In several countries, the right of privacy has recently been interpreted to include the right to use<sup>38</sup> or import<sup>39</sup> contraceptives or even to have abortion upon request during the first trimester of pregnancy.<sup>40</sup> Since these newly discovered derivative rights are based upon a more fundamental, pre-existing right, their legal quality must be considered as having originated contemporaneously with that of the parent right.

28. It is submitted that whether a right is "expressed" or "inferred", its legal validity remains the same. Thus, not all population laws need be explicitly categorized as part of natural law, customary international law or as human rights before partaking of their legal character.

29. Based on the foregoing discussion, the traditional treaty approach to human rights must be considered too restrictive. Once a right has been accepted with the requisite consensus, whether or not expressly set out in a formal treaty, it is automatically a legal right and carries with it all the implications of that status.

#### DOCTRINE OF ESTOPPEL

30. Even assuming a failure on the part of a country to accord full legal status to human rights, that country's vote on a General Assembly resolution or a human rights declaration must be taken as reflecting its official opinion with all the implications that go with it. As Humphrey propounded:

"How, indeed, could that opinion be more officially or more formally reflected? There is, it will be noted, an element of estoppel in the creation of customary law. How can a State be heard to say on one occasion that the law is such-and-such and later deny that this is the case?"<sup>41</sup>

<sup>37</sup> General Assembly resolution 2200 A (XXI) of 16 December 1966, annex.

<sup>38</sup> See *Griswold v. Connecticut*, 381 U.S. 479, 14 L. Ed. 2d 510, 85 S. Ct. 1678 (1965).

<sup>39</sup> For a summary of the ruling of the Irish Supreme Court in the McGee case that part of section 17 of the Criminal Law (Amendment) Act of 1935 banning the importation of contraceptives was unconstitutional for invasion of the right of privacy, see *The Times* (London), 20 December 1973. For a background of the case, see *The Irish Times*, 9 June 1972.

<sup>40</sup> See *Roe v. Wade*, 410 U.S. 113 (1973); *Doe v. Bolton*, 410 U.S. 179 (1973). <sup>41</sup> J. P. Humphrey, *op. cit.* The "Ihlen Declaration", in Eastern Greenland Case (*Denmark v. Norway*), P.C.I.J., Ser. A/B, No. 53 (1933), 3 Hudson, *World Court Reports* 148 (1938), is instructive. An oral declaration by M. Ihlen, the Norwegian Minister for Foreign Affairs, in regard to Eastern Greenland having been relied upon by the Danish Govern-

31. Such official opinion, if it were not to be treated flippantly, must be taken to indicate the country's intention to conform its laws to the human rights standard. This, in itself, would justify the initiation of steps towards the review and reform of the law.

#### DECLARATION ON POPULATION AND HUMAN RIGHTS

32. Since "right" and "duty" are two sides of the same coin, acceptance of human rights entails a corresponding duty not only to refrain from activities which would impede the exercise of the right, but, positively, to undertake the necessary measures for the realization of such a right.

33. It may be seen that the Teheran Proclamation and the Declaration on Social Progress and Development have laid down certain minimum conditions for the exercise of the family planning right. Still other conditions may be implied as being necessary to enable couples to determine "freely and responsibly" the number and spacing of children. A composite list of 14 such conditions, without which the family planning right would prove illusory is given below:

- (a) The right to adequate education and information on family planning;<sup>42</sup>
- (b) The right of access to the means of practising family planning;<sup>43</sup>
- (c) The right to the equality of men and women;<sup>44</sup>
- (d) The right of children, whether born in or out wedlock, to equal status under the law and to adequate support from natural parents;<sup>45</sup>
- (e) The right to work;<sup>46</sup>
- (f) The right to an adequate social security system, including health and old-age insurance;<sup>47</sup>
- (g) The right to freedom from hunger;<sup>48</sup>

ment, was held by the Permanent Court of International Justice to be binding upon Norway. The Court concluded:

"The Court considers it beyond all dispute that a reply of this nature given by the Minister for Foreign Affairs on behalf of his Government in response to a request by the diplomatic representative of a foreign power, in regard to a question falling within his province, is binding upon the country to which the Minister belongs ..."

Might not the same reasoning apply equally to recorded voting at the United Nations General Assembly or specially convened diplomatic conferences by duly accredited representatives of Governments?

<sup>42</sup> Teheran Proclamation on Human Rights resolution XVIII (1968).

<sup>43</sup> United Nations Declaration on Social Progress and Development, General Assembly resolution 2542 (XXIV) of 11 December 1966, art. 22 (b).

<sup>44</sup> Universal Declaration of Human Rights, art. 2; International Covenant on Civil and Political Rights, art. 3; International Covenant on Economic, Social and Cultural Rights, art. 3; and Declaration on the Elimination of Discrimination Against Women, General Assembly resolution 2263 (XXII) of 7 November 1967, arts. 1, 4, 6, 9 and 10.

<sup>45</sup> Declaration of the Rights of the Child, General Assembly resolution 1386 (XIV) of 20 November 1959, principles 1, 4, 6, 9 and 10.

<sup>46</sup> International Covenant on Economic, Social and Cultural Rights, General Assembly resolution 2200 A (XXI) of 16 December 1966, annex, art. 6.

<sup>47</sup> *Ibid.*, art. 9.

<sup>48</sup> *Ibid.*, art. 11 (2).

- (h) The right to an adequate level of living;<sup>49</sup>
- (i) The right to freedom from environmental pollution;<sup>50</sup>
- (j) The right to liberty of movement;<sup>51</sup>
- (k) The right of privacy;<sup>52</sup>
- (l) The right of conscience;<sup>53</sup>
- (m) The right to separation of Church from State, law from dogma;<sup>54</sup>
- (n) The right to social, economic and legal reforms to conform with the above mentioned rights.<sup>55</sup>

34. Fulfilment of each of the above-mentioned rights requires, in turn, the fulfilment of certain pre-conditions. The first right, for example, presupposes a compulsory education, thus necessitating a revision of education law towards that end as well as permitting or requiring sex or population instruction in schools. A law on compulsory education, however, cannot be enforced in the absence of a compulsory registration of births. Also, existing laws on obscenity need to be changed if they forbid the publication, broadcasting, televising or mailing of family planning material. Regulations of publicly owned mass communication media should be re-examined with a view to determining their obligation to disseminate family planning information.

35. To be studied also is the way in which the individual's right to adequate education can harmonize with the collective demands, especially in the face of a shortage in resources, both actual and potential.<sup>56</sup> How may the conferment of certain benefits, like education allowances, while meeting the actual needs, not constitute a "bonus" for increased fertility? Conversely, how may the withdrawal of certain benefits, while furthering the aim of a population policy, not constitute a penalty for the innocent or the needy, thereby impinging upon their basic rights? What controls must be established to prevent the effects of a law from being contradicted in purpose by another law or frustrated in its implementation by inadequate or inconsistent administrative decrees?<sup>57</sup> What should be the relations

<sup>49</sup> *Ibid.*, art. 11 (1).

<sup>50</sup> *Ibid.*, art. 12 (2) (b); Declaration of the United Nations Conference on the Human Environment, principles 1, 8, 13, 15 and 16.

<sup>51</sup> International Covenant on Civil and Political Rights, General Assembly resolution 2200 A (XXI) of 16 December 1966, annex, art. 12.

<sup>52</sup> *Ibid.*, art. 17.

<sup>53</sup> *Ibid.*, art. 18 (1).

<sup>54</sup> *Ibid.*, arts. 18 and 26.

<sup>55</sup> This right flows logically from the fact that human rights are *ipso facto* legal rights entailing legal obligations on the part of Governments to undertake the necessary reforms to conform with such rights.

<sup>56</sup> See para. 61 and foot-note 63.

<sup>57</sup> The effects of the French legalization of the sale and distribution of contraceptives in 1967, for example, must be weighed against yearly increases in family allowance payments, on the one hand, and the non-enactment of administrative decrees to implement the 1967 law, on the other. As of this writing, many French gynaecologists still refuse to either counsel or prescribe contraceptives to patients in the absence of such administrative decrees. Similarly, notwithstanding liberalization of an abortion law in the State of New York, confusion reigned in New York City because of local health

between municipal and international law through the medium of human rights, which includes the family planning right?

36. It is obvious that a systematic approach to these problems calls for a joint and co-ordinated effort on the part of all government agencies concerned. The hitherto adoption of piecemeal legislation or measures focusing generally on the availability of contraceptives to the end-users must be seriously reconsidered.

37. The foregoing discussion shows the complexity of tasks confronting the socially conscious lawyer.

#### METHODOLOGY FOR RELATING LAW TO WORLD POPULATION

38. Convinced that it is time for lawyers and law schools to contribute to the solution of the population problem, the United Nations Fund for Population Activities, along with the International Planned Parenthood Federation and a few private organizations, has, since 1971, supported law and population projects in over 20 countries.<sup>58</sup> Each of these projects involves a compilation stage, an analysis stage and a recommendation stage. The second stage has been carried out in universities or Government-sponsored seminars in Costa Rica, Ghana, Indonesia, Lebanon, the Philippines and Sri Lanka. These have been attended by government officials as well as experts and students, and have involved public administration, public health, sociology, demography and economics, as well as law. In these countries, the recommendation stage has now been reached and has, in several countries, borne results.

#### Compilation

39. Clearly, the laws that affect fertility behaviour and population in each country will be different from those of every other country and the way in which they have their effect will be different.

40. Since reform is impossible unless it is known what the law is and about it works, the compilation stage is the first step. Indeed:

"Knowledge as to what a law actually provides is obviously a prerequisite step towards the work of assessing the impact of a law on patterns of decision-making relevant to population trends . . . . Nor are the prospects bright for any national family planning programme . . . if it is prosecuted in disregard of laws and practices which operate in a contradictory manner nullifying and frustrating the objectives of the programme."<sup>59</sup>

regulations restricting the performance of abortions on an out-patient basis. *The New York Times*, 20 October 1970.

<sup>58</sup> As of January, 1974, work on law and population projects is being carried out in the following countries: Brazil, Chile, Costa Rica, Egypt, Ethiopia, Ghana, Indonesia, Kenya, Lebanon, Malaysia, Mexico, Morocco, Nepal, Nigeria, Pakistan, the Philippines, Romania, Singapore, Sri Lanka, Thailand, Togo, Tunisia and Turkey.

<sup>59</sup> K. Bentsi-Enchill, "Law teaching and research: the Ghana law and population project", *Human Rights and Population*:

(Continued on next page)

41. To make compilation effective, it was felt necessary to draw up a classification plan which lists all the possible types of law which should be considered. This plan is not only useful as a check-list for researchers but it provides a format for world-wide reporting, so that developments in each country can easily be compared. The outline<sup>60</sup> of this report is as follows:

- 100 Fertility regulation
  - 110 Sterilization
  - 120 Contraception
  - 130 Abortion
- 200 Family status and welfare
  - 210 Marriage
  - 220 Termination of marriage
  - 230 Extended family obligations
- 300 Children and child welfare
  - 310 Support of children generally
  - 320 Protection of children
  - 330 Artificial insemination
  - 340 Legitimacy of children
  - 350 Registration of births
- 400 Criminal offences penology
  - 410 Criminal law treatment of sexual activity
  - 420 Penology (as affecting ability of prisoners to continue family relations)
- 500 Public welfare
  - 510 Family allowances generally
  - 520 Housing assistance programmes
  - 530 Maternity leaves and benefits
  - 540 Old age and retirement benefits
  - 550 Death benefits to survivors
  - 560 Labour protection and employment standards
  - 570 Personal status and integrity
  - 580 Personal mobility (intra and international migration)
- 600 Public health
  - 610 Health insurance and medical assistance
  - 620 Hospital insurance and public clinics
  - 630 Control of medical facilities
  - 640 Medical profession (licensing, education and regulation)
  - 650 Drugs and pharmaceuticals
  - 660 Food distribution and control
  - 680 Environmental protection programmes (efforts to control population growth as a means of protecting the environment)
- 700 Education
  - 710-720 Compulsory education

- 730 Literacy programmes
- 740 Adult education programmes
- 750 Financial assistance to education
- 760 Educational opportunities for women
- 770 Education affecting population directly (health, sex, marriage, contraception and population)
- 800 Property and economic factors
  - 810 Income distribution measures generally
  - 820 Taxation
  - 830 Land tenure and land improvement programmes
  - 840 Distribution of decedents' property
  - 850 Employment guarantee and public works programmes
  - 860 Guaranteed wage and income subsidies
- 900 Miscellaneous
  - 910 Military service
  - 920 Religious law
  - 930 Other

42. The compilation task may be more difficult than at first appears. Statutes and decrees are often scattered throughout the body of the law, and administrative and judicial decrees and regulations are usually buried and, in many instances, not generally known. Moreover, customary law is hard to "compile"; and this, in turn, affects the important question of whether a particular piece of legislation is actually enforced or not. In addition to these problems, the compilation stage may be complicated in a country with a federal-state form of government, since state as well as federal laws may be involved.

#### *Analysis*

43. As suggested above, an indispensable component in the review of population law is the determination of the degree of compliance therewith and of the reasons for any divergence which may exist between law and practice.

44. Even in countries with relatively developed legal institutions, differences between the law on the books and the law in actual practice inevitably exist. The differences are much greater in many of the developing countries. Thus, adequate methodology involves not only an analysis of the formal legal framework, but a considerable amount of empirical investigation of what people are, in fact, doing under it. An important part of the analysis stage should, if possible, involve a systematic interviewing with such groups as physicians, nurses, pharmacists, public health and welfare officials, educators, prosecutors, judges, lawyers and legislators, as well as a sample survey of public opinion classified according to age, sex, religion, education, occupation, race and geographical region.

45. Needless to say, a successful investigation of this kind would hinge upon close co-operation with sociologists who are trained in the preparation of questionnaires, the conduct of field surveys and the

*From the Perspectives of Law, Policy and Organization, Proceedings of the Second Annual Meeting of the International Advisory Committee on Population and Law, 30-31 October 1972, Tokyo, Law and Population Book Series No. 5 (Medford, Mass., Tufts University, 1973), pp. 17-18.*

<sup>60</sup> For detailed breakdowns, see Morris L. Cohen, *Law and Population Classification Plan*, Law and Population Monograph Series No. 5 (Medford, Mass., Tufts University, 1972).

evaluation of results. A pilot project undertaken at the University of the Philippines in 1972 demonstrates the feasibility as well as desirability of such interdisciplinary co-operation.<sup>61</sup>

46. Reference has already been made to the legal status of the human right to family planning and to the minimum obligation on the part of Governments to initiate steps towards aligning their laws with the human rights standard. It follows logically that population laws must be reviewed to see whether they conform in theory and in fact with the principles of human rights and in particular with the 14 rights enumerated above in paragraph 33.

#### *Formulation of recommendations*

47. The final phase of the review process is the formulation of suggested revisions of laws the objective of which is the full realization of the "human rights" ideals, but which take into account not only existing laws, but the political, social, economic, religious and cultural factors which give rise to such laws. The resultant synthesis of practice and theory, and of realism and idealism, could help generate the necessary interest in legal reforms as well as provide a basis for concrete action. Needless to say, it is essential to include government officials, particularly legislators, in this process.

#### CONCLUSIONS

48. Despite the shortness of the time in which law and population projects have been established, some legal changes of major significance have already occurred in countries where projects exist. Only a few need be mentioned. The Philippine Labour Code of 1973, for example, contains the mandatory provision of family planning services in clinics which employers are required to maintain, limits the number (four) of maternity leaves with pay for female employees and requires the Department of Labour to develop incentive bonus schemes to encourage family planning. These provisions came on the heel of an earlier step by the Government to limit income-tax exemptions to four children.

49. In his opinion, rendered 17 September 1973, the Philippine Secretary of Justice interpreted the Revised Penal Code as allowing "surgical sterilization for both sexes (tubal ligation and vasectomy)". Earlier, in his letter of support for the establishment of a law and population project in the Philippines, dated 16 March 1972, the Secretary of Justice stated:

"Having been endowed with the character of a 'human right', family planning therefore imposes not merely a moral but also a legal responsibility upon the state. Our own government has a legal duty to see to it that laws and policies contradictory to this

right should be amended or abolished, and new ones adopted in conformity with and in promotion of this right. To bring our present laws in consonance with official recognition of family planning as a right, it is necessary to institute systematic legal reforms, and thereafter to co-ordinate them into the legal mainstream."

50. On the local government level, the City of Cagayan de Oro has embarked upon a "Model City Project" directed to the realization of the principle that family planning is a basic human rights for its citizenry. In September 1973, the City Mayor issued an Executive Order (No. 9-73) establishing the Population Planning Commission, which will serve as the policy-making body and co-ordinate all population activities for the city.

51. In Indonesia, the Government has limited family allowances to three children.

52. In Mexico, the new Sanitary Code of 1973 not only legalizes the use of contraceptives, but calls for their official distribution and provides the authority for the training of paramedical personnel for family planning services, including training in the insertion of IUDs.

53. The Government of Tunisia liberalized its abortion law on 26 September 1973 (Décret-loi No. 73-2), to allow the artificial interruption of pregnancy if "performed during the first three months in a hospital, a health centre, in an authorized clinic by a duly authorized practitioner". Earlier, speaking on the eve of the *Mouled*, a religious holiday, in April 1973, President Bourguiba declared that since voluntary sterilization, unlike castration, does not interfere with the conjugal functions, it is not contrary to Moslem law.

54. Both Pakistan and Thailand have lifted the prescription requirement for pills so as to increase their distribution.

55. Moreover, the "spill-over" effects of law and population projects should not go unmentioned. In October 1973, the Management and Planning Committee of the International Planned Parenthood Federation (IPPF) resolved to establish a panel of experts on the matter of "law and Planned Parenthood". The purpose of the panel is to work with the IPPF constituent national associations in bringing about revisions in legislation which affect the activities of the IPPF.

56. In his welcoming address to the Seminar on Voluntary Sterilization and Post-Conceptive Regulation, sponsored by the IPPF South-East Asia and Oceania Region at Bangkok, 30 January-2 February 1974, the Minister of Public Health of Thailand, Dr. Udom Posakrisana, drew attention to the fact that the laws of the countries in that region, with a few exceptions, were lagging behind people's actual practice. He continued:

"This lag is dangerous and expensive, both in terms of fostering public discontent for outmoded laws and, by extension, for law itself; and in terms

<sup>61</sup> L. T. Lee and R. A. Bulatao, "In-depth study on law and fertility behavior: preliminary observations", mimeographed, 1972.

of delaying the attainment of our goals of improved family health and accelerated national development. Unless many of our countries update their existing laws governing voluntary sterilization and post-conceptive regulation, the law itself—rather than popular acceptance or technical problems—will become the largest obstacle in the way of wider practice. I was therefore especially glad to note that the programme for your Seminar includes a consideration of the legal status of sterilization and post-conceptive regulation. I hope that Seminar participants will be stimulated by this discussion to return to their countries to take an active part in the review, at a national level, of their countries' existing laws and regulations governing these family planning procedures."

57. The Government of Lebanon appointed a Population Planning Commission in 1973 to formulate and co-ordinate population policies and programmes. The Law and Population Project in Lebanon plans to broaden its scope of activities in observance of the International Women's Year, 1975, by compiling all the laws bearing on the status of women in each of the countries of the Middle East region.

58. In Morocco, a substantial population component was built into the Five-Year Development Plan (1973-1977), thus forging a link between population and development.

59. In Kenya, the Law and Population Project has initiated contact with the United Nations Environment Programme (UNEP), headquartered at Nairobi, to explore the possibility of expanding its compilation of population-related laws to include also environmental laws, thus strengthening the co-operation among UNFPA, the United Nations Development Programme (UNDP) and UNEP.

60. In summary, recognition of human rights as entailing legal, and not just moral, responsibility upon States holds vast potential for opportunity, particularly in the field of population law. Aided by a custom-

generating process through the United Nations, the human rights aspects of population obligate Governments to match deeds with words and enable lawyers to contribute to the solution of one of the most critical social problems of our times.

61. Many problems remain, however, to test the inventiveness and ingenuity of lawyers. To give but one example: the question may be raised whether the language of the Teheran Proclamation would allow couples to have as many children as they want (or do not want). The Proclamation specifically provides that family planning must be made not only "freely", but also "responsibly". Involved in a responsible parenthood is the balancing of the "individual" with the "collective" right—i.e., from the right of children to that of the society at large. Just as the individual right to freedom of speech must take into account the collective right whether in time of peace (e.g., libel, defamation, nuisance, obscenity) or during war or emergency (e.g., treason, sedition, censorship), so must the individual right of family planning be harmonized with the collective right, particularly where the resources, both actual and potential, of a country dictate the limitation of the size of its population in the interest of all. The question when exactly the individual right gives way to the "collective" is always difficult to answer—even in the case of freedom of speech notwithstanding its century-old development and refinement.<sup>62</sup> However, it is equally clear that inability to define with exactitude the relationship between the two rights does not negate their existence.

62. The first step, perhaps, to the solution of the above-mentioned dilemma is the active involvement of the law and lawyer in population matters, as proposed in this paper.

<sup>62</sup> This problem of balancing the individual with the collective was also discussed at the United Nations Symposium on Population and Human Rights, Amsterdam, 21-29 January 1974. The Symposium, however, was unable to reach a consensus on this problem.

## OBJECTIVES AND PRINCIPLES OF THE WORLD POPULATION PLAN OF ACTION

*Wendy Marson Dobson* \*

1. The purpose of this paper is to discuss the objectives of the Draft World Population Plan of Action and the principles and guidelines underlying these objectives, which should be observed in formulation of the Plan. The principles and guidelines will be based on internationally recognized values and goals reflected in political decisions of United Nations bodies and in international instruments.

2. A review has been undertaken of the content of existing international instruments, including the Charter of the United Nations, proclamations, declarations, conventions, covenants and other resolutions from inter-governmental bodies of the United Nations. These bodies include the General Assembly, the Economic and Social Council and its functional and regional economic commissions, the United Nations Development Programme (UNDP), the United Nations Children's Fund (UNICEF) and the specialized agencies.

3. In 1972, the Department of Economic and Social Affairs of the United Nations Secretariat convened a meeting of an Advisory Committee of Experts on Global Population Strategy to discuss the objectives and content of a Plan of Action. This paper is based on discussions of that Committee in 1972 and 1973.

### OBJECTIVES OF THE DRAFT WORLD POPULATION PLAN OF ACTION

4. A suggested set of objectives for the Plan, based on discussions of the Expert Group, based on the technical background study to the Plan and on relevant discussions of the role of the United Nations system in population is as follows:

(a) To advance understanding of population at global, regional, national and subnational levels, recognizing the diversity of the problems involved;

(b) To advance national and international understanding of the interrelatedness of demographic and socio-economic factors in development; of the nature and scope of the contribution of demographic factors to the attainment of over-all goals of advancing human welfare, on the one hand, and the impact of broader social, economic and cultural factors on demographic behaviour, on the other;

(c) To promote the development of population policies not only in the field of family planning, but with regard to other socio-economic measures and programmes designed to affect reproduction and family formation, and with regard to measures and programmes affecting morbidity, mortality, population distribution, internal and international migration and demographic structure;

(d) To recommend guidelines for population policies consistent with internationally recognized values and national goals;

(e) To encourage the development of appropriate training, statistical, research, information and education services in pursuit of the above-listed objectives.

5. The first objective is important in so far as the Plan must not concern itself solely with the global population situation; that is, the problem as defined by "averaging" national demographic growth and distribution characteristics. The Plan must also recognize that these characteristics vary in the relative importance accorded them in differing regional and national situations. Thus, while one country may consider its population growth to be too rapid and an obstacle to development, another, with similar rates of growth, may consider it to be too slow—or consider itself underpopulated.

6. The second objective is comprehensive. The Plan should recognize that measures to influence population growth or distribution are not ends in themselves. Rather, the over-all goal of development is the enhancement of individual human welfare. Population policies are means to that end. It should also recognize the importance of interrelationships between population and the other factors in development in so far as the complexity of these interrelationships is being taken into account by the international community. To the extent that population variables present obstacles to development efforts, "population problems" can be diagnosed. Population problems can be defined as growth at too slow or too rapid a rate for the achievement of desired rates and levels of development, or as maldistribution of the population. To deal with these problems, social and economic measures may be formulated. They may be implicit measures and their impact may be indirect, their main purpose being the promotion of some larger social goal.

7. The third objective of the Plan should be that of promoting more widespread recognition and under-

\* International Development Research Centre, Ottawa, Canada.

standing by the international community of the nature and scope of population policy. During the past decade, much attention has been accorded family planning programmes not only as a means of assisting couples to regulate fertility, but as a public policy measure to reduce rapid population growth. Unrealistic expectations of the demographic impact of such programmes have been frequently formulated. Other demographic problems and measures have received much less attention. Thus, the Plan should promote a broader appreciation of the diversity of demographic problems existing in the international community and of the wider range of programmes and measures to deal with them.

8. The fourth objective of the Plan is the development of international standards which should be met by population policies. To be effective, any public policy should serve important human values as well as social objectives and national goals. Values reflected in the Charter of the United Nations, including preservation of individual freedom, fairness, promotion of the collective welfare and safeguarding human survival, should be taken into account in the formulation of policies to influence population events.

9. Lastly, having recognized differing population problems, having considered alternative measures to influence population events and having discussed standards for population-related measures, the Plan should encourage the allocation of international resources to activities necessary to achieving the objectives. These would include training, statistical and other research activity, information and education services and evaluation activities.

#### PRINCIPLES UNDERLYING THE DRAFT WORLD POPULATION PLAN OF ACTION

10. A wide range of public policy possibilities to influence population events will be included in the World Population Plan of Action. A number of internationally recognized principles and guidelines should guide their formulation, reflecting technical standards and ethical values on which there is consensus among States Members. Many have been stated in United Nations instruments<sup>1</sup> and in intergovernmental conferences. Others have been formulated in discussions of the Expert Group. They include:

(a) A principle aim of socio-economic development is to improve levels of living and the well-being of all people—population goals and policies should also serve this ultimate objective;

(b) Population and development are interrelated: population variables influence development variables and are also influenced by them;

(c) Population policies are constituent elements of socio-economic development policies, never substitutes for them;

<sup>1</sup> See annex for a complete list of international instruments and documents referred to in this discussion.

(d) Population policies, while serving socio-economic objectives, should be consistent with internationally and nationally recognized human values of individual freedom, justice and the survival of national and other population groups;

(e) While the main responsibility for achieving the objectives of this Plan of Action lies at the national level, international co-operation is essential;

(f) Recommendations in this Plan of Action with regard to policies to deal with population problems recognize diversity of conditions within and among different nations and recognize the sovereignty of national Governments in determining their population policies;

(g) The occurrence in the world of rapid demographic change accompanied by rapid social changes and changes in human values must be taken into account in formulating this Plan of Action;

(h) The objectives of this Plan of Action should be consistent with the objectives of the Second United Nations Development Decade; changes in demographic variables during the Decade are largely the result of past demographic events and the changes sought during the Decade will have social and economic repercussions up to and beyond the end of this century.

11. The first and fifth principles reflect a fundamental principle underlying the purpose of the United Nations, as set forth in Chapter I, Article I, of the Charter: "To achieve international co-operation in solving international problems of an economic, social, cultural or humanitarian character . . .".

12. The second principle underlies the first and second objectives of the Plan. The population-development relationship is a two-way relationship, population variables being influenced by development measures and vice versa. Policies should therefore be integrated. This principle goes hand-in-hand with the third and was recognized by the General Assembly in resolution 2211 (XXI) of 17 December 1966, Population Growth and Economic Development, which recognized:

" . . . the need for further study of the implications of the growth, structure and geographical distribution of population for economic and social development, including national health, nutrition, education and social welfare programmes carried out at all levels of government activity. . . ."

It was also recognized in resolution 1838 (XVII) of 18 December 1962, Population Growth and Economic Development:

" . . . economic development and population growth are closely interrelated, . . . Member States . . . in formulating their economic and social policies . . . useful to take into account the latest relevant facts on the interrelationship of population growth and economic and social development, and that the forthcoming . . . Asian Population Conference might throw new light on the importance of this problem, especially for the developing countries."

13. The Second Asian Population Conference in 1972 reaffirmed the "importance of integrating population into the strategy of the Second United Nations Development Decade". In resolution 1486 (XLVIII) of 3 April 1970, the Economic and Social Council urged recognition of this principle in its resolution on "Work programmes and priorities in the field of population":

"7. Urges interested Governments of States Members of the United Nations and members of specialized agencies to give full attention to population programmes in development planning and in policy-making and to utilize the available resources to this end;"

14. A fourth principle underlying the Plan's objectives relates to the development of ethical guidelines for policies. Policies will only be effective to the extent to which they observe important national values and goals. This includes recognition of the rights and freedoms of individuals, and obligations of the State, which should be taken into account in formulation and implementation of policies to influence population variables. Observance of this principle may constrain policy choices for public intervention by States Members. Some standards may also be unacceptable to some States. However, the discussion of such standards in the World Population Plan of Action will be based on values observed in the Charter of the United Nations and in United Nations instruments. They may be adapted as appropriate by States Members of the United Nations.

15. Recognition of the sovereignty of national Governments in determining their population policies is the sixth basic principle guiding the Plan. Just as it must be recognized that different countries perceive their population problems differently, their sovereignty in dealing with them must be recognized. This principle has been repeatedly recognized in United Nations instruments:

(a) General Assembly resolution 1838 (XVII) of 18 December 1962: "*Recognizing further* that it is the responsibility of each Government to decide on its own policies and devise its own programmes of action for dealing with the problems of population and economic and social progress;"

(b) World Health Assembly resolution 18.49, May 1965: "*Bearing in mind* that it is a matter for national administrations to decide whether and to what extent they should support the provision of information and services to their people on the health aspects of human reproduction;"

(c) General Assembly resolution 2211 (XXI) of 17 December 1966: "*Recognizing* the sovereignty of nations in formulating and promoting their own population policies with due regard to the principle that the size of the family should be the free choice of each individual family;"

(d) General Assembly resolution 2626 (XXV) of 24 October 1970: "Those developing countries which consider that their rate of population growth hampers

their development will adopt measures which they deem necessary in accordance with their concept of development;"

(e) General Assembly resolution 2683 (XXV), 1970: "*Acknowledges* that the formulation and implementation of population policies and programmes are matters falling under the internal competence of each country and, consequently, that international action in the population sphere should be responsive to the varied needs and requests of individual Member States;"

(f) Economic and Social Council resolution 1672 (LII) of 2 June 1972: "... to ensure, in accordance with their national population policies and needs, that information and education about family planning, as well as the means to practice family planning ...";

(g) Declaration of the Stockholm Conference on the Human Environment, Principle 16: "... Demographic policies ... which are deemed appropriate by Governments concerned, should be applied ...";

(h) Economic and Social Council resolution 1763 (LIV) of 16 May 1973: "*Aware* of the fact that there are considerable differences in the population and demographic situations in each country and that it is therefore necessary to adopt different approaches and solutions for each country, ...".

In these texts, it is recognized that it is up to each Member State to define its problem and to determine the appropriateness of measures to deal with these problems. The United Nations system may recommend alternative actions, but in providing assistance, it should be responsive to requests of individual States.

#### GUIDELINES FOR POPULATION POLICIES IN THE PLAN OF ACTION

16. The acceptability of policies to influence population variables is an important factor to be considered in relation to alternatives suggested in the World Population Plan of Action. Internationally recognized human values as set forth in the Charter of the United Nations, and as recognized in other United Nations instruments, may form the basis for guidelines. The Preamble of the Charter of the United Nations recognizes several important values:

"to reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women ... ,

"to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be maintained, and

"to promote social progress and better standards of life in larger freedom".

The Purposes and Principles of the United Nations, as set out in Chapter I, Article I, of the Charter, include the following purpose:

"3. To achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting an encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion."

Article 55 of the Charter further states:

"... based on respect for the principle of equal rights and self-determination of peoples, the United Nations shall promote:

"a. higher standards of living, full employment, and conditions of economic and social progress and development;

"b. solutions of international economic, social, health, and related problems; and international cultural and educational co-operation; and

"c. universal respect for, and observance of, human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion."

17. From these statements, four basic human values can be identified, which may form a basis for policy choices:

(a) Freedom: encouragement of fundamental freedoms for all;

(b) Equity and justice: observation of the principle of equal rights and self-determination of peoples without distinctions;

(c) Promotion of general welfare: through social progress, better standards of life and solutions to problems of economic, social, cultural or humanitarian character;

(d) Promotion of security/survival of human group(s), by taking measures to strengthen universal peace.

The potential impact of policies on these values should be taken into account in assessing their feasibility. Policies that promote population goals and serve these values may be viewed as desirable and potentially effective. This section of the paper reviews the definition and application of these criteria in existing United Nations instruments and discusses aspects of their implementation in relation to the World Population Plan of Action and policy alternatives suggested therein.

#### *Freedom*

18. References to freedom in United Nations instruments include the following concepts: freedom from restraint or coercion, and the desirability of choice among alternative courses of action. The implication is made that freedom is promoted when the individual has knowledge and means of exercising available alternatives, as well as knowledge of the probable consequences of these actions. The instruments do not deal with the assertion that no one has free choice, that everyone is subject to implicit social pressures which narrow the range of options, nor do they deal with the question of

how Governments may intervene to provide knowledge to the individual. By its very nature, government intervention may influence freedom of choice by restricting information and opportunities available to the individual, thereby influencing selection among options.

19. The instruments have, to varying degrees referred to the freedom of individuals to make decisions as to the size and spacing of their families; freedom to choose the location of residence and employment; freedom from conditions causing illness and death. Exercise of these freedoms are fundamental considerations in population policy, for each has demographic consequences.

#### *Freedom of choice in size and spacing of family*

20. The right of the couple, of parents, of the family, of girls and women to make informed decisions on the size and spacing of their families, has been recognized in the following instruments:

(a) Commission on the Status of Women resolution 7 (XVIII), 1965: "Considering that married couples should have access to all relevant educational information concerning family planning, ..."

(b) World Health Assembly 18.49, May 1965:

"Recognizing that problems of human reproduction involve the family unit as well as society as a whole, and that the size of the family should be the free choice of each individual family;

"Bearing in mind that it is a matter for national administrations to decide whether and to what extent they should support the provision of information and services to their people on the health aspects of human reproduction;"

(c) General Assembly resolution 2211 (XXI) of 17 December 1966: "... with due regard to the principle that the size of the family should be the free choice of each individual family,"

(d) General Assembly resolution 2263 (XXII) of 7 November 1967, article 9:

"All appropriate measures shall be taken to ensure to girls and women, married or unmarried, equal rights with men in education at all levels, and in particular:

... (e) Access to educational information to help in ensuring the health and well-being of families."

(e) Proclamation of Teheran, 1968: "Proclaims ... the protection of the family and of the child remains the concern of the international community. Parents have a basic human right to determine freely and responsibly the number and spacing of their children."

(f) International Conference on Human Rights, resolution XVIII, Human Rights Aspect of Family Planning:

"Believing ... it is timely to draw attention to the connection between population growth and human rights,

...

"3. Considers that couples have a basic right to decide freely and responsibly on the number and spacing of their children and a right to adequate information and education in this respect."

(g) World Health Assembly 21.43, May 1968, Requests the Director General . . . to assist Member States . . . with "(i) the integration of family planning within basic health services without prejudice to the preventive and curative activities which normally are the responsibility of those services; (ii) appropriate training programmes for health professionals at all levels;"

(h) General Assembly resolution 2542 (XXIV) of 11 December 1969:

" . . . Parents have the exclusive right to determine freely and responsibly the number and spacing of their children . . .

"Article 22: (b) The formulation and establishment, as needed, of programmes in the field of population, within the framework of national demographic policies and as part of the welfare medical services, including education, training of personnel and the provision to families of the knowledge and means necessary to enable them to exercise their right to determine freely and responsibly the number and spacing of their children;"

(i) General Assembly resolution 2716 (XXV) of 15 December 1970: in setting targets for Maternal and Child Health for the Second United Nations Development Decade: "Making available to all persons who so desire the necessary information and advice to enable them to decide freely and responsibly on the number and spacing of their children and to prepare them for responsible parenthood, including information on the ways in which women can benefit from family planning. Such information and advice should be based on valid and proven scientific expertise, with due regard to the risks that may be involved."

(j) Advisory Committee on the Application of Science and Technology to Development, Report on Population, 1972:

"91. A program of studies should be especially aimed at the human rights aspects of family planning, with respect to both the rights of mothers and the rights of children to be born into an environment which, given the general social and cultural situation, is optimal for their growth and development."

21. As early as 1963, the First Asian Population Conference expressed the concerns of Asian States with the importance of preserving individual freedom in the implementation of State family planning programmes: "In programmes aimed at promoting family planning, individuals should in all cases be left free to select the methods which they prefer for spacing and limiting births, in accordance with their religious convictions and other preferences."<sup>2</sup> Subsequently, similar resolutions

were passed by the Commission on the Status of Women and the World Health Assembly in 1965. In 1966, the General Assembly first recognized the principle of the "family's" right to freely choose the size of the family in resolution 2211 (XXI) on Population Growth and Economic Development, which was unanimously adopted.

22. The principle was refined by the International Conference on Human Rights in 1968. There, resolution XVIII was submitted by Finland, India, Morocco, Pakistan, Sweden, Tunisia, the United Arab Republic, United Kingdom of Great Britain and Northern Ireland, and Yugoslavia with the original text: "3. Considers that parents have a basic human right to decide on the number and spacing of their children and a right to information and available services in this respect". In Committee discussions, this text was subsequently amended by Chile and Belgium to read: "3. Considers that couples have a basic human right to decide freely and responsibly on the number and spacing of their children and a right to adequate information and education in this respect". It was passed by a vote of 49-0 with 7 abstentions. The Belgian delegate proposed the revised phrasing should include "responsibly" as follows:

" . . . right of couples to decide on the number of their children should never be exercised selfishly, but with the interest of the unborn children at heart. Before bringing children into the world, parents should consider the means available to them; they bear a responsibility to their children in that respect; in which duty should take priority over right."

23. This resolution referred for the first time to the duty of couples and the obligations of the State in the exercise of the family planning freedom. Subsequent resolutions of the General Assembly in 1969 and 1970 further elaborated the obligations of the State. The Declaration on Social Progress and Development, resolution 2542 (XXIV) of 11 December 1969 was most explicit in its recommendation that Member States formulate and establish programmes which would provide couples with both the knowledge and means to exercise their rights. Debate on article 22 (b) included opposition to inclusion of reference to the provision of "means" to exercise the right. Efforts were made to confine the recommendation to: "(b) the formulation and establishment, as needed, of programmes in the field of population, within the framework of national demographic policies". The final vote on this section was 60-16 with 17 abstentions. Those opposed included Argentina, Austria, Bolivia, Brazil, Chile, Dominican Republic, Ethiopia, Ireland, Italy, Mexico, Mongolia, Nicaragua, Peru, Philippines, Portugal, and Spain. However, in 1970, additional specific references were made to the provision of services in setting targets in Maternal and Child Health for the Second United Nations Development Decade (resolution 2716 (XXV) of 15 December 1970). This resolution was adopted unanimously. In 1972, the Advisory Committee on the

<sup>2</sup> Report of the Asian Population Conference and Selected Papers (United Nations publication, Sales No. 65.II.F.11), chap. VII.

Application of Science and Technology to Development recommended that "... attention should be given to the availability, distribution and use of contraceptives, and to legal provisions regarding abortion and voluntary sterilization". This recommendation raises a question about the definition of services to space and limit births. Do these implicitly include abortion and sterilization services as well as contraception?

24. General Assembly resolution 2542 (XXIV) of 11 December 1969 also referred to the "exclusive right" of parents on the one hand, and on the other, to the establishment of programmes "within the framework of national demographic policies". This reference raises additional questions about the role of the State vis-à-vis parents. If parents have "exclusive rights" then it would appear that the State should not undertake any action to influence their choice of family size, no matter what the larger demographic or development objectives. If parents desire large families, thereby contributing to rapid population growth (assuming falling mortality), it can be argued that the State should not intervene with anti-natalist measures. Yet, in the same resolution, it is recommended that "national demographic policies" be taken into account. In such a context, this reference is contradictory since the "exclusive right" of parents has already been recognized. These instruments do not fully come to grips with the underlying issue of individual freedom and the rights of the State to consider larger social objectives. Should they assert the right of every parent or couple to family planning information, regardless of society's demographic objectives? This is a very real issue in countries that consider themselves under-populated. The argument has been made that the State should not deny family planning or contraceptive information and services, and that other policy measures should be the major means to promote population growth.

25. Equally important is the obligation of the State to assist those couples and individuals who have sub-fertility problems. They have the right freely to determine the size and spacing of their families. Again, the State's obligation to assist them, regardless of its overall demographic objectives, needs to be clarified. World Health Assembly resolution 21.43, in 1968, refers to the provision of sub-fertility assistance, implicitly referring to the State's obligation: "... Reiterating the opinion that every family should have the opportunity of obtaining information and advice on problems connected with family planning, including fertility and sterility; ..."

26. In summary, international instruments have reached some consensus on the obligation of the State to provide information and means to parents to enable them to exercise the family planning right. They have not, however, resolved the question whether States have this obligation, regardless of their over-all demographic objectives. Lastly, they have not, outside of the World Health Organization (WHO), defined the nature of "information and means" to include services to promote

as well as regulate fertility. The recommendation in 1972 of the Advisory Committee on the Application of Science and Technology to Development would, furthermore, imply that services to regulate fertility should include abortion and sterilization services as well. These are issues which might be resolved in the World Population Plan of Action.

27. The International Conference on Human Rights held at Teheran in 1968 introduced in its resolution the concept of the duty of parents to determine "responsibly" the spacing and size of their family. The text of the resolution, however, fails to make clear the views of the Conference as to parental obligations to consider both the individual and the social consequences of their actions. The implication of the term "responsibly" is that someone, presumably the State, may define appropriate behaviour and may penalize behaviour it deems irresponsible. In this regard, the Universal Declaration of Human Rights, in article 29, has referred to the duty of the individual to consider the social consequences of the exercise of individual freedom:

"1. Everyone has duties to the community in which alone the free and full development of his personality is possible.

"2. In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirement of morality, public order and the general welfare in a democratic society."

It can further be argued that the ideal expressed has little relevance in many contemporary countries, unless the State exercises its obligation to make the information and means available to all individuals and couples. Even then, it is a question whether it is realistic to expect a change in individual behaviour in the light of information on the collective consequences of that behaviour.

28. A subsidiary issue raised in these instruments relates to the varying definitions of the individuals to whom they are directed. In all, they refer to the following units as having freedom of choice: the "individual family"; "parents"; "couples"; "families"; and "all persons who so desire". Furthermore, General Assembly resolution 2263 (XXII) of 7 November 1967, on Elimination of Discrimination Against Women, states that "girls and women ... should have access to educational information to help in ensuring the health and well-being of families". General Assembly resolution 2716 (XXV) of 15 December 1970, recommends that information be made available on ways women can benefit from family planning. Once again, the valuation inherent in the resolution is ambiguous, and should be clarified.

#### *Freedom of movement*

29. The second freedom of concern in formulation of standards refers to freedom of individuals to move to

better employment or living conditions. Most States have long had very specific policy regulating the inflow of international migrants in particular. Many use coercive measures to regulate flows by specifying standards which must be met by immigrants and by setting annual admission quotas. Some have rules with regard to requirements to be met by emigrants. Specific recognition of the rights of individuals to free movement, internally and internationally, has been recognized in article 13 of the Universal Declaration of Human Rights:

"1. Everyone has the right to freedom of movement and residence within the borders of each State.

"2. Everyone has the right to leave any country, including his own, and to return to his country."

It has also been recognized in the International Convention on the Elimination of All Forms of Racial Discrimination,<sup>3</sup> article 5 (d):

"... States parties undertake ... to guarantee the right to everyone ... to equality before the laws, notably in the enjoyment of the following rights:

"(d) ...

(i) The right to freedom of movement and residence within the border of the State;

(ii) The right to leave any country, including one's own, and to return to one's country;"

30. Concern expressed in operative instruments relates mainly to learning more about the determinants of the "brain-drain" from developing countries and finding measures to halt the flow. The freedom of trained persons to migrate to better job opportunities in the developed countries is not, however, questioned. General Assembly resolution 3017 (XXVII), on Outflow of Trained Personnel from Developing to Developed Countries:

"Invites the Secretary-General, in collaboration with the organizations of the United Nations system ... to draft ... guidelines for a programme ... practical and effective guidance to be followed, mainly by the Governments of industrialized countries, to put an end to, and to reverse, that process without prejudice to existing international agreements and in conformity with the Universal Declaration of Human Rights."

The Commission for Social Development, at its twenty-third session in 1973, passed a resolution on migrant workers,<sup>4</sup> calling for promotion, particularly through the International Labour Organisation (ILO), and adoption of international standards relating to "equality of opportunity and treatment of migrant workers, and their social protection". This legislation recognizes the freedom of workers to migrate, and calls mainly for their protection from exploitation, and for freedom of opportunity for them and their children. In addition,

<sup>3</sup> General Assembly resolution 2106 A (XX) of 21 December 1965.

<sup>4</sup> *Official Records of the Economic and Social Council, Fifty-fourth Session, Supplement No. 5, chap. XIII.*

considerable legislation was adopted, as early as 1949, by the General Conference of the ILO concerned with recommendations of standards member States should observe in the treatment of migrant workers. Similar legislation does not exist, however, with respect to refugees and nomads, who present demographic problems in particular areas of the world.

31. This whole area of migration is politically sensitive. Religious, ethnic and political factors are included as causative factors in such movement. The imposition of international boundaries on areas through which nomads have traditionally wandered imposes a problem where none previously existed. The feasibility of developing international standards is questionable, but nevertheless desirable. This principle was recently affirmed by the Economic and Social Council at its fifty-fourth session in resolution 1788 (LIV), 4 June 1973, which:

"2. *Affirms* the need for Governments, with respect to the enjoyment of the right of everyone to leave any country, including his own, and to return to his country, to bear in mind the relevant resolutions of the United Nations, the provisions of article 13 of the Universal Declaration of Human Rights, and other relevant provisions of the Declaration, the provisions of the International Covenant on Civil and Political Rights and the Charter of the United Nations."

This resolution recommends that Governments observe these rights, "when considering legislation or regulations dealing with the question of freedom and non-discrimination in respect of everyone to leave any country, including his own, and to return to his country". Furthermore, the question is to be retained on the agenda of the Commission on Human Rights.

#### *Freedom from morbidity and mortality*

32. The right of individuals to freedom from disease and to the means of promoting health has been implicitly recognized in the Charter of the United Nations, Chapter IX on International Economic and Social Cooperation, Article 55, "... the United Nations shall promote: ... (b) solutions of international economic, social, health and related problems". The World Health Organization is devoted to assisting member States with development of health services to provide preventive and curative facilities to their populations, and particularly maternal and child health care. Many pieces of World Health Assembly legislation are devoted to recommendations on ways to improve delivery and distribution of health services. The International Covenant on Economic, Social and Cultural Rights (General Assembly resolution 2200 A (XXI) of 16 December 1966), states in article 12:

"1. The States Parties to the present Covenant recognize the right of everyone to the enjoyment of the highest attainable standard of physical and mental health.

"2. The steps to be taken by the States Parties to the present Covenant to achieve the full realization of this right shall include those necessary for:

- "(a) The provision for the reduction of the still-birth-rate and of infant mortality and for the health development of the child;
- "(b) The improvement of all aspects of environmental and industrial hygiene;
- "(c) The prevention, treatment and control of epidemic, endemic, occupational and other diseases;
- "(d) The creation of conditions which would assure to all medical service and medical attention in the event of sickness."

The importance of health care is further elaborated in the Declaration on Social Progress and Development (General Assembly resolution 2542 (XXIV) of 11 December 1969): "Social progress and development shall aim at the . . . continuous raising of . . . standards of living . . . through the attainment of the following main goals:

...  
Article 10: "(b) The elimination of hunger and malnutrition and the guarantee of the right to proper nutrition;

...  
"(d) The achievement of the highest standards of health and the provision of health protection for the entire population, if possible free of charge;

...  
Article 11: "(b) The protection of the rights of the mother and child; concern for the upbringing and health of children; the provision of measures to safeguard the health and welfare of women and particularly of working mothers during pregnancy and the infancy of their children, as well as of mothers whose earnings are the sole source of livelihood for the family; the granting to women of pregnancy and maternity leave and allowances without loss of employment or wages;"

The Declaration also recommends action, including in article 19: "(a) The provision of free health services to the whole population and of adequate preventive and curative facilities and welfare medical services accessible to all".

33. In summary, international instruments consistently recognize the importance of States' obligations to provide health services to individuals, to ensure that they shall be able to exercise their rights to freedom from morbidity and mortality. The Declaration on Social Progress and Development goes so far as to recommend the provision of free health services to all—a recommendation adopted by a vote of 80-0 with 5 abstentions. Attention is also paid to the provision of health care to correct differential morbidity and mortality, particularly among mothers and children. Clearly,

the development of this value in existing international instruments indicates that policies in the World Population Plan of Action should promote freedom from morbidity and mortality, particularly through nutrition and sanitation programmes.

#### *Welfare*

34. A second major value included in the Charter of the United Nations is concern with obstacles to promotion of general social welfare. Definitions generally refer to "social" goods and services to which most members of a society consider it desirable that they have access, regardless of social or economic distinctions. Distinction is usually made between the welfare and interests of society as a whole, and individual welfare. In economic theory, the concept of Pareto optimality refers to social welfare as maximized if, in the distribution of income, goods and services, no one is made worse off when others are made better off. The concept involves numerous definitional questions including the requirement that a population should agree on social desirability of goods and services, and the question of how to account for the welfare of future generations. However, the discussion here is limited to the way in which United Nations instruments deal with promotion of collective welfare through population policies.

35. Specific reference to the general welfare is incorporated into the Universal Declaration of Human Rights. Article 29 states:

"In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirement of morality, public order and the general welfare in a democratic society."

This statement implies that promotion of the general welfare may constrain the exercise of individual freedoms, as may the requirements of "public order" and "morality". The question of who makes the judgement that these requirements have been interfered with, and according to what criteria, is not answered. Such judgements are often reached by Governments according to views of civil servants as to "what is good for the people", rather than by any real process of achieving a consensus of views held by society as a whole.

36. Further review of United Nations instruments concerned with population and development indicates that a major welfare value relates to the protection of the family as a fundamental social unit, and to the removal of population growth as an obstacle to social and economic progress, and enhancement of "the quality of life".

37. Reference to protection of the family unit is included in the following instruments:

(a) Universal Declaration of Human Rights, article 16:

"1. Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and to found a family.

...

"3. The family is the natural and fundamental group unit of society and is entitled to protection by society and the State."

(b) General Assembly resolution 1838 (XVII) of 18 December 1962: "*Recognizing* . . . that the health and welfare of the family require special attention in areas with a relatively high rate of population growth,";

(c) Proclamation of Teheran, 1968: ". . . *Proclaims* . . . the protection of the family and of the child remains the concern of the international community."

These instruments imply an obligation by the State to consider consequences of population policies for the integrity of the family. Missing, however, is reference to the importance of the "integrity of the family" in relation to other values. Must it be maintained at all costs? Policies to moderate rapid growth or to promote migration may separate spouses, as well as parents and children. Policies enhancing role alternatives for women may take them out of the home, and loosen the bond between mother and child. State services for child care, which may be pro-natalist in effect, may at the same time weaken the family as it is traditionally regarded. If this is the case, should such policies be abandoned? It would appear that this particular criterion recognizes the institution of the family in a narrow sense, without recognizing alternatives to traditional families, which allow for greater freedom for women and have demographic impacts.

38. Recognition of the particular importance of protecting the family and promoting the welfare of future generations was made at the first World Health Assembly in 1947; resolution 1.43 recommended that Governments take necessary measures to care for pregnant women, and for the upbringing of children, recognizing that "the children of today represent the whole future of humanity . . .". The resolution states:

"Whereas [it is considered that] the children of today represent the whole future of humanity and that maternal and child health is a problem of primary importance,

"THE FIRST WORLD HEALTH ASSEMBLY

"*Recommends* that Governments take—subject to the conditions in their countries—preventive, curative, legislative, social and other measures necessary for the protection of the health of mothers before, during and after confinement, as well as for the welfare and upbringing of children, drawing special attention to:

"(i) the protection of the health of adolescents—particularly girls—and expectant and nursing mothers who are employed in gainful occupations, and the prohibition of the gainful employment of children;

"(ii) introduction of leave of absence for expectant mothers and leave after the birth of the child, with the continuation for the duration of leave of adequate wages;

"(iii) access to adequate attendance for mothers during the birth of the child, both at home and in hospital, especially for artificially aided births;

"(iv) the organization of non-governmental and governmental institutions where adequate medical consultation on pregnancy hygiene and on feeding, care, and upbringing of children can be made accessible to families."

This theme is reiterated in General Assembly resolution 1386 (XIV) of 20 November 1959, the Declaration on the Rights of the Child; and in resolution 2542 (XXIV) of 11 December 1969, the Declaration on Social Progress and Development.

39. The second aspect of general welfare referred to in the instruments is recognition of population trends as obstacles to social and economic development, and therefore to improvement in levels of living and the "quality of life". References in instruments include:

(a) International Conference on Human Rights, resolution XVIII, 1968:

"1. *Observes* that the present rapid rate of population growth in some areas of the world hampers the struggle against hunger and poverty, and in particular reduces the possibilities of rapidly achieving adequate standards of living, including food, clothing, housing, medical care, social security, education and social services, thereby impairing the full realization of human rights;

"2. *Recognizes* that moderation of the present rate of population growth in such areas would enhance the conditions for offering greater opportunities for the enjoyment of human rights and the improvement of living conditions for each person;"

(b) General Assembly resolution 2626 (XXV) of 24 October 1970: "Those developing countries which consider that their rate of population growth hampers their development will adopt measures which they deem necessary in accordance with their concept of development.";

(c) Declaration of the United Nations Conference on the Human Environment, held in Stockholm in 1972, principle 16:

"Demographic policies, which are without prejudice to basic human rights and which are deemed appropriate by governments concerned, should be applied in those regions where the rate of population growth or excessive population concentrations are likely to have adverse effects on environment or development, or where low population density may prevent improvement of the human environment and impede development."

These instruments advocate policies to influence population growth and density where continuation of current

trends would hamper progress to enhance social and individual well-being. However, while recognizing that such trends may be obstacles to development, they do not come to grips with the questions of who makes this judgement and on what grounds. The danger exists that such measures may be used as substitutes for more serious structural changes needed to achieve the stated welfare goals. It raises the difficult question of who pays the real costs and who benefits from amelioration of population trends. Slowing population growth may achieve greater growth in income, but is individual welfare enhanced? If income is maldistributed, the poor may be worse off—no better off in income, yet no better off in the number of children (assuming they have fewer) and the tangible and intangible benefits those may bring.

40. In summary, existing instruments are incomplete and unclear in their treatment of the general welfare criterion. The issue of conflict between policies which may enhance the collective welfare, in the sense of ameliorating population trends, and their effects on the integrity of the family, is not joined. Hence it is not possible, in the World Population Plan of Action, to make judgements as to the relative collective costs and benefits of policies which have anti-natalist effects, yet at the same time may weaken the institution of the family. Perhaps the "integrity of the family" as an indicator of general welfare is not correct and should be refined. With respect to achievement of development goals, more care should be taken in referring to the gains of ameliorating population trends, since if the benefits are not distributed, those who gain the least, yet suffer the costs of moderating the trends, may be no better off and, indeed, may be worse off.

#### *Distributive justice*

41. The third major guideline to be applied to population policies in the World Population Plan of Action is the extent to which they are just and fair. In the Charter of the United Nations, this value is referred to as the "principle of equal rights", and "respect for freedoms . . . without distinction . . ." In its application to policy, it generally refers to the fair application of policies and to the just distribution of goods, services and knowledge among the population. With respect to implementation of measures included in the Plan, two major distributional questions may be considered.

42. The first question relates to accessibility of necessary information and services—in family planning in particular. Do all sectors of the population have access to the necessary information and services to regulate their fertility and family size? In many countries, such services are often lacking in rural and low-income areas, giving rise to maldistribution and differential availability. Similarly, with respect to information about job opportunities, information is frequently maldistributed and many migrants move in response to erroneous information, often leading to serious problems of urban unemployment. In relation to mortality

and morbidity, differentially available information, health services, and nutritional factors give rise to highly unequal mortality and morbidity experiences, by age, geographical and socio-economic groups, in particular.

43. The second distributional question relates to the application of policies in ways that influence existing inequities. Should measures be applied in such ways that their impact on different groups is equalized? There are some important examples, particularly in relation to economic incentives in population programmes, which impact unevenly by the very fact that they are economic incentives. Such incentives are bound to be more attractive to the poor, especially if they are direct, immediate monetary incentives. As a result, behaviour may be disproportionately affected among the poor. When that behaviour is reproductive behaviour and irreversible sterilization is the "price" of the incentive, serious questions about the justice of such measures and the effect on individual freedom must be raised. Similar questions may be raised with regard to inducements to participate in family planning or migration programmes. Should the State recognize that such inducements mean much more to the poor? Where this is the case, should the State acknowledge that the purpose in utilizing such programmes is to influence disproportionately the poor who tend to have the larger families (assuming a judgement has been made in favour of promotion of over-all welfare by changing the behaviour of the poor)? It can also be argued that where economic incentive is large and greatly desired by the poor, it closes other options and is a form of coercion.

44. Despite the obvious importance of this criterion, there is little reference in United Nations instruments to the need for distributional equity in population programmes. Article 21 of the Universal Declaration of Human Rights states: "2. Everyone has the right of equal access to public service in his country." Article 3 of the International Covenant on Economic, Social and Cultural Rights refers to the obligation of the State to ensure such equality: "The States Parties to the present Covenant undertake to ensure the equal right of men and women to the enjoyment of all economic, social and cultural rights set forth in the present Covenant." Further specific reference is made within the context of the Convention on the Prevention and Punishment of the Crime of Genocide. Article II (d) states: "In the present Convention, genocide means any of the following acts committed with intent to destroy, in whole or in part, a national, ethnical, racial or religious group, as such . . . (d) Imposing measures to prevent births within the group;"

45. With regard to equality of opportunity and freedom to move, specific reference is made in article 3 of the International Convention on the Elimination of All Forms of Racial Discrimination, prohibiting *apartheid*: "States Parties particularly condemn racial segregation and *apartheid* and undertake to prevent, prohibit and eradicate all practices of this nature in

territories under their jurisdiction." (General Assembly resolution 2106 A (XX), annex.)

### *Survival*

46. The contribution of policy to ensuring survival of society, or of certain groups within society, is a criterion by which all policies are implicitly judged. Yet, it is difficult to visualize population policies by themselves as ensuring (or seriously threatening) survival of a society or a country. The possibility of genocidal policies may, however, threaten the survival of a particular group. Specific references have been made in United Nations instruments to the potential contribution of population policies to deal with threats to peace and improved levels of living, but no reference to survival was found. The Declaration on Population by World Leaders in 1966 and 1967 stated: "We believe that lasting and meaningful peace will depend to a considerable measure upon how the challenge of population growth is met." In 1968, the Proclamation of the International Conference on Human Rights recognized: "Too rapid population growth seriously hampers efforts to raise living standards, to further education, to improve health and sanitation, provide better housing and transportation, . . . human aspiration, common to men everywhere to live a better life is being frustrated and jeopardized . . .". However, these statements do not clarify how population growth threatens peace. While such growth may hamper development, it is not necessarily seen as a threat to survival. An important issue in any such assertion would be the establishment of criteria for when the threat could be considered to exist. Survival is obviously a basic value; and other criteria, such as individual freedom, would obviously be subordinated to it, with potentially far-reaching consequences.

47. Then, the question must be faced as to who has the right to define the threat to survival, and whether the cost in terms of human freedom is worth the price. Who pays the cost, i.e., gives up reproductive freedoms? Who benefits, i.e., whose chances of survival improve? Are these the same or different people? How is their choice in the matter taken into account? What about the consequences for future generations? Are freedoms given up now to be denied future generations without consulting them? Or, are people willing to give up freedoms now to preserve or return freedom and ensure survival of future generations?

48. The paucity of references in United Nations instruments to relationships between population factors and survival and peace might be taken as an indication that the threat is not considered serious by most States. However, there is increasing discussion about the responsibility of Governments to consider the effects of national population trends and policies beyond their boundaries. This view should be reflected in the Plan.

49. The preceding section has identified four major internationally recognized values which should guide and be recognized and maintained by population policies included in the World Population Plan of

Action. The extent to which these guidelines have already been defined and applied in existing United Nations instruments has been examined. It is obvious that they are not independent of each other, and that a number of problems and questions concerning their application may be raised.

### APPLICATION OF GUIDELINES

50. In the application of these guidelines to population policy, a number of factors must be considered which affect the definition, acceptance and relative priority with which States Members would use them. In addition, it is recognized that application would depend upon differing social, cultural, political and environmental considerations in States Members. At the international level, and common to most national situations, factors to be considered would include: (a) relative importance accorded criteria by international forums; (b) definition of the problem with which policies are to deal (and time frame applied in this definition); (c) trade-offs or reconciliations to be made among values when alternative policies produce conflict between or among them.

#### *Relative importance of guidelines*

51. One of the primary factors to be considered in resolving conflicts among values would be the assignment of relative importance to each. In the Plan of Action, such relative weighting may be derived from the attention accorded these values in United Nations instruments. For such an exercise, the different instruments may also be weighted, depending upon their acceptance and adoption as standards by States Members. In this context, covenants and conventions ratified by a majority of Member States would appear to have the most weight, since their ratification makes them legally binding. Resolutions from the General Assembly and the Economic and Social Council, while not legally binding, would also represent a degree of consensus among States Members. Proclamations and declarations would have weight according to the degree of consensus underlying their acceptance at United Nations conferences and in the General Assembly. Instruments formulated in the commissions of the Economic and Social Council and by regional bodies would have correspondingly less system-wide weight since they are formulated by smaller representations of States Members. Instruments of a regional commission, formulated and supported by States Members from a particular region, would have importance geographically.

52. By this scheme, recognition of the freedom of couples to decide the spacing and size of their families has received the most recognition. Reference has been included in four General Assembly resolutions and the Proclamation of the International Conference on Human Rights, as well as the Asian Population Conferences. General Assembly resolutions include General Assembly

resolutions 2211 (XXI) of 17 December 1966, on Population Growth and Economic Development; 2263 (XXII), 7 November 1967, the Declaration on Elimination of Discrimination against Women; 2542 (XXIV) of 11 December 1969, the Declaration on Social Progress and Development; and 2716 (XXV) of 15 December 1970, the Programme of Concerted International Action for the Advancement of Women. The first, second and fourth were adopted unanimously. The Declaration on Social Progress underwent debate and attempted revision of article 22 (b) to exclude reference to provision of knowledge and means. The article was subsequently passed by 60 favouring, 16 opposing, with 17 abstentions. Resolution XVIII on the Human Rights Aspects of Family Planning was passed by the International Conference on Human Rights by a vote of 49 in favour, none opposed and 7 abstentions. Freedom with regard to movement was specifically recognized in the Universal Declaration of Human Rights, adopted by the General Assembly. However, it has not been incorporated into legislation of States Members in the same way as freedom of choice with regard to family planning.

53. The general welfare criterion has not been explicitly dealt with in United Nations instruments, with the exception of concerns about preserving the integrity of the family (which conflicts with the outcome of other legislation eliminating discrimination against women) and concerns about rapid growth as an obstacle to development.

54. The distributive justice criterion has received remarkably little attention in United Nations instruments, with the exception of a statement of general principles in the Covenant on Economic, Social and Cultural Rights, and the General Assembly's Declaration on Social Progress and Development.

55. Lastly, the survival criterion has received little recognition as such, with the exception of the Declaration by World Leaders.

#### *Definition of population problem*

56. Another problem in application of these guidelines is the definition of the problem with which the policies are designed to deal. Implicit is the question of whose definition is being used. Environmentalists perceive population problems from the point of view of the impact of population on the environment and on survival. Some environmentalists weigh the survival criterion more heavily than the freedom criterion, and advocate policies which infringe on individual reproductive freedom at present, to ensure more options for the collective group vis-à-vis resource use and survival, at a future period in time. This point of view is not reflected in existing United Nations instruments. Others, more concerned with reducing obstacles to achievement of development objectives, advocate family planning programmes as a means of persuading and influencing individual choice to smaller family size. This point of

view is reflected in the 1966-1967 Declaration by World Leaders and in the Proclamation of Teheran.

57. Values of family planners are reflected in the Proclamation of Teheran, originating in the United Nations system the concept of freedom of choice with regard to size and spacing of families. Family planners commonly advocate exercise of such freedom regardless of over-all, societal demographic goals. This value is accepted by a number of Governments, which, while considering population growth as deficient, support or allow family planning programmes to exist. Thus, it is important in considering the relative weighting of these criteria in the World Population Plan of Action, to consider also the interest groups and the sometimes differing perceptions of the population "problem" which these groups bring with them to their valuation of measures to deal with it.

58. Another factor affecting differing valuations of population problems relates to the time-frame used by those defining them. Conflicts are possible between serving current or future values. The time factor particularly influences trade-offs made by those primarily concerned with survival. As long as it is believed that population is a major factor in permanent depletion of resources, restriction of current and possibly future individual reproductive freedom may be valued on grounds that such action is necessary to survival or to maintenance of current levels of resource use. A similar stand may be taken by developmentalists who see unrestricted, unplanned population trends as obstacles to achievement of development goals.

#### *Trade-offs*

59. The preceding discussion has referred to the most basic issue to be faced in formulation of population policy—the reconciliation of values in choosing among alternative policies. The World Population Plan of Action will suggest a number of alternative measures which may be considered by States Members when confronting particular demographic goals. Some measures may enhance freedom, yet also threaten survival. Other measures may restrict freedom now to protect the range of choice for future generations. The question is how to choose the kind of public intervention. Such choice must depend upon the social ranking of the values involved.

60. At the international level, the question of such ranking has not received attention, nor has the question of trade-offs—giving up some of one value to gain more of another. The preceding discussion has indicated freedom of choice in family planning to be most highly valued, but no indication has been made as to whether and how much of it could be given up to assure survival or greater distributive justice at the same time. The Declaration of World Leaders and the Proclamation of the International Conference on Human Rights reconcile the major values: greater family planning freedom is a means of achieving welfare and survival goals. The Declaration on Social Progress and Development in-

cludes a value conflict between individual freedom ("the exclusive right of parents") and the collective welfare ("within the framework of national demographic policies"), but does not make any attempt to reconcile the conflict. Such an attempt was made at the Second Asian Population Conference. After declaring the right of couples to decide on spacing and size of their family, and their right to the means to do so, the Conference recognized the social and economic impact of individual family size on societies, and considering it appropriate for Governments to take social and economic measures, in addition to family planning programmes, that will make a smaller family more acceptable and beneficial to the individual couple. However, this is a statement from one region only. This value reconciliation has not been considered at the global level.

61. With regard to freedom of movement on the other hand, most States have already moved to curb individual freedom of movement and to regulate international flows of migrants. There is no legislation calling for greater freedom of movement and no concern expressed that freedom of movement be increased at perhaps the cost of some level of public welfare in the receiving country (assuming incoming labour would lower wages, or involve training and transportation costs).

62. Obviously, consideration of measures to influence population variables involves a number of trade-offs. Many conflicts occur in measures to deal with growth problems. For instance, some groups consider that unrestricted exercise of individual freedom to reproduce will lead to larger families, thereby interfering with larger welfare and the range of options available to future generations. Some advocate that current individual procreative freedom should be curtailed to enhance the current collective welfare and possibly future individual freedom (assuming projected population growth would decline as a result of public intervention). Similarly, it is argued that unrestricted freedom of internal movement leads to the accumulation of unskilled manpower in cities, infringing on collective welfare, even threatening survival. Restriction of such movement is advocated.

63. Some ecologists and environmental groups go further and argue that unrestricted procreative freedom leads to rapid population growth, threatening over-all survival. They advocate subordination of procreative freedom to ensure better chances of survival. National minority groups have been known to oppose implementation of voluntary family planning programmes and voluntary migration opportunities, fearing adverse effects on their group survival. In effect, they would trade off individual freedom in favour of group survival.

64. These examples illustrate some obvious situations in which values conflict in policy alternatives. In the case of the World Population Plan of Action, a clearer picture of the relative importance to international bodies of the values involved would help in policy choices. Definition of population problems and of the

values to be served by policies to influence those problems would be useful as guidelines to States Members in making future policy choices.

#### IMPLICIT GUIDELINES

65. Discussion on implementation of guidelines for population policies has not included reference to an implicit guideline for policy formation—that of truthfulness by Governments—truthfulness in relating the real intent of policies, and concern for information on potential impacts, both intended and unintended, of policies.

66. With respect to population policy, there is a growing body of demographic-economic research which indicates that a wide range of socio-economic measures have demographic consequences. These measures include raising the age at marriage, raising the level of education for men and women, female labour force participation (all affecting fertility), location of industry, use of capital *versus* labour-intensive technologies affecting population distribution. United Nations instruments recognize the right of women to equality with men, the right of the child to education, the right to freedom from hunger and to liberty of movement. They advocate a minimum age at marriage. They recognize these measures as desirable ends in themselves, desirable for their contribution to the enhancement of individual freedom. Yet, research indicates that in addition to enhancing freedom, they should also be considered on their demographic merits. If States employ such policy alternatives for their supposed demographic ends, do they also have an ethical obligation to state the demographic objective underlying the selection of the policy alternative? This question may be particularly important if freedoms are curtailed, or measures distributed unfairly. It is not as yet dealt with in international instruments.

67. The second issue relating to truthfulness is the obligation of States to base the adoption of measures on the best available scientific information of their consequences—both intended and unintended. Governments have a responsibility to test such measures and inform themselves and their people of the demographic and social consequences. This is a relevant issue for instance with regard to education and infant mortality programmes. While desirable in themselves, their desirability may increase because of their anticipated future demographic impact. However, little is yet known of the practical mechanisms by which these measures actually influence fertility. Similarly, with regard to population distribution, the mechanism that induces people to move is not sufficiently understood to translate it into strategies to influence such distribution into more socially useful directions. Furthermore, the full range of consequences of such measures is not always clear. They may be ethical as well as social, economic and demographic. Ethical considerations are particularly important in relation to the use of socio-

economic incentives to induce participation in fertility reduction programmes. Thus, international standards for population policies should encourage Governments to inform themselves on the mechanisms and consequences of population measures before employing them on a widespread basis.

#### IMPLICATIONS FOR THE WORLD POPULATION PLAN OF ACTION

68. This paper has examined the development of universal guidelines for population policies based on international values recognized in the Charter of the United Nations. In summary, it has been found that little explicit attention has been paid in international instruments to such guidelines for population policies, with the exception of freedom to plan families. The ever-present problem of reconciling conflicting values has also received little attention. This section summarizes possible next steps which might be taken at the international level to recognize, clarify and implement such standards.

69. With respect to valuation of individual freedom, several clarifying steps might be taken. States Members have already reached some consensus on parents' rights to decide "freely and responsibly" the size and spacing of their families and on States' obligations to assist them to do so. However, the question whether States have these obligations regardless of larger demographic objectives has yet to be resolved. Other measures might be suggested to achieve these larger goals, such as reducing mortality or recruiting international migrants to promote population growth. Furthermore, better definition is needed of family planning services to be provided, to include means to promote as well as to regulate fertility. Whether the latter includes abortion and sterilization services is also a question to be considered.

70. The Plan of Action may also wish to expand the concept of reproductive freedom beyond that of family planning to include consideration of maintenance and expansion of ranges of alternatives to reproduction open to couples. Emphasis might be placed on the idea of large families as a problem of restricted choice. If Governments adhered fully to ideals of free choice and full exercise of human rights set forth in the Universal Declaration of Human Rights, this positive effort to enhance human freedom could of itself significantly affect fertility levels, since a number of these measures have been related empirically to declining fertility trends. Measures consistent with this view would include children receiving the education to which they are entitled in the Declaration on the Rights of the Child, equal status for men and women, employment of productive labour and encouragement of a minimum marriage age.

71. Advocacy of expanded individual freedom should not overlook the possibility of value conflicts with collective welfare. The problem of reconciling social

needs with individual freedom needs to be addressed. Coercion of reproductive behaviour clearly is not acceptable under the terms of the Charter of the United Nations. Guidelines need to be developed which define and include such measures as use of public education, persuasion and feedback to individuals about the social and personal consequences of their actions, consistent with the ideal of expanding freedoms. Underlying this is the idea that people who understand the advantages of changing their behaviour, to themselves as well as to society, may be more willing to do so.

72. It may be useful to recommend that States avoid the use of measures directed towards influencing population growth or distribution as substitutes for other measures, particularly distributional measures, necessary to development.

73. With regard to distributional considerations, more attention could be paid to the importance of standards for fairness to be considered in formulating policies on family planning and socio-economic measures to influence fertility, and in formulating such policies to influence internal migration as regional development and location of industry.

74. With regard to the survival criterion, the Plan might also attempt to define more clearly the threat to survival posed by rapid population growth and by rapid movements of populations into cities. An important aspect of the definition will be the time-frame involved. It can be argued that population problems, if removed, would not remove major threats to survival of mankind. Thus, Governments should be careful of infringing on individual freedom, or resorting to coercive measures.

75. With regard to implementation, there are no legally binding pieces of legislation to ensure observation of guidelines discussed. The Conference may wish to make basic statements on guidelines, underlining that important national and international values must be served by policy if they are to be implemented and effective in achieving demographic goals.

76. Practical measures that might be taken include the organization of interregional inquiries into the nature and extent to which these guidelines and others are recognized and incorporated into formulation of national population policies. Further conceptual work is necessary to develop more clearly the international standards. Technical resources should be available from the United Nations to States Members who desire assistance in developing and applying standards. It might be recommended that the United Nations system direct its assistance to programmes upholding these standards, other things being equal.

77. Recommendations might also be made that States Members set up internal population policy review mechanisms. The function of the mechanism would be to screen policies that directly or indirectly influence population variables for their internal consistency and to ensure they shall not be coercive or unfair in impact

and that they shall not obstruct the collective welfare or threaten survival of society or any particular group. Membership in such mechanisms should be interdisciplinary and composed not only of social and legal

scientists, but of policy-makers and administrators. Location of such a mechanism might be in a quasi-governmental institution for policy studies, where it would be relatively free of political pressures.

## ACTIVITIES OF THE UNITED NATIONS SYSTEM IN THE FIELD OF POPULATION

### *United Nations Secretariat\**

1. The main aim of this paper is to provide Governments and participants at the World Population Conference with a concise and readily usable review of the population activities currently being carried out by the United Nations and its specialized agencies. In addition, the paper records the highlights of the major legislative decisions, that is, the broad policy directives under which these activities take place. Since the Conference deliberations—and any plan of action that may emerge from the Conference—will clearly affect the course and content of the future activities of the United Nations system, it was deemed desirable to have on hand this “bench-mark” of the nature and scope of the system’s activities on the eve of the Conference.

2. A distinctive feature of this paper is its focus on the United Nations system, taken as a whole, rather than on the programmes of individual organizations. It should be read in conjunction with the companion background paper, on the role of international assistance,<sup>1</sup> prepared by the United Nations Fund for Population Activities (UNFPA). That paper covers, in addition, the broad range of international activities being carried out by non-governmental organizations and institutions, and by individual Governments through bilateral programmes.

3. The present paper was prepared by the United Nations, in co-operation with the organizations concerned, and reviewed and approved by the Administrative Committee on Co-ordination.<sup>2</sup>

#### LEGISLATIVE AND INSTITUTIONAL FRAMEWORK

##### *Legislative framework*

4. The competence of the United Nations system to promote action in the field of population derives fundamentally and in a very general sense from the Charter of the United Nations and the constituent instruments of the specialized agencies. It was defined more specifically in the provisions of the International

Development Strategy for the Second United Nations Development Decade. This Strategy, adopted by the General Assembly on 24 October 1970, comprises a statement of goals and objectives agreed by the world community, and an outline of policy measures which Governments resolved to adopt and implement during the 1970s. The section of the Strategy relating to human development declares:

“Those developing countries which consider that their rate of population growth hampers their development will adopt measures which they deem necessary in accordance with their concept of development. Developed countries, consistent with their national policies, will upon request provide support through the supply of means for family planning and further research. International organizations concerned will continue to provide, when appropriate, the assistance that may be requested by interested Governments. Such support or assistance will not be a substitute for other forms of development assistance.”<sup>3</sup>

5. The targets contained in the Strategy with respect to a minimum annual gain in real gross production of 6 per cent and a *per capita* gain of 3.5 per cent for developing countries imply at least a lowering of the annual rate of population growth from the 2.8 per cent forecast for the 1970s to 2.5 per cent. “In this context”, the Strategy states, “each developing country should formulate its own demographic objectives within the framework of its national development plans”.<sup>4</sup>

6. It should, perhaps, be recalled at this point that the relationship between population and development has been a concern of the United Nations since its inception. The Economic and Social Council established the Population Commission as one of its functional commissions as long ago as 1946. In the same year, a Population Division was established in the Department of Economic and Social Affairs of the United Nations Secretariat, as the substantive arm of the Commission. The Commission’s terms of reference, as approved by the Economic and Social Council on 10 August 1948,<sup>5</sup> were to arrange for studies and advise the Council on:

\* Population Division of the Department of Economic and Social Affairs.

<sup>2</sup> The Administrative Committee on Co-ordination is composed of the executive heads of all United Nations organizations and meets under the chairmanship of the Secretary-General of the United Nations.

<sup>3</sup> General Assembly resolution 2626 (XXV) of 24 October 1970, para. (65).

<sup>4</sup> *Ibid.*, para. (15).

<sup>5</sup> See resolution 150 (VII). The membership of the Population Commission consists of experts nominated by the

(Continued on next page)

(a) The size and structure of population and the changes therein;

(b) The interplay of demographic factors and economic and social factors;

(c) Policies designed to influence the size and structure of population and the changes therein;

(d) Any other demographic questions on which either the principal or the subsidiary organs of the United Nations or the specialized agencies may seek advice. These terms of reference have never had to be changed, their broad scope having enabled the Population Commission to respond to the dramatic changes that have occurred over the past 25 years in the world demographic situation, and to the consequent shifts of emphasis in the research and field activities of the United Nations system in the population sphere.

7. Another of the Council's functional commissions—the Statistical Commission—has worked closely with the Population Commission, because of their mutual interests in demographic and related statistics.<sup>6</sup> Other functional commissions of the Economic and Social Council with an interest in various facets of population include the Commission for Social Development, the Human Rights Commission and the Commission on the Status of Women.

8. While the Economic and Social Council has discussed periodically population questions when reviewing the reports of its Population Commission, the General Assembly, prior to the adoption of the Strategy, addressed itself specifically to population problems on only two occasions, in 1962 and 1966. In December 1962, the Assembly concluded its first full-scale debate on the matter by formally recognizing the close relationship which existed between economic development and population growth, and resolving that the United Nations should encourage and assist Governments "in obtaining basic data and in carrying out essential studies of the demographic aspects, as well as other aspects, of their economic and social development problems".<sup>7</sup>

9. The subsequent action of the General Assembly in 1966 can best be understood in the light of important developments that had occurred in the intervening four years. One such development was the concern aroused in the international community by the conclusions of a Secretariat study of world population projections showing that population in developing regions would, under the medium assumption, more than double between 1965 and the year 2000. Deep concern over the

Governments of the countries elected by the Economic and Social Council to serve on the Commission. The number of countries serving on the Commission has increased periodically from the original number of 12 to the current number of 27, to reflect the increased membership of the United Nations.

<sup>6</sup> The responsibilities of this Commission are to assist the Council in promoting the development of national statistics (including demographic statistics) and their international comparability, and the improvement of statistics and statistical methods in general, and in developing the statistical services of the Secretariat.

<sup>7</sup> General Assembly resolution 1838 (XVII) of 18 December 1962.

rapid growth in population and its disturbing consequences for development was also registered by the Asian Population Conference in 1963, an intergovernmental Conference convened by the United Nations Economic Commission for Asia and the Far East (ECAFE). Similar concerns were reflected in the discussions of the Second World Population Conference, held at Belgrade in 1965, and in the Declaration on Population Growth and Human Dignity and Welfare, signed by several Heads of State of both developing and developed countries, and issued by the Secretary-General on Human Rights Day on 10 December 1966.<sup>8</sup> Important decisions reflecting these preoccupations were also taken during 1965-1966 in both the World Health Organization (WHO) and the United Nations Educational, Scientific and Cultural Organization (UNESCO). Thus, four years after its first full-scale debate on the subject, the General Assembly, on 17 December 1966, unanimously approved resolution 2211 (XXI) on "population growth and economic development", an event widely heralded as a turning-point in the role being played by the United Nations system with respect to population problems.

10. This resolution embodied the consensus reached by States Members with regard to the seriousness of population problems and the need for gaining a proper understanding of the effects of those problems on economic and social development. It also emphasized the necessity for accelerated action to implement the expanded programme recommended by the Population Commission in 1965 and endorsed by the Economic and Social Council.<sup>9</sup> It provided that the United Nations and the specialized agencies "should assist, when requested, in further developing and strengthening national and regional facilities for training, research, information and advisory services in the field of population". Although "advisory services in the field of population" were not specifically defined, the tenor of the debate and the various provisions of this resolution clearly signalled the departure from existing restrictions with respect to United Nations technical assistance projects in the field of population. In taking the fore-

<sup>8</sup> In the declaration, the Heads of State affirmed their conviction of the importance of population problems for national planning of economic goals and for the achievement of lasting peace, their belief in the right of parents to decide and plan the size of their families and the conviction that the enrichment of human life is the objective of family planning. The 12 original signatories were: Colombia, Finland, India, Malaysia, Morocco, Nepal, Republic of Korea, Singapore, Sweden, Tunisia, United Arab Republic of Egypt, and Yugoslavia. A year later the leaders of 18 other countries—Australia, Barbados, Denmark, Dominican Republic, Ghana, Indonesia, Iran, Japan, Jordan, Netherlands, New Zealand, Norway, Pakistan, the Philippines, Thailand, Trinidad and Tobago, United Kingdom of Great Britain and Northern Ireland, and the United States—added their signatures to this Declaration and presented it to the Secretary-General on Human Rights Day in 1967.

<sup>9</sup> In resolution 1084 (XXXIX), adopted in July 1965, the Economic and Social Council had, for the first time, specifically called upon the Secretary-General "to provide ... advisory services and training on action programmes in the field of population at the request of Governments desiring assistance in this field".

going steps, the Assembly recognized "the sovereignty of nations in formulating and promoting their own population policies, with due regard to the principle that the size of the family should be the free choice of each individual family".

11. This action by the General Assembly and, more particularly, its appeal to the United Nations and the agencies to strengthen the assistance they were giving Governments in this area was followed by decisions of the governing and legislative bodies of the specialized agencies to extend and to intensify their contributions in this sphere, within the framework of their special areas of competence.

12. The World Health Organization, which had already taken important policy decisions in 1965 and 1966 on the health and medical aspects of population problems, saw its population mandate further broadened by decisions of the World Health Assembly in 1967, 1968 and 1969. By these decisions, the Assembly affirmed the responsibility of WHO to provide advisory services to Governments, at their request, on health aspects of fertility, sterility and fertility regulation methods, including the organization of family planning services as part of organized health services, particularly their maternal and child health components. Recently, the World Health Assembly has noted "with satisfaction the increasing assistance given by WHO to Governments to further develop their health infrastructure for the provision of family planning care . . ." and urged that WHO "intensify its leadership role in the medial and health aspects of family health, in collaboration with UNICEF and UNFPA as well as with other appropriate organizations within and outside the United Nations system".<sup>10</sup>

13. Since 1967, the United Nations Children's Fund (UNICEF) has likewise been empowered by its Executive Board to support family planning projects as part of its maternal and child health services, in so far as such projects were requested by Governments. This mandate was further broadened in succeeding sessions to permit UNICEF to provide assistance to the motivational, educational and social aspects of family planning.

14. In the same year, the Conference of the Food and Agricultural Organization of the United Nations (FAO) recommended that "... the Director-General increasingly involve the organization in the study of the food/population dilemma"; and considered that home economics and agriculture, through their established extension programmes, specialized programmes for women and youth and applied nutrition, provided "excellent channels" to reach the family. The Conference recognized the need to help families achieve, through appropriate policies and programmes, conditions that would increase well-being and would contribute to national development, and agreed that education and training activities in support of these

national programmes, through better utilization of resources and improved nutrition, were within the competence of FAO. Accordingly, it recommended that on Government request, FAO be prepared to provide assistance in the organization of educational programmes directed to helping populations in their search for well-balanced family life.<sup>11</sup> More recently, the Conference has emphasized the role of FAO in integrating population aspects into existing food and agricultural policies and programmes, and has authorized the examination of the population implications of all FAO programmes.<sup>12</sup>

15. Following important decisions taken by its General Conference and Executive Board in 1966 and 1967, respectively, the United Nations Educational, Scientific and Cultural Organization was given a detailed mandate in the population field by the General Conference in November 1968.<sup>13</sup> The over-all purpose of the UNESCO population programme, as defined in this and subsequent resolutions and recommendations<sup>14</sup> of the General Conference, is to improve knowledge and to increase awareness of the causes and consequences of population change, of their interrelations with other aspects of social, cultural and environmental change, and of their implications for human rights and the quality of life. The programme thus involves activities in education, as well as communications and the social and natural sciences.

16. The International Labour Conference, at its fifty-first session in June 1967, adopted a resolution highlighting the influence of rapid population growth on opportunities for training and employment and on the welfare of workers, and outlining the role to be played by the organization in this regard. The following year, the Governing Body of the International Labour Organisation (ILO) endorsed the following lines for action by the ILO in population fields:

(a) Promotion of information and educational activities on population and family planning questions at various levels and particularly through workers' education, labour welfare and co-operative and rural institutions' programmes;

(b) Policy-oriented research on the demographic aspects and measures of social policy in certain fields, such as employment and promotion of social security;

(c) Action to stimulate participation by social security and by medical services at enterprise level in promotion of family planning.

17. The decision of the International Bank for Reconstruction and Development (World Bank) to enter the population field dates back to 1968. It was based

<sup>11</sup> Food and Agriculture Organization of the United Nations, *Report of the Fourteenth Session of the Conference*, Rome, 4-23 November 1967, paras. 260 and 367.

<sup>12</sup> Approved FAO Programme of Work, 1974-75, pp. 75-78.

<sup>13</sup> Resolution 1.241 of the Fifteenth Session.

<sup>14</sup> See, in particular, resolution 7.25 of the Sixteenth Session (1970) and recommendation 7.4 of the Seventeenth Session (1972) of the General Conference of the United Nations Educational, Scientific and Cultural Organization.

<sup>10</sup> World Health Assembly, resolution 26.49 of 22 May 1973.

on the Bank's conviction that too rapid population growth was a major barrier to the economic and social progress of most of its member countries. The World Bank (including its affiliate, the International Development Association (IDA)) has extended conventional "Bank" and "soft loan" assistance to the population sector, and its commitments for population activities have since steadily grown and by the end of 1973 had reached \$71 million.

18. In the United Nations itself, following the adoption by the General Assembly of resolution 2211 (XXI) of 17 December 1966, the Secretary-General announced his decision to establish a Trust Fund for voluntary contributions by Governments, institutions and individuals to supplement the limited resources available to the United Nations under its regular budget and the United Nations Development Programme (UNDP), in order to obtain the resources needed to tackle the expanded programme of population activities that had been called for by the General Assembly.

19. In May 1969, responsibility for the administration and management of the Fund was transferred to the Administrator of the United Nations Development Programme, and the Fund was renamed the United Nations Fund for Population Activities. At the same time, the scope of population activities which the Fund could support was expanded to include fields of concern to other organizations in the United Nations system and to appropriate non-governmental organizations. The Fund was authorized, in principle, to provide all forms of assistance that might be required, including even those not normally considered to fall within the range of multilateral technical co-operation.

20. In December 1972, the General Assembly put the Fund under its own authority and designated the UNDP Governing Council as the Fund's governing body. The Economic and Social Council, in May 1973, defined the aims and purposes of UNFPA to be:

(a) To build up, on an international basis, with the assistance of the competent bodies of the United Nations system, the knowledge and the capacity to respond to national, regional, interregional and global needs in the population and family planning fields; to promote co-ordination in planning and programming; and to co-operate with all concerned;

(b) To promote awareness, both in developed and in developing countries, of the social, economic and environmental implications of national and international population problems; of the human rights aspects of family planning; and of possible strategies to deal with them, in accordance with the plans and priorities of each country;

(c) To extend systematic and sustained assistance to developing countries at their request in dealing with their population problems; such assistance to be afforded in forms and by means requested by the recipient countries and best suited to meet the needs of the individual country;

(d) To play a leading role in the United Nations system in promoting population programmes, and to co-ordinate projects supported by the Fund.<sup>15</sup>

21. Pursuant to this mandate, the Fund has been orienting its activities increasingly towards responding directly to requests from Governments for assistance on comprehensive country projects. However, during these initial years of its operation, the Fund has also been able to contribute substantially to the newly expanded activities of the specialized agencies and to the progressive involvement in the population field of United Nations regional bodies.

22. Although most of the regional economic commissions were already involved in demographic work at the end of the 1950s, the development of significant population activities at the regional level may be said to have begun only in the late 1960s. A notable exception is the Asian region, where concern about population and its impact on development has been evident since the inception of ECAFE in 1947. This long-standing interest was given new impetus in 1964, when the Commission, as the aftermath of the first Asian Population Conference, approved resolution 54 (XX), generally regarded as the first "action-oriented" resolution on population matters adopted within the system. Even within ECAFE, however, the formulation of a large-scale regional programme to reflect the special economic and social problems of a region which comprises more than half of the world population had to wait until 1968.<sup>16</sup> Recently, the Second Asian Population Conference has recommended a further strengthening and expansion of the role of ECAFE as the focal point for all population activities within the region.

23. An expanded population programme for the African region was adopted in 1969. The following year, the United Nations Economic Commission for Africa (ECA) approved the establishment of a biennial Conference of African Demographers<sup>17</sup> to review this programme, and called for a comprehensive study "of population levels and trends in relation to economic and social development" within the region.

24. The main elements of the population work programmes of the United Nations Economic Commission for Europe (ECE), Economic Commission for Western Asia (ECWA) and Economic Commission for Latin America (ECLA) are described in the next section and need not be outlined here. As far as ECLA is concerned, however, reference should be made here to resolution 304 (XIV), adopted by the Commission in 1971, which formalized the long-standing collaboration between ECLA and Centro Latinoamericano de Demografía (CELADE) by recognizing CELADE as an autonomous agency under its aegis, and urging the

<sup>15</sup> See Economic and Social Council resolution 1763 (LIV).

<sup>16</sup> Resolution 74 (XXIII), adopted by the United Nations Economic Commission for Asia and the Far East in 1967, provided the impetus for this programme, which was endorsed at the succeeding session of the Commission in April 1968.

<sup>17</sup> The Conference was convened for the first time in December 1971.

Centre to continue its teaching and research activities and the provision, on request, of demographic services on population to Latin American countries.

25. This brief summary of key legislative developments may conclude with some mention of the Economic and Social Council's most far-reaching action to date. In 1972, on the recommendation of its Population Commission, the Council urged member States, *inter alia*:

(a) To give full attention to their demographic objectives and measures to achieve the goals of the Second United Nations Development Decade and to improve demographic statistics, research and planning machinery for developing population policies and programmes;

(b) To co-operate in achieving a substantial reduction of the rate of population growth in those countries which consider their current rate of growth too high and in exploring the possibility for setting of targets for such a reduction in those countries;

(c) To ensure, in accordance with their policies and needs, that information and education about family planning, as well as the means to practise family planning effectively, are made available to all individuals by the end of the Second United Nations Development Decade.<sup>18</sup>

Other provisions of this resolution dealt with the World Population Conference and the World Population Year, and called for placing a draft World Population Plan of Action on the agenda of the World Population Conference.

#### *Institutional framework*

26. Within the United Nations system of organizations, those with specific roles in the field of population include, as has already been indicated, the United Nations, WHO, FAO, UNESCO, the ILO and the World Bank. Within the United Nations, several separate units of organizations may be singled out, i.e., the Population Division of the Department of Economic and Social Affairs, UNFPA, UNICEF, and the five regional economic commissions (ECA, ECAFE, ECE, ECLA and ECWA<sup>19</sup>). The five demographic and training centres serving the different regions of the world must also be mentioned. Lastly, the United Nations Industrial Development Organization (UNIDO) and the newly created United Nations Environment Programme (UNEP) also have a growing interest in population problems.

<sup>18</sup> Economic and Social Council resolution 1672 (LII). The basic right of parents to determine the number and spacing of their children and of access to adequate information to practise that right was previously affirmed by a proclamation adopted at the International Conference on Human Rights, held at Teheran in 1968 (see *Final Act of the International Conference on Human Rights* (United Nations publication, Sales No. E.68.XIV.2), chap. II, para. 16); and by the Declaration on Social Progress and Development adopted by the General Assembly in 1969.

<sup>19</sup> Formerly the United Nations Economic and Social Office in Beirut (UNESOB).

27. In the United Nations Secretariat, the Population Division, as the counterpart of the Population Commission, provides the substantive services required of the Secretariat in carrying out the programme recommended by the Population Commission. The Division's work programme has the following components: population statistics and population projections; studies and research in fertility, mortality and morbidity, migration and urbanization, and interrelations between population and economic and social development; population policies; family planning; and training and other educational activities supporting population work. In the crucial area of population statistics, the Division collaborates with the United Nations Statistical Office, which is responsible for the promotion and improvement of demographic statistics.

28. At the regional level, the economic commissions for Africa, for Asia and the Far East, and for Western Asia each has a separate population division or section. In the European region, population work is carried out within other divisions. Recently, however, a special population team has been established to carry out a number of studies in this area. In the Latin American region, CELADE performs certain functions which in the other regions are carried out by the regional economic commissions. Recently, a joint ECLA/CELADE division has been established within the ECLA secretariat. The regional work programmes are established by the regional units in consultation with the Population Division at Headquarters. The Population Commission receives periodic reports from these regional bodies, and from the United Nations organizations concerned, on their work programmes in the field of population. In accordance with arrangements worked out at the intersecretariat level, the Commission, for the first time in 1973, received this information in the form of one comprehensive report covering the activities of the entire system (E/CN.9/284).

29. Reference has been made in the preceding section to the origins and establishment of UNFPA. The secretariat of the Fund, headed by an Executive Director, has the continuing functions of formulating policies and plans for the organization, conducting its external relations, promoting population programmes and building capacity in the United Nations system and elsewhere to respond to population needs. In January 1974, the Governing Council of UNDP approved a reorganization of the UNFPA secretariat and the establishment of two new units, a Programme Planning Division and a Project Division, which have been assigned the functions of discharging the operational functions of UNFPA relating to programme and project development, assessment and implementation. At the field level, UNFPA has a network of coordinators to assist Member States in the development of projects to be supported by the Fund. The UNFPA receives advice from and consults with the specialized agencies through an Interagency Consultative Com-

mittee (see para. 34) and seeks technical and expert advice from *ad hoc* technical groups.

30. Separate units dealing with population have recently been established in many of the specialized agencies. In WHO, the Division of Family Health is entrusted with the functions of developing and administering programmes concerned with the development of services, education and training and research for the organization in the areas of human reproduction, family planning and population dynamics. The Division maintains close collaboration with other divisions in WHO headquarters interested in population (such as the Health Statistics Division, the Division of Strengthening of Health Services and the Health Manpower Division) and with WHO regional offices and country representatives. The World Bank has two specialized units dealing with population; the Population and Nutrition Projects Department, which is an operating unit engaged in preparing and monitoring population projects; and the Population and Human Resources Division of the Development Economics Department, whose primary focus is research and policy work. Similarly, in UNESCO, a Population Co-ordination and Research Unit has been established within the Social Science Department. In addition to substantive responsibilities for social science research, the Unit has been entrusted with over-all planning and both external and internal co-ordination functions.

31. The institutional arrangement of the (ILO) and FAO is somewhat different. In the ILO, a population focal point has been established in the Technical Co-operation Department, with the functions of providing an over-all view of the ILO interests in this field, and of promoting the development and co-ordination of its UNFPA-assisted programme; as a general rule, however, the ILO specialists within the various technical units and in the regions are responsible for implementing population activities within their fields of competence. In FAO, the function of advising the organization on the development of policies and programmes is carried out by an Interdepartmental Working Group on Population, serviced by a population programme co-ordinator and chaired by the Head of the Economic and Social Policy Department, where FAO population work is mostly centred.

#### *Machinery to ensure system-wide co-operation*

32. Substantive programme co-ordination between the United Nations and the specialized agencies is ensured: (a) by senior staff of the organizations concerned, who, *inter alia*, exchange and comment on one another's programmes of work in advance of their consideration by legislative bodies; and (b) by informal meetings at the working level on various technical aspects of the work requiring intersecretariat co-operation.

33. In 1967, the Administrative Committee on Co-ordination established as part of its continuing machinery a new subsidiary body—the Sub-Committee

on Population—with the function of co-ordinating and harmonizing the population programmes carried out within the system. The Sub-Committee has met annually under the chairmanship of the Director of the Population Division of the United Nations Secretariat, and has been attended by the officials dealing with population in WHO, FAO, UNESCO, the ILO, the World Bank, UNICEF, and the regional economic commissions, and by representatives of UNFPA. In 1972, the Sub-Committee's parent body, the Administrative Committee on Co-ordination, reported to the Economic and Social Council on the shift of emphasis that was taking place in the Sub-Committee's work from an initial preoccupation with the harmonization of mandates, to the systematic examination of programmes, and of the co-operative measures required to ensure their effective implementation.

34. This emphasis on programme co-ordination is also reflected in the activities of the Inter-Agency Consultative Committee of UNFPA, which has the function of over-viewing and ensuring intersecretariat co-operation with respect to UNFPA-supported activities. The meetings of this Committee, usually held in conjunction with the Administrative Committee's Sub-Committee on Population, are chaired by the Executive Director of UNFPA.

#### MAIN ACTIVITIES OF THE UNITED NATIONS SYSTEM IN THE POPULATION FIELD

35. The following summary of the principal activities being carried out by the various organizations in the United Nations system provides in a concise and easily digestible form, the "bench-mark" referred to in the introduction. Participants wishing a more detailed and comprehensive account of the programmes of individual organizations will find it in the interagency programme report submitted to the Population Commission at its seventeenth session (E/CN.9/284). Moreover, the functional structure of this chapter has made it difficult to do full justice to the role and activities of UNFPA, whose operational and financing activities, carried out in co-operation with other United Nations organizations, cut across the five functional programme areas singled out below. A fuller description of the role of UNFPA will be found in the companion paper prepared by the Fund for the Conference.<sup>20</sup>

36. The five major programme areas are:

- (a) Population statistics and projections;
- (b) Population studies and research;
- (c) Population policies;
- (d) Family planning;
- (e) Training and other educational activities supporting population work.

Tables 1-3, showing the expenditures of the United Nations system in the field of population, are given below.

### Population statistics and projections

#### Population statistics

37. Efforts to improve demographic statistics by the United Nations Statistical Office in collaboration with other organizations of the United Nations system involve two general types of programmes: the development and improvement of national systems of demographic statistics; and the world-wide dissemination of national statistics in as comparable form as possible.

38. Activities under the first type of programme provide variously for the formulation of common standards relating to types of data to be collected and the methods of their collection, processing, classification and presentation; the preparation of technical manuals and handbooks designed to aid national statistical services in implementing the standards; direct assistance to Governments through seminars, consultations and the provision and supervision of qualified

field experts; and provision for training of national technical personnel. Subject fields currently covered include population censuses and sample surveys, vital statistics and migration statistics.

39. The United Nations World Population Census Programmes have made a significant contribution to the notable improvement in the quantity and quality of national census data which has taken place during the past 20 years. The goal of the 1970 programme is to have at least one reliable population census held in each country of the world between 1965 and the mid 1970s, providing data as nearly internationally comparable as possible, in accordance with the United Nations census recommendation.<sup>21</sup> Activities have been directed towards all regions of the world, with particular emphasis currently on the countries of Africa, through the medium of the African Census Programme, funded largely by UNFPA.

40. Development of vital statistics is promoted under the World Programme for the Improvement of Vital Statistics, in which WHO plays a basic role. The goal of this programme is the establishment or revitalization by 1979, in every country of the world, of a vital statistics system capable of producing reliable measures of births, deaths and rates of natural increase, as well as of the other vital data needed for planning economic and social development. Because of the difficulties faced by developing countries in the ultimate achievement of comprehensive civil registration systems, interim measures for meeting their urgent needs for basic data are also provided. The first major step under the programme was the publication of the *Principles and Recommendations for a Vital Statistics System*.<sup>22</sup> Resources are being directed towards the preparation of a handbook of vital statistics methods to supplement

<sup>21</sup> *Principles and Recommendations for the 1970 Population Censuses* (United Nations Publication, Sales No. 67.XVII.3).

<sup>22</sup> United Nations publication, Sales No. 73.XVII.9.

this publication and the direct provision of advice and assistance to Governments.

41. Activities are under way in connexion with migration statistics, beginning with the preparation of recommendations for international and internal migration statistics. Regional bodies and Governments are being consulted, and United Nations recommendations on this matter will probably be issued in 1975.

42. With programmes in the improvement of statistics in the individual fields well under way and with the growing interest in unified approaches to analysis, new programmes will be directed towards the development of statistical presentations that will facilitate the study of the interrelationship between demographic, social and economic factors.

43. Statistics on education, health, employment, crime, cultural activities and the use of leisure, and on the population, are being brought into consistency with one another through common and interacting classifications and socio-demographic accounts being developed by the Statistical Office.

44. Activities in the statistical offices of the regional economic commissions are co-ordinated with those of the United Nations Statistical Office in respect of emphasis. Each of the regional offices is preparing programmes in vital statistics to be put into effect either immediately or, in the case of Africa, as soon as resources can be released from the African Census Programme. It is anticipated that regional programmes designed to aid countries in the collection of current statistics will create a situation in which the results of the censuses taken in the 1970 census decade can be updated with greater accuracy than has been possible in the past.

45. The statistical systems of each of the specialized agencies complement and extend the universality of the over-all United Nations system of statistical activities in the population field. The World Health Organization, for example, compiles and disseminates statistics on mortality by cause and on morbidity, as well as statistics related to fertility (pregnancy, prematurity, abortion etc.). Collection and analysis of data on urban-rural differences in fertility, mortality and morbidity, as well as in the provision of health services, also form an integral part of WHO statistical activities. The International Labour Organisation concentrates on manpower statistics (labour force, employment, unemployment and underemployment), which are published together with a great variety of other labour statistics on a world-wide basis in the *ILO Yearbook of Labour Statistics* and the *Quarterly Bulletin of Labour Statistics*. The FAO develops statistics on the population dependent upon agriculture, agricultural labour force and agricultural labour requirements. It also promotes the collection of data on farm population and farm employment through the World Censuses of Agriculture, and on interrelationships between population dynamics and agricultural change, through appropriate surveys. The UNESCO compiles, analyses

and disseminates statistics on education, science, culture and communications.

46. Aggregated national population data collected by questionnaires are being stored in the computer in the International Computer Centre of the United Nations. The utility of these data for research will be enhanced by permitting access to the data files at shorter intervals and by making possible computation of a variety of rates and ratios required for analysis. Long-range plans for extending types of data available and improving their comparability envisages assembling duplicates of national tapes. Computerized data banks and automated information systems are also being developed by WHO and the ILO for their respective statistical systems.

47. A continuing function of the United Nations system is the evaluation of the accuracy and consequent adjustment of basic demographic data provided by Governments particularly on the age and sex structure of population and on fertility, mortality and international migration. Such evaluation and adjustment must precede any use of these data for making projections or in comparative studies. Much of this work is carried out by the Population Division in collaboration, in so far as possible, with the regional economic commissions and the research and training centres sponsored by the United Nations. The adjusted data is made available for the use of organizations in the United Nations system. Attention is also given by the specialized agencies to the improvement of the adequacy and international comparability of the statistics in their respective fields.

48. An ancillary international programme in which the United Nations is participating and that will add considerably to the available statistics on fertility throughout the world is the World Fertility Survey. This Survey is being undertaken by the International Statistical Institute in co-operation with the International Union for the Scientific Study of Population (IUSSP) and other organizations with the collaboration of the United Nations and the financial support of UNFPA and the United States Agency for International Development (USAID). The Survey is in the planning stage with the implementation scheduled for the period from 1 July 1974 to 30 June 1977. Its aim is to provide scientific information which would enable each country to describe and interpret its situation with regard to human fertility and to help compare fertility levels and the factors that influence them in different countries and regions.

49. The most comprehensive sources of world-wide population statistics are the United Nations *Demographic Yearbook* and the United Nations *Statistical Yearbook*. More current population statistics are published in the United Nations *Monthly Bulletin of Statistics* and the quarterly *Population and Vital Statistics Report*.

#### *Population projections*

50. One of the objectives of the population estimates

and projections programme is to provide the United Nations, the specialized agencies, Governments, other institutions and the general public with estimates and projections of the total population of countries, regions and the world and its structure by age and sex, urban and rural sectors, and households and families. Another objective is to analyse the future trends and their implications for requirements for food, housing, education, employment, health etc. The projections of total population by sex and age prepared by the United Nations are the basis for other demographic projections, such as the labour force projections prepared by the ILO, projections of the economically active persons in agriculture and of the agriculturally dependent population prepared by FAO, and country projections of age-specific education enrolment ratios, by sex and level prepared by UNESCO. The programme of work in population estimates and projections is carried out in collaboration with the regional economic commissions, regional demographic centres and in co-ordination with the specialized agencies.

51. The United Nations is currently revising the projections of total population by age and sex to the year 2000, on the basis of data from the 1970 round of population censuses and of other new data and information acquired since the revision based on the 1968 assessment was completed. These revisions will then be used by the specialized agencies to prepare corresponding revisions in their demographic, labour force and education enrolment projections. Work is also in progress on the revision of projections of rural, urban and big-city population, to be followed by urban and rural population projections by sex and age.

52. During the past few years, there has been increasing public interest in the long-range projections of the world population beyond the year 2000. Accordingly, and with particular reference to the needs of the United Nations symposia on Population and Development held at Cairo in June 1973; and on Population, Resources and Environment, held at Stockholm in September-October 1973, provisional population projections extending to the end of the twenty-first century and beyond have been prepared for the more developed and less developed regions of the world and for the eight major areas. The basic frame of reference is the stabilization of population growth, which is assumed to be eventually achieved in each area. The results of these long-range speculative projections have been issued as a chapter in a background paper for the 1974 World Population Conference.<sup>23</sup>

53. The work on population, labour force, educational and agricultural population projections is carried on as a system-wide co-ordinated activity through the Sub-Committee on Population of the Administrative Committee on Co-ordination (see para. 33). This is necessary to assure the consistency of the various types

of demographic projections with the underlying United Nations projections of total population by sex and age. At the working level, agreement is reached by an inter-agency working group of specialists which meets periodically to review the basic methodologies and assumptions underlying the projections.

54. Population and related projections recently published include the following: *World Population Prospects as Assessed in 1968*;<sup>24</sup> *Growth of the World's Urban and Rural Population, 1920-2000*;<sup>25</sup> "Projection of world agricultural population";<sup>26</sup> *Labour Force Projections, 1965-1985*.<sup>27</sup>

#### *Population studies and research*

55. The work of the United Nations system in the field of population is based on the premise that "population change" is not an independent variable but one closely associated with economic and social development, and that a deeper and more universal understanding of the determinants of population trends and their consequences in relation to human welfare and development will foster that development.<sup>28</sup> The thrust of the population research and studies programme is to identify and analyse the factors involved in population growth and distribution and to investigate the inter-relationship between population and development. The fields selected for research are those named as priority areas by the Population Commission and the programme of work in each area is designed to produce knowledge essential to policy considerations or to the support of technical assistance requested by Governments. They are also areas of research that are likely to be important to whatever world population plan of action may emerge from the World Population Conference.

#### *Fertility, mortality and morbidity*

##### *Fertility*

56. The objectives of the system's programme of research in fertility are to analyse fertility levels and trends, factors affecting them and their consequences, particularly to developing countries, in order to assist Governments to broaden their knowledge and develop such national objectives in the area of fertility as they consider appropriate in the light of their circumstances.

57. The research is directed towards identifying the regions and population subgroups with high fertility and the particular features of their fertility patterns, and relating those features to the characteristics of the family in each region and subgroup, as well as to

<sup>24</sup> United Nations publication, Sales No. 72.XIII.4.

<sup>28</sup> *The Determinants and Consequences of Population Trends: New Summary of Findings on Interaction of Demographic, Economic and Social Factors*, vol. I (United Nations publication, Sales No. 71.XIII.5).

<sup>23</sup> United Nations Secretariat, Population Division, "World and regional population prospects", *Population Debate*, vol. I, part two.

variations in underlying economic and social conditions. Such studies are indispensable for the formulation of national population policies and are needed to ensure efficiency in the design, administration and evaluation of national family planning programmes. The findings of such studies may aid Governments in identifying priority areas where communication programmes might be effective in motivating change in human reproduction behaviour. It is anticipated that the World Fertility Survey in which the United Nations is participating will add greatly to the knowledge of human fertility patterns and the way in which they are interrelated with the different socio-economic and cultural factors in various areas and regions of the world.

58. A number of important studies have been completed in recent years, including: *Conditions and Trends of Fertility in the World, 1960-1965*;<sup>29</sup> *Variables and Questionnaire for Comparative Fertility Studies*;<sup>30</sup> *Human Fertility and National Development: A Challenge to Science and Technology*;<sup>31</sup> *Measures, Policies and Programmes Affecting Fertility*.<sup>32</sup>

59. At the regional level, a considerable amount of work on fertility is being done by CELADE. In recent years, comparative surveys in fertility were carried out in seven Latin American capital cities and in rural areas and small towns in four of these countries. These investigations have yielded much information on fertility levels and differentials and on the extent of knowledge and use of contraceptives. More recently, CELADE has undertaken a study of induced abortion to determine its incidence and its social correlates. Surveys in four capital cities were carried out and the results are being analysed.

60. At the Economic Commission for Europe, a project on fertility and family planning has been undertaken recently based on a comparative study of twelve European national surveys. A relevant project of the Economic Commission for Africa is the conduct of pilot studies on fertility and infant mortality. ECA is also collaborating with the University of Ibadan to study the sub-fecundity and sterility which are prevalent in some population groups in Africa. The WHO may also be involved in this study. The ECLA is studying the sociological aspects of family size and structure in the context of Latin American conditions. Also in Latin America, as in other regions, UNFPA is funding the processing of 1970 census data or demographic sample surveys with special emphasis on fertility patterns, as in the Dominican Republic and elsewhere. Analyses of fertility differentials in relation to levels of education, occupational skills and other characteristics are incorporated in the country demographic studies being done by ECAFE and by ECWA.

61. The WHO is, of course, the principal agency in the United Nations system involved in promoting,

assisting and co-ordinating research on all aspects of human reproduction, including methods of fertility regulation. Further information on this topic is given in paragraphs 81-95. An area receiving increasing attention from WHO is the study of the interrelationships between health, fecundity and fertility.

#### *Mortality and morbidity*

62. The concern of the United Nations system with morbidity and mortality conditions is, of course, many-sided, ranging from the promotion of health and well-being through the reduction of mortality and incidence of disease to the purely statistical aspects of compiling and disseminating more complete and reliable data on mortality levels and trends by sex and age and by cause. These differing foci of concern partially delineate the programmes and objectives of the different agencies of the United Nations system: the role of WHO in the health and biomedical fields; the concern of the ILO with labour productivity and job-absenteeism as affected by morbidity, length of working life, job safety and occupational hazards etc.; the concern of FAO with the state of nutrition and its role in morbidity and mortality, particularly among children and youth; the role of UNICEF with its programmes in collaboration with WHO in training and education for better maternal and child health care and the prevention of disease or premature mortality.

63. From a demographic point of view, studies of mortality levels and their future trends are essential inputs for preparing population estimates and projections. Such studies also throw light on the relative contributions of public health programmes and of economic and social development to the decline in mortality and the role of declining mortality in the acceleration of population growth rates. Very high priority is placed on studies of infant and childhood mortality in view of their significance as indicators of living conditions and of areas where health and nutrition programmes could achieve fairly rapid progress.

64. Population policies in relation to development strategies and goals within the context of United Nations declarations and principles, presuppose the necessity of continuing progress in reducing mortality. Hence, for countries where population growth rates are deemed too rapid, the desirable solution is to balance lower mortality with lower fertility. Advancing civilization and progress have taken mankind much beyond the primitive conditions of slow rates of population growth automatically brought about by high fertility rates very nearly offset by high mortality rates.

65. Development of model life tables by the United Nations in the early 1950s was an important contribution to demographic research, particularly in the preparation of population projections for developing countries where census and vital statistics data are deficient. Recent methodological advances, as well as an increase in basic statistical information, suggest that a revision of the United Nations model life tables may

<sup>29</sup> United Nations publication, Sales No. E.72.XIII.3.

<sup>30</sup> United Nations publication, Sales No. 69.XIII.4.

<sup>31</sup> United Nations publication, Sales No. 71.IIA.12.

<sup>32</sup> United Nations publication, Sales No. E.72.XIII.2.

be timely. The report of an *Ad Hoc* Committee of Experts on Methods of Revising United Nations Model Life Tables has recommended such revision.<sup>33</sup>

66. The World Health Organization is participating actively with the United Nations in formulating the assumptions concerning future trends in mortality for purposes of the current revisions in the population projections by countries and regions. Furthermore, current and projected WHO studies (supported in part by UNFPA funds) on foetal, infant and early childhood mortality patterns in relation to social and economic factors, and on urban-rural differentials in mortality levels will have important applications in the population work of the United Nations system, as well as in broader areas of social policy.

#### *Migration and urbanization*

67. In many countries, developed as well as developing, a major population problem relates to the geographical maldistribution of the population and to the excessive flow of rural migrants to urban centres. It is recognized that urbanization is not, in itself, an undesirable phenomenon. It may be the reflection of vigorous development and modernization processes and may, in turn, contribute to them. Urbanization tends to have undesirable consequences when it is unplanned and when its momentum is out of balance with economic and social development, as is often the case in developing countries. In such circumstances, a large and rapid flow of rural migrants to central cities results in the creation of slums, high urban unemployment and a variety of other social problems as the absorption capacities of these cities become overstrained. Problems of unplanned and rapid urbanization also threaten the preservation of environmental quality and bring into sharp focus the need for regional development planning within national development plans.

68. Work at the United Nations includes studies of the levels, trends and structures of the urban and rural population, their changing redistribution and their accompanying economic and social correlates. Projections of urban and rural population for countries and regions of the world have also been made<sup>34</sup> and are currently being revised. Such projections provide an important demographic component for government planning in such areas as housing, education and health services. Work along similar lines is being done by the regional economic commissions for countries in their respective regions. Studies of internal migration with emphasis on rural to urban migration have also figured in the work programme of CELADE and the regional economic commissions, and additional studies are projected in the light of 1970 census of population results.

69. Problems of rural employment and under-employment engage the attention of both FAO and the ILO, as do various aspects of rural to urban migration.

<sup>33</sup> E/CN.9/273, dated 10 August 1972.

<sup>34</sup> *Growth of the World's Urban and Rural Population, 1920-2000.*

The impact of rapid urbanization on health and educational services are matters to which WHO and UNESCO are giving increased attention. In view of the fact that large proportions of rural youth, particularly in developing countries, leave the countryside for work and life in the cities by the time they reach their late teens, their basic literacy, education and vocational preparation for urban life is a matter of urgent importance. Governments need to give much more attention to this general deficiency in their rural school systems. The provision in the urban receiving areas of special vocational training for rural migrants, both youths and adults, is another approach. Greater international assistance to developing countries is badly needed in the area of education and vocational training of rural youth through appropriate programmes of UNESCO, the ILO and FAO, if more resources can be made available.

70. Additional national and international assistance is also needed to help remedy the serious gaps in information in developing countries concerning the volume, characteristics, origins and destinations, and employment experience of migrants. This information should relate to all patterns and streams of current internal migration (rural to urban, urban to urban, urban to rural and rural to rural) to provide policy guidance for directing, or redirecting, existing patterns of population and labour force redistribution.

71. In contrast with the field of internal migration, where a considerable amount of work is being done, the field of international migration appears to have been relatively neglected over a long period of time. International migratory movements have become of increasing importance as policies of major developed countries have undergone much change affecting the volume, direction and duration of migratory moves as well as the demographic, economic and social characteristics of the migrants. In many developing countries, on the other hand, an important problem is the exodus of professional and highly skilled workers who emigrate to developed countries—the so-called “brain-drain”. The whole matter of international migration needs restudy and reappraisal to develop the facts essential to international policy consideration. The Economic Commission for Europe is, in fact, including a chapter on the European experience and prospects regarding inter-country migration of labour in its current study of demographic trends in Europe and outlook to the year 2000. The ILO, which has in the past adopted several international labour standards to safeguard terms of employment and working conditions of migrant workers is now giving renewed impetus to research, debate and standard-setting in this field.

#### *Interrelations between population and economic and social development*

72. The objectives of the system's research and studies on demographic aspects of development are to improve knowledge of the two-way relationships between population growth, structure and distribution

on development and of the effects of development levels and patterns on population trends. Such studies are particularly relevant to the implementation of the International Development Strategy which, as already indicated, urges Governments to include demographic objectives in their national development plans. They are also essential to sectoral development strategies, such as the ILO World Employment Programme, the FAO Indicative World Plan for Agricultural Development, and especially to any World Population Plan of Action that may emerge from the World Population Conference in 1974.

73. The nature of the interrelations between population and development is, however, both complex and varying among regions, countries and cultures. Contrary to the commonly held view, current knowledge makes it easier to understand the general nature of the impact of economic development on population growth than the significance of population trends on economic growth. Studies and meetings preparatory to the World Population Conference have generated background and symposia papers which have examined this and related issues. The report of the Symposium on Population and Development<sup>35</sup> pointed out that it is not possible to have a clear-cut line of causation between population growth at one end and consequences at the other end. The reason for this is that the consequences must depend upon what else is occurring in the economy simultaneously. The Symposium examined some of the important interrelations between population and socio-economic development, as for example, population in relation to: (a) natural resources; (b) food and agriculture; (c) health; (d) education and employment; and (e) social inequality.

74. The research and operational programmes of each of the specialized agencies, of UNFPA and of the other organs of the United Nations system directed towards socio-economic development, have been shaped in the light of the interactions with population factors and are being continually reoriented to take into account advancing knowledge and experience.

75. To the extent that it covers practically every aspect and facet of development, the United Nations and its system of organizations are well situated to develop the comprehensive knowledge on the interrelationships between population and development which is needed for both national and international decision-making. Although much work still remains to be done, a considerable amount of methodological research and of comparative and case studies has already been made available by them to States Members. Mention may be made, for example, of the ILO research programme (including the elaboration of economic-demographic simulation models and empirical studies) on the interaction between population and employment factors, within the framework of its World Employment

<sup>35</sup> Report of the United Nations Symposium on Population and Development, Cairo, 4-14 June 1973; see *Population Debate*, vol. II, annex I.

Programme; the FAO methodological research and country studies on the effects of different rates of population growth on food and agricultural development; the stimulus given by WHO to research into the implications of population trends for health policy planning and investment needs; the UNESCO studies on the interrelations between population change and educational development (including the development of related simulation models) and on socio-cultural institutions, values and attitudes related to demographic change, especially at the family level; and the research being carried out on the dynamics of population/environment interrelations within the framework of the UNESCO programme on Man and the Biosphere.

76. In historical perspective, few achievements in demographic and related socio-economic research rival in importance the pioneering contributions of the United Nations in developing in the early 1950s the first scientifically based projections of the growth of the world population,<sup>36</sup> and the landmark study, *Determinants and Consequences of Population Trends*,<sup>37</sup> a synthesis of the then existing world literature on the relationship between population changes and economic and social conditions. The massive work of revision and updating the text of the latter study was recently completed.<sup>38</sup>

#### *Population policies*

77. The main objectives of the system's programme of work in this relatively new field are:

- (a) To analyse and systematize national experience in the development and implementation of population policies;
- (b) To develop further the pertinent knowledge;
- (c) To provide technically sound advice to the Economic and Social Council, the General Assembly and the governing organs of the agencies concerned;
- (d) To provide guidance in all aspects of national population policies to Governments that desire it.

78. While taking into consideration the economic, social, cultural and institutional aspects of policy-making, the programme concentrates on major demographic variables, their determinants and implications relating to development policies and the various policy measures and programmes that would direct population trends towards desired national objectives. The work largely relies upon the findings of the research and technical work being done by the Secretariat and upon studies and findings of the regional economic commis-

<sup>36</sup> "The past and future growth of world population—a long-range view", *Population Bulletin of the United Nations*, No. 1 (Sales No. 52.XIII.2), pp. 1-12; and "Framework for future population estimates, 1950-1980, by world regions", *Proceedings of the World Population Conference, 1954*, vol. III (United Nations publication, Sales No. 55.XIII.8), pp. 283-328.

<sup>37</sup> United Nations publication, Sales No. 53.XIII.3.

<sup>38</sup> *The Determinants and Consequences of Population Trends: New Summary of Findings on Interaction of Demographic, Economic and Social Factors*, vol. I (United Nations publication, Sales No. 71.XIII.5).

sions, regional demographic research and training centres, the specialized agencies and by the competent national research institutions organized under the Committee on International Co-ordination of National Research in Demography (CICRED). It will be developed with due regard to other developmental policies, such as educational, health, employment and rural and agricultural and industrial development policies that come within the purview of the respective specialized agencies and organizations of the United Nations system.

79. Major emphasis is placed on national policies and on the specific tasks required for successful implementation of the International Development Strategy. Within this framework, special attention is given to problems and techniques relating to the consideration of demographic factors in planning; the establishment of demographic objectives and the necessary technical background; adoption of appropriate measures and programmes relevant to population changes; and review and appraisal of the implementation of national policies in so far as demographic factors are concerned. Guidance on population policy matters will be provided to Governments that request it as knowledge and methodology develop.

80. In addition to the foregoing, an inventory of national population policies is maintained. Major studies now in progress include the following: comparative analysis of population policy development; guidelines for demographic considerations in planning; a technical background study for the World Population Plan of Action and a draft World Population Plan of Action. The analysis of the results of the Second Inquiry among Governments concerning Population Growth and Development recently carried out by the Secretariat with assistance from the regional commissions is also relevant here. A report on the findings of the Inquiry constitutes part of the background material for the World Population Conference.

#### *Family planning*<sup>39</sup>

81. The three main objectives of national family planning programmes launched by developing countries are to improve the health of mothers and children, to increase the welfare and over-all well-being of the population and to accelerate the pace of economic and social development.<sup>40</sup> In recognition of the fact that the rate of growth of population is related to the pace of economic and social progress of a given country, family planning programmes have, in many instances, been fostered as an element in national development plans. In such a context, family planning efforts are considered in relation to other national development policies and programmes, such as health, education, employment and social welfare.<sup>40</sup>

<sup>39</sup> Including education and communication in the field of family planning.

<sup>40</sup> *Human Fertility and National Development: A Challenge to Science and Technology* (see foot-note 31), p. 62.

82. The activities of the United Nations in support of national family planning programmes, like other types of United Nations assistance, are carried out only at the request of Governments and in accordance with the provisions and guidelines of relevant resolutions of the General Assembly and of the Economic and Social Council, and in the case of the specialized agencies, in accordance with the enabling resolutions of their own governing organs. As has already been indicated, the system views and supports population programmes as integral and complementary efforts to, and not as substitutes for, the promotion of economic and social development.

83. The UNFPA has been devoting a substantial part of its allocations to family planning programmes through assistance to Governments and through funding related activities of the various United Nations organizations, such as WHO, UNICEF, the ILO, FAO and UNESCO.<sup>41</sup> These programmes mainly involve the provision of services, but also encompass a variety of activities concerned with planning, administration, training, research and evaluation. Large-scale country family planning projects assisted by UNFPA are under way in all developing regions. These activities are now being further strengthened by providing direct funding assistance to national organizations selected by the countries concerned.

84. Assistance to family planning is an integral part of the programme of WHO to develop and strengthen health services. An expanded programme of work in family planning as part of the national health services, and integrated particularly with maternal and child care, has been implemented in consultation with over 50 Governments by WHO or through joint planning missions with the United Nations and other specialized agencies. WHO multidisciplinary teams have been established in all regions and in the inter-regional programme to provide over-all guidance and direction for country projects or request an inter-country and interregional activities. Major national programmes for the development of integrated maternal and child health/family planning services are receiving joint WHO/UNICEF/UNFPA assistance in each of the regions. The WHO is also expanding its work in the collection, processing, evaluation and dissemination of family planning statistics.

85. A series of operational studies to test and evaluate a variety of approaches to family planning has been designed by WHO. Particular emphasis is given to studies on the acceptability and utilization of services as well as functions of health personnel in family planning. Collaborative epidemiological studies on the effects on family health of patterns of family formation are being undertaken in a number of countries. Special studies are being conducted to investigate statistical aspects of evaluation of family planning programmes.

<sup>41</sup> "United Nations Fund for Population Activities, 1969-1972: progress report by the Executive Director" (DP/L.273/Add.2), para. 73.

86. The WHO has been active in promoting, assisting and co-ordinating research on all aspects of human reproduction, including methods of fertility regulation, the impact on health of family planning and the delivery of family planning care in health services. Other major components of the WHO programme in human reproduction include the building up of research facilities in the context of national family programmes and support to epidemiological and operations research in human reproduction and family planning. These projects have as their objective studying, or developing the resources required to study, factors affecting the provision and acceptance of family planning, including, in particular, the study of the side-effects of contraceptive agents in different populations.

87. The UNICEF sees its involvement in family as yet another means of carrying out a comprehensive approach to improve the health and welfare of children and their families in which family planning is a component in a broader scheme of policies, programmes and services affecting them. In this broad context, UNICEF supports the idea of planning for the family, which is a responsibility shared by the country, the community and the parents, covering positive social measures to improve the level of living of families, to educate and enlighten parents and to protect and prepare children and adolescents so that they in turn may contribute to the development and enrichment of their families, their communities and their countries.

88. The activities of UNICEF with regard to fertility regulations are concerned with measures undertaken at the request of Governments, through the strengthening of maternal and child health services in collaboration with WHO to assist family planning programmes. In some countries, urban and rural health centres are being strengthened with cash grants for training of personnel, equipment and transport to provide expanded maternal and child health services, including family planning. The Fund is also actively seeking ways to support educational and motivational activities designed to reach broader segments of the population, and especially women and girls, not ordinarily reached by health and social services. Some of the channels would be agricultural extension services, various forms of women's education, including literacy programmes, as effective means of raising the status of women and increasing their motivation towards responsible parenthood, community development programmes, social services and the mass media. Some beginnings have been made in exploring these new channels for reaching not only mothers, but other members of the family.

89. Production possibilities of contraceptives in developing countries are currently under active consideration in UNIDO. In response to increasing requests from States Members, the organization is now formulating a technical assistance programme for UNFPA financing, including feasibility studies for the setting-up of contraceptive production facilities, research of developed

and local raw material for production of contraceptives and projects for the development and modernization of existing plants.

90. The ILO has as its objective the full involvement in family planning programmes of the social institutions and services within its purview—in particular, trade unions and labour education bodies, managements and occupational health and welfare services, labour administration, social security and co-operatives.

91. The ILO programme in this respect (with UNFPA funding) uses four main approaches:

(a) To stimulate and support trade unions and labour education bodies to enable them to participate in family planning programmes;

(b) To stimulate employers in view of the role occupational health and welfare services can play in bringing family planning information and facilities to the place of work;

(c) To encourage the extension of family planning promotional, educational and motivational activities to include co-operatives;

(d) To promote family planning service through medical care component in social security, especially in Latin America.

To ensure full co-ordination of efforts in the various fields of competence of the ILO concerning population and family planning, the ILO regional advisers in Asia and Africa have been grouped together to form labour and population teams. In 1974, a similar programme is to be initiated in Latin America and in the Middle East.

92. A major problem in developing countries is to reach the families in the numerous and scattered villages in the rural areas where most people live and to motivate them, through educational measures, to make rational decisions on family size in the context of everyday living conditions. The existing agricultural programmes of FAO and its institutions and services provide excellent channels of communication with farmers and their families through measures for extension, home economics, agrarian reform, social security, agricultural credit, co-operatives, improved nutrition and general improvement in rural life. There is, therefore, considerable opportunity for including population education and motivation activities within the over-all scope of FAO activities for rural development. Work in this area was initiated under the FAO Planning for Better Family Living Programme (PBFL), approved by the FAO Conference in 1967. Field activities are now also being supported in an increasing number of countries.

93. In direct support of family planning programmes, UNESCO is promoting research, training, evaluation and materials development in family planning communications, and has begun work on the development of a systems approach for programme management. Regional communications advisers (family planning) have been appointed for the Arab States

and the Africa, Asia and Latin America regions, to service and assist regional and national programmes, on request. Long-term assistance is being given with UNFPA financing, to the communication components of a number of large-scale national programmes, and training programmes have been established for national personnel. The UNESCO expects to assist some 25 national programmes and train approximately 400 family planning communications personnel during the period 1973-1978.

94. The World Bank assists national population programmes through the strengthening and extension of institutions, facilities and activities involved in carrying out such programmes. A substantial portion of the Bank's funds are devoted to extending the network of health facilities used in delivering family planning services and in training programme personnel. Such facilities include training schools, family planning clinics, rural health centres, maternity hospitals and smaller maternity centres, and necessary equipment and vehicles. In addition, the Bank's projects often provide financial and technical assistance support for the provision of family planning services; the training of social workers, demographers and medical and paramedical personnel; public information campaigns and face-to-face motivation activities; population education in schools; and evaluation and research activities. Throughout project development and execution, the Bank pays particular attention to activities designed to support the development of institutions and personnel, to develop information needed by management to measure and analyse the progress of programmes, and to broaden the content of programmes by including innovative and experimental components that may add to programme effectiveness. Bank projects have also supported research on the socio-economic determinants of fertility behaviour.

95. Evaluation, now generally recognized as a fundamental component of any family planning scheme, is receiving increasing attention from all organizations. Several interagency missions have recently been organized by the United Nations to evaluate family planning programmes in individual countries. Countries with such programmes are being assisted and encouraged to gain the necessary expertise and develop the basic evaluation machinery needed to carry out evaluation of their programmes on a continuous basis. These activities are accompanied and supported by research to develop practical evaluation techniques and to test a variety of approaches to family planning and population dynamics. Particular emphasis is placed on the communications and educational aspects of these programmes (UNESCO) and on the acceptability and utilization of services and the functions of health and other specialized personnel (WHO).

#### *Training and other educational activities supporting population work*

96. One of the most effective means for the United Nations system to assist Governments in developing

their capacities to deal with population matters is through technical training of countries in demography, statistics and related disciplines covering substantive and methodological fields. This has led to the establishment over a period of years of a number of regional demographic training and research centres as co-operative undertakings of the United Nations.

97. There are now five of these centres for regional demographic training and research: in Asia and the Far East, at Chembur, India; in Latin America, CELADE at Santiago, Chile, with a regional centre at San José, Costa Rica; and in Africa, at Cairo, Accra and Yaounde. These centres receive financial support from UNFPA. The centres at Chembur and Santiago are the oldest, having been established in 1956 and 1957, respectively; the centre at Cairo began operations in 1963 and the number of countries served by it has increased from eight to 25. The centres at Accra and Yaounde are the newest ones, having been established only at the end of 1971. While it would be tedious to detail extensive training programmes of the centres, their important contributions to research and operations have been suggested in the preceding paragraphs.

98. Fellowships for training abroad or at the United Nations-sponsored regional training centres for study and training in population are awarded to persons from developing countries nominated by their Governments. These fellowships are normally awarded for periods of up to one year, but may be extended. During the two-year period ending 30 June 1973, fellowships were awarded by the United Nations alone to 1,045 nationals from 94 developing countries.

99. Requests for United Nations support for the establishment of additional demographic training and research centres have been received from the Governments of Egypt, Romania and the Union of Soviet Socialist Republics. The Romanian request has now been approved, and the other proposals are now under study and in various stages of negotiation between the United Nations and the Governments concerned.

100. A plan for a co-operative project of the United Nations and several of the specialized agencies to provide interdisciplinary training on population matters on both a short-term and a long-term basis was recommended by the Population Commission. A committee has been established to develop this programme, including the expansion of the current training programmes at existing national and regional institutions. This committee has thus far discussed the possibilities of setting up centres for training in population policy and for family planning.

101. Another important set of education and training activities are those designed to include population topics in broader training programmes (such as those for development planners in education, agriculture and other fields) and basic courses for various categories of professionals, particularly health personnel. In the same context, mention may be made of the assistance being provided by UNESCO in the introduction of

population and family life subjects in school curricula and out-of-school programmes.

102. Another important contribution to, and instrument of, education and training in population fields is represented by the series of methodological manuals and reports prepared and published by the United Nations in several languages. Many of these manuals have been prepared by the Population Division, others by the Division in collaboration with some of the specialized agencies, and still others by outside experts. These manuals are being used throughout the world at universities, research and training centres, and by countless individual investigators and analysts working in various Government or private agencies. The scope and variety of these manuals is suggested by the titles of the following more recent publications: *Estimating Future School Enrolment in Developing Countries*,<sup>42</sup> which was a joint project with UNESCO; *Methods of Estimating Basic Demographic Measures from Incomplete Data*,<sup>43</sup> prepared for the United Nations by the Office of Population Research, Princeton University; *Methods of Analysing Census Data on Economic Activities of the Population*,<sup>44</sup> prepared for the United Nations by the Population Studies Centre of the University of Pennsylvania; *Methods of Measuring Internal Migration*,<sup>45</sup> *Methods of Projecting the Economically Active Population*,<sup>46</sup> prepared in collaboration with the ILO; and *Methods of Projecting Households and Families*.<sup>47</sup>

103. In addition to formal training programmes, the United Nations system has sponsored (or co-sponsored) many other forums for discussion or technical examination of various facets of population problems and issues. These forums have included workshops, seminars, symposia, regional and world population conferences. The seminars and workshops of a regional or inter-regional character have served to stimulate and orient demographic research and to reveal gaps in knowledge, while the regional and world population conferences have provided broad international forums for the interchange of information on population problems and to call attention to their interaction with economic and social development issues and policies.

104. The two Asian Population Conferences (New Delhi, 1963, and Tokyo, 1972) organized by ECAFE were the first intergovernmental conferences sponsored by the United Nations. Twenty-three countries were represented at the Second Asian Population Conference which resulted in the adoption by the Conference of a Declaration of Population Strategy for Development. It is considered as one of the most far-reaching policy statements thus far endorsed by an international conference of Governments.

105. The first Latin American Regional Population Conference was held at Mexico City in August 1970, under the joint auspices of the International Union for the Scientific Study of Population, CELADE, ECLA and El Colegio de Mexico. An African regional population conference was held at Accra, Ghana, in 1971. A population conference for the region of Western Asia was held at Beirut in February 1974.

106. Reference has already been made to the inter-governmental character of the present World Population Conference, in contrast to the previous two World Population Conferences (Rome, 1954, and Belgrade, 1965) under United Nations auspices. The present Conference has been preceded by four international symposia attended by technicians and experts. Regional consultations preparatory to the Conference also have been held at meetings of an intergovernmental nature organized by the regional economic commissions. The Conference itself is the largest of its kind ever held and marks the high point of the extensive world-wide activities organized for the observance of World Population Year by UNFPA.

#### CONCLUDING OBSERVATIONS

107. Any over-all assessment of the population activities of the system must recognize that "population" is a relatively new field of international endeavour. In most of the agencies, the development of significant activities in population has only taken place during the past two or three years; even in the two organizations with a long-standing interest in population matters—the United Nations and WHO—the development of a comprehensive operational programme in population may be said to have begun only in the latter part of the 1960s.

108. The formulation and implementation of an effective programme of international assistance entail institutional promotional problems, and often raise difficult programming and technical issues. Various factors, however, peculiar to the population field have permitted the United Nations system to make gratifying progress in this programme sector in a relatively short period of time.

109. When, in the second half of the 1960s, the agencies were directed to embark upon the execution of expanded programmes of assistance in population, few of them were adequately equipped with the infrastructure with which to develop these programmes. The support forthcoming from UNFPA—received, first, at the end of the 1960s, and in increasing amounts since 1970—has, however, greatly helped them in overcoming this difficulty. The early phase of the existence of UNFPA was characterized by a procedural flexibility which permitted it to provide assistance to organizations where it was most needed, be it for programmes or infrastructure, thus enabling them to begin carrying out their expanded mandates while at the same time strengthening their capacity for further expansion.

<sup>42</sup> United Nations publication, Sales No. 66.XIII.3.

<sup>43</sup> United Nations publication, Sales No. 67.XIII.2.

<sup>44</sup> United Nations publication, Sales No. E.69.XIII.2.

<sup>45</sup> United Nations publication, Sales No. E.70.XIII.3.

<sup>46</sup> United Nations publication, Sales No. 70.XIII.2.

<sup>47</sup> United Nations publication, Sales No. 73.XIII.2.

110. Much, of course, remains to be done, both to strengthen the capacity of the system to deliver assistance and to heighten awareness of population problems among agency "constituencies". In a number of organizations, for example, population programmes are still too headquarters-based, and a considerable amount of promotional work will continue to be required in the years to come to expand field activities still further. Moreover, internal efforts are still required to make all officials in the various technical units and in the field aware of the population "dimension" of their work, and to convince them to give the time and attention to population concerns that they deserve.

111. The clarification of population mandates has naturally been followed in most organizations by the formulation and approval of specific programmes, and activities in the field of population have now gained their rightful place in the programme budgets of practically all organizations concerned.

112. Perhaps the single most important constraint encountered, so far, by all organizations has been a general shortage of trained personnel and, more particularly, the difficulty of finding experts for field assignments in the various technical areas of competence of United Nations organizations who are also sufficiently knowledgeable in population matters. This problem is being attacked, as greater experience is gained, through such measures as learning-on-the-job, the provision of in-service training courses for experts, and the systematic dissemination of literature and other information on population. However, the organizations are agreed that it will continue to require priority attention by all concerned in the years to come.

113. Co-operation among the organizations in carrying out these activities is also entering a new stage. During the second half of the 1960s, the main emphasis was on the harmonization of mandates and on

division of responsibilities. This emphasis on the "formal" aspects of co-ordination is now being progressively replaced by a new and more creative approach, stressing collaboration at the technical level and co-operation in the formulation and execution of programmes, rather than the mere allocation of responsibilities. The Population Commission at the inter-governmental level, and the Sub-Committee on Population of the Administrative Committee on Co-ordination and the Inter-Agency Consultative Committee of UNFPA at the intersecretariat level, have played a key role in promoting this trend.

114. It must be acknowledged that in these efforts to ensure effective programme control and a high level of interorganizational co-operation, an elaborate network of committees and working groups has been established, both at the intergovernmental and secretariat levels. As those concerned become more accustomed to working together and population activities become a more familiar part of organizations' programmes, it is expected that this machinery will be much streamlined and simplified.

115. It is increasingly realized that co-ordination of programme policies and objectives, at both the country and the global levels, must precede co-ordination of short-term programmes, if fragmentation of activities is to be avoided and efforts concentrated on priority needs. The new programming and budgetary techniques recently introduced in most United Nations organizations, particularly programme-budgeting and medium-term planning, are providing valuable opportunities for working towards concepts of joint planning in programme areas of major interagency concern, such as population. In helping define the tasks and objectives of the system, the results of the Conference will not only guide the future programmes of organizations, but will greatly facilitate progress towards more integrated planning of population activities.

## THE ROLE OF INTERNATIONAL ASSISTANCE IN THE POPULATION FIELDS

### *United Nations Fund for Population Activities*

1. The focus of this paper is on the transfer of funds, materials and technical expertise for population activities from international, governmental and non-governmental sources to developing countries. The discussion touches on the growth and current and future volume of such assistance, its adequacy in terms of current and future needs, the terms on which it is given, the problems of making it effective and the difficulties of co-ordinating multiple sources of assistance.

2. In the past several years, such assistance has been expanding rapidly both in concept and in practice, as appreciation of its fundamental importance for the achievement of significant and lasting improvements in the quality of life and particularly of the complex inter-relationships between population and the development process has also grown.

3. There is, unfortunately, no consensus as to just exactly what "population activities" are, although it is clear that they cover much more than pure demography or the delivery of family planning services and that they include a broad spectrum of training, research, information and operational activities on population matters. Population activities so far covered by international assistance have been broadly classified into the following major subject areas: (a) basic population data; (b) population dynamics; (c) population policy; (d) family planning; and (e) communication and education.<sup>1</sup>

#### DEVELOPMENT OF INTERNATIONAL ASSISTANCE FOR POPULATION

4. The history of international population assistance is brief but spectacular. As recently as from 10 to 15 years ago, there was little open discussion among Governments of the need for assistance to the third world except in demography and statistics. On the contrary, the forces opposing assistance to such activities as family planning and population policy on religious, cultural, nationalistic or political grounds were still generally dominant. Within developed countries themselves, the promotion of family planning was still to a large extent seen as the exclusive concern of voluntary endeavour, supported by private philanthropy. Today, population activities are fully recognized as the legitimate concern of Governments and of the international community.

5. In the early 1950s, the United Nations began to assist developing countries with census-taking, demographic training and the preparation of studies of the relationships between population trends and social and economic factors, as well as with some action-oriented activities. In 1952, two non-governmental agencies concerned with assistance on population were established—the International Planned Parenthood Federation (IPPF) and The Population Council. The Ford Foundation and the Rockefeller Foundation also began to assist population-related activities. Together, these four non-governmental agencies were the main sources of assistance for population and related activities until the late 1960s when governmental resources became available on a large scale.

6. The first Government to give assistance for family planning to a developing country was that of Sweden in 1958. That assistance was for support of an experimental programme in Sri Lanka (Ceylon), and was followed by similar assistance to the Government of Pakistan in 1961. The United Kingdom of Great Britain and Northern Ireland initiated its bilateral population assistance programme on a modest scale in 1964. The Government of the United States of America began to include population activities in its development assistance in 1965, and since 1968 has earmarked an ever-increasing amount of funds within its foreign assistance programme for population activities.

7. In the early 1970s a number of Governments followed the lead provided by Sweden, the United Kingdom and the United States, most notably Canada, Denmark, the Federal Republic of Germany, Japan, the Netherlands and Norway, all of which increased their support of bilateral as well as multilateral programmes.

8. The barriers, which to a large extent had prevented the United Nations system from responding directly to the needs of developing countries for assistance in family planning and many other population activities, began to lift around the mid-1960s. Undoubtedly, a major factor was the Asian Population Conference, held in 1963 and organized by the United Nations Economic Commission for Asia and the Far East (ECAFE). It set the tone for the development and extension of population programmes in this region and spurred other policy-making bodies within the United Nations system to action. The first advisory mission on family planning organized by the United Nations was

<sup>1</sup>United Nations Fund for Population Activities, *Report 1969-1972* (New York, 1972), p. 11.

at the request of the Government of India in early 1965.

9. Beginning in 1965, the World Health Organization (WHO) initiated its assistance to the health aspects of human reproduction, family planning and population dynamics. The Organization's mandate was gradually broadened to provide advisory services to Governments and other supporting activities on health aspects of fertility, sterility and fertility regulation methods, including the organization of family planning services as part of organized health services, particularly maternal and child health.

10. Late in 1966, a consensus was reached in the United Nations General Assembly (resolution 2211 (XXI)) concerning the provision of population assistance, upon request, in the areas of training, research, information and advisory services.<sup>2</sup> In response, the following year, the Secretary-General established a Trust Fund for Population Activities which, in its early stages, served mainly to strengthen the capacity of the United Nations proper to support demographic activities in the population fields. As demands upon the Fund increased, the General Assembly decided in 1969 to transfer its management to the United Nations Development Programme (UNDP) in order to associate its operations more directly with general funding for development as well as cover all responsibilities in the population field of the entire United Nations system. Following this, the Fund—renamed the “United Nations Fund for Population Activities” (UNFPA)—began to grow rapidly into a major source of international population assistance, in terms of both financial resources and programme funding.

11. In the meantime, the governing bodies of the United Nations Children's Fund (UNICEF), the International Labour Organisation (ILO), and the Food and Agriculture Organization of the United Nations (FAO), closely followed by the United Nations Educational, Scientific and Cultural Organization (UNESCO), also broadened their own mandates to include those aspects of population and family planning falling within their areas of competence.<sup>3</sup> In 1968, the International Bank for Reconstruction and Development (IBRD) began to consider the need for assistance to family planning programmes and related activities in developing countries and made its first loan—to Jamaica—in 1970.

12. While in 1960 total international assistance for population activities was only about \$2 million, by 1965 this figure had grown to \$18 million and by 1973 it exceeded the \$200 million mark (see tables 1 and 2). Thus, within a span of 13 years, such assistance had increased a hundredfold. Undoubtedly, much of the rise

in assistance can be attributed to the growing awareness during this period in both developed and developing countries<sup>4</sup> of the importance of the population variable as a major factor in development. Recognition of the impact of population factors on the development process was acknowledged in the general strategy adopted by the United Nations for the Second Development Decade.<sup>5</sup>

13. In 1973, a new stage of development in the short history of international assistance for population activities was reached—demands for assistance from UNFPA and several other donors began to exceed substantially the supply of funds available. It has been noticed that as countries adopt population programmes or policies in the context of their development plans, their absorptive capacities for population projects tend to expand, thus making it possible to increase international co-operation and support. It is important that the momentum of growth in population assistance be maintained, as continued increases can be expected both in the needs for aid by the developing countries and in their capacities to use such aid effectively.

<sup>b</sup> Not available.

<sup>c</sup> Some adjustments to the data for multilateral organizations (and to the totals) have been made by UNFPA to include more recent data.

## SOURCES OF POPULATION ASSISTANCE <sup>6</sup>

14. Today, a large number of donors provide assistance for population programmes (see table 1). Assistance flows through three channels: multilateral; bilateral governmental; and non-governmental. Although the private sector is an important source of funds, by far the greater part of resources now comes from Governments. Major donors channel funds for assistance through international or national bodies (governmental or non-governmental) or provide such assistance directly to developing countries.

15. Although over 60 Governments have at one time or another contributed to international population assistance,<sup>7</sup> the major share comes from less than a dozen countries. By far the greatest contribution is that provided by the United States of America—from a modest beginning in 1965 of \$2.1 million, its assistance reached \$126 million in 1973. Over the period 1965-1973, 46 per cent of the assistance was used in direct support of population and family planning projects in the third world; 30 per cent was channelled through international organizations for regional and country activities; and the remainder went to universities and other institutions in the United States for research, training and advisory services mainly directed towards supporting activities in the developing countries.

16. The Scandinavian countries have also led in increased international involvement in population matters. In 1973, total Swedish financial contributions reached approximately \$25 million. In the same year, Norway contributed a total of about \$6 million for population assistance, representing about 9 per cent of its total official development assistance programme—the highest proportions of any donor country. Denmark has also given high priority to foreign population assistance, with a contribution in 1973 of nearly \$3 million.

17. The United Kingdom is another major contributor, with a multilateral contribution of about \$6.7 million in the year 1972/73. The Netherlands, the Federal Republic of Germany and Japan began their contributions in 1969 with the amounts of \$340,000, \$250,000 and \$200,000, respectively. In 1973, their support had grown to \$4.2 million, \$4.3 million and \$3 million, respectively. Canada joined in 1971 with an amount of \$4 million, which was increased to \$5 million in 1973.

### Multilateral assistance <sup>8</sup>

18. Multilateral population activities have grown remarkably in recent years. Until the mid-1960s, the

<sup>7</sup> United Nations Fund for Population Activities, "Annual Report, 1973", document DP/44, para. 13.

<sup>8</sup> A more comprehensive statement of the role of various

role of the organizations within the United Nations system was restricted not merely by limited mandates in the population fields and lack of funds, but by the fact that few Governments had yet formulated national population policies or foreign aid policies on population. In 1972, approximately 5 per cent of total Government development assistance provided to multilateral programmes was for population activities. Some countries, however, devote a high percentage of their multilateral funding to population work—for example, Norway, 13 per cent; Sweden, 10 per cent; and the United States, 7 per cent—but the majority of donor Governments limit population components to 2-3 per cent (see table 3).

### United Nations

19. In the United Nations Secretariat, an indispensable technical basis had been laid for the development of population assistance by the work carried out since 1946 by the Population Division of the Department of Economic and Social Affairs, especially through its demographic studies, including studies of social and economic factors related to demographic variables and through its promotion of training of personnel in demographic techniques. The Statistical Office has also, from 1946, made an indispensable contribution through its promotion of the improvement of demographic data and through dissemination of the data. In recent years, the activities of the United Nations in the field of population have expanded considerably in scope. Population planning and the formulation and implementation of population policies have been included as new

organizations is presented in United Nations Secretariat, "Activities of the United Nations system in the population field", *Population Debate*, vol. II, part nine.

important areas of activity. Moreover, the activities of various offices of the United Nations in the field of population now encompass research and operational activities in fields relating to social development, human rights, status of women, public administration and rural and community development. The work of the United Nations includes important regional programmes in Africa, Asia and the Far East, Western Asia and Latin America, including regional demographic training and research centres. Assistance by the United Nations is provided mainly through development of international recommendations, preparation of technical manuals and handbooks, convening of conferences, seminars and training courses, provision of advisory services, development of regional training and research centres, provision of fellowships and preparation of studies and technical reports.

#### *United Nations Children's Fund*

20. The population activities of UNICEF arise from its concern for the health, welfare and development of children. In 1967, the mandate of UNICEF was broadened to include assistance in family planning as part of its maternal and child health services, upon the request of Governments. Realizing that those services could not carry the whole burden, UNICEF extended its assistance in 1970 to include schools, agricultural extension services and community development programmes. UNICEF aid is given mainly in the form of supplies, equipment, vehicles, training and educational materials.

#### *World Health Organization*

21. Of the specialized agencies of the United Nations, WHO has so far been the most involved in population activities. The mandate of WHO emphasizes the importance of the problems of population dynamics, human reproduction and family planning for the health and well-being of the family as well as the community. It recognizes the rationale of providing family planning as an integral part of health services, and the benefits resulting from it. The heavy involvement of WHO in population activities is reflected in the number of requests to WHO and UNFPA originating from national health authorities in some 60 developing countries. Assistance is provided mainly in the following areas:

(a) Promotion of the health aspects of family planning as a component part of a country's health services through project planning, administration and evaluation;

(b) Training of health personnel, including revision of curricula for the orientation of health workers in family health care and population dynamics;

(c) Biomedical and operational research, with emphasis on epidemiology, health behaviour, the delivery of services, and biomedical aspects of reproduction

including contraceptive technological development, infertility, sub-fertility and abortion care.<sup>9</sup>

#### *Food and Agriculture Organization of the United Nations*

22. The FAO was the first specialized agency seriously concerned with world population growth, because of its effect on the balance between food and people. In 1967, the FAO Conference recommended that the Organization should be increasingly involved in the study of the relationship between food supplies and population growth and the interaction between demographic and agricultural changes. The Conference also approved an integrated approach to reaching families with information about the relationships among family resources, needs, goals, and size through existing national programmes. In 1973, the FAO Conference approved an expanded programme for population activities with the objective of strengthening national development policies and programmes by integrating population aspects into existing food and agricultural policies and programmes. It authorized the examination of all FAO programmes with a view towards broadening national development strategies to include population policies and programmes as an integral part of education, training, extension and other programmes reaching rural communities.

#### *The International Labour Organisation*

23. The involvement of the ILO derives from the impact of rapid population growth in developing countries on employment, training and the welfare of workers. A major programme of research and action on population and employment is being carried out under its World Employment Programme. The main objective is to expand the knowledge base for policy-making so that adequate account may be taken of the effect of population factors on employment and income distribution policies and of the effect of both of these on population policies. Furthermore, the ILO seeks to foster and support the involvement in population and family planning activities of its constituents—workers' and employers' organizations and public authorities responsible for employment and labour policies—within its fields of competence—labour education policies, occupational health and welfare services, social security institutions, co-operatives and management institutions.

#### *United Nations Educational, Scientific and Cultural Organization*

24. The work of UNESCO in population mainly concerns social science research, education and communication. Studies are conducted on the socio-cultural context for population and family planning activities, on behavioural change aspects, on methodological issues

<sup>9</sup> See World Health Organization, "Health trends and prospects in relation to population and development", *Population Debate*, vol. I, part four; *idem*, "Health and family planning" and "Research on the biomedical aspects of family planning programmes", *Population Debate*, vol. II, part eight.

countries, mainly in Asia and Africa. In Latin America, the emphasis has been on the study of population problems and reproductive biology.

41. Over the period 1963-1972, support from the Rockefeller Foundation on population questions totalled nearly \$50 million. The Rockefeller Foundation provides support for biomedical research in fertility control and for studies on the interaction of social and biomedical factors. In 1971, for example, the Rockefeller Foundation gave a joint grant with the Ford Foundation of \$5 million to The Population Council for the international programme to follow up new leads in contraceptive research. The Rockefeller Foundation also provides technical assistance for family planning programmes. While both foundations give substantial support to American and some European universities and research centres, programmes aided are devoted largely to population activities of developing countries.

42. In introducing and extending family planning services, the Pathfinder Fund finances a number of projects at the country level and at the same time works through nationals of the recipient countries in order to provide continuity of activities after external funding ceases. OXFAM, a non-operational agency, provides funds for family planning through IPPF or individual country family planning associations. Its sister organization, OXFAM CANADA, also assists family planning activities. The Japanese Organization for International Co-operation in Family Planning, Inc., provides family planning assistance with commodities and audio-visual and other educational aids. A number of other private agencies, such as CARE, Church World Service, Association for Voluntary Sterilization, World Neighbours, World Education, Inc., Family Planning International Assistance, American Friends Service Committee, Family Health Foundation and International Educational Development, support population programmes within the context of their over-all specific objectives and activities.

43. The World Assembly of Youth, in co-operation with its national committees, sponsors national, regional and local conferences or seminars on population, development and family planning and responsible parenthood for students, young workers, rural leaders and youth groups to make young people aware of rapid

population growth and the relationship between it and family life. The Population Reference Bureau works to improve public understanding of population questions. It operates within the United States and internationally, but especially in Latin America, to improve channels of communication by distributing information material. The Population Crisis Committee, although not an aid-giving agency, is also active in promoting public awareness of the problems of world population growth and has helped stimulate Governments to provide greatly increased support for international assistance on population.

44. The Asia Foundation has expanded its assistance to Asian institutions to include the population and family planning fields; it is also exploring the way in which the Japanese experience in family planning can help in dealing with population problems in other Asian countries. The Tinker Foundation supports demographic education and information activities in Latin America.

45. Furthermore, a number of universities and other educational institutions, mostly in the United States of America, but also some in Europe, conduct training programmes specifically oriented towards the needs of developing countries and support research programmes in some of these countries or organize research activities relevant to selected population issues in these areas.

#### SOME CHARACTERISTICS OF POPULATION ASSISTANCE

##### *Types and areas of supported activities*

46. International population assistance covers a wide range of activities. In the absence of generally recognized definitions and classifications of types of activities, statistical data provided by donors and recipients are difficult to compare and aggregate; but some over-all characteristics emerge, based mainly upon aid statistics collected by OECD and information available from the largest multilateral agency, UNFPA.

47. Over two thirds (72 per cent) of the total resources available for population assistance (excluding administrative expenses) were given to support family planning activities of various kinds in 1972. About one fifth (19 per cent) was granted to support biomedical research and about one tenth (9 per cent) was for demographic activities (see table 4).

TABLE 4. DISTRIBUTION OF POPULATION ASSISTANCE BY PURPOSE AND REGION, 1972  
(Millions of dollars)

Purpose	Region						Net total	Percentage
	South Asia	East Asia	Africa	Latin America	Oceania	Inter-regional

SOURCE: Organisation for Economic Co-operation and Development, "Aide aux programmes démographiques, 1972", Paris, January 1974 (mimeographed).

Note: Excluding administrative costs.

48. The largest share of support went to South Asia, namely 41 per cent, and to interregional activities, 31 per cent. Latin America received 16 per cent, and Africa, 10 per cent. On a *per capita* basis, Africa received considerably less than other developing regions—undoubtedly reflecting the fact that the main area of over-all international population assistance is family planning programmes—which are less structured in the African region and for which assistance is less in demand. *Per capita* population assistance is highest in Latin America, nearly double the level of that in Africa.<sup>14</sup>

49. Family planning activities account for a substantially higher than average share of the global total in Asia (90 per cent)—only slightly above the average in Latin America (76 per cent), substantially lower in Africa (59 per cent), and the lowest as regards activities at the interregional level, mainly carried out in North America and Europe (48 per cent). Globally, biomedical research received a substantially higher proportion of resources than average (19 per cent)—at the interregional level (34 per cent), slightly higher in Africa (25 per cent), at average in Latin America (19 per cent) and considerably lower than the global level in Asia (7 per cent). The levels of support for demography at the interregional level (18 per cent) and in Africa (16 per cent) were higher than the global level (9 per cent), and well below average in Asia (2 per cent) and also in Latin America (5 per cent).

50. The distribution of activities supported by UNFPA, as compared with the distribution of total population assistance, indicates considerably more UNFPA support (in 1973) to demography (16 per cent for basic population data, 13 per cent for population dynamics and 2 per cent for population policy). The modest contribution by UNFPA to biomedical research is included with family planning activities, which together amount to scarcely 30 per cent as compared with 90 per cent of the net total of population assistance in general.<sup>15</sup> This pattern of support is a reflection of the importance given by the Fund and the countries to improving the demographic data base for the formulation of population policies and for development planning, particularly in Africa and the Middle East. It also indicates the growing capability of recipient countries to absorb support for demography.

51. In this connexion, some broad regional differences in assisted activities may be mentioned. In

<sup>14</sup> A recent study by the International Planned Parenthood Federation (IPPF) on its distribution of assistance for family planning programmes also shows that the regional distribution of funds was not closely related to need (as indicated by high birth rates) or to population size. About 6.2¢ *per capita* were granted to the Caribbean area, 7.9¢ to Latin America, 5.5¢ to South-East Asia, 4.9¢ to the Middle East and North Africa, 3.3¢ to Africa and only 1.5¢ to the Indian Ocean area (see C. Howell and G. Varky, *International Funds for Family Planning, Preliminary Report* (London, IPPF, 1973)). All data based on funds committed in 1971 rather than actual disbursements.

<sup>15</sup> United Nations Fund for Population Activities, "Annual Report, 1973".

Asian countries, where most Governments actively support measures for reducing fertility, international assistance from various sources is mainly for the strengthening of family planning delivery systems and related activities. In Africa, where many countries have never taken a population census, the need for basic demographic data is being met by the African Census Programme, which is supported by UNFPA in the amount of some \$16 million to provide experts, training, and equipment to enable as many countries as possible to participate. In Latin America, support is being given from various sources to biomedical and social science research related to population questions and to developing an approach to family planning for health reasons.

52. Most research on human reproduction is still carried out in the United States of America, financed mainly through the Department of Health, Education and Welfare, large foundations and USAID.<sup>16</sup> However, an increasing amount of similar research of various kinds is also being carried out in developing countries, partially through the Expanded Programme of Research, Development and Research Training in Human Reproduction of WHO, which is supported directly by several Governments.

53. On the other hand, the non-governmental organizations are largely involved in support of family planning activities and, especially through the large foundations, in biomedical research. At the country level, international assistance from non-governmental organizations for family planning usually changes over a period of time. At first, and prior to official action, attention may be focused mainly on providing advice and services and on promotional work to create awareness of the problems; financial assistance is often in the nature of "seeding". The subsequent involvement of Governments and the development of major official programmes makes the role of the non-governmental organizations supplementary to that of the Governments. The new area of work for these organizations may include experimentation and innovation, for example, or educational and informational work or the provision of services to sections of the population which otherwise would not be reached.

54. More generally, the pattern of population assistance shows increasing emphasis on operational activities, training and general programme support. In recent years, large-scale funding has become available to some country programmes—bilaterally through the United States, and multilaterally through UNFPA and the World Bank—for example, in India, Indonesia, Pakistan, the Philippines and Thailand. As a result, a large proportion of total assistance is concentrated in relatively few countries. The importance of training as such in the flow of assistance is clearly indicated by the allocations made by UNFPA over the period 1969-

<sup>16</sup> In a more refined system of statistics, some of this research in the developed countries may be excluded or shown separately from population assistance totals.

1973, when one third of all its funds were for that purpose.<sup>17</sup>

55. The recent trend has been towards an increase in the proportion of population assistance going into the area of family planning. Indications are that this trend may continue for the next few years. From 1971 to 1972, support for family planning increased by 37 per cent with a similar percentage increase for bio-medical research, while there was no increase (and, in fact a slight decline) in the assistance granted in the area of demography. The Fund maintained the proportion of its resources going to family planning in recent years, taking into account the fact that in its earliest stages it devoted a large share of its resources to programme development and support for developing the capabilities of executing agencies in the United Nations system. The Fund's Work Plan for the period 1974-1977 indicates, however, a growing commitment to family planning, especially within maternal and child health care. This is indicated by an estimated increase in the share of the total project budgets of the Fund from 32 per cent in 1974 to 50 per cent in 1977. In the fields of communication and education which will, at least in part, be in support of family planning services, some increase is expected in its share of the total from 12 per cent in 1974 to 16 per cent in 1977.

#### *Terms of assistance*

56. At first, all population assistance was given on a non-reimbursement basis. As with other development assistance, it was sometimes tied to procurement in the donor country, but this practice, never popular with recipient countries, has decreased. Today, population assistance is not usually so tied.

57. All assistance provided by UNFPA is in grant form. The Fund does not prescribe any particular form of assistance or approach but does provide assistance for population activities which contribute to economic and social development.

58. The entry of World Bank assistance in the form of long-term loans has grown in importance in the population sector. "Soft loans" available to the least developed among the developing countries are interest-free over a period of 50 years with merely a small service charge being applied.

59. It is likely that in the future an increasing amount of population assistance will combine grant and loan funds in ways that will permit larger, more flexible and better co-ordinated programmes of external assistance. The mechanics of developing a co-ordinated approach which would permit the simultaneous use of grants and loans must still be worked out, but it is apparent that the lack of technical support (which comes largely from grants) can nullify the benefits arising from infrastructure development (funded from loans) and vice versa.

60. The trend also appears to be for donors to commit support over a longer term, though actual transfers of funds are normally made on an annual basis in the case of grants. The comprehensive country agreements negotiated by UNFPA and a number of Governments are now made for a period of up to five years. The recipient countries find that longer term funding eases some of the problems of absorbing assistance. It is, for example, easier to train personnel and build up institutional support for continuing programmes when longer term commitments are made.

#### *Approaches to assistance*

61. The initial approach for assistance to country programmes is normally made by Governments themselves. Arrangements for interregional, for which nearly one third of total population assistance is allocated (see table 4), and regional programmes are generally made jointly by international agencies and Governments. With non-governmental organizations, the approach is more flexible since they can act largely outside official channels; the initiative often comes from a private, national or local organization, university or research institute in the countries seeking aid.

62. Requests for assistance are subject to the usual technical co-operation criteria. Decisions are made regarding the need for the activity, its technical merit, possibilities of implementation and availability of funds. In the formulation of national population policies, and particularly in regard to family planning programmes, two major additional guiding principles apply—first, respect for the sovereignty of each country; and, secondly, respect for the private personal decision of each couple on the size of the family and the spacing of the children it wishes to have.

63. The importance of these principles is generally recognized by all members of the donor community. For example, USAID has laid down guidelines by which assistance to population programmes in developing countries is provided only upon the request of the recipient country, and participation by the citizens in any assisted population programmes must be voluntary.<sup>18</sup> The United Nations system is guided by mandates under which population assistance is given only upon request of countries, and the rights of individuals to make their own decisions on population matters are safeguarded. Assistance for important activities, including training, research, surveys and conferences, at the interregional and regional levels are governed by decisions of the intergovernmental legislative bodies.

64. Organizations within the United Nations system encourage countries to choose their own approach according to their own specific needs. There is no fixed model for assistance, but a flexible response to different needs is generally applied. Recipient Governments and organizations are expected to demonstrate clear and

<sup>17</sup> United Nations Fund for Population Activities, *Annual Report 1969-72; idem, "Annual Report 1973"*.

<sup>18</sup> United States Agency for International Development, *op. cit.*

realistic population objectives and the determination and capacity to implement them.

#### ASSESSMENT OF INTERNATIONAL ASSISTANCE

##### *Current problems and constraints*

65. The rapid growth of development assistance in general has recently been subjected to a set-back, and there are indications that it may tend to level off and reach a plateau in terms of real purchasing power at least for the time being. The reasons for this development include such factors as inflation and balance of payments problems, especially in the traditionally major donor countries; the changing pattern of world trade; the continued large budgets for armaments; the disenchantment, at least in some countries, over political relations between recipient and donor countries; criticism about the effectiveness of the aid process and limited or falling support for foreign aid programmes by the public in major donor countries.

66. Some of the criticism made of general development assistance also applies to population assistance. While managerial processes appear to have a built-in tendency to attract more criticism than praise, it is of utmost importance that all relevant criticism of population activities be examined so that the effectiveness of programmes can be improved. The long time-span of some population activities especially emphasizes the need for, and importance of, effective management. In order to maintain and intensify the faith and support of the donor community, it is essential to review, assess and demonstrate advances made and results already achieved.

67. To some extent, the problems with regard to population assistance may in part be ascribed to the rapid rise in the volume of assistance, to the large number of donor agencies and to the variety and novelty of the assistance machinery in donor and recipient countries alike.<sup>19</sup> However, to date only limited attempts have been made to evaluate the successes—and failures—of assisted population activities, and to come to grips with the problems that might emerge from such evaluations. Experience gained in tackling the problems of donor management and recipient absorptive capacity in development activities in general has not yet been sufficiently applied in the population fields.<sup>20</sup>

<sup>19</sup> See H. Gille, "Population", in R. Symonds, ed., *International Targets for Development* (London, Faber and Faber, 1970), pp. 72-80; Organisation for Economic Co-operation and Development, *The Constraints on Population Activities and the Problem of Absorptive Capacity: Proceedings of an Expert Group Meeting* (Paris, 1973); *idem*, *An Assessment of Family Planning Programmes* (Paris, 1972); United Nations Fund for Population Activities, unpublished findings of a Seminar on the Management of Family Planning Delivery Systems at the Local Level, July 1972; *idem*, *Work Plan 1972-1975* (New York, 1972), paras. 132-138.

68. Some of the problems and constraints, along with some suggested means of improvement, mainly from the recipient side, are briefly discussed below. This is not intended to be a comprehensive presentation, but is based mainly on discussions that took place at two recent international meetings in which both donor and recipient countries participated.<sup>21</sup>

69. The lack of basic data required for planning and the absence of full knowledge and appreciation of the problems and characteristics of the recipient countries, within the recipient country particularly in the social context in which policies and action programmes should be formulated and implemented, are often handicaps to donor agencies. The absence of a comprehensive "philosophy" or a strategy in the fields of population—including family planning—often makes it difficult for donors to provide effective assistance.

##### *Problems mainly within donor responsibility*

70. Recipient countries sometimes complain that population assistance is not focused sufficiently upon the needs and priorities of the developing countries concerned. They suggest that the donors not use assistance as a lever to speed up the acceptance of any particular policy or approach. They say that assistance should be given to countries without, as well as those with, official population policies. They feel that they should be given clearer information on the attitudes of the different donors and the types of assistance available from them. They point out that donor agencies often delay proposed programmes by suggestions for changes or additions which may be of minor significance. And they say that aid agencies, because of the constraints on them, often fail to adapt their responses to different situations (for example, if there are no trained people or the necessary infrastructure is not already available in the recipient country, the assistance programme should be so modelled as to fill that gap).

71. Some recipient countries have been concerned with the considerable delays which have occurred in the delivery of equipment and supplies. Standardization of equipment and supplies would help, but recipient countries should also be encouraged to manufacture their own. Steps have been taken by UNFPA to enable UNICEF to establish stocks of vehicles and contraceptive supplies for delivery without delays in response to requirements in supported programmes.

72. Some recipient countries have requested simplification and co-ordination of operating procedures.

Commission on International Development (New York, Praeger, 1969); *U.S. Foreign Assistance in the 1970's: A New Approach*, Report to the President from the Task Force on International Development (Washington, D.C., Government Printing Office, 1970); R. C. Nairn, *International Aid to Thailand: The New Colonialism?* (New Haven, Connecticut, Yale University Press, 1966).

<sup>21</sup> United Nations Fund for Population Activities Seminar on the Management of Family Planning Delivery Systems at the Local Level, July 1972; Organisation for Economic Co-operation and Development, *The Constraints on Population Activities and the Problem of Absorptive Capacity*.

Other impediments to effective operations mentioned are too frequent (and too many): fact-finding, exploratory, appraisal, evaluation and other types of missions and visits which take up excessive time and resources of local personnel in recipient countries.

73. Another view is that closer donor co-ordination may be difficult to establish and may even be undesirable. Some recipient countries may even prefer the different approaches offered by different agencies. Some other countries may prefer co-ordinating the arrangements of activities of United Nations technical assistance from a single source of funds.

74. Some recipient countries are concerned about unduly complicated reporting procedures and funding controls. Donor agencies usually point out that they are obliged to report fully to their Parliaments for financial authority to use funds; but steps have been taken by some donors, including the United Nations system, to simplify reporting procedures.

75. There are divergent views on the roles of local representatives of donor agencies. Many recipient countries prefer them to have sufficient authority to approve operational programme details. Donor agencies, however, find a tendency for local representatives too often to exceed the limits of their authority. The UNFPA has assigned local co-ordinators, especially to support comprehensive country programmes. It has been suggested they might also act for other donor agencies or at least provide a focal point for the exchange of information and the co-ordination of local activities.

76. Donor agencies frequently have difficulty in finding and placing appropriately qualified foreign advisers. A number of recipient countries report dissatisfaction with their quality, attitude and roles, pointing out that in some cases the adviser appeared more interested in pursuing his own research, and, consequently, the time available for his assignment was affected. "Consultant" or "adviser" are more appropriate terms to apply than "expert", it is felt. More use should be made by donors of the expertise available in many of the recipient countries themselves and more attention should be paid to local training. Donors should not consider foreign personnel a necessary part of any project in the field, nor use them as reporting officials.

#### *Problems mainly within recipient responsibility*

77. Lack of commitment or low priority given to population policies and programmes by ministries or other Government departments and at times by the Government itself has, on occasion, been a major constraint upon donor assistance. Commitment can be strengthened by long-term population plans which clearly evidence their implications for the relevant sectors of Government.

78. Health ministries generally have responsibility for family planning programmes, and this sometimes leads to low budgetary priority for the programmes. An interministerial co-ordinating body may be required to ensure that all relevant sectors shall make the maxi-

imum contribution of their particular expertise within the over-all programme.

79. A major constraint to the capacity of recipients to absorb assistance once a commitment is made is the lack of the means to organize an effective programme. Inadequate basic population data cause serious difficulties in planning and in assessing results. Weaknesses in supporting institutions are reflected in poor delivery, particularly in rural areas. Shortage of qualified personnel may affect progress at all levels. In a survey carried out recently by IPPF among its member associations and other national contacts, of the elicited responses which illustrated the inhibitions on full acceptance of family planning, the lack of appropriately trained staff for performing essential functions was the barrier most often cited.<sup>22</sup>

80. The material available to OECD and UNFPA, however, points to some substantial progress in tackling some of the administrative and other obstacles over the past four years. There are fewer problems over tied aid and the delivery of supplies. Co-ordination machinery has been improved. Donor agencies more often enter into longer term commitments. The widening of the approach to family planning beyond the health sector and the growing support for comprehensive country programmes have eased problems of absorptive capacity. In particular, UNFPA and other organizations in the United Nations system are taking further steps to improve the management of population activities under their responsibility. Increased efforts are being made to expand training facilities and to develop new training schemes in various fields relevant to population activities, including interdisciplinary training.

#### *Results*

81. Only a partial, very general picture can be given of the achievements of international population assistance. No over-all survey is available from which a meaningful analysis could be made. Yet, it is known that there has been impressive growth of the international resources committed, of the number of projects and programmes supported and of the range and types of activities promoted.<sup>23</sup> Moreover, the quickly growing demand from the third world for population assistance is clear testimony of needs felt and benefits expected. Particularly in Africa and Latin America, population activities are being introduced or extended where only five years ago they existed on a very small scale or not at all. In Asian countries, they are being built up on the firm base of existing commitments of international assistance.

82. In financial terms, the over-all contribution of international assistance is small compared with the actual costs of the population activities they support

<sup>22</sup> S. C. Huber, *World Survey of Family Planning Services and Practice* (London, International Planned Parenthood Federation, 1973), p. 14.

<sup>23</sup> For a summary of recent activities, see United States Agency for International Development, *op. cit.*

in the developing world. International assistance in any field can never be—and should never be—more than a marginal addition to the development efforts of recipient countries. International population assistance received by India was estimated to constitute about 10 per cent of the total cost of the national family planning programme in 1970—which is a somewhat higher proportion of aid to total resources than in other sectors. In a number of other countries, particularly smaller countries, population assistance is probably a somewhat higher proportion of total costs. In so far as organized family planning programmes are concerned, it has been estimated that in 1971 about one third of the total cost was provided through international funding.<sup>24</sup>

83. There is no question, however, that the role and significance of international population assistance go far beyond the often comparatively modest financial contributions committed to it. It constitutes, in many cases, an essential element and a spur to national efforts and to enlisting local resources. Many of the activities supported would probably not be taking place at all without the interest and contributions of donor Governments and agencies, for example, in the fields of fundamental research in human reproduction, the development of new methods of fertility regulation, intercountry exchange of research and operational experience in population programmes and the high-level training of personnel at regional institutions as well as other training abroad. The involvement of international organizations, in particular, has had a considerable effect by calling attention to the importance of various population activities and by encouraging countries and institutions to participate in common efforts, to adopt policies and programmes which have been found useful elsewhere and to undertake demonstration and pilot projects, the results of which can have broad application. Very often, international assistance provides the essential spark needed to overcome reluctance at the local level to expend the necessary financial, human and material resources for worth-while activities. The African Census Programme is a case in point under which a number of developing countries are, for the first time, involved in taking a population census. Sometimes, the will and the necessary local sources may be there; but crucial inputs of equipment and supplies cannot be obtained due to foreign exchange difficulties unless international assistance is made available.

84. It is an extremely difficult—if not impossible—task to identify and measure the impact of international assistance in developing countries. Inputs originating from abroad are usually interwoven with local inputs of various kinds and the effects of the former can hardly be measured as separate from the effects of the latter. Instead of attempting to estimate the effects of international population assistance, some general observations about the impact of the programmes they support are made below.

85. Since the majority of population assistance is provided for family planning activities, far more questions are being asked about their impact—so much so that the benefits of the support for demographic statistics and demography and activities other than family planning are not sufficiently stressed. The provision of basic demographic data through the establishment of population census machinery and vital registration systems as well as the development of skills acquired through demographic training is of great importance to many sectors of Government. Assistance to aid in the formulation of population policies is also of great significance in many countries since such assistance enables them to set realistic targets for population programmes and in other sectors.

86. In some areas, such as research, the benefits may only appear in the long run. Increased support for research in reproduction and fertility control enhances the possibility of developing a variety of new, safer, more effective and more acceptable methods of fertility regulation within a shorter period of time. Further improvement in contraceptive methods applicable to large-scale programmes in developing countries could, in due course, have consequences of decreased fertility out of all proportion to the resources currently available for such research.

87. Problems over the availability of data arise in assessing the results of family planning programmes. Considerable time periods may be necessary to measure the results either because of implementation difficulties in the early stages or because early success in gaining acceptors of contraception may not be sustained. It may also be difficult to separate the effect of programmes from other factors, such as general modernization trends.

88. A recent review finds national family planning programmes uneven in execution and in impact. Encouraging developments are reported in Colombia, Iran, the Philippines and Thailand. Relatively substantial fertility declines have apparently been due in some part to family planning programmes in Fiji, Hong Kong, Mauritius, the Republic of Korea and Singapore. The range of grammatical effects in terms of annual acceptors of contraception is from about 10-15 per cent of married women of reproductive age in areas with a strong programme in a favourable setting to about 2 per cent or less in areas with a weak programme in an unfavourable setting. As yet, no method exists for stating beyond a doubt how much effect a family planning programme has on the birth rate.<sup>25</sup> This applies even more to the effect of various components of a programme such as motivation and communication activities.

89. Important results are reported for the internationally supported post-partum programme. By the end of 1972, the acceptance rate of contraception or steril-

<sup>24</sup> C. Howell and G. Varky, *op. cit.*, p. 17.

<sup>25</sup> B. Berelson, *Status Report on Population Developments* (New York, The Population Council, 1973), pp. 20-22.

ization was 37 per cent of the entire obstetrical and abortion case load at the hospitals and clinics participating in the programme since 1966. Results may, however, be more difficult to achieve at the next stage as the emphasis of the programme is shifted from urban to rural areas.<sup>26</sup>

90. Uneven results are reported in terms of meeting national demographic targets in 25 developing countries with programmes designed to reduce birth rates. While the targets may not always be realistic, seven countries were found to be on target, but in six, progress has been poor. In six other countries, review is premature, and in five, evaluation is not possible for technical reasons. The comparatively poor results, at least in relation to targets in the two largest countries with the longest programmes, India and Pakistan, apparently support the view that economic and social change may have to occur before family planning programmes can have a significant demographic impact. In cost/benefit terms, however, based on estimated returns for each averted birth, family planning programmes are found to be highly profitable investments.<sup>27</sup>

91. In conclusion, it is clear that population assistance has been a significant factor in the recent upsurge in population activities in the developing world. It is not possible, in general, to demonstrate definite effects upon population trends, but in any case, such results could not be expected in the short span of a few years. Support, in particular for the training of personnel, for research and evaluation, for building of institutional structures and for related education and communication activities, can be expected to have important multiplier and long-term benefits although they may be difficult to measure in quantitative terms. Sometimes the assistance provided constitutes a comparatively high proportion of initial costs, such as demonstration and pilot projects, but over the duration of the projects the proportion is considerably reduced and the results of the projects may be felt long after their completion.

92. At the same time, it must be recognized that international assistance in support of population activities, particularly family planning programmes, has not yet had the impact one might have expected, especially when set against the need for such activities. Furthermore, the role of international assistance should not be exaggerated to imply that without it major results cannot be accomplished in tackling population problems in the developing world. The large majority of developing countries need and want international assistance to facilitate and expedite the process of dealing with their population problems.

## FUTURE OF INTERNATIONAL ASSISTANCE

### *Estimated needs*

93. It is a difficult, if not an impossible, task to estimate the needs for international population assistance. Much depends upon the criteria to be applied with regard to the types of population activities which are required, the extent to which support from external sources is needed, the availability of local resources and the absorptive capacity of the developing countries. Few attempts have been made to estimate the requirements for and costs of population programmes in developing countries irrespective of the source of financing.

94. The UNFPA has attempted to make estimates of the costs of developing comprehensive population programmes to meet various ideal targets or goals such as to provide information and services on family planning for the entire population in the developing countries, to conduct a complete population census in all countries at least every 10 years, to establish vital statistics registration systems with a coverage of at least 90 per cent, to provide population education in and out of schools, to train personnel required for various population programmes, and to support research required for planning and implementing effective population programmes, including operational research and development of improved contraceptive techniques. The estimates mainly cover activities designed to affect fertility and population growth directly or indirectly, including family planning, maternal and child health, communication and motivation and population statistics and analysis, but leave out of consideration other activities related to morbidity and mortality, population distribution and migration and the broader socio-economic measures affecting population trends.

95. The estimates are generally limited to requirements in the developing countries except those in the field of basic research, in particular on human reproduction and fertility regulation, where the global needs rather than those of any particular group(s) of countries have been considered. The cost estimates are aggregate total costs and not additional costs over and above expenses already borne in ongoing programmes. The estimates are made on a *per capita* basis and are merely rough indications of the magnitude of the costs involved based upon 1973 prices.

96. An approximate total annual cost for all these relevant population activities is estimated at \$1.17 *per capita* or \$2.3 thousand million for the developing world as a whole. The provision of family planning and maternal and child health services according to established minimum requirements<sup>28</sup> accounts for the major share estimated at \$0.65 *per capita* or about two

<sup>26</sup> The Population Council, *op. cit.*, pp. 73-74.

<sup>27</sup> D. Nortman, "Status of national family planning programmes of developing countries in relation to demographic targets", *Population Studies* (London), vol. 26, No. 1 (March 1972), pp. 9-13.

<sup>28</sup> H. C. Taylor and B. Berelson, "Comprehensive family planning based on maternal/child health services: a feasibility study for a world program", *Studies in Family Planning*, vol. 2, No. 2 (February 1971).

thirds of the total. Other organized family planning services through various other channels would require around \$0.10, and unorganized services, a similar amount. Population education activities in and out of schools are estimated at \$0.05 *per capita*, communication activities at \$0.05, training of non-service personnel at \$0.04, collection and analysis of population statistics and studies on population dynamics at \$0.12 and research on human reproduction and fertility regulation at \$0.06 *per capita per annum*.<sup>29</sup>

97. An independent estimate of the costs of a population programme for developing countries, excluding China, assuming an increase in contraceptive practice from the current level of about 10 per cent to 50 per cent in 1990, concludes that the total estimated annual costs of a world-wide population programme would be \$1.2 thousand million in 1980 and rise to \$2 thousand million in 1985. The totals include costs of distribution systems, population censuses, information and education, research and evaluation.<sup>30</sup>

98. As it stands now, no accurate estimate can be made of the need for population programmes in developing countries and the estimates provided here may not take fully into account several concomitant needs in the economic and social fields which would have to be strengthened if the programmes were to have their maximum impact.

99. The fact remains, however, that the estimated total of around \$220 million available for population assistance from international sources in 1973—excluding the contributions of Governments, non-governmental organizations and individuals in the recipient countries—amounts to a small proportion, probably less than 10 per cent of total estimated needs for external and internal resources for population activities.

100. The UNFPA forecasts a substantial increase in the demand upon its resources within the next few years. Requirements for assistance are expected to increase from \$47 million in 1973 to \$86 million in 1977—nearly a doubling of the total annual project budget. The entire increase is for meeting the direct needs of developing countries, while support for regional and interregional activities carried out by organizations in the United Nations system will be maintained at the current level (allowing for inflationary cost increases). This forecast of needs takes into account the commitments already made to ongoing projects for the coming years as well as replies received from some 60 Governments in response to a recent UNFPA inquiry made about national requirements for assistance from the Fund, taking into account the viability of the activities proposed and the experience gained with regard to delayed project formulation and implementation.

<sup>29</sup> United Nations Fund for Population Activities, "Cost estimates of a comprehensive population programme", 1974, unpublished.

<sup>30</sup> W. H. Draper, Jr., "A population programme", 1973 (mimeographed).

### *Future resources and programmes*

101. While the total of population assistance has grown rapidly in recent years, there are indications that this growth might not continue unabated—at least for the time being. The main source of funding, from Governments, increased only slightly from 1972 to 1973, from \$163 million to \$180 million—hardly more than what was absorbed by inflation. There was, in fact, a substantially lower increase in governmental contributions in 1972/73 compared with the increase in 1971/72—the latter amounting to \$41 million. The most significant factor was the temporary halt in the upward trend in recent years of contributions on the part of the largest donor, the Government of the United States (see table 2). This Government's resources for population assistance actually declined from \$125 million in 1973 to \$112.5 million in 1974 (funds available for programmes were further reduced in view of some administrative charges amounting to around \$8 million). Some of the major foundations, such as The Population Council, Ford Foundation and Rockefeller Foundation, have also reduced in absolute terms funds devoted to population activities in 1973 as compared with 1972.

102. The important question is whether other major donor Governments will continue to increase their contributions substantially as they have in recent years. On the average, population assistance constituted only about 2.3 per cent of total official development assistance and 0.008 per cent of the total gross national product of donor countries in 1973. Many donors may be prepared, within their total development assistance budgets, to give higher priority to requirements in the fields of population if they are convinced of the need for, and the usefulness of, such programmes. It should be appreciated, however, that an increase in assistance for population activities should not be brought about at the expense of assistance to other vital sectors of development.

103. The future prospects for increased population assistance, therefore, become much more dependent upon the extent to which population programmes can be made more effective and the extent to which the management of aid, both on the donor and recipient side, can be improved to overcome current criticism. Some suggestions for improvements and changes are briefly outlined below.

#### *Improvements in programme formulation and implementation*

104. Various steps can be taken by both donors and recipients to improve the effectiveness of aid-supportable activities and programmes, thereby making them more attractive to international funding. The stage has been reached in many countries with established programmes where attention needs to be directed as much towards project accomplishments and evaluation as to the development of services.

105. Many programmes suffer from ill-defined aims and purposes. Concrete objectives and targets should always be clearly established. The recipients should take steps to provide better statistical and other data as a part of any major activity. Detailed planning of projects should be made before population assistance is committed to minimize problems of implementation and the unnecessary blocking of funds in the pipelines. Appropriate planning would include full understanding of the responsibilities of all the parties involved on the donor and recipient sides throughout the life of the project and the preparation of time-tables for the various inputs to be made available and the phasing of the various activities. Frequent evaluation of results obtained and problems encountered, preferably with the participation of technically competent representatives of the major donors concerned, and at various stages of programming, can contribute greatly to overcoming any scepticism and may ensure continued or even increased support.

106. Steps should be taken by donors to improve the implementation of assisted activities. Long delays in the recruitment of advisers, the purchase of equipment and the provision of supplies are well-known causes for frustration among recipients. Greater reliance should be made, whenever possible, upon locally available expertise, particularly in large countries where it is often available and may be more suitable and considerably less expensive than foreign advisers. Donors providing equipment and supplies should, in so far as possible, establish stockpiles to avoid delays in delivery or call upon other donors who may have made such prior arrangements. Furthermore, direct project implementation by the recipient Government or an appropriate local institution in the recipient country may be more effective and less costly than using a donor agency for project execution, except when technical guidance is required and not locally available. The UNFPA has already taken steps in many of these directions to improve the implementation of its supported activities.

#### *Improvements in management and co-ordination*

107. There is no question that the management and implementation of the aid process by donor agencies needs to be improved. A common and simplified management system may, in some cases, be applied by donors to ensure effective implementation. Co-ordination between donors should be strengthened in collaboration with the recipient countries most directly concerned by regular exchanges of information on needs for assistance, experience gained and results achieved. The UNFPA has recently taken the initiative in convening *ad hoc* meetings of interested donors which are in the process of developing comprehensive country projects. Initial steps have also been taken to exchange information between and among donors on requests received for funding of the same projects. Further steps towards such co-ordination of funding may be taken. At the country level, the recipient Governments should

be encouraged to take initiatives and to convene meetings with donor representatives in order to keep them informed of relevant programme developments and funding, and, at the same time, to solicit better information on funding prospects.

108. Donor agencies and recipient countries together might develop guidelines on how to assess and demonstrate the impact of population assistance and how to best evaluate the effectiveness of activities being supported. There is an urgent need for identification of the criteria to be applied in evaluation and for the development of measurement techniques to be applied.

109. More and better statistical data are required to provide coherent and reliable information on the characteristics of and trends in population assistance. A number of difficulties are currently involved in the collection and use of financial data on assistance. Some donors report disbursements, others, commitments. Some use calendar years as the reporting period, others, fiscal years—not identical to calendar years. Substantial funds are channelled from one donor to another, leading to problems of “double counting” those not always being adequately reported. Differences of definition and of classification of types of activities often result in inconsistencies and difficulties in interpretation of such data. Agreement should be reached among donors concerning improvements for reporting and presenting financial data.

#### *Reorientation of programmes*

110. The modest results obtained in many national family planning programmes suggest that alternative approaches should be fully explored for achieving established goals. It would appear that there can be no generally applicable over-all approach or content for family planning programmes. They must be sensitive and responsive to local conditions and needs. Available knowledge about social, cultural and administrative factors is apparently not always sufficiently considered in programme formulation and implementation. Where necessary, local studies should be supported to provide this required information.

111. More attention, no doubt, needs to be given to non-clinical approaches, including the distribution of contraceptives through commercial and other channels than traditional health services. A new programme in this area, launched by IPPF, should demonstrate to Governments and non-governmental organizations in developing countries the possibilities which exist in this regard, and thus ensure quick responses to requests for supplies. At the same time, fuller advantage should be taken of dissemination of information about newly available and appropriate methods of fertility regulation. While encouraging the expansion of the current distribution schemes, support should be given to simplifying the procedures as much as possible.

112. So far, large parts of family planning programmes have concentrated on increasing the delivery of services. In many countries, greater attention should

be given in the future to ways of encouraging the demand for such services by strengthening motivation in individual families as well as at the political leadership level. Such encouragement would, however, only be appropriate if current demands can be adequately met and provisions be made for effectively meeting additional demands. Efforts to strengthen motivation are particularly difficult but important where large families still represent a rational response to economic and social conditions.

113. In spite of the current trend towards more assistance to family planning, far greater attention than is currently paid should be directed to the support of other action programmes, such as changes in marriage patterns and the influence of employment and education upon fertility, as well as programmes affecting migratory movements to bring about a better balance between human resources and economic opportunities. Considerable research is needed in support of such activities.

#### CONCLUSION

114. A strategy for population assistance should be developed involving the broader elements of national population policies as these elements relate to other social or economic areas which can support or supplement population objectives, such as health, employment, education, migration and urbanization. Those social and economic policies and measures which can help to accomplish population goals within the broad context of development should be fully explored. A conceptual framework should be developed for a truly integrated approach to the three crucial problems facing most developing countries—poverty, population and environment. The optimum mix of the various activities

and their costs should be studied in particular settings and with reference to various target groups. Donor agencies should assist recipient countries in carrying out such tasks and readily participate in their funding.

115. There is, of course, no way of knowing what the level of international assistance to population activities might be five or 10 years hence. Demographers appear to be able to forecast population growth with a reasonable degree of accuracy, and thus one can assume that the world population will probably double between now and the end of this century. Unfortunately, there are too many variables involved for economists or financial experts to forecast with any degree of accuracy future levels of international assistance to population activities.

116. It would appear safe, however, to predict that the level of international assistance will never be equal to the job that needs to be done, nor will it be equal to either what the countries requesting assistance want done or what the donor agencies themselves want to do. Thus, priorities will, of necessity, have to be established by all those involved in international assistance to population activities—by the recipient countries and by the donors. Co-ordination and consultation among all parties is clearly the first priority. Equally important, however, will be the recommendations put forth by the World Population Conference and any guidelines that it may lay down for both recipients and donors.

117. The fact of the Conference, coming as it does during World Population Year, when the attention of Governments and citizens around the world is focused on population issues, cannot help but place tasks, objectives and obligations of both recipients and donors in clearer perspective for all those involved in population activities.

## Annex I

### REPORT OF THE SYMPOSIUM ON POPULATION AND DEVELOPMENT

#### INTRODUCTION

1. The Symposium on Population and Development was held at Cairo from 4 to 14 June 1973. It was one of a series of symposia held in preparation for the World Population Conference, 1974, as recommended by the Population Commission at its sixteenth session<sup>1</sup> and endorsed by the Economic and Social Council in its resolution 1672 (LII).

2. The Conference, as endorsed by the Economic and Social Council in its resolution 1484 (XLVIII), is being organized as a meeting of Government representatives. It will differ from the World Population Conference, 1954, held at Rome, and the World Population Conference, 1965, held at Belgrade, which were technical meetings. Therefore, a series of scientific activities was planned in preparation for the World Population Conference, 1974, to identify and clarify critical problem areas at the technical level.

3. Among those pre-Conference activities were four symposia on: population and development; population and the family; population, resources and environment; and population and human rights. Those were technical meetings of experts participating in their personal capacity.

4. The Symposium on Population and Development, relating directly to the second of the substantive agenda items of the World Population Conference, 1974, on "Relations between population change and economic and social development", was organized in collaboration with the Government of Egypt, represented by the Central Agency for Mobilization and Statistics. The Symposium was made possible through the financial assistance provided by the United Nations Fund for Population Activities. Twenty-five experts representing different disciplines in the field of population and development participated in the meeting. The meeting had before it technical papers prepared by experts, by the United Nations Secretariat and by the specialized agencies specifically for the Symposium, and some draft background papers prepared for the Conference.

5. The meeting was opened by Mohammed Abdul Kader Hatem, Deputy Premier for Culture and Information. Sayed Gaballah, Minister of Planning, and Lt. General Gamal Askar, President of the Central Agency for Mobilization and Statistics, addressed the meeting. The Secretary-General, World Population Conference, 1974, expressed the gratitude of the United Nations to the Government of Egypt for its hospitality and to the experts participating in the Symposium. He observed that as a meeting of experts prior to the Conference, the Symposium offered the opportunity to bring the talent and judgement of the scientific community to bear on the issues before the Conference. The Director of the Population Division, reviewing the task which the Symposium had before it, stated that the experts had a fundamental role to play in stimulating and aiding the Conference and Governments in their policy- and decision-making.

6. At its first session, the meeting elected V. Urquidi as Chairman and Ester Boserup and I. Selim as Vice-Chairmen. L. Tabah was Director of the Symposium and Mr. Gobba was Co-Director. H. Leibenstein was designated Rapporteur, Kath-

leen M. Jupp, Co-ordinator of the World Population Conference, 1974, and the World Population Year, 1974, Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat, acted as Co-ordinator, and J. van den Boomen was Technical Secretary.

7. The meeting adopted the agenda reproduced in the appendix to the present report.

8. Among the major issues of international concern dealing with current and prospective world problems and challenges, the theme of the Symposium and this report—the interactions between economic and social development and population—merited a prominent place. In dealing with that question, a broad framework and perspective had been adopted by assembling the scientific information available; by delineating the different approaches to understanding the basic issues; by recognizing the basic principle that solutions to the wide range of associated problems were conditioned by variations in socio-cultural conditions, political systems and so forth; by noting differences in points of view among persons representing different disciplines and parts of the world; but most importantly, by bringing together the rapidly growing consensus on the most urgent questions. The consensus on substantive matters, which transcended differences in terminology and degrees of emphasis on different aspects and details, was of special value.

9. Although full agreement on those complex issues could not be expected among participants coming from different regions, political backgrounds and professional experience, a convergence of ideas on basic themes was evident throughout the debate. That convergence, found also in the documentation for the Symposium, is reflected in the current report. It was particularly significant because it represented a greater degree of consensus than had been usually found in the past.

10. During the past two decades, the attention of the United Nations had focused increasingly on the development problems of the poorer countries, in relation both to their domestic effort and to the means of stimulating and channelling international co-operation in order to improve trade conditions, provide long-term capital funds, transfer technology and encourage innovation in support of economic growth and social change. Progress along those lines was the major objective of the International Development Strategy for the Second United Nations Development Decade. Efforts to accelerate the development of the poorer countries and to reduce international inequalities among countries are essential for the attainment of the well-being desired by all countries and for social peace and order in the future world, just as social justice, equality for opportunity and the satisfaction of basic needs were indispensable for the harmonious and undisturbed development of any society as well as for individual achievement. Those objectives were interrelated with population trends and policies as stated in the International Strategy for Development.

11. Recent decades, especially the last two, were periods of man's history during which population growth had accelerated to the point at which it had become a major concern. While concern with population growth was hardly new, it had become of world-wide dimension as the decline of mortality, in very short periods, combined with the maintenance of high birth rates, had brought about an unprecedented increase in numbers. To state some figures, not with a view to raising apocalyptic

<sup>1</sup> See *Official Records of the Economic and Social Council, Fifty-second Session, Supplement No. 3*, para. 166.

fears, but to place the dimensions of the problem in perspective, there was a clear prospect that by the end of the century, world population would reach from 6 thousand million to 7 thousand million, of which number well over 75 per cent was expected to live in countries currently classified as developing. Under some assumptions, world population might be of the order of 11 thousand million at the middle of the twenty-first century. Those prospects undoubtedly presented problems for the future development of the countries of the world.

12. The policy concepts of and the theoretical approaches to the issue of population growth and development could be found within the limits set by two extreme positions. The first of those was the view that the current high rates of population growth were already exerting an unfavourable influence on social and economic development. On the other hand, there was the view that, given the presence of certain social and economic policies, a larger population could be beneficial for development. However, there was growing support for an intermediate position held by those who recognized the potential benefits from population growth, but who also saw in high rates of population increase a serious impediment to socio-economic development even in areas which would benefit from a larger population attained more gradually.

13. The degree of concern with the economic and social implications of the high rates of population growth varied according to the size of the country, natural resource endowment, initial income *per capita*, industrial structure, education and skill levels, possibility of participation in world markets, and, not the least, cultural, social and political factors. The perception and evaluation of those problems also differed considerably, especially in respect of implications. It was important, in that context, to recall that the time dimension of population change was greater than that for other economic and social change.

14. There was a growing body of scientific evidence on the impact of accelerated economic development and social change on population variables. The record suggested that advances in knowledge and technology applied in the fields of medicine and public health were, to a large extent, responsible for the high rates of population growth through a rapid reduction of mortality, especially among infants and children. At the same time, *per capita* income had increased, contributing also significantly to lower mortality rates. Food supplies had become more certain and famines less frequent in the current century. In turn, a number of related influences, such as changes in educational attainment, the rising status of women and shifts in familial roles among those participating more fully in the process of change had led in varying degrees to declines of fertility. It was also widely agreed that the decline of the high fertility levels, still prevailing among large sectors of the population which had maintained traditional patterns and a traditional way of life and, as a consequence, traditional fertility levels, was most likely to occur in response to socio-economic development.

15. The demographic evidence compiled by the United Nations, coupled with the economic and social information, indicated a considerable diversity of situations in the various regions of the world. In the developed countries, both free enterprise economies and centrally planned economies, current rates of population growth were low and in some instances were even causing a preoccupation with a need to stimulate birth rates. In developing countries, current rates of population growth were, for the most part, high. A growing number of those countries, socialist and non-socialist, were adopting policies to initiate fertility decline or to reinforce existing trends in that direction.

16. There were also significant differences between the three major developing regions of the world: Africa, Asia and Latin America, as well as within those regions. It was by no means evident from the statistical record that countries with lower rates of population growth had developed more rapidly or

efficiently, or that high rates of population increase had been inconsistent with development at a fairly high pace. Whatever the precise demographic patterns, economic growth appeared to have resulted from a wide variety of factors, including favourable situations with respect to international trade coupled with purposeful domestic policies, institutions that encouraged the introduction of innovations, an energetic population and the introduction of social improvements. In turn, developing countries that had stagnated or lagged economically had done so for reasons not necessarily connected with a particular rate of population growth. The absence of a close statistical correlation between population growth and socio-economic development was not surprising. It was explained by the two-way relationship between the two, by the multiplicity of factors affecting development and by the long-term nature of the influence exerted by population trends. It was, nevertheless, clear that certain aspects of development were adversely affected even in the short term by the rapid rates of population growth found in some countries.

17. A major consideration in the adoption of population policies was the reduction of mortality, because of the universal value of human life, through health programmes. More recently, policies and programmes had been initiated to help parents to avoid unwanted children and to improve the health of children and mothers, thus contributing directly to human welfare by way of family planning. While those considerations were valid, it was important to add new dimensions to population policy, putting it within the wide socio-economic development context.

18. In many developing countries, there was inadequate allowance for population variables in the formulation of development plans and strategies. Allowance could take two forms: incorporating policies intended to influence population trends in the over-all development strategy; and shaping developmental strategy so as to accommodate population trends that were not readily subject to modification. Examples of policies intended to influence population trends were: efforts to reduce or divert very extensive flows of rural-urban migration; or a shift to an increasing range of activities to lower fertility. Population trends not readily subject to modification included changes in the next few years in the number of persons in certain significant age-categories, such as children in the primary-school age or persons at the age of entry into economic activity. It was important to recall in that context that in developing countries with a high proportion in young ages, substantial population growth was likely to continue for some time and that the time dimension for significant changes in population growth was wide in comparison with that of many economic and social factors.

19. In so far as the strategies and policies of developing countries towards higher standards of consumption and social well-being succeeded, they were expected, on the basis of the historical experience and observable current trends, to have certain effects on population variables. Mortality was certain to decline further. The continued spread of health programmes, changed motivations and attitudes, increasing industrial development, and a strong measure of modernization, including greater participation of women in many spheres outside the home, were bound to affect, in differing degrees, fertility and population trends. It was reasonable to assume that current population trends would not continue in the very long run. However, the timing of the expected decline in fertility might not be such as to secure the most favourable economic and social progress. It was thus likely that population policies would be designed and implemented to an increasing extent as part of development programmes.

20. This report is intended only to highlight those relationships between population and development which appeared most relevant to a clear understanding of basic issues for the formulation of policy options. These considerations—which are detailed in the three following chapters—were the foundation for the wider area of consensus referred to above.

## I. THE EFFECT OF SOCIAL AND ECONOMIC DEVELOPMENT ON POPULATION TRENDS

21. This discussion first examined what could be learned from the historical record of population trends. Patterns distilled from the record were briefly surveyed and conflicts over detail were considered later.

22. On the population side, the basic generalization of the emerging patterns was generally known as "the demographic transition". It was considered best to present at the outset an outline that is deliberately simplified and sharp. Shadings, subtleties and exceptions to the general pattern were introduced later. Based on European experience, the highlighted features that emerged were:

(a) An initial situation in the late eighteenth and early nineteenth century of relatively high birth rates and death rates, say, from 33 to 45 per 1,000;

(b) During the early process of European modernization, the conditions and opportunities had arisen for a gradual decline in mortality rates. In most cases, fertility decline had not followed for some time, or if fertility decline had set in quickly it had not been of equal magnitude to the mortality decline;

(c) A significant consequence had been the increase in the rate of population growth to a magnitude not experienced before. Towards the last third of the nineteenth century, birth rates between 35 and 40 per 1,000 and death rates between 25 and 30 per 1,000 implied rates of population growth of about 1 per cent. In comparison with the previously known sustained rates of growth, that rate had been unprecedented, although in contrast to the situation in contemporary developing countries, such rates were rather modest;

(d) In the course of time, however, a decline in fertility and in the rate of population growth had taken place. A new ideal of the small family had arisen in urban areas, under conditions of declining mortality, rising costs of child-rearing and declining contributions to family income from children. Family limitation had begun with the more privileged classes and had moved gradually to the less educated and lower income sectors of the population. Generally speaking, the decline in fertility was more rapid in areas in which mortality decline occurred later. It was important to note two additional features of the decline in fertility in the countries that had developed earlier. First, the decline had been an individual decision on the part of families unsupported by Governments, religious institutions and other centres of authority, but contrary to their attitudes on fertility, often expressed in active and passive resistance to limitation of family size. Secondly, fertility decline in those countries had been achieved without the mass dissemination of chemical and mechanical contraception.

23. Some qualifications to the broad picture just presented are called for. First, there were significant differences in fertility in pre-modern society. In Western Europe, when industrialization had begun, there had already been a much lower birth rate than in the currently developing countries because of an unusual pattern of marriage, and because permanent spinsterhood had kept as many as 50 per cent of the women of child-bearing age from exposure to the risk of fertility. In addition, marital fertility had also varied to a considerable degree, although maximum fertility rates had almost never been observed and fertility had been controlled to some degree by various means. Secondly, within the experience of the developed countries could be found areas in which the fertility decline had been parallel with rather than later than the decline of mortality and even a few instances in which it had occurred before the decline of mortality. Clearly, different socio-economic and cultural factors had been empirically relevant in different areas. But in spite of varying circumstances, there was an over-all generalization that could hardly be denied: every population that had experienced the full impact of modernization—that is, wholly literate, mostly urban and highly industrialized—had much lower fertility and mortality than before it had been subjected to such social and economic development.

24. Turning to the question of what specific features of social and economic change affect population trends, it must be stated that there appeared to be better understanding of the general nature of the impact of economic development for population than discernment of the significance of population trends on economic growth. That was noteworthy since it was frequently believed that the consequences of population growth were easy to understand—by some it was even presumed to be obvious—whereas fertility was presumed to depend upon physiology and a complex set of socio-economic and cultural variables.

25. The history of socio-economic development in the developed countries had been characterized by certain coherent and persistent features. Among the important features were the stream of inventions and innovations which had revolutionized productive processes; the simultaneous increase in education; advances in medical knowledge and the gradual spread in the application of this knowledge; improvement in sanitation and public health measures; the increased capacity to store and transport food and other goods and increases in income per family. All of those had led to an increase in average duration of life through a reduction of mortality rates in all ages, but especially in infancy and childhood.

26. Before proceeding to consider the way in which some of those characteristics of modernization had also contributed to eventual fertility decline, mention should be made of the great difference, in terms of human welfare and the quality of life, between the two extreme alternative ways of achieving low population growth rates: (a) the high mortality and high fertility pattern *versus* (b) the low mortality and low fertility pattern. The overwhelming advantages of the low mortality-low fertility alternative, and the socio-economic conditions consistent with this pattern, were obvious. Once mortality rates had declined and population growth accelerated, no one would argue that a sensible way of returning to lower rates of population growth was through raising mortality. Only lower fertility could reasonably be sought as an answer if rapid population growth was deemed to be undesirable.

27. Modern economic growth, where it had occurred, had manifested itself through major shifts in the structure of production, which, in part, had stimulated or at the very least facilitated, the option and choice of gradually lower fertility rates. Some of the correlates of modern economic growth were: the introduction of technologically sophisticated types of equipment and managerial arrangements; great increase in the scale of the average enterprise; a persistent shift in the balance of production towards non-agricultural commodities; and a persistent shift in the locale of production and of population to urban areas. The increase and greater technological sophistication of production required types of administrative procedures, which in turn required for productive effectiveness higher levels of literacy, communication abilities, orderliness and punctuality, as well as other attributes of education. Those shifts in structure away from the farm and handicrafts had signified also a shift in economic activities away from the family. That had not only decreased the control of children by the family, and the dissipation of values favouring children within the family, but had changed the moral and intellectual context in which children were reared so that a widening gap appeared between the generations. In various ways, it had usually been argued that children in urban contexts not only did not confer on their parents the advantages of their labour and/or constitute a source of social security, but that, in addition, they contributed to increasing the costs of raising a family. One could not go into all the details why that should be the case; but, in general, it was quite frequently argued that the increases in direct and indirect cost of children had led at the very least to incentives for a lower desired family size, regardless of whether the means of achieving such a family size existed.

28. There were numerous conflicts of opinion, some of which were brought out at the Symposium, about the exact details of the process responsible for fertility decline, and

different scholars would unquestionably emphasize different bundles of influences; but despite disagreements on details and language there was general agreement that the process of persistent modernization contained within it the seeds of the attenuation of the extended family, the change in location of the family and the shift in the pattern of social relationships within which the incentives were towards relatively small nuclear families. In fact, the very word family changed its meaning and significance as socio-economic development occurred.

29. While there was a general coherence to the situation described above, in which the nature and characteristics of modern economic growth appeared to influence eventual and sustained fertility decline, some qualifying remarks must be made. To begin, there were a few exceptions to the general picture. There were cases where the onset of fertility decline appeared to have preceded modernization. However, such examples in no way contradicted the proposition that modernization facilitated fertility decline. Secondly, modernization affected different groups in different ways. It usually influenced first those at higher socio-economic levels and then spread to other groups in society. It really was not known whether there was an international "demonstration effect" in fertility reduction as there was reputed to be with respect to many aspects of urban consumption patterns. Lastly, while it had frequently been emphasized that social and cultural aspects played a role in fertility decline; and, in some cases, it had been argued that that role was exceedingly significant, so far no one had attempted to measure those differences, and differing views on that subject, in the absence of quantification, appeared irreconcilable. Nevertheless, sustained, modern economic and social development as such was unquestionably a significant force.

30. The effect of late marriage on fertility, mentioned earlier in connexion with the experience of Western Europe at the beginning of the demographic transition, had been a significant factor in recent trends in many Asian populations. Increasing age at marriage had accounted for a major fraction of the decline of the birth rate in Japan from 1930 until the 1950s. It had been an important element in the recent pronounced declines in fertility in Hong Kong, the Republic of Korea, Singapore and Sri Lanka. In other developing areas, nuptiality has been a potentially powerful but generally neglected instrument for influencing population trends.

31. There was a question whether the historical experience of Europe, the United States of America and some parts of the British Commonwealth, all of which had developed prior to the Second World War, was of relevance to the currently developing countries. One could easily point to the differences in the two sets of situations. Mention has already been made of the very much higher rates of population growth that currently existed in the developing countries, and the fact that many countries with low income *per capita* had achieved low mortality rates. But despite those differences, the relevance of the lessons of the past remained. There was every reason to believe that the modernization of the currently developing countries would eventually lead to sustained fertility decline. The decline of fertility in Southern and Eastern Europe, in Western Europe, in sparsely settled Argentina and Australia, as well as in densely populated Belgium and the Netherlands; the similar population trends in developed socialist and non-socialist countries, the completion of the demographic transition in Japan and its initiation in Cuba and the Republic of Korea, and other countries in South-East Asia and the Caribbean, all confirmed the view that socio-economic development facilitated a reduction in fertility. However, it was not possible to specify a precise list of quantitative values of social and economic indexes identified with a beginning in decline of fertility. Three general conditions could be considered as having been essential for a major reduction in marital fertility: (a) the regulation of fertility after weighing advantages and disadvantages of additional births must be an accepted mode of behaviour; (b) lower fertility must be perceived by individual couples as advantageous to the parents and the children; and (c) there must be adequate knowledge and acceptance of effective means

of reducing fertility, sufficient skill in the use of such means and ready availability of necessary supplies and services. Those conditions were found in every society at an advanced stage of socio-economic development. However, historical experience indicated that they had existed—when the only means available were folk methods—in less developed areas in Europe that had been at the time agrarian and low in literacy. The relevance of those conditions for the understanding of the trends in currently developing countries was as follows: (a) their universal prevalence in developed societies demonstrated the importance of social and economic development in facilitating the reduction of fertility; and (b) their occasional existence in populations that had not yet experienced social and economic development, suggested that population policies designed to reduce fertility need not be postponed to the later stages of development programmes and might in fact be reinforced by acceptance of recently developed, more effective means of fertility control associated with family planning services. In summary, historical as well as contemporary experience supported the widely held view that policies designed to influence population trends should be an integral part of general development strategy.

## II. POPULATION GROWTH IMPACT ON ECONOMIC DEVELOPMENT

### A. Natural resources

32. In view of the fact that the Symposium on Population, Resources and Environment was to include references to the problem of natural resources, it was considered sufficient to go into the assessment of this issue only in so far as necessary to make the general argumentation complete and consistent. In discussing the relation between population growth and resources, a distinction must be made between that which represented fairly solid knowledge and that which represented a high degree of speculation. First, it must be noted, perhaps emphasized, that population growth *per se* had not been the only nor the major cause of the increased use of natural resources. In general, *per capita* income growth had been more responsible for the increased world-wide consumption of natural resources. Secondly, if one projected the need for resources to the turn of the century, or for the next 50 years, those projections would suggest that population growth *per se* would not lead to the exhaustion of resources. The historical experience of the United States of America, for instance, provided no evidence that domestic resource scarcities had developed and suggested that resources had grown as rapidly as industrialization and had become available at lower prices. That had been accomplished through discoveries of new resources or substitutes for natural resources, and through price changes operating as a stimulus to discoveries and as a rationing mechanism.

33. Shortages for certain resources did loom in the foreseeable future. There were grounds, however, to expect that properly guided scientific and technological progress, including the development of substitutes, coupled with long-run planning, should overcome the shortages.

34. A paper prepared by the United Nations Secretariat (E/CONF.60/BP.9) pointed out some of the details connected with the ideas presented above in a very general way. One should consider the large number of categories that were possible substitutes for any specific energy source—petroleum, natural gas, coal and lignite, oil shale, nuclear energy, solar energy, hydroelectric power, tidal energy, geothermal power. Almost all of those sources were being used to various degrees. Some sources of energy, such as nuclear energy and tidal energy, were in the early stages of development. Geothermal energy was an untapped resource where the question of reserves was hardly a consideration. Energy development was very capital-intensive and initial costs rather than population growth might be a severe inhibiting factor. On the question of reserves, it was important to keep in mind that large parts of the earth's surface had only been slightly, if at all, prospected.

Man had only begun to use the inevitable buildup of usable scrap supplies which were a consequence of industrialization. Off-shore production of resources and the utilization of the sea-bed were likely to be increased significantly.

35. Water resources constituted an obvious determinant of population level and economic growth in areas where, in relation to its demand, water availability was scarce. In extreme circumstances, water scarcity might eventually limit the population size which a region could support within a given pattern of water use, or at least seriously limit the patterns of economic growth that might be otherwise available. The long-term trend towards water-supply scarcity in relation to its demand was a subject of concern to a growing number of developing countries. A need for larger food production by means of irrigated agriculture and other water uses in certain developing countries might lead to high rates of withdrawals which would put a strain on the reserves of water available. But even in the case of water it was important to mention that in many instances, man was not using water nearly as well as he knew how. Recycling of water should add substantially to its availability. As water prices rose and desalination methods were further developed, it might pay to use desalination more effectively. In that connexion also, it was necessary to repeat the general principles that the question was not one of over-all availability, but availability at a given cost, which in turn was likely to depend in part upon the research and development of fairly well-known means of creating new sources of supply or of using more effectively existing supplies.

36. Once one moved to longer periods of projections, considerable and almost irrepressible controversy arose as to whether population growth would lead to specific or general resource exhaustion. To a considerable degree, the controversy depended on whether the individual was an invention optimist or pessimist with regard to technological change. There was no way of predicting future technology. If one ignored such change, then at some point positive population growth would lead to resource exhaustion. On the other hand, if one believed that the mechanism in the future would work as in the past, then one predicted that as a resource became relatively scarce, the search for substitutes or new inventions and discoveries would overcome the scarcity. The critical question was not the extreme one of amplitude *versus* exhaustion, but rather that of relative scarcity and its impact on resource price. It was likely that the greatest consequence of socio-economic development and population growth in connexion with natural resources was not on the production of goods and services but on the pollution of the environment. The substitutes for many natural resources involved by-products and wastes, which in turn involved the social costs of pollution. Those costs and problems were not easily handled by modern societies. Thus, it is not scarcity which was to be stressed under that heading, but the contribution of population growth to the undesirable by-products of the introduction of modern technology.

37. The foregoing argument might have to be modified, if one considered the very long run, say, until the end of the twenty-first century and thereafter. Man's power of anticipation was too weak for such a time horizon, however, and the conclusions therefrom were not imminent. If there were convincing arguments for more rational population patterns in the developing countries, they should not be sought in the limitations of the world's natural resources. Rather, the argument of limited resources should be exploited for demanding appropriate patterns of consumption and production in the highly developed societies and in the developing countries as they achieved higher economic levels.

#### B. Population, food and agriculture

38. It was generally agreed that, in the developing countries, the levels of calorie and protein intake were too low, and infant under-nutrition and malnutrition were widespread problems that had serious consequences for the future health and intellectual ability of the child. Solutions to those problems implied the need to raise the productivity of agriculture,

enrich existing food-stuffs, conduct programmes to increase food consumption and improve nutritional levels through proper information, education and other means. A considerable part of the world population lived in areas where the food supply was precarious. Those were often also the areas of rapid population growth. Consequently, estimates of future food needs were derived from both the requirement that basic standards of food consumption be met and from the high rates of demographic change. All that pointed to the necessity of conducting intensive programmes to increase food supply in the developing countries and of organizing adequate world food programmes through international co-operation. In some countries, the prospects for food supply might appear better than in others, but in the developing countries as a whole the experience so far indicated that, even with the introduction of new agricultural inputs and techniques in some areas, it had not been possible to increase agricultural output by as much as 3 per cent per annum. Although the rate achieved probably exceeded that of population growth, it allowed for a margin too small to raise significantly and permanently the average levels of nutrition.

39. In many countries where the prospects for increased agricultural output were limited, the advantage of a lower population growth rate in bringing sorely needed gains in nutrition was evident.

40. Furthermore, the prospects for agricultural development were, in general, not clear. It was still possible to bring much forest and wasteland, as well as fallow and grazing land, into cultivation, at least in theory. While in Asia, excluding China, 24 per cent of the land was under cultivation, in other areas only 6-7 per cent was so used. Nevertheless, the technical and organizational difficulties, and the cost of extending the area of land under cultivation could not be minimized. Moreover, population density in Asia was much higher than in Africa or Latin America. The main hope lay in the use of improved seed varieties, more intensive use of industrial inputs and increasing agricultural skills, in order to raise yields per acre. Multiple cropping, wherever that was possible, should also help. So far, actual results had, on the whole, fallen short of expectations, and the net income to the agricultural population had, in the face of rising costs, not been increased very much. In general, the economic, social and agrarian structures had not favoured substantial improvements in the level of living and nutritional levels of the rural populations.

41. A significant question which arose was whether there were enough new types of production techniques in agriculture which were known and which could be borrowed by developing countries in order to continue to increase productivity per acre as population grew. In other words, different countries were at different points in what might be called their "technological option frontier". Some areas, or parts of countries, might have exhausted most of the possibilities for technological improvement, and if such countries had rapid population growth in agriculture then they, indeed, faced serious difficulties in maintaining output per man, but many other areas might be in a situation where they could quite readily find new possible improvements available so that through the adoption of such innovations productivity per man could continue to rise.

42. In any event, the high birth rates prevailing generally in the agricultural sector of the developing countries, combined with the substantial proportion of population living on the land, signified that food availabilities had to be shared, according to an increasingly difficult choice of policies for equitable distribution, particularly when rapid urbanization took place between rural and urban sectors. In many areas, surplus farm population existed and serious agricultural employment problems had arisen. In most areas, migration to urban settlements had alleviated the pressure on the land, but had added, in the absence of sufficiently rapid industrialization, to the burden of employment and of providing food supplies and services in the cities. The impact of rapid population growth on agricultural productivity, food supply, employment and migration consti-

tuted a complex interrelationship, which varied according to different national and local conditions. Most technical solutions, in spite of the need for labour-intensive methods of production, tended, on the contrary, to be in the direction of lower labour-input requirements. That should be carefully taken into account in assessing the significance of current population trends.

43. In a balanced over-all approach to agricultural development in relation to population growth, the prospects of the international market for the agricultural produce of the developing countries should also be considered. The highly protective policies of the developed countries were frequently an obstacle to the encouragement of agricultural output in the developing countries, particularly through their effect on export prices and consequently on balance of payments prospects. The combination of inelastic supply of food and the restricted market outlook obliged many developing countries to devote large shares of their normal export proceeds to meeting food imports. Such countries, under exceptional conditions, as in the case of current famine conditions in parts of Africa and India, also had to resort to international food aid programmes. That was not a lasting solution to the pressing problems posed by the population growth and nutritional needs of the poorer nations. In the long run, international technical and financial resources would be required in much larger volumes to help the developing countries achieve a large measure of self-sufficiency in basic foods, which would also be facilitated by a lower rate of population growth.

### C. Population and health

44. Health interacted with population and development and tended to be an intervening variable in the interrelations between the two. Health directly affected levels of mortality and population growth, was directly and indirectly related to fertility and had considerable influence on migration, productivity and attitudes to work and social welfare. Population growth, in its turn, created an increased demand for health services and a rapid increase in numbers produced a strain on delivery systems and the development effort.

45. Better health had multiple effects on population trends. The provision and growth of health services would reduce mortality—and morbidity—and thus contribute directly to population growth. Although there was controversy about whether past reductions in mortality had been caused primarily by health services or by improvements in general economic and social conditions, there was little doubt that both were involved and that medical and public health advances would continue to further declines in mortality. It had also been noted that better health might cause a slight increase in fertility in the absence of family planning.

46. Abundant evidence had been accumulated showing that high parity directly affected the health of children. The risks of stillbirth, infant mortality and child mortality were high with first births; they declined and then increased with parity after the fourth birth. Similarly, short birth intervals were found to have a deleterious effect on child health. For national development, the effect of parity and spacing on child health and growth might be an even more important consideration than mortality. The height and weight of children was inversely associated with family size. Various intelligence tests showed that scores decreased with increases in family size, and that effect had been shown to persist with social class. More specifically, malnutrition had been shown to be more common in large families and money spent per week on food decreased with increase in family size. Careful longitudinal studies had shown increasing incidence of common respiratory infections and gastro-enteritis with larger family size, presumably because of greater exposure. There was a clear association between the quality of maternal care and family size. The health of mothers was similarly affected. Parity directly affected maternal mortality, with a steady and sharp increase in risk after the third birth. All those manifestations were, of course, linked with

multiple causal relationships, and unobserved mediating variables might be more important than those observed. In particular, social and economic conditions would appear to be among the major underlying causes.

47. In recent years, increasing attention had been given to the proposition that the experience and/or expectation of high infant and child mortality might hinder significant movement towards lower fertility in much of the developing world. Substantial reductions in child mortality might be an important, although perhaps not essential means of encouraging a decrease in fertility in areas where both fertility and mortality were high. Efforts directed specifically towards the reduction of child loss and especially towards increasing perception of greater child survival, although not guaranteeing fertility decline, might shorten the demographically important lag between the decline of mortality and fertility rates. That did not mean that mortality decline would "lead to" or "cause" fertility decline. What might be true was that lower mortality either facilitated or was a necessary condition for the introduction of the incentives for lower fertility. Several studies had consistently demonstrated higher fertility in association with the experience or fear of child mortality, an association which was explained neither by socio-economic differentials nor in terms of the greater risks generally noted for higher parity children. All studies were quite clear that among couples experiencing child loss, attitudes towards contraception were less favourable, current usage was depressed and the timing of first use was delayed in comparison to couples without such loss. It would be from a prospective evaluation of the magnitude of those effects and their consequences for fertility reduction that the case for investment in an attack upon infant and child mortality would be most persuasive. Prospective field studies to quantify those effects for population at different levels of mortality and fertility, and in different geo-cultural regions, could make a significant contribution to the understanding of them.

48. Whereas better health had usually been considered a major cause of population growth, the point needed to be made that it could also contribute to a more rapid fall in birth rates by increasing the practice of family planning. There were obvious organizational and political benefits to be obtained by combining health, nutrition and family planning services. Integrated services allowed more efficient use of available supplies, equipment, transportation facilities, personnel and organizational structure. Integrated services made more sense to those using health services. Thus, family planning services might have minimal impact because they did not provide adequate follow-up care to acceptors and that could be most readily done in conjunction with other health and nutrition services. Political acceptability was increased by relating activities for which public demand was equivocal to care programmes that were spontaneously and continuously in demand. In some places, complications resulting from induced abortions might also lead to recognition of the need for family planning.

49. Rapid population growth in low *per capita* income countries required the expansion of low-cost services. The high cost, one-to-one doctor-to-patient relationship, plus the provision of ample modern hospitals or clinics of the type found in major urban centres could not do the job and could not be financed. But experiments were under way which provided integrated family planning and health services through regionalized delivery systems using auxiliary personnel and simplified techniques at very low costs *per capita*. Where basic health delivery systems existed, family planning could be incorporated at very little extra cost. Even where all services were lacking, the obvious advantages from better health and improved nutrition could be introduced at little cost to the economy because of the improvement in the quality of labour and raised labour productivity. Health and nutrition were themselves major objectives of development, since they contributed directly to a better quality of life. Their synergism, when integrated with family planning services, then represented a practical and constructive priority emphasis in social development.

#### D. Population, education and employment

50. In the developing countries, with annual rates of population growth of around 2.5 per cent and high fertility, the vast majority of the population was in the younger age groups. The growth of the potential school-age population might be as high as or higher than 4 per cent per annum. If one considered simultaneously the desire in such countries to shift towards universal education, at least at the primary-school level (frequently as a shift away from low current attendance levels, sometimes as little as 30 per cent), then one could visualize fairly high rates of expansion in the demand for education per year. A level of, say, from 5 to 8 per cent might become fairly common. Clearly, that would strain the existing budgets available for education and other welfare expenditures. In such circumstances, a critical question was whether quantity and quality were in conflict. A case in point was that of finding sufficient and qualified staff for such rapid rates of expansion.

51. Special attention given to the demographic aspects of education was reflected in the educational plans formulated for the developing regions. The educational burden on developing countries weighed heavier not only because the proportion of the school-age population was higher, but because the working population which had to bear that burden would be relatively smaller. A young age structure with prevailing pupil-teacher ratios and enrolment also implied the need for a larger number of teachers per thousand population. Since rapid population growth was associated with a young age-distribution, providing for the education of the school-age population placed a heavy demand on national resources. The reduction of fertility might have a substantial effect on educational demand. It had been estimated, on the basis of different assumptions concerning the time period required to attain a high enrolment ratio, that compared with what could be normal in the case of population growth at a relatively low level, under conditions of high fertility and population growth, either a very intensive educational development effort or a decline in fertility would be necessary to attain a given increase in enrolment ratios.

52. One of the issues in the growth of urban populations was the set of complex relations that had evolved between population growth, education and employment opportunities. Rapid growth in the number of children of school-going age, together with pressure for the early attainment of universal primary education and higher enrolment ratios in secondary schools had tended to lower the quality of education. On the other hand, as the result of increased schooling, even if defective, the rural educated considered themselves over-trained for farm labour, and the lure of the cities and the possibility of higher wages caused a considerable flow of migrants to urban areas or to larger towns. But the economy frequently could not expand sufficiently to absorb all migrants and new urban graduates into jobs that they felt were appropriate to their levels of education—although such jobs might have been available to them when the supply of graduates had been much smaller. The net result was urban unemployment, frustration because some graduates must take jobs at a lower level than they deemed appropriate, and a waste of resources, since some of the training was never utilized. Moreover, lower quality in education frequently meant that actual skills and productivity levels would be below that which the certificate implied, even for those who did obtain employment appropriate to their presumed certification level.

53. Even in the absence of population growth, the existence of considerable wage differentials between the agricultural and urban sectors and the frequent belief that life was more attractive in the urban areas, would lead to some degree of migration and therefore would increase the labour force in the urban areas. Hence, the basic problem arose out of wage rate differentials, employment possibility differentials and the different degrees of productiveness of urban *versus* rural life. Nevertheless, population growth contributed to the problem in two ways. On the one hand, it might contribute by lowering the real

consumption standard per person in the agricultural sector. On the other, it contributed by providing a greater number of people to migrate to the urban sector. If sufficient jobs were not created in the urban sectors, such migration led to an enlarged pool of urban unemployed or partially employed.

54. Furthermore, a point that must not be overlooked was that even if population growth was a link in the chain of causation, it was usually not the only cause. The demand for almost universal education was the significant link. Very low population growth would not entirely eliminate the problem, but certainly would reduce it. Furthermore, inadequate as some of the education might be, it might be considerably better than none. Also, partial employment in the city might still lead to a higher product than a fuller degree of employment in the countryside.

55. Looking at the impact of education on population, it must be emphasized that a great many correlations suggested the reasonable hypothesis that education, especially the education and employment of women, usually in combination with other influences, was one of the elements that facilitated or was responsible for the eventual sustained fertility decline that took place in the course of socio-economic development.

#### E. Population and social inequality

56. The most difficult problem to discuss was the relation between population growth patterns and social justice, in which income distribution stood as a crucial issue. In part, that was because there was really little understanding about the relationship between economic development and income distribution. To the extent that a generalization could be made, it was believed that more often than not, the early stage of development was characterized by a great inequality of income and opportunity. Under the prevailing patterns in many countries, the development process tended to aggravate that inequality still further. It would be misleading to state that that tendency was mainly due to the population growth patterns, although they did play a certain role. It was emphasized, however, that that should not lead to a neglect of the other factors, which were by far more important, but to place the population issues within a wider framework of socio-economic development policies supportive to the attainment of greater social justice.

57. As previously observed, rapid rates of population growth put a heavy burden on educational capacities and might hamper the improvement of educational quality. The same was true, *mutatis mutandis*, for health services. Those phenomena could not be viewed, however, except in over-all, aggregated terms. They had a clear impact on equality of opportunity and on the distribution of income. They affected particularly adversely the poorest population strata. Historical experience had demonstrated that fertility decline took place first in higher income groups. Such groups were then able to "invest" in their children's education, skills, and provide other types of opportunities. Through being the earliest to adopt a small family system, they achieved an advantage for their children as compared with lower socio-economic groups. To the extent that Governments provided relatively equal opportunities for education to all groups, that might counteract to some degree the influence of differential fertility rates. By and large, however, high fertility rates prevailing among the poorest sections of the population presented a formidable obstacle to overcoming the existing great inequality of opportunity.

58. Population growth also contributed to the problem through its effects on the relative distribution of labour in the two main sectors of the economy; internal migration and, particularly, the degree of employment. The problem of income distribution was, to a great extent, a question of productive employment. It was from that point of view that a rough picture of the impact of rapid population growth on employment and income distribution could be obtained.

59. An illustration was provided by the comparison of a developed country (from Western Europe) with a developing country (in Africa). The latter had a rate of labour force

growth of 3.3 per cent per annum compared with 0.4 per cent in the developed country. Hence, the developing country must create—per thousand population—eight times as many additional employment opportunities as the developed country. However, it was estimated that the resources of the developing countries for this purpose were only one fifteenth of the total resources per thousand population in the developed country. Thus, the available resources per job to be created in the developing country were only one one-hundred-twentieth of those available to the more developed country. If the developing country attempted to provide additional employment opportunities identical to those offered in the developed country, it could provide less than 1 per cent of the total number of additional employment opportunities needed.

60. Strong arguments had indicated that there was a significant age distribution impact on income distribution. Unemployment and relatively low incomes were more common amongst the young. Hence, countries with high fertility rates, where the proportion of young people in the population was higher, were also likely to have a more unfavourable income distribution. In addition, young populations had a high dependency ratio, that is, a smaller proportion of the population was within the working age groups; and, as a consequence, a higher ratio of family members were dependent upon those who worked. That obviously contributed to a lower level of consumption per family member. Thus, reduction in fertility, the consequent change in the age distribution, and a narrowing of the degree of differential fertility between socio-economic groups contributed to achieving a more even international income distribution. The same was true within countries where high fertility and higher dependency ratios might be found among the lower income strata.

61. The foregoing reasoning did not imply that a mere decline in the fertility of the poorest population strata would lead to a greater equality of opportunity. There existed a strong feedback interrelation between poverty and high fertility rates. Although that feedback had reinforced social inequalities in the past in many countries, the reverse of this mechanism might and should be used to achieve greater social justice. That open alternative should be clearly perceived.

### III. POPULATION AND SOCIO-ECONOMIC DEVELOPMENT

62. An interesting and, in the opinion of some, an important type of work undertaken in recent years had involved attempts to create models of the economy that reflected both important aspects of the process of socio-economic development and the impact of population growth on various sectors of the economy. Some obvious influences and sectors were the growth of the labour force, the effect of productivity on agriculture, the degree of migration from rural to urban areas, the demand for jobs in various categories, the demand for education, health and other welfare services, and the need to supply additional labour with the requisite additional equipment so that productivity per man was maintained or increased. For the most part, that work was in an experimental stage. There were grave problems involved in determining the appropriate form of the formalized system, the exact equations to use in order to reflect the behaviour of human economic agents—and in finding the necessary data to feed into the formalized system. It was hoped that work of that kind would lead to a more sophisticated understanding of the complexity of the interactions between economic and demographic variables. It was also hoped that formal models of that kind would clarify the exact meaning of certain concepts which were currently used rather vaguely, that they would increase the precision in the use of ideas and expression of relationships, and that they would suggest explicitly the data that would be useful for countries to collect, and so on. Clearly, should such models prove to be successful and lead to reasonably accurate predictions, that would help considerably in the work of calculating the cost and benefits of alternative population policies. There, when one used the word "policies", one meant not only

specific family planning programmes, but those policies which influenced social and economic variables or conditions, which in turn influenced the incentives of households in determining the desired family size.

63. Even if such models could not make successful predictions, they might help in the assessment (if they were well formulated and if adequate and proper data were available) of the consequences of alternative rates of population growth in specific development contexts. It was frequently of great interest to try to determine how sensitive a given development plan and its results were to different prospects of population growth. Also, models of that type, if they were reasonably reliable, would make it possible to determine the consequences if current population trends were to continue well into the future. As stated before, it was impossible to envision that current trends would continue indefinitely. However, it would be of interest to know what the consequences would be. There probably was enough knowledge currently available to assess the direction of future prospects and to encourage socio-economic development, inclusive of appropriate population policies and measures, in order to avoid unfavourable consequences of current demographic trends; but reliable models might make it possible to fashion policies that would move somewhat closer to optimal results, and suggest something about the urgency of such policies.

64. There was one very significant logical obstacle to building population impact models for reliable predictions. It was not possible to have a clear-cut line of causation between population growth at one end and consequences at the other end. The reason for that was that the consequences must depend upon what else was occurring in the economy simultaneously. For example, consequences of population growth with a 5 per cent rate of investment would be very different than with a 25 per cent rate of investment. Likewise, the consequences would be very different if innovations in agriculture shifted agricultural practices from a single crop per year to a double crop per year, as against those cases where no such innovations were undertaken or attempted. Also, the consequences were likely to be different if a great deal was spent on education and on-the-job training, which in turn affected the quality of labour, as against the cases in which very little was spent on education, or where education was ineffective. It was easy to think of many other examples. The main point was that such models must have limited applicability, since it was difficult to conceive that they could predict enough about the other inputs into the economy necessary to obtain accurate information on the significance of the rate of population change. Nevertheless, such models might be extremely important in suggesting the different consequences of population change under alternative exogenous input-time patterns. Only the future could tell how useful such models would turn out to be.

65. In the past decade and a half, considerable work had been done in attempting to formalize the theory of fertility, that is, to create formal models along the lines of economic theory or socio-economic theories. That work had assumed that, to some degree, economic conditions created pressures on families to calculate whether or not it was desirable for them to have additional children. For the theory to make sense, it was not important to assume that everyone made such calculations, but only that a sufficient number of households did so. Those theories presumed that what really mattered was the motivation for family size limitation, and that family planning techniques were, for the most part, facilitating devices. In general, those theories emphasized the benefits and costs that a representative couple would take into account (and the psychic evaluation of the benefits and costs) in order to determine the number of children they desired.

66. There was considerable controversy as to which of the variety of specific models of this type happened to be correct. In general, considerable emphasis was put on the costs of children. That involved the costs of nurture, education, the

income forgone by the mother because she was prevented from working in order to care for children, or by the child who sacrificed income from work when he went to school. In addition, the psychological cost of family planning was frequently not taken into account. Space limitations prevented discussion of any of those specific theories. The econometric work that had been employed to test some of these models showed that only a small amount of the variance in fertility rates either between occupational groups, other groups, or countries, or over time, could be explained by such models. Nevertheless, it had been argued that that work was of importance since it was hoped that eventually a formalized model of fertility determination would be developed that could explain a considerable amount of the change that took place.

67. Should a fairly successful socio-economic model of fertility determination be worked out eventually, then it would be likely to be of value for policy purposes. Such a theory, if applied carefully to real countries, should enable policy-makers to determine what aspects of the changes that were taking place in the economy, and what socio-economic changes that were controlled by government, such as the tax system or the availability of housing, contributed to the change in fertility and to what extent they did so. It might turn out that some changes in policy might reduce fertility more rapidly or that some policies directed to reducing fertility in fact increased fertility. Some would argue that that was an area well worth promoting, but others would suggest that other research areas were more productive. The need existed to investigate much more carefully than was done at the Symposium where the most fruitful research frontiers were likely to be. Nevertheless, despite the controversy, if work in that area turned out to be successful, it would help Governments to a considerable extent to fashion policies, if they wished to do so, and to implement such policies, in order to come closer to reaching their objectives.

68. Some recent attempts had been made to build models describing the interactions between population variables and relevant economic and social variables. In those models, population was viewed as an inseparable component of the entire development process. One such model being developed was discussed at the Symposium. It involved a highly disaggregated model, based on a general equilibrium input-output consistency model with built-in supply constraints. Having a high degree of disaggregation and endogeneity, the model made it possible to trace the influence of a given exogenous factor through the entire course of relationships which formed vital links in the chain of economic and social processes.

#### IV. CONCLUSIONS AND IMPLICATIONS

69. The problem of population and development had become one of world-wide concern. Population in developing countries was increasing at unprecedented rates. By almost any measure, the great disparities in levels of living between more developed and developing countries were widening. The increasing concern with population trends and their impact on socio-economic development patterns reflected in the convening of the World Population Conference, 1974, and the formulation of the World Population Plan of Action, was fully justified.

70. It needed to be emphasized that the problems posed by development and population were not separate issues. The understanding of the socio-economic determinants of population trends was essential for a fuller comprehension of the development process. Consideration of the nature and consequences of demographic trends for development was a prerequisite of the formulation of appropriate measures and strategies to improve levels of living.

71. Strong feedback effects existed between population and development. Rapid population growth in the developing countries was fundamentally brought about by the improvement of health and reduction of morbidity, themselves among the basic elements of individual and social well-being. In turn, rapid economic growth and social progress, provided their patterns

were appropriate, were likely to bring about a decrease in fertility. That again facilitated economic and social improvement.

72. Voluntary, informed decisions about the number and spacing of children were basic rights of each couple and are a constituent part of social welfare.

73. Population policies, however designed, could not by themselves solve the major problems of the world and a preoccupation with population should not divert attention from critical issues in the world development process. However, in conjunction with other policies, they could greatly facilitate the solution of those problems and contribute to a more rational development of humanity over a longer time horizon.

74. Population growth was not always an obstacle to development; and lower population growth did not automatically bring about faster development. Nevertheless, many countries found that lower population growth, and the characteristics associated with it, would facilitate the solution of their basic social and economic problems. In addition, there was, in the Symposium, a general consensus that very high rates of population growth were usually an obstacle to development.

75. Since high birth rates were usually prevalent primarily among the less privileged sectors of population which maintained the traditional modes of production and social organization, development policies—including population policies—should emphasize fostering socio-economic change in those sectors. Elements of such policies included a balance between agriculture and industry in development planning, sufficient employment opportunities, a more equitable distribution of income and special concentration on the provision of education and of employment opportunities for women outside the home. Such measures would help to fulfil the basic development objective of social justice and contribute to favourable changes in patterns of demographic behaviour.

76. In considering the relation of population to development, one must distinguish the different positions and diversity of circumstances that existed. In most developed countries, fertility was low and mortality from infectious disease had been reduced to very low levels. While there were in those countries social and economic problems associated with population trends and characteristics, they were usually of a different nature or degree from those in developing countries. The most prominent problems included pronounced irregularities in the age and sex structure, increasing numbers and proportions at old ages and inadequate access among the relatively impoverished segments of the population to the information and means needed for voluntary control of fertility. In addition, much attention was directed to such questions as reducing the degradation of the environment, fighting pollution and preserving natural beauty. Those problems were caused only in a small part by population growth and were mostly the consequence of inadequate guidance of modern technology and modern means of production and excessive urban concentration.

77. The precise nature of the interrelations between population and economic and social variables in the developing countries differed among regions and individual countries. One must distinguish between countries rich and poor in resources, between large and small countries, between densely settled and sparsely settled, those which had high and even growing population growth rates and those where rates had begun to fall, differences in degree of urban concentration, cases in which agricultural output was easily expanded as against those in which it was difficult to do so, and so on. It should be noted that in different cultures, traditions may differ (that is, with respect to the role of women or to the importance of having sons) in such a way as to alter the links between the policies that might be deemed to be desirable and the action and programmes that were feasible.

78. Rapid population growth in developing countries with predominantly young age structures was likely to persist for some time. Resources for socio-economic development were limited. Hence, rapid population growth could put a strain on

the possible budgetary allocations made available for social goods and services, such as health services, education, maternal care, the education and training of women and the provision of social security. Reducing population growth was likely to lessen the constraints on the provision of those elements of social progress.

79. Socio-economic development was a powerful force in improving the qualitative characteristics of human beings, both physiological and intellectual, which conversely made a significant contribution to socio-economic development. Improved health conditions might tend to have the net effect of increasing population growth in the short run. However, the expansion of health services in the widest sense, including the use of auxiliary personnel, would contribute to lowering fertility, directly when effectively integrated through promoting family planning utilization, and indirectly through the changing attitudes towards fertility resulting from declines in infant mortality.

80. The reduction of morbidity and mortality was a high priority in any type of society and met both individual and social needs. It was thus an essential goal of development, aside from its indirect contribution to economic progress.

81. High rates of internal migration and urbanization were characteristic of many developing countries and were also related to high rates of over-all population growth. In spite of the tendency for long-term urban residents to have lower fertility, newly arrived migrants in the cities tended to maintain their rural fertility patterns for some time. Such migration was again partially the result of restricted employment opportunities in certain low-productivity agricultural areas, in which the flow away from low-productivity agricultural areas was aggravated by high fertility. Population policy should include efforts to influence the flow of internal migration in order to produce a more balanced future distribution of population. In any event, rapid urbanization would require an appropriate allocation of resources to provide urban infrastructure and low-cost housing.

82. Population growth, age structure and rural-urban migration were important factors making for increased educational demand in developing countries, while the goal of universal primary education and higher rates of enrolment at other levels also contributed significantly to the prevailing pressures on the educational system.

83. The integration of women in the development process through the provision of their widespread inclusion in the educational, social, political, and economic opportunities was likely to create the conditions that would foster the reduction of the birth-rate. That, in turn, would improve the status of women and their ability to participate in social and economic life. Adequate employment opportunities for women should therefore be provided.

84. Lack of access to education, insufficient nutrition and poor health tended to perpetuate inequalities in opportunity and in income distribution. That, in turn, prevented fertility from

declining. Social and economic policies should, therefore, as a matter of high priority, pursue programmes to improve income distribution and social justice. At the same time, programmes to reduce fertility in the least privileged strata of the population would work in the same direction.

85. It was necessary to increase knowledge of the inter-relationships, evolve better analytical methods, improve data collection and overcome the acute shortage of qualified personnel in socio-economic and demographic research. Greater international co-operation was needed in that area.

86. Population policy should in every case be an integral part of development planning and policies. Development programmes that encouraged faster economic growth and appropriate social patterns were essential to facilitating solutions to population problems. By the same token, international policy measures directed to more rapid progress of the developing countries by way of trade, aid and transfer of technology would also contribute to the same end. The world community should be made fully aware of those considerations.

## Appendix

### AGENDA

1. Election of officers
2. Adoption of the agenda
3. Population and development in perspective
  - (a) Population and development in historical perspective
  - (b) Prospects for demographic change and economic and social development
4. Economic and social implications of alternative demographic prospects
  - (a) Population trends and economic growth and structure
    - (i) The growth of income and its determinants
    - (ii) Industrialization and agricultural development
    - (iii) Urbanization and the geographical distribution of population
  - (b) Population trends and the demand for goods and services
  - (c) Population trends and the distribution of income, and economic welfare
5. The implications of prospective trends of economic and social development for demographic change
6. Population and development in regions and selected countries
  - (a) Regional population and development trends
  - (b) Demographic aspects of economic and social development in selected countries
7. The quest for optimal patterns of demographic, economic and social development

## Annex II

# REPORT OF THE SYMPOSIUM ON POPULATION, RESOURCES AND ENVIRONMENT

### INTRODUCTION

1. The Symposium on Population, Resources and Environment was held at Stockholm from 26 September to 5 October 1973. It was one of a series of symposia held in preparation for the World Population Conference, 1974, as recommended by the Population Commission at its sixteenth session<sup>1</sup> and endorsed by the Economic and Social Council in its resolution 1672 (LII).

2. The 1974 Conference, as endorsed by the Economic and Social Council in its resolution 1484 (XLVIII), is being organized as a meeting for Government representatives. It will differ from the World Population Conference, 1954, held at Rome, and the World Population Conference, 1965, held at Belgrade, which were technical meetings. Therefore, a series of scientific activities was planned in preparation for the World Population Conference, 1974, to identify and clarify critical problem areas at the technical level.

3. Among those pre-Conference activities were four symposia on: population and development; population and the family; population, resources and environment; and population and human rights. Those were technical meetings of experts participating in their personal capacity.

4. The Symposium was organized by the United Nations in co-operation with the Government of Sweden, with the financial assistance of the United Nations Fund for Population Activities. The agenda for this Symposium is reproduced in the appendix. Thirty-five eminent scholars from a variety of scientific disciplines with particular concern on some aspects of population participated in the Symposium. A number of technical papers were specifically commissioned for the Symposium; other papers were submitted by various agencies and organizations of the United Nations system.

5. The Symposium was opened by Alva Myrdal, a Cabinet Minister, who welcomed the participants on behalf of the Government of Sweden. Mrs. Myrdal referred briefly to her country's experience as the host of the United Nations Conference on the Human Environment, 1972, which had been able to achieve a remarkable success in the negotiations of new and controversial issues among countries. She admitted, however, that population questions were more complex in nature than the environmental issues. The Secretary-General of the World Population Conference expressed the appreciation of the United Nations to the Government of Sweden for its invitation to convene the symposium at Stockholm. He observed, among other things, that the United Nations Conference on the Human Environment had recommended that the World Population Conference, 1974, should devote special attention to the questions of population in so far as they related to the environment of human settlements. He reminded the experts that the Symposium was in a particular position to formulate scientific views on those and other pertinent issues before the Conference. He particularly emphasized the recent changes in the pattern of human settlement and urbanization as well as their profound implications on social and physical environments.

6. The Director of the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat, in outlining the particular issues relevant for the elaboration of the Symposium, drew the attention of the participants to the danger inherent in indulging in emotional speculation, exaggeration and dogmatism during the deliberations. He warned the participants of apocalyptic statements, although he admitted that, as in all cases, the fundamental difficulty in an empirical approach to the solution of the problems of population, resources, environment and development in their complex interrelations lay in ascribing to each factor the appropriate weight it deserved. The Deputy Executive Director of the United Nations Environment Programme recalled, among other things, that at Stockholm in June 1972, the world, for the first time, had acknowledged that something had gone wrong with the way in which man had been managing his environment. He stressed that good management of the earth's resources was a key and that if the countries of the world managed the planet carefully, it would be possible to optimize food production by controlling pollution, reclaiming damaged land and developing modern agriculture. He expressed a belief that in a well-managed world, the upper limit to the number of people that the earth can support comfortably might be raised significantly.

7. L. Tabah served as Director of the Symposium; G. Adler-Karlsson of the host country was Co-director; Kathleen M. Jupp, Co-ordinator, World Population Conference, 1974, and World Population Year, 1974, Population Division, acted as co-ordinator; and R. A. Agile of the Population Division acted as the Technical Secretary. Owing to the nature and scope of the Symposium, there were several chairmen, varying according to the topic of the agenda as described below: A. Herrera chaired the meetings related to agenda item "Population and natural resources"; R. Revelle, "Population and environment"; S. H. Ominde, "Population and settlement"; H. Uzawa, "Impact of technological innovation and transfer on population"; J. Fisher, "Critical review of population-resources-environment models"; A. Bose, "Interactions of population, resources and environment"; and P. Hauser chaired the final sessions for the adoption of the Symposium report. R. Ridker acted as the Rapporteur of the Symposium.

### I. BASIC THEMES AND CONCLUSIONS

8. The objective of the Symposium was to review recent scientific knowledge concerning the interrelationships of population, natural resources and environment in order to provide background for the Government representatives to the forthcoming World Population Conference to help them in their deliberations about the role that population policy can play to improve future events. Underlying this interest was a series of questions posed to the participants on its opening day. Why was there growing concern with population growth? Were recent warnings that the world was in danger of running out of resources correct? Was man seriously disrupting the environmental systems upon which all life depended? To what extent could technology overcome those problems? What were the implications of the highly unequal distribution of population in relation to resources and incomes in the world? How were the changes in human settlement patterns likely to affect the

<sup>1</sup> See *Official Records of the Economic and Social Council, Fifty-second Session, Supplement No. 3*, para. 166.

situation? Were such changes, along with other socio-economic changes, likely to ameliorate environmental problems directly (by reducing destructive uses of its environment) or indirectly (by affecting demographic variables themselves)?

9. The discussion of those and related issues ranged far and wide. In part, that occurred because of the interconnectedness of the variables of main interest: a change in population size, distribution or growth rate within specific areas not only affected resource and environmental variables, but those variables could have significant effects on population parameters as well. It also occurred because population was only one of the many factors—and not always the most important one—causing resource and environmental problems. The composition, rate of growth and geographic distribution of economic activities, the technology utilized, and a host of socio-economic, institutional and political factors were all extremely important in determining the character of the relationships between the three central variables of the Symposium.

10. Lastly, the diversity of the discussion reflected the problems that the members of the Symposium had in trying to answer those difficult questions. Such concepts as resource exhaustion, environmental deterioration and limits to growth were not very precise. The questions posed could not be answered in the abstract. Ultimately, the answers must be based on empirical evidence for specific countries, specific resources and specific environmental threats. But for most of the issues at hand there was not much empirical data that could be used for scientific analysis of future opportunities and constraints, or to understand historical processes.

11. In a situation such as that, where the evidence was poor, the questions broad and general, and the participants from a variety of countries, professional fields and political backgrounds, it was, perhaps, inevitable that there should be significant differences of opinion. While those differences can be fully appreciated only by studying the individual papers presented at the meeting, a brief, initial characterization is useful in order to put into perspective the broader conclusions that were finally reached.

12. To a large extent, those differences centred around attitudes concerning two different kinds of limits or barriers to human development and progress. First, there were what might be called ultimate, or natural, limits to material growth. Those had to do with the fact that growth within a finite space could not continue for ever. Scientific and technological advance could postpone the time and moderate the way those limits were reached, but it could not repeal fundamental laws of nature. Ultimately, therefore, all countries must choose how they wanted population and material economic growth to cease, through the operation of natural forces, or in a manner and at a time chosen by man. Secondly, there were proximate, or man-made, barriers to growth and human development. Those were the institutional, political and international conditions that restricted the ability of individual countries and some groups within countries to take full advantage of the available resource base. The unequal distribution of income and power in the world, both between and within countries, bore stark testimony to the presence and seriousness of those barriers.

13. There was little disagreement about these proximate barriers. All participants emphasized their importance in creating and perpetuating poverty in many areas of the world, the need to give top priority to efforts to eliminate them, and the difficulties that rapid population growth created for such efforts. Differences about the means that should be used to correct the situation and about the importance of population growth in relation to other casual factors were, of course, present; but many of those could be related to differences in the socio-economic situations of various countries. One of the important themes to emerge from the Symposium was the diversity of circumstances to be found around the globe.

14. There was more disagreement about the ultimate limits. If the world, or major portions of it, were approaching such limits within, perhaps, the subsequent 100 years, it was consid-

ered imperative that population and material economic growth be stopped, or at least significantly slowed, in the near future. Given the enormous momentum involved in demographic and socio-economic processes, there was no time to lose. But if humanity was still several centuries away from the ultimate limits, the policy implications would be much different. In that case, there would still be reason for concern about the speed with which population, resource consumption and environmental disruption increased, since high rates of change in those variables could throw up problems faster than solutions could be found, force mankind to live with greater uncertainty and risk, and make the elimination of the proximate barriers more difficult. But if it was not imperative to limit growth in the immediate future, according to that view, other considerations could and should play an important role in decisions.

15. The problem was ignorance of the factors determining such ultimate limits. The mineral and energy reserves ultimately available to man were unknown. Unknown also were how much new land could be made suited for agriculture, the extent to which additional fresh water-supplies could be developed, the seriousness of the disruptions to ecosystems caused by man's efforts to acquire those resources or the timing of technological advances required to extend current limits. Nor was much known about behavioural responses likely to result from growing resource and environmental pressures. It was agreed, however, that far more serious efforts must be devoted to overcoming those areas of ignorance and that until they were overcome, mankind must search for some strategy that took appropriate account of the uncertainties and risks involved. In most cases such a strategy must involve serious attempts to contain the growth in demand as well as efforts to break supply constraints; one without the other was unlikely to be sufficient.

16. A second important issue to emerge at the Symposium pertained to the relative importance of different factors in creating or aggravating resource and environmental pressures. It was generally agreed that three broad sets of factors were involved: population; *per capita* output; and a set of qualitative factors, such as institutions, policy and technology, that determined the material content of total output, its allocation and the way it was used.

17. Those who stressed the importance of reducing population growth argued that there were few if any additional advantages to be obtained from further population growth at the current stage in human history. No matter where a country was with respect to the ultimate limits to growth, a higher population growth rate meant more rapid depletion of domestic and international resources, greater pressures on the environment, more dependence upon continued rapid technological developments to solve the problems, less time to overcome the social, institutional and political barriers to progress, fewer social options and a continued postponement of the resolution of the problems caused by past growth. In contrast, a lower population growth rate bought time, resources and additional options: time to find solutions; resources to implement solutions; and additional freedom of choice in deciding among various patterns of living.

18. The participants holding that view recognized that a slow-down in economic growth might provide similar advantages in the developed countries. Indeed, one study cited in the Symposium indicated that a reduction in economic growth for developed countries would be likely to reduce resource consumption and environmental pressures by more than would a further slow-down in population growth. But, they argued, growth in the economy could be utilized for other ends. While it added to problems that needed solution, it also added to the capacity to solve problems. It was difficult to find similar offsetting advantages from rapid population growth.

19. No one suggested that economic growth in the poor countries should be stopped, but several participants did argue in favour of a slow-down in material economic growth in what some called the "overdeveloped countries". Reference was made to the disproportionate share of the earth's resources consumed

by those countries and it was claimed that their consumption patterns were wasteful and environmentally detrimental. In essence, the argument was that *per capita* income was already so high in those countries that the advantages, domestically and internationally, of additional increases in output were no longer greater than the disadvantages.

20. A third position to emerge at the Symposium was that the composition of output, its distribution and how it was used were more important than its magnitude in causing resource and environmental problems. Instead of attempting to influence population growth or growth in *per capita* output, therefore, policy emphasis should be placed on modifying the social structure, institutions and preferences that guided and allocated material flows within and between countries.

21. In the end, a number of participants came to feel that each of those positions contained important insights and should not be considered mutually exclusive. The wisest course was to develop policies that took account of all three positions. But so much depended upon the particular situation in which different countries found themselves with respect to population concentration and growth rates, the size of the resource base, and the relationship between economic growth, unemployment, and income inequalities, that few generally valid recommendations could be made, at least until some of the more glaring gaps in the understanding of the relationships were filled. Moreover, in establishing policies, each country would want to take into account the capabilities, needs and aspirations of its own population.

22. With this background of different perspectives presented at the Symposium, the areas of common agreement can now be discussed. These areas are listed below, much as the participants drafted them on the final day of the Symposium:

(a) The Symposium examined problems of population, resources, environment and development in many of their manifold and complex interrelations, with the consideration that the elimination of absolute poverty was the most important task facing mankind;

(b) With sensible and prudent use, the earth's minerals, energy, land, water and other natural resources appeared to be potentially adequate to cover the necessities of the growing world population for many decades to come;

(c) However, even currently, in various regions of the world, serious shortages of some resources were evident and there was a growing threat to the environment. Some of the reasons for that included uncontrolled and irrational use of resources, absence of appropriate global, regional and national policies, inadequate socio-economic institutions and unsound biological and technological practices, as well as increasing demands resulting from population and economic growth. The resolution of those problems would not come quickly, easily or cheaply;

(d) Given current levels of technology and social, economic and organizational structure, current rates of energy consumption might not be able to continue for many decades ahead. Since such rates of consumption were difficult to change, the world could face very serious problems in the near future. Conservation policies would help and should be promoted vigorously;

(e) In some countries, resource and environmental problems were acute because of rapid population growth, coupled with inadequate institutional and social structures. That might lead to serious crises, including food and water shortages, hunger and increased rates of morbidity and mortality;

(f) Barring dramatic increases in death rates, it was virtually certain that the world population of 3.8 thousand million, would become at least 6.5 thousand million by the end of the century. That would occur despite efforts in many countries to implement family planning programmes, because of the enormous momentum built into population growth by the relatively young age of populations resulting from recent fertility rates. Unless policies to reduce fertility were extraordinarily

successful, world population was considered unlikely to stabilize before the middle of the next century at less than 12 thousand million. That increase would create additional obstacles to economic and social development, problems that could not be surmounted easily, plus many serious rural and urban environmental problems, in both developed and developing countries;

(g) Along with that growth in numbers would come an unprecedented increase in the number of persons living in urban areas. By the year 2000, it was possible that more than half of the world population would live in urban regions, 80 per cent in developed countries and 40 per cent in less developed countries. In absolute terms, that would mean an increase of nearly 2 thousand million city dwellers—about 450 million in developed and 1.5 thousand million in the less developed countries—in the course of one generation. Such huge increments to urban human settlement would have vast global and national repercussions and would require major policy decisions and investment programmes just to maintain current levels of urban life, let alone improve it;

(h) That trend towards the concentration of population in urban and metropolitan areas would present mankind with the prospect of changes in life-styles of unprecedented magnitude. Many human beings who, until recently, had resided in small communities, would have to adjust to high densities of mass societies. Changes might be anticipated in human interrelationships, family structure and function, systems of preferences and amenities, social organization and institutions. The traditional order would be undermined and many frictions could become manifest in personal and social relations. On the other hand, urbanism as a way of life would also open up new vistas for the expansion of human potentials, including new opportunities for education, science, technology, the arts and variations in life-style;

(i) The explosive increase in urban population would require bold and innovative policies and programmes if the frictions and problems in the transition were to be minimized and the positive gains of urban living were to be realized. Governments of all countries and especially the developing countries must mobilize their imaginations and resources on an unprecedented scale to prepare for expected social, cultural, economic and administrative as well as the physical changes;

(j) In many developing countries, a prerequisite of the improvement of agriculture and the rural economy might be more equitable distribution of land and access to public and private goods. To the extent that land reform succeeded in giving land to the landless agricultural workers, it might also have a favourable impact on fertility. One cause of rural-urban migration in most of the developing regions was economic and social stagnation in rural areas, as manifested in the high differential between rural and urban wages, the drab and unexciting social image of rural life and the absence of public services. Rural development would, no doubt, lead to some lessening of rural out-migration, but it must be realized that with increased labour productivity in agriculture there might be a new impetus to migration from the countryside to the cities. That called for a suitable national strategy to obtain a better balance in settlement patterns between urban and rural regions;

(k) A critical issue in the poorer regions of the world was not merely how to build cities that cost less, but cities that would provide more benefits to the poor. The "low-cost housing" concept was examined and found inadequate. The type of housing envisaged in the concept was generally still so expensive that it was beyond the means of the urban poor. The needs of that majority were mainly for jobs and essential services—transport, water and waste disposal—and only secondarily for brick or concrete houses. Such houses in tropical countries were not essential and their construction could be deferred. The concept of "no cost housing" was suggested as a possible alternative, the aim being to provide opportunities for the urban poor to construct houses themselves on their own land with materials they could afford, even if quality and

durability were to be sacrificed. The forthcoming United Nations Conference on Human Settlements at Vancouver in 1976 would take up those matters in detail;

(l) The problems outlined above required a unified analytical framework to be understood properly and an integrated set of policies to be effectively resolved. The typical sector-by-sector approach utilized by most administrations was no longer adequate. Participants of the Conference at Bucharest were therefore urged to give serious consideration to ways of conceiving a unified approach to development planning, and to methods of managing resources that would harmonize development goals with the need for environmental protection;

(m) As far as the developing countries were concerned, consideration of the problems mentioned above reinforced the conviction shared by many that steady economic and social improvement could not be achieved by merely following the historical development path of industrialized countries. New societal goals must be defined and development patterns outlined that would make the best possible use of available resources, including manpower. That would require new, appropriate technologies and far-reaching institutional changes. The new strategies should be ecologically sound, giving due consideration to environmental impacts. All countries were urged to establish population policies—that is, policies with respect to birth and death rates and migration—as an integrated part of eco-development policy;

(n) Participants were convinced that long-term and lasting solutions to the environment-resources-population-development complex in the rich countries would require a thorough redefinition of societal goals. In particular, wasteful uses of resources and uncontrolled growth of material consumption should be drastically curtailed. That was considered all the more important because an average person in a rich country, through his consumption, exerted a much greater pressure on the world's resources and on the global environment than did an average person in a poor country;

(o) A new perspective was considered necessary for Governments in the rich countries, which had historically been involved in promoting economic growth without regard either to its internal environmental impact or to global resources and environmental balances. The Symposium urged those Governments to redefine development goals so that increases in material consumption would cease to play the most central role. Emphasis instead should be put on widening the range of social and cultural services, so as to achieve a less resource-intensive and environmentally disruptive development profile. Such a shift would require changes in the pattern of society, including a drastic reduction of inequalities, and institutional changes. It was thought that political leaders needed to consider the range of desirable alternative futures;

(p) Efforts that could be made by each country on a national level, taking into consideration local conditions, demographic factors, resource availabilities, historical contexts, cultural patterns and political preferences, had been considered thus far. In addition, there were a number of important regional and global problems that required the common endeavour of all countries for resolution. The United Nations Conference on the Human Environment had outlined some steps to deal with threats to environmental resources that were the common property of all peoples on earth. It was understood that institutional changes would have to be made at the international level before a rational and equitable management of the world's material and environmental resources could be achieved. While that was a very ambitious task, mankind had reached a stage of its history in which such a reorientation was necessary in order to avoid social conflicts created by the unequal use of resources and technology within and among countries and to avoid possible ecological disasters;

(q) No policies to deal with problems of survival and growth on a global basis could win agreement unless they included measures to ensure that the poor of the world should achieve a reasonable improvement in living conditions;

(r) Some concrete international actions could be considered immediately as steps in the right direction. Those included a world food security plan of the type proposed by the Food and Agriculture Organization at its seventeenth session; a world programme to provide clean water to the 50 per cent of the world population that, according to the World Health Organization, did not have access to such water; international efforts to develop urban housing at a cost poor people could afford; international agreements to control dumping and manage the extraction of minerals in the oceans; and a coupling of the "earth-watch" programme with co-operative international research into the nature and functioning of the world's basic life-support systems;

(s) Whatever sense of optimism may be read into this report presupposes, among other things, rapid scientific and technological progress in certain directions. Goal-oriented research efforts must be of a magnitude that would leave little room for anti-scientific attitudes and polarization. Ways must be found to reverse the recent declines in research budgets and in student enrolment in engineering and science in some developed countries;

(t) Put another way, the Symposium concluded that: if appropriate research efforts were not mobilized immediately; if the problems of the next century were approached on the basis of the simplistic ideologies of the last; if irresponsibility under the cloak of sovereignty were tolerated further, and if the rich countries did not give the problems of the underprivileged more serious attention, then research priority should be given to relief and emergency planning, because a continued irrational use of human and material resources would produce serious problems;

(u) The world was faced with unprecedented problems in the interrelations of population, resources and environment. Indefinitely continued growth in population and material consumption was impossible in the finite space of the world. Planetary disaster was not immediately in prospect, but it was important boldly to face up to the formulation of national, regional and global policies to avoid the deterioration of the biosphere and to improve the quality of life for all of mankind.

## II. RESOURCES AND ENVIRONMENT

### A. Determinants of resource and environmental pressures

23. Resource and environmental problems arose primarily in conjunction with the flows and use of minerals, energy and other resources through the economy. Other things remaining constant, that flow was closely related to the over-all size of the economy, an index of which was gross national product (GNP). Since GNP was by definition equal to population size times *per capita* GNP, that relationship was a convenient starting-point for discussions of the resource and environmental consequences of growth in population and the economy.

24. But in any long-run analysis other things did not remain constant. If technological advances made it possible to obtain the same output with less resources, or if tastes shifted away from material goods towards services, the impact of a change in population and *per capita* GNP on resource requirements and the environment would be less; on the other hand, if land of poorer quality must be called into production to satisfy growing food requirements or if more persistent forms of pesticides were utilized, the environmental problems associated with a given population and *per capita* GNP would be greater. The situation was complicated by the fact that most of the intervening variables were poorly defined; and they were characterized both by time lags—often quite long, between the introduction of materials into the economic system and their environmental effects—and by interactions among the variables and feedback loops, for example, from environmental changes to demographic changes. As a consequence of those complications, plus ignorance of the numerical quantities involved, no simple, yet reasonably accurate, way had been found to specify the relationships among the variables of principal inter-

est. It was possible, however, to list the major determinants affecting resources and the environment and try to keep all of them in mind when considering specific resource or environmental problems. For convenience, those determinants could be grouped into seven categories as summarized below:

(a) *Demographic variables.* It was not just the size and rate of growth of the population that counted, but in different contexts, the sex and age structure, the number and size of family units, and labour force participation rates might all be important. For example, they all influenced the volume and composition of consumer goods as well as the level and character of economic activities;

(b) *Level of living.* Quite clearly, that factor, measured very roughly by *per capita* GNP or income, plus its distribution among countries and among individuals within countries, played an important role in determining the level and types of material flows through both the world and national economies;

(c) *Style of living.* The style, or pattern of living, was important in determining the composition of output and the way that output was used. An increase in *per capita* GNP would have less effect on the environment if it was accompanied by a shift towards services than if the composition of output remained constant. Similarly, a style of living that included throw-away bottles and high-compression motor-cars was more detrimental to the environment than one that paid less attention to packaging and more to mass transit;

(d) *Geographical distribution.* The geographical distribution of both population and economic activities could have a significant impact. A high degree of concentration of those activities, for instance, made the absorption and assimilation of pollution through natural processes more difficult, but it reduced the cost of the collection and transportation of waste materials for recycling and waste treatment;

(e) *Technology.* The technologies used at each stage of economic activity, ranging from mining and the transformation of energy, through transportation and production to the emission and treatment of wastes, could have significant effects on the nature and extent of environmental and resource problems. About the same output of industrial products could be obtained, for example, using large or small quantities of water, or by recovering wastes or emitting them into the environment;

(f) *International relations.* Often ignored but likely to play an increasingly important role in the future were international relations among countries, particularly the terms of trade at which resources and finished products could be obtained from abroad. For example, the decision to set up atomic energy plants, with all the environmental problems involved depended in part upon the cost of alternate fuels, especially imported coal and oil;

(g) *Institutional and policy factors.* All the foregoing determinants were affected by such factors as patterns of capital and resource ownership, the organization of the market, the norms and rules governing waste disposal and land use, import policies with respect to fuel and minerals, decisions concerning the allocation of public investments and so forth. If, for example, the use of common property resources, such as air and water, could be appropriately priced, there would be considerably more incentive to conserve them. Similarly, the technologies used by less developed countries might be quite different if they had the means to develop technologies themselves rather than having to rely on transfers from developed countries.

25. The relative importance of each of those factors depended upon a number of considerations, among which four were especially important. First, it depended on the time horizon considered in the analysis. If the concern was for the subsequent few years—the time horizon of the typical economic planner—investments in municipal water and waste-disposal plants and restrictions on the use of motor-cars would be more effective than a slow-down in population or economic growth. In some intermediate time horizon, all seven factors would come into play. In the very long run, at least according to

many ecologists, population would emerge as perhaps the single most important factor.

26. Secondly, it depended upon the rate at which the various factors changed. In many developed countries, growth in *per capita* GNP and shifts in the composition of output, for example, towards more energy-intensive goods, were more important than population growth. In some developing countries with high rates of growth in population but not in *per capita* GNP, the relative importance was reversed.

27. Thirdly, the relative importance of those seven factors depended upon the particular resource or environmental pressure under consideration. Population size was relatively more important than *per capita* GNP and its distribution in determining the need for resources for food production, but the latter were relatively more important in so far as mineral and energy requirements for consumer durables were concerned. The environmental problems associated with slash-and-burn agriculture, farming of marginal land, rural and urban water-supply and disposal of human waste were more related to demographic variables than were the environmental problems associated with transportation. Lastly, relative importance depended upon the country and its stage of social and economic development. That was certainly the case with respect to developed and developing countries, both of which had serious, though often different, environmental problems, but it was also the case within each of those heterogeneous groupings of countries.

#### B. Population and resources

28. The discussion covered three broad classes of natural resources—land and water, minerals and energy—and then environmental problems, beginning with global considerations and moving on to the special problems faced separately by the developed and the developing countries. The breakdowns were adopted for purposes of exposition only, without pretence of covering the diversity of circumstances involved.

##### 1. Land and water for production of food

29. Considering the amount of potentially arable land in the world, the amount of water that currently ran off to the sea but that could be captured for irrigation purposes, and the high levels of yield achieved through the use of good management and modern, high-yield seeds and proper fertilizers, pesticides and water, the earth appeared capable of providing an adequate diet for many thousands of millions of persons more than were currently alive. Indeed, the detailed calculations of one member of the Symposium indicated that with inputs and technology comparable to those of the typical Iowa corn farmer, as many as from 40 thousand million to 50 thousand million people could be provided with an adequate diet.

30. But that conclusion must be placed in the context of obstacles to the expansion of the earth's cultivated areas, increased yields and containment of environmental effects. Since the latter were dealt with later, reference was made in the discussion only to obstacles involved in increasing agricultural production.

31. Before significant expansion could take place in the humid tropics, new technologies must be devised. There was reason to believe such technologies could be developed, but they were not currently available. Large capital investments were required for any major expansion of the cultivated area; indeed, one participant estimated that they would be of the order of from \$500 to \$1,000 per hectare. Some mechanism more effective than current international trading arrangements must be found to counteract the uneven distribution of population and the availability of potentially arable land. To increase yields on currently cultivated land, farmers in developing countries must be able to purchase the modern inputs they needed, a requirement that in many countries involved no less than the wholesale modernization of the society, general economic development and the ability to produce or acquire substantial quantities of mineral and energy resources. Some of the additional land and water needed for agriculture must be obtained

at the expense of other uses, such as for industrial, municipal, recreational, and wildlife and wilderness areas. Irreversible loss of the latter could have serious long-term ecological consequences. Lastly, means must be found to mitigate whatever adverse distributional problems those developments generated and to provide productive non-farm employment for those who could not be employed effectively in agriculture.

32. There was a paradox operating in that matter. If all those requirements could be met, the modernization and improvement in the level of living inherent in that process would be likely to bring the birth rate down so that the full agricultural potential of the earth need not be developed. Yet, it might not be possible to accomplish all those tasks as long as population growth continued at its currently high rates. Especially in the more densely populated countries of the world, there appeared to be no alternative to working on both aspects at once: the attempt to modernize society and transform traditional agriculture and, at the same time, the attempt to reduce the birth rate through direct measures.

33. Land and water also were required for many non-agricultural uses, including industry, transportation, municipal requirements and recreation. Many countries, even those with large aggregate water-supplies, currently faced serious local shortages, and in all countries the protection of water from pollution was becoming one of the most acute problems of modern life. The resolution of those problems would be costly and in the process would give rise to other problems.

34. The oceans, because of their magnitude and importance as a medium of transportation, as a source of protein, petroleum and metals, as a potential source of fresh water, and at the same time, as a dump for waste products—including, in recent years, oil, metals, chemicals and radio-active materials—presented special opportunities and problems. Given foreseeable technologies, desalination was likely to remain a costly procedure. Many uses of the ocean required that it be protected from increased pollution. With the co-operation of all countries, such protection could certainly be provided, although, of course, at a cost. If, however, such co-operation was not forthcoming in the near future, the ocean's current and potential value for mankind might be seriously impaired.

## 2. Mineral resources

35. The Symposium was in general agreement that on a global basis the sheer physical availability of minerals would not pose any limit to population growth: man was far more likely to run into other barriers to growth in his numbers long before he ran out of minerals in any absolute sense. Considerations on both the supply and the demand side of the equation explained this conclusion.

36. Even in current times, large parts of the earth had not been explored in the detail necessary for resource discovery purposes. That was especially true of the sea-bed and in areas more than a few metres below the land surface; but it was also true of significant portions of the exposed land surface itself. Moreover, the average crustal rock was known to contain potentially useful amounts of important minerals and there was a tendency for the quantity of such minerals at a given concentration level to increase as concentration decreased, at least down to very low concentration levels. If the price of a mineral increased or the cost of mining went down sufficiently, it would not be surprising to find that the volume of mineable minerals increased by factors of hundreds.

37. On the other side of the equation, some doubts could be raised about the likelihood of demand continuing to grow at the high rates of the recent past. It was a commonly observed phenomenon that intensity of use (quantity per unit of GNP) tended to decrease as income *per capita* rose beyond a certain point. Most of the major consumers of minerals in the world were well beyond that point of maximum intensity. The prognosis was less clear for developing countries, which were just moving into the heavy industrialization phase of growth; it was difficult to predict how rapid their growth would be and

to what extent they would follow in the footsteps of currently developed countries.

38. Much depended, of course, upon the rate and direction of technological change. But, it was suggested, the expansion of technological knowledge might be the steepest exponential curve of all. In that connexion, it was interesting to point out that the ability to utilize lower concentrations would permit mining in more and more regions of the earth, thereby helping countries currently considered devoid of economic concentrations of important minerals.

39. But before concluding that there would be enough minerals for future populations, five serious qualifications should be mentioned. First, if demand for minerals continued to grow, the attempt to mine, refine, move and utilize ever-increasing quantities of minerals would multiply pollution and environmental problems at even faster rates. That was especially true because of the ever-greater quantities of earth that must be moved and energy that must be applied to obtain minerals from lower concentration ores. Secondly, in strip-mining, as the grade of ore being mined declined, ever-greater quantities of land were required and its surface removed. The cost of reclaiming such land for other uses could become a serious problem, especially in semi-arid regions. Thirdly, ever-increasing quantities of energy would be required to ensure adequate mineral supplies in the face of increases in demand and declines in concentration levels. Such quantities might not become available in a timely fashion and, if available, might have serious side-effects of their own. Fourthly, since mining operations were by nature transitory, lasting only until the mine was exhausted, the introduction of greater rates of exploitation might involve greater rates of migration and social disruption.

40. Lastly, and perhaps most important, inequalities in the distribution of the world's income and wealth must be considered. Adequacy could be insured only for a country that had the socio-technical capacity to produce what it needed or the international purchasing power to acquire from abroad what it could not produce domestically. It mattered little to a country without such capabilities that there were adequate supplies elsewhere in the world.

## 3. Energy

41. Much the same picture emerged for energy, that is, potential abundance but emerging shortages given current modes of allocation and use. Energy was so important in permitting man to improve the conditions of life that it was most relevant to concentrate on gaining an understanding of the serious nature of the international, socio-economic, environmental and technical constraints involved.

42. By historical standards, the current conversion of inanimate energy by man was very large. Its use was very unevenly distributed, however, with some rich countries consuming on a *per capita* basis as much as one hundred times the consumption of some poor countries. Conversion was increasing rapidly, by more than 5 per cent per annum, about two and a half times as fast as population; and in the absence of dramatic increases in prices that could inhibit economic growth, many experts believed that that rate would continue for some time to come. Even if wasteful uses and commercial pressures to increase use were to be curbed, the efforts of developing countries to industrialize, plus greater needs for winning metals from ever leaner ores, obtaining fresh water and controlling pollution were likely to mean quite high rates of increase in demand for some time to come. In all that, the role of population growth was somewhat less important than growth in *per capita* income, technological change and the geographical distribution of populations and their economic activities. The explanation of that point required a review of the circumstances and prospects with respect to each major energy source.

43. Man was overwhelmingly committed to fossil fuels. Close to 97 per cent of his energy came from those sources. Total world reserves of petroleum liquids were considered adequate for several generations. But from one third to a half

of those reserves were located in a single region. Because of that and the fact that in many cases there were no substitutes that could come on stream in a timely fashion, the price of petroleum could be expected to rise. That rise in price could be very serious, especially for poorer, import-dependent countries. The world's remaining natural gas resources were of similar magnitude and somewhat more evenly distributed than its remaining petroleum reserves. The rate of use of natural gas was increasing more rapidly than that of petroleum, though the total quantity used to date was much smaller.

44. World coal and lignite resources—over 97 per cent in the northern hemisphere—were about 10 times larger than world oil and gas resources. If they could be used, it would be enough to support world industry for a few centuries. But the environmental and social costs of a coal economy would be considerable and recovery of the reserves might be unacceptable in some regions unless the technology could be modified considerably. Known resources of high-grade oil shales were about one tenth as large as world oil reserves (mainly in the United States of America and in South America). Recovery of oil from those deposits could have even greater environmental impacts and higher direct costs than those for liquid petroleum. Low-grade shales appeared very difficult to extract economically; it was therefore not of much use that they are far larger than total world oil reserves.

45. Subject to many qualifications and delays, non-fossil fuel technologies could be further developed. Some would be most useful to high-technology societies, while others appeared suited to mainly agricultural and rural societies.

46. There was ample fuel for nuclear fission for a few centuries without breeder reactors and for millenia with them, but neither technology appeared capable of sufficiently rapid development to meet the deficits likely to develop in energy supplies within the next few decades. There were many as yet unsolved technical problems, and it was a slow and costly technology to put into world-wide operation. Moreover, environmental problems, especially the need safely to store extremely lethal radio-active wastes for hundreds and perhaps thousands of years, plus the spread of materials that could be utilized for weapons of mass destruction, posed moral and ethical problems of a nature that man had never before faced. The anxiety concerning those environmental problems within the technical communities of some countries was likely to cause increasing public pressure to hold up developments in that direction. Nuclear fusion might solve the difficulties, although there was still some debate about its environmental acceptability; but the best scientific opinion was that it would take several decades before the fusion reaction could become technologically and commercially practicable.

47. Hydroelectric power, currently providing about 2 per cent of the world's energy and the main source available for future development to many developing countries, was certainly capable of substantial increase, but, for several reasons, it was unlikely to supply much more than a small fraction of future energy demand. That source, however, often constituted only one aspect of a multipurpose project; the other aspects included irrigation, flood control and navigation. It was generally costly to develop, was of limited life and sometimes unreliable; and unless carefully planned, it could be environmentally and socially disruptive. Tidal power probably had an even smaller potential for economically practical development.

48. On a long-range basis, two other promising possibilities appeared—the use of geothermal heat and solar energy, though much research and development were needed before a realistic evaluation could be made. Both sources were widely diffused throughout the earth and might be capable of development in a manner that did not require a high technology society for its maintenance. Environmental effects for solar power might be small. The technologies for large-scale use had not been developed and it was difficult to say when they would be. Other possibilities included the use of modern windmills, sea-thermal power and biomass conversion of agricultural and industrial wastes.

49. A number of participants voiced concern about one particularly difficult environmental problem related to energy use. That problem pertained to the possibility of a change in the earth's heat balance, which at some point in the next century could cause major climatic changes throughout the world. It was a particularly troublesome issue because it was difficult to see any way that science and technology could be used to correct the problem. In that case, the only solution in the long run might be the cessation of growth in energy use and conversion. That problem should be the focus of far greater collaborative international research efforts than had been devoted to it so far.

50. At best, those technological, environmental, economic and social problems involved in increasing supplies of energy would not be solved quickly. As a consequence, unless dramatic technological breakthroughs occurred, there was a good chance that supply would not be able to keep up with the rapid increase of demand expected in coming decades, despite abundant potential energy sources. The need for adjustments on the demand side could be so serious as to make many countries rethink fundamental social goals, especially as regards economic growth and the geographical distribution of population and economic activities. While there was some dissent from that general message, all agreed that the problem required careful monitoring and far more serious study than it had been given.

### C. Population and the environment

#### 1. Global and long-run considerations

51. Environmental problems could usefully be classified into those with direct effects on human welfare and those with indirect effects. The first category included damages to health and productive capital, social disruption (such as the displacement of populations as a result of hydroelectric or mining projects) and other direct effects on what people perceived as their "quality of life". Indirect effects on human welfare involved interference with the services provided for society by natural biological systems (such as the reduction of ocean fishing by pollution in coastal waters). Most public attention had been focused on the direct effects, and within that category on acute rather than chronic manifestations. Far too little was known about what small amounts of persistent substances, such as chlorinated hydrocarbons, radiation, mercury, lead and DDT, might do to the human body when accumulated over 20- or 30-year periods.

52. Nor were most people aware of the vast number of "public services" rendered by the natural environment. Almost all potential plant pests were controlled by natural ecosystems, only those of crops being controlled by man. Insects pollinated most of the vegetables, fruits and flowers. Natural vegetation reduced floods, prevented erosion and beautified the landscape. As the size of human populations and economic activities increased, man's potential for disrupting such systems grew. With the world population doubling in the next 30 or 40 years and economic activities at least tripling during that period, man's impact on these systems could no longer be ignored.

53. One should consider, for example, how the quest for high agricultural yields had led to the creation of monocultures in which large areas were planted to a single variety of rice or wheat. An unexpected disease strain or insect infestation entering such an area could cause enormous damage. Another example involved the disruption of heat balances and weather patterns as a consequence of ever-increasing uses of energy. Such disruptions had already been observed on a small scale in local areas. If continued growth in the consumption of fuels caused such perturbations to occur over wider areas, rainfall and monsoon patterns could be affected.

54. Non-linearities and time lags built into environmental systems might make the effects of small changes all the more serious when they did occur. If diminishing returns to the use of fertilizer and pesticides caused farmers to use more per hectare as population and the need for food increased, those chemicals would accumulate in the environment at a faster

rate than the rate of population increased. Moreover, for some pollutants, it was known that damage increased at increasing rates as concentration levels rose. Similarly, it was known that persistent pesticides and other long-lasting chemicals tended to become concentrated as they moved up the food chain.

55. Many such effects occurred only with a delay and thus could come unexpectedly. Time was required for persistent chemicals to concentrate in food chains; and quite often, as in the case of cancer and radiation, damage did not become apparent until long after exposure to the pollutant. The most pernicious example of such a phenomenon might be radio-active wastes from nuclear power plants. Minute quantities of such wastes could remain extremely damaging for thousands of years. Since the problems of safe storage for that length of time had not yet been solved, future generations might be committed to high risk each time the output of nuclear power plants was increased.

56. Far too little was known about such phenomena. The probability that a serious ecological disruption would occur could not be predicted, nor could much be said about the magnitude of the damage that might occur. The best that could be done was to state that the probability of such occurrences was above zero, that it was increasing with time as population and economic growth continued and that the consequences for life on earth as currently known could be very serious indeed.

57. Two important implications followed from those considerations. The first, of course, was the need for a great deal more research effort than had been devoted to those problems in the past. The second had to do with what constituted prudent behaviour in such circumstances. Until current ignorance in those areas was overcome, would it not make sense to refrain from introducing certain compounds and technologies believed to be environmentally damaging? In some cases, current benefits from the use of such materials and methods were so great that that path was not feasible. That might be the case for DDT in less developed countries, for example. In those cases, political leaders were confronted with extremely difficult choices.

## 2. Problems of the developed countries

58. The environmental problems of developed countries were sufficiently well known that they did not require characterization. But it was important to indicate that with current low rates of natural increase in population, those problems were probably less related to population growth than they were to growth in *per capita* output, and to the failure to develop proper policies and institutional arrangements to protect the environment. Population growth rates in most developed countries were not much above zero and might be falling. On the other hand, *per capita* use of minerals and energy was high and rising. In those countries which had not yet introduced stringent controls on pollution emissions and on use of land and water, such rising utilization rates could be expected to cause increasingly severe environmental problems. But the cost of protecting the environment might not be excessively large, at least not for the very rich countries, where, according to one study, adequate controls would not require more than 2.5 per cent of gross national product, at the very most.

59. The principal task facing developed countries, therefore, would be to search for and implement the policies and institutional changes necessary to create an adequate degree of environmental protection. Appropriate policies would differ, depending upon the particular problems faced and the economic capacities, social institutions and political realities of various countries. In general, there was considered much to be said for a policy of including environmental costs in prices, for example, through the use of emission charges levied on specific pollutants. Other environmental disruptions, certainly those of a severely damaging or lethal character, should be prohibited outright. A preferable approach for the longer run would be to restructure incentives so as to encourage the development and use of new technological processes that were not harmful to the environment. In some contexts, such a restructuring could be accomplished through tax preferences, research and

development subsidies and regulations on access to raw materials and markets, but in other contexts, more fundamental changes in property rights might be required.

60. Often, however, the appropriate direction for policy was not clear. For example, metropolitan areas could be organized more compactly so as to reduce the need for private motor-cars, reduce the costs of providing mass transit and permit more efficient handling of sewage and solid wastes. Alternatively, future population and industrial growth could be guided away from existing large cities, giving up some economies of large scale to obtain some environmental and other benefits. While that and related issues were discussed elsewhere (see chapter II), it was useful to mention that far more research would have to be undertaken to assess benefits and costs of such alternatives before one could say with any confidence which direction was best in any particular case.

61. In addition to those policies, some participants advocated restrictions on the growth in *per capita* GNP in developed countries as a means of easing environmental pressures. That measure would have the additional advantage of conserving minerals and energy. Such benefits must be weighed against the social problems involved, some of which, such as unemployment and inequalities in the distribution of income and wealth, would be more difficult to solve in the absence of economic growth. Moreover, economic growth need not continue to entail the same composition of material commodities as it had in the past. If the proper policies were implemented, the composition of output would be forced to change in a favourable direction, and, incidentally, some modest reduction in economic growth would occur in the process. Such pros and cons must be carefully assessed before settling on a particular policy, and many value judgements would have to be taken into account.

62. Some participants were of the opinion that, even in the light of those considerations, there was still a role for population policy in developed countries. First, it would be wise to monitor the fall in birth rates and be ready with countervailing policies if it began to fall too fast or began to rise again by any significant amount. Secondly, population policy should pertain to more than national fertility, mortality and migration; policies designed to deal with the effects of environmental disruption on particularly vulnerable groups, such as the young, the elderly and the handicapped, and, in general, on human welfare and productivity, should also be taken into account. That latter view was challenged by some participants, who questioned the value of broadening the definition of population policy in that way, suggesting that if the elderly were not adequately taken care of by a society, it would be due to a failure to properly redistribute income and social welfare measures rather than to population policy.

## 3. Environmental problems of the developing countries

63. While less had been written about them, the environmental problems of developing countries might be more serious and complex than those of developed countries. In contrast to developed countries, most of their problems were associated with underdevelopment, that is, with a lack of adequate investments to correct the situation. That is certainly true with respect to water-treatment and waste-disposal systems, housing and public health facilities. Secondly, to the extent that industrialization, urbanization and rural development had occurred, they were often beset by problems similar to those of the developed countries, but without a commensurate ability to cope with them. Thirdly, the damages resulting from environmental deterioration might be more serious in their effects on health, labour and resources productivity and the quality of life. Soil erosion and losses in labour productivity resulting from water-borne debilitating diseases were just two examples. In principle, developing countries had the advantage of being able to learn from the experience of developed countries, but many of their problems were different and remained to be solved. In that situation, it was difficult to estimate the cost of environmental protection, but it was unlikely to be any less than that for the developed countries.

64. Population growth might play a more important role in causing, or at least exacerbating, those problems in developing countries than it did in developed countries. The rate of population growth was generally higher, making it more difficult to keep up with the needed investments to correct the problems. In traditional agriculture in tropical and subtropical regions, an increasing pressure of population was more likely than in the modernized agriculture of temperate regions to produce various hazards to the environment, such as leaching of nutrients and degradation of farmland following deforestation, rapid soil depletion owing to permanent cultivation of land not suited for it, soil erosion, loss of forests and even climatic changes.

65. Nevertheless, environmental deterioration in developing countries could not be ascribed solely to the size or growth of the population. Over-grazing and over-cultivation could occur even in the absence of population pressure on a national scale. Likewise, modern agricultural inputs like pesticides and chemical fertilizers could have serious environmental effects if not used properly. Moreover, rapid rural-urban migration, which was not always the result of population pressure *per se*, tended to aggravate the situation, at least in urban areas which typically could not adjust rapidly enough to the increased demands put on the urban infrastructure.

66. The unprecedented nature and magnitude of those problems would require unprecedented remedies. In all developing countries, a basic requirement was capital, both domestic and foreign savings to invest in the necessary facilities. In some countries, a slow-down in population growth would be necessary, if for no other reason than to provide some breathing-space in the attempt to solve problems of past growth. Beyond that, one must contemplate new patterns of development, patterns that would take advantage of but would not follow the experience of countries that had developed earlier, plus the use of new technologies specifically developed to meet local needs. Developed countries could play a useful role in that process by helping to supply capital and research facilities, and by sharing their experiences in trying to cope with environmental problems.

### III. POPULATION AND HUMAN SETTLEMENT

#### A. Benefits and costs of alternative settlement patterns

67. This section of the Symposium's deliberations focused on two questions: first, could an optimal city size be specified in operational terms; and, secondly, what could be said about "desirable" national population distributions among centres of different sizes.

68. On the first question, the members of the Symposium agreed that it was not possible to say with any confidence that some cities were too large and others too small. Four inter-related reasons explained that conclusion. First, the shape and cost and benefit curves could not be specified. Secondly, such curves would be made up of different components and could not be quantified objectively; quantification could be accomplished only by assigning weights based on subjective value judgements. Thirdly, the appropriate distribution of city sizes probably varied significantly over time and space, and often by more than man's ability to influence the situation. Lastly, those who claimed the existence of an optimal city size tended to over-emphasize the social costs, to understate the economic benefits and to ignore the social benefits.

69. Real income was positively associated and poverty was inversely associated with city size. The relationship between city size and density, on the one side, and environmental costs (air pollution, traffic congestion etc.), on the other, was unclear: while potential damages per unit of space were greater in larger, more densely populated areas, there were economies of scale in the provision of social overhead capital and control measures to clean up the environment. For some phenomena, there was a relationship between high densities and social costs, suggesting that city size was merely an intervening variable.

70. That was not to say that some cities were not growing too fast. Indeed, many problems commonly associated with large cities—social disruption, unemployment, poor housing and social services—might be more closely related to rates of change and patterns of physical administration and organization than to size *per se*. Given some respite from the continuous and rapid influx of migrants, cities could probably make an adequate adjustment to that influx. A second important qualification was that while big cities promoted growth, the gains might accrue to landowners and owners of capital, thereby making for inequality. It was unlikely, however, that much scope existed for correcting the situation by trying to alter city size. The first problem highlighted the need to intervene to keep population growth and provision of urban services closely in step, while the second called for extensive policies for redistribution within cities.

71. A similar conclusion applied to the search for an optimal or near-optimal national settlement pattern: given the current state of knowledge, that search was considered unfruitful. However, it was considered clear that alternative spatial distributions had differing economic, social and political impacts. Also, some patterns might be preferable to decision-makers and to society as a whole. Such preferences could only be revealed if alternative "scenarios" of the future spatial distribution of population were brought into the forum of public discussion.

72. There was no evidence available to suggest that a particular spatial distribution of population would minimize the strain on natural resources. As for pollution and other forms of environmental disruption, tampering with the settlement pattern (either as a whole or in individual cities) was considered—in the short and medium terms, at least—an ineffective instrument compared with compulsory environmental standards or pricing, taxation and subsidy strategies.

73. Primate city size distributions in developing countries appeared to be consistent with economic efficiency, offered the opportunity for personal income gains and did not conflict with equity objectives, if only because rural conditions were so bad. In terms of long-term development goals, the reduction of primacy might be a legitimate policy goal, but implementation might be harmful to both the rural and urban populations unless associated with effective development strategies that would improve job, income and social opportunities in smaller cities and in rural areas.

74. It was difficult for Governments to alter the national settlement pattern. The location of infrastructure, if determined in the light of population distribution goals rather than by responding to spontaneous growth and movement, would, of course, have some impact; but even in countries with high population growth and migration rates, the response was likely to be slow. Given the lack of knowledge about desirable settlement patterns, Governments should be cautious when they intervened and should attempt to retain the maximum flexibility in their options. Even though differential migration was the key to modifying the settlement pattern, migration subsidies and controls were less effective instruments than urban infrastructure location decisions, interregional transportation strategies and policies for distribution of industry.

75. These mildly negative conclusions about policies designed to improve urban size and settlement patterns did not suggest a total switch of attention towards aggregate population measures, as there was a wide range of urban policies unrelated to city sizes that influenced as well as responded to population growth and change. In other words, there was a distinction between urbanization policy and urban size policy. In the former, spatial and non-spatial policies intermeshed on the urban plane; while the latter was concerned with the size of individual population concentrations, and more generally, with the size and spacing of centres in the national settlement pattern. Even if little could be done on the urban size front, either because the evidence indicates that intervention would be harmful or because of a lack of sufficient understanding of the relationships between a particular national settlement pattern

and efficiency, equity and environmental goals, there, nevertheless, remained considerable scope for the co-ordination of policies (sectoral as well as spatial, national and regional as well as urban) that influenced urbanization trends and population change and distribution. Those policies should, *inter alia*, ease the transition from rural to urban life, attempt to improve the welfare of both urban and rural populations, promote redistribution within and between cities, be broadly consistent with economic and social efficiency criteria, and induce neither a higher rate of resource utilization nor additional environmental deterioration.

#### B. Internal organization of metropolitan areas

76. The efficiency of individual cities in providing for human needs might depend more upon internal organization and structure than upon population size *per se*. Nevertheless, as had previously been stated, the speed with which a city's population increased was important, since rapid growth aggravated the problems of adjusting internal organization and structure to requirements.

77. Much of the discussion about internal organization centred on strategies for controlling land use, it being recognized that the distribution of income, wealth, housing and social services was greatly influenced by the way urban land was allocated and used. Government authorities must acquire sufficient control, either through ownership or regulation and zoning, so that priority could be given to uses that contributed to the needs of the majority of the population, not just to the private owner, developer or speculator whose decisions were, in the absence of regulation, responsive only to market incentives.

78. While housing typically absorbed a large fraction of the capital invested in cities, many participants expressed the view that it was often given too much priority in developing countries. The needs of the majority were for jobs and essential services, such as transport, water-supply and waste-disposal facilities, and only secondarily for housing. In that connexion, the concept of low-cost public housing was examined and found to be inadequate. Often, that concept meant capital-intensive, permanent dwellings of brick or concrete that typically were not essential in tropical countries and often turned out not to be "low cost". As a consequence, such dwellings tended to be beyond the means of the urban poor who needed them the most. Several participants suggested substituting the concept of "no-cost housing", by which they meant the provision of improved land, plus water and sewerage facilities, to the poor, who would then be permitted to construct houses with materials they could afford. The provision of technical assistance and some materials by public authorities might be beneficial. An important secondary benefit of that approach was the fact that it was likely to absorb substantial amounts of otherwise unemployed labour during the construction phase. Densities would not need to be much lower than in a high-rise approach.

79. Financial strategies for urbanization also came under discussion. One such strategy, which had been applied in the development of Bombay II, a new town located on the outskirts of the original city, involved the purchase of land which, after development, was sold or rented in order to finance the original purchase plus the investments in infrastructure and mass transit. Other approaches to solving that and related problems of internal organization were also raised and discussed.

80. Note was taken of the importance of the forthcoming United Nations Conference on Human Settlements, to take place at Vancouver in 1976, where there should be an opportunity to pursue those issues in more detail. It was hoped that policies with respect to rural-to-urban migration, urban slums, urban land use, financing of low-cost housing and environmental management could be recommended at that time.

#### C. Location policies and experiences relevant to rural development

81. In 1970, 72 per cent of the world population had lived in rural areas and 82 per cent of all rural inhabitants had

lived in developing countries. Despite the very rapid increases in the world's cities and towns due to rural-urban migration, the over-all rural population was continuing to grow in absolute size.

82. The preoccupation with urban pollution and sanitation problems led to underestimates of the urgency of environment problems in rural areas of developing countries. Floods, deforestation, soil erosion, absence of clean water and inadequate public health facilities were only a few examples. Full understanding of those problems and efforts to formulate appropriate policies and programmes for them were very important in tackling the question of population and environment. In those circumstances, the tendency to look upon rural-to-urban migration as a nuisance and to assume that urbanization was occurring "too rapidly" was an oversimplification of the problem. It ignored the positive role of migration in relieving rural poverty in developing countries. No matter how bad the situation was in the cities, it was unlikely that large-scale migration would be occurring if conditions were not still worse in the countryside.

83. The success of policies designed to slow the rate of urbanization in developing countries depended to a considerable extent upon the ability to generate rural and agricultural development. An important way to give urban areas the breathing space they needed to solve their problems was to develop sufficient job opportunities, higher *per capita* incomes and public services in rural areas so as to reduce out-migration.

84. Accordingly, planners would be well-advised to consider whether the allocation of social overhead capital, which all too often favoured urban areas at the expense of rural, was appropriate. But in many developing countries, more than capital was needed for the modernization of agriculture and the rural economy. Often, reforms and some redistribution of wealth were necessary as well, if tenants and the landless were to be encouraged to stay in rural areas.

85. It was of interest to note that such rural developments might also be necessary to create a desire for smaller families and therefore make family planning programmes effective in rural areas. A number of participants expressed the opinion that the absence of personal security, with respect to health, old age, employment and income, was closely linked to the desire for large families and that priorities for rural development should take their cues from that fact.

86. A number of examples from different countries were provided, and with the case of China was discussed at some length. Modernization there appeared to be less a consequence of technological change, such as the introduction of new seeds, than of a purposive and orderly organization. It had involved the use of highly labour-intensive methods in agriculture and construction and the location of many small-scale industries in the countryside not only for agriculture, but for building roads and houses. Efforts were being made to provide environmental sanitation and basic public health facilities, and responsibilities were clearly laid down with respect to the provision of old-age and other forms of social security. Family planning programmes were being pursued vigorously. The consequence of those and related measures appeared to be some restraint on population growth and a significant slow-down in rural-to-urban migration. Some loss in efficiency due to the rural industry programme was also mentioned. That, plus the other examples cited, served as illustrations of what could and was being done about problems of human settlement related to rural development.

#### D. Location policies and experiences relevant to urban development

87. Despite the best efforts to improve rural life in developing countries, the population of both large and small cities must be expected to continue rapid growth during the remainder of the century. Given that growth, perhaps the best that could be done would be to attempt to spread it out among cities of various sizes in such a way that growth rates would be lowest in those cities where facilities were the most overloaded. It was

generally thought that that meant attempting to divert the flow of migrants away from the very large metropolitan areas and towards medium-sized cities and major provincial centres, but that proposition should be carefully examined in specific contexts. It might well be, for example, that some larger cities were uniquely situated to attract capital and central government revenues and therefore could adjust to the influx of migrants more easily than smaller cities.

88. An alternative approach involving the establishment of new towns had been used to good effect in some countries. If a new, independent, administrative unit could be established with authority and capacity to acquire land or to control land use, and to invest in the development of the necessary infrastructure, the new town approach could work well. It was also useful as a means of experimenting with new organizational and structural patterns. But that approach could be both costly and risky: costly at least in the short run because infrastructure must be built from scratch, and risky in that planners might not be as wise as market forces in selecting sites that were capable of becoming economically viable in a reasonable period of time. At best, new towns were unlikely to absorb a very large fraction of those seeking urban residence in countries with rapid rates of population growth and migration.

89. In either event, careful thought must be given to the choice of regions, to the possibilities of sustaining viable economic development without unacceptable ecological damage within those regions, to ways in which the economies of the urban centre and its larger region could be integrated and to planning techniques that would maintain a maximum degree of flexibility. Spatial planning undertaken at the national level, while necessary to set over-all guidelines, should not be permitted to become very detailed and rigid. Of more importance was the development of competent local planning bodies with the authority and capacity to implement their plans. Even at that level, it was wise to proceed cautiously, in relatively small, incremental steps, so as to minimize the chances of making very large, costly errors. The experience of various countries was reviewed to illustrate those general principles.

#### IV. IMPACT OF TECHNOLOGICAL INNOVATION AND TRANSFER OF POPULATION

90. An intimate link was evident between demographic trends and the nature of the technology that existed in, or was imported into, a society. High post-war rates of population growth had resulted in part from the introduction of new medical technologies, and that, in turn, had contributed to unparalleled levels of unemployment and other social problems in many developing countries. Those problems were often exacerbated by attempts to apply technology not suited to local conditions, for example, capital-intensive technologies in capital-scarce, labour-abundant countries and temperate agricultural techniques in tropical areas.

91. Among future technological transfers, high priority should be given to innovations that would tend to correct current and prospective imbalances between population and food and other resource supplies. Apart from the urgent need for further direct efforts at fertility limitation, the introduction of labour-intensive technologies that would not produce excessive sacrifices of productivity, and of patterns of production that would encourage fertility decline should become central considerations in development planning. Such production patterns should include concentration on mass-market goods that would provide an incentive to control family size, and the organization of production to maximize the employment of young women. Institutions and organizations engaged in technology transfer should take into account the recipient country's employment situation and resource structure as well as its environmental susceptibility to the new technology.

92. When developing countries were in a position to make autonomous decisions regarding the type of technology to be employed, their absence of structural commitment to large-scale, high-impact technologies gave them a greater potential flexibility

over the choice of innovation than that enjoyed by highly industrialized societies. That factor might be greatly to their advantage in the long run if they had practical access to knowledge of alternative technological choices.

93. It was important for Governments of developing countries to remember the extent to which the values of their societies (on which their technological choices must be based) might be influenced by the demonstration effects of high-consumption societies. Looking further into the future, it was possible to foresee some decline in the currently extreme divergence in life-styles between developed and developing countries. As industrialized societies experienced increasing environmental and social constraints upon further material economic growth, they might turn their attention to improvement of their service sectors and other less resource-intensive patterns of economic development. Some participants foresaw the time when that new pattern would mean the close of the current era of material acquisition as a means to fulfilling psycho-social needs and the opening up of new possibilities for the underprivileged in both developed and developing countries.

94. The Symposium time and again emphasized the need for a rather different technology in the poor countries, one that would be sufficiently employment-intensive and capable of preventing spreading unemployment, poverty and inequality. No accurate method existed for measuring the structure of world technological power between the poor and rich countries, although the research and development expenditures—expenditures on applied research and experimental development in scientific and technical institutions leading to technological innovation—could reflect and provide a rough and practical measurement. The share of poor countries in world research and development expenditure was considered to be extremely low—about 2 per cent.

#### V. CRITICAL REVIEW OF POPULATION-RESOURCES-ENVIRONMENT MODELS

95. A significant and growing number of models dealt with population, resources and the environment. They differed in their coverage of those three topics, in their treatment of the linkages between them, in the extent of their geographical coverage and in the time period studied. Those models could also be classified by purpose; some were meant solely to illustrate the operation of physical and economic laws, and, as such, were very useful for educational purposes. Others were normative in the sense that they attempted to assess the consequences of different policy actions. Still others were positivistic and attempted to predict or extrapolate the consequences of current trends. Lastly, there was a type of model that was principally useful as a consistency framework, to bring together bits and pieces of specialized knowledge in an orderly way, making it easier to discover inconsistencies and gaps in the knowledge base. It was important to recognize that a model designed for one of those purposes, or covering a particular space and time dimension, usually was not appropriate in other contexts.

96. Most of those models introduced demographic considerations as independent variables, affecting but not being affected by economic and other variables. Although significant progress had been made recently in introducing interactions running in the opposite direction, lack of data and empirically tested theories about possible socio-economic determinants of demographic variables had limited the usefulness for policy and prediction purposes of models that included such feedback mechanisms.

97. The time period covered by those models was an important characteristic. All of those reviewed by the Symposium were meant to be applied to the future rather than to the past, with the consequence that the validity of their conclusions could not, or at least had not so far, been tested against actual events. Moreover, the attempt to cover longer and longer time periods into the future, while important in studying population-resource-environment interactions, introduced ever-greater com-

plications for the model-builder because fewer factors could be held constant. A short-term model could, as a first approximation, ignore changes in tastes, institutions and technology; a long-term model could not, even though it was extremely difficult to estimate how such factors would change in the future.

98. The best models were those which were capable of absorbing large quantities of reliable data. While that presented problems of tractability, it became a crucial point as models expanded in time and space. As a corollary, it was also desirable to construct models that were sufficiently disaggregated so that major interrelationships—for example, substitution possibilities—would not be overlooked. A high degree of aggregation tended to hide interrelationships and effects which could be very important for the correct interpretation of the phenomenon studied. For example, models that treated the world as a whole tended to obscure the effects of any given policy or development on poor countries. Such global models did little more than illustrate obvious conclusions about the finite nature of the world; indeed, they sometimes did harm by purporting to add an unwarranted degree of precision to such conclusions.

99. Great attention should be given to regional and national differences in the selection of the variables and parameters to be used. A highly detailed model for a country or a region might not be appropriate for use in another region due to, among other things, the lack of reliable information on the variables selected, or to a different economic or social structure, which might make irrelevant some of the central elements of the model.

100. It was necessary, in each case, to specify clearly the objectives, structure, assumptions and conclusions of the model. That was essential to avoid misinterpretation of the real significance of the results. Models were an aid to thinking; they should not be used as a substitute for it.

101. More empirical research was needed to reach an adequate understanding of the relationships among population, resources and environment, in order to construct models increasingly representative of the real behaviour of the world. Such work must be accorded high priority. Until good empirical material became available, those models would be of limited use. Their principal value would be for educational purposes and as a guide to identify where the priorities for more empirical research lie.

## VI. RESEARCH IMPLICATIONS

102. In the course of their deliberations, the Symposium participants became increasingly concerned about glaring gaps in the state of knowledge about many life and death issues that faced the human race. As stated in the introduction, whatever sense of optimism one may read into this report presupposes continued rapid scientific and technological progress in certain specific directions. While a substantial degree of continued progress could be expected, several participants voiced concern about both the magnitude and direction of the changes that were likely to occur. A decline in university enrolment in some scientific fields, weakening financial support for fundamental science, and a concentration of research and development expenditure on military, space and the consumer needs of wealthy countries were a few of the signs that were mentioned. It could not be assumed that scientific and technical advance would continue at an adequate pace to solve man's most pressing problems unless the massive efforts necessary to validate that assumption were in fact made.

103. As the various sections of this report suggest, there are serious gaps in knowledge in all fields reviewed by this Symposium. While many such gaps were identified, it was beyond the scope and mandate of the Symposium to work out priorities among them. Nevertheless, a number of general guidelines were suggested.

104. First, the needs of developing countries should be given much higher priority. Much of the work pertaining to those countries would have to be interdisciplinary, cutting across traditional academic and scientific fields. One example was research on agriculture in the humid tropics, where viable solutions could be found only by combining the efforts of agronomists, ecologists and economists, to mention just three of several essential disciplines.

105. Secondly, the research should emphasize empirical and experimental work. Choices among theoretical models and hypotheses would need a stronger base of data gathered through experimentation. The participants took note of a number of interesting suggestions for resolving specific problems; but in each case there was no way to know whether the suggestions would work without actually trying them out in the field. Thus, for example, self-help or "no-cost" housing was a possibility that needed substantially more field-testing. Similarly, the only way to determine whether improvement in an individual's sense of security would induce him to have fewer children was to observe his behaviour when he was provided with such security. In recent years, a number of proposals to establish field experiments to test such ideas had been developed and a few had been implemented to good effect. Such efforts needed encouragement.

106. Thirdly, emphasis should be placed on projects suited for joint research efforts by both developed and developing countries. It was considered clear that developing countries did not have the scientists and the funds available to undertake all the necessary work required; but it was also clear that solutions developed in richer countries were not always appropriate for poor countries. Joint research efforts would facilitate the transfer of techniques and the development of new ones particularly suited to the needs of developing countries. Several fields of research appeared particularly suited for this approach. Those included efforts to achieve greater efficiency in the use of energy, the development of solar and geothermal energy sources, forest management, research on factors affecting land use, integrated pest control, rural water-supply and waste disposal, the development of new materials for construction and manufacturing industry and the development of ecologically sound technologies for less developed areas.

107. Fourthly, in establishing research priorities in areas related to improving human welfare and living conditions, priority should be given to those projects most likely to influence demographic behaviour in desirable directions. That point suggested, for example, giving priority to such areas as rural development, public health and new methods of primary and secondary education, on the assumption that improving and making more secure the conditions of rural life, and providing new opportunities for individuals, would make large families less necessary and desirable. That assumption needed empirical testing, as indicated above, for example, through the use of field experimentation.

108. Fifthly, population-influencing policies in the poor countries were not an end in themselves—their justification depended on the contribution such policies could make to over-all social and economic development. Conversely, certain types of development policies, for example, policies to increase GNP without regard to income distribution and the welfare of the great majority of the people, were liable to have little effect on the average fertility in developing countries. Both empirical and analytical research were needed to find better ways of integrating development policies and population policies. Historical and comparative studies could be a powerful tool for that research.

109. Sixthly, in problems of urbanization, much could be learned by placing greater emphasis on historical and comparative studies of the urbanization process in different countries at different times.

110. Some other specific areas of research that participants suggested should be given more emphasis are listed below:

*Population and resources:*

1. Surveys to identify and evaluate existing natural resources in developing countries;
2. Problems of food production in the humid tropics;
3. Methods of maintaining genetic variety;
4. Methods of bringing about agricultural modernization;

*Population and environment:*

1. Environmental factors in health, morbidity and mortality, and their economic and social effects;
2. Ways to reduce the environmental impact of recovery, transport and use of energy;
3. Environmental impact of the flow of population from rural to urban areas;

*Population and settlement:*

1. New forms of human settlement, taking into consideration the modern revolution in communications;
2. Primacy of metropolitan cities: its impact on regional welfare;
3. The impact of high population density on the human environment: thresholds for external diseconomies;
4. Effects of political and institutional frameworks upon urban development;
5. Comparative studies of the goals, instruments and efficiency of policies relating to the ownership of urban land in countries with different socio-political framework;
6. The relationship between alternative national, regional and intra-urban settlement patterns and: (a) rates of resource utilization; (b) disruption of the natural environment; (c) creation of pollution and congestion.

**Appendix**

**AGENDA**

1. Opening of the Symposium
  - (a) Opening addresses
  - (b) Election of officers
  - (c) Adoption of the agenda
2. Population and natural resources
  - (a) Land and water resources
  - (b) Mineral resources
  - (c) Energy resources
3. Population and environment
  - (a) Environmental problems of the developed countries caused primarily by their advanced industrial structure
  - (b) Environmental problems found mainly in the developing countries as a result of poverty and under-utilization of resources or imports
  - (c) Global environmental problems derived from man's potential for modifying the resources in the global ecosystem
4. Population and settlement
  - (a) Benefits and costs of alternative settlement patterns
  - (b) Internal organization of metropolitan areas
  - (c) Location policies
    - (i) Policies and experiences relevant to rural development
    - (ii) Policies and experiences relevant to urban development
5. Impact of technological innovation and transfer on population
6. Critical review of population-resources-environment models
7. Interactions of population, resources and environment
8. Adoption of the report
9. Closing of the symposium

## Annex III

# REPORT OF THE SYMPOSIUM ON POPULATION AND THE FAMILY

### INTRODUCTION

1. The Symposium on Population and the Family was held at Honolulu from 6 to 15 August 1973. It was one of a series of symposia held in preparation for the World Population Conference, 1974, as recommended by the Population Commission at its sixteenth session<sup>1</sup> and endorsed by the Economic and Social Council in its resolution 1672 (LII).

2. The Conference, as endorsed by the Economic and Social Council in its resolution 1484 (XLVIII), is being organized as a meeting of Government representatives. It will differ from the World Population Conference, 1974, held at Rome, and the World Population Conference, 1965, held at Belgrade, which were technical meetings. Therefore, a series of scientific activities was planned in preparation for the World Population Conference, 1974, to identify and clarify critical problem areas at the technical level.

3. Among those pre-Conference activities were four symposia on: population and development; population and the family; population, resources and environment; and population and human rights. Those were technical meetings of experts participating in their personal capacity.

4. The Symposium on Population and the Family was organized in collaboration with the Government of the United States of America. Host facilities were provided by the East-West Population Institute of the East-West Center, Honolulu, which acted as agent for the Government. The meeting was made possible through the financial assistance of the United Nations Fund for Population Activities. Twenty-six experts in the fields of demography, sociology, anthropology, economics, psychology, cultural geography and social welfare participated in the meeting. Those experts were a broad interdisciplinary group of specialists, all with a particular interest in the population aspects of their field of specialization. The consultation with the experts was organized to take the form of a discussion and exchange of views centring around three substantive agenda items leading systematically to the crucial and concluding fourth item on the benefits and liabilities of population and other public policies for the family and society.

5. As bases for the discussions, participants were provided with technical papers prepared by experts especially for the symposium, and draft background papers prepared for the Conference.

6. The meeting was opened by Everett Kleinjans, Vice-Chancellor, East-West Center. The Secretary-General of the World Population Conference, 1974, expressed the appreciation of the United Nations to the Government of the United States of America for its collaboration in convening the symposium, to the East-West Center for its hospitality and to the participants for their contribution to the work programme of the United Nations. He traced the concerns of the United Nations world conferences in the fields of population, noting the logical movement towards the current emphasis upon policy. He elaborated upon the place of the symposium in the programmes and activities of the World Population Conference, 1974, and reminded the experts that they had the task of formulating the scientific opinion that would be brought to bear upon

relevant issues before the Conference. The Director of the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat outlined the particular issues relevant to population and family to which attention would be directed during the deliberations and set forth a broad framework within which discussions of those scientific concerns might yield conclusions as to policy options and implications.

7. L. Tabah served as Director of the Symposium and J. A. Palmore acted as Co-director. The meeting elected C. Chandrasekaran as Chairman and G. J. A. Ojo as Vice-Chairman. Jean Thompson was appointed the General Rapporteur; Kathleen M. Jupp, Co-ordinator, World Population Conference, 1974, and World Population Year, 1974, Population Division, acted as co-ordinator; and Gwendolyn Johnson Acsádi, Population Division, was designated as Technical Secretary. The following participants were appointed as discussion leaders: Judith Blake Davis, Laila El-Hamamsy, M. Livi-Bacci, L. Ratinoff and G. W. Roberts. C. F. Westoff was appointed to present an overview of the symposium. The following participants served as rapporteurs: S. del Campo, Margarita M. Errazuriz, Sattareh Farman-Farmaian, J. T. Fawcett, K. Kulcsar, H. V. Muhsam and Mely Tan.

8. The meeting adopted the agenda represented in the appendix to this report.

9. The opening item dealt with the cultural and historical perspectives of the effect of modernization on the family—its size, composition, structure and functions. Emphasis was given to those aspects of family change thought to have significant implications for population trends. Stress was also laid upon the variations in the historical evolution of the nature and functions of the family that had taken place among different cultures. Particular note was taken of the dissimilarities in the evolutionary process as it had occurred in the currently developed regions and as it was occurring in the developing regions. The objective was to focus attention on: (a) different types of families and their relationship to conditions of development; and (b) transformations in the family and its adaptation to changing conditions of development and population dynamics.

10. Conditions and changes that have a bearing upon the family cycle—its formation, development and dissolution—was the subject of the second agenda item. Three distinct, but interrelated, types of factors were identified:

(a) *Demographic factors* such as health, mortality, nuptiality, reproductive patterns and migration;

(b) *Development factors*, such as conditions of employment, development policy, urbanization, industrialization and education;

(c) *Socio-cultural factors*, such as the rôle of the family in society, value and belief systems, definitions of intrafamily rôles and the rôles and status of women and children within the family and in the society as a whole.

11. The discussion of various factors producing changes in the family cycle led naturally to the third agenda item: the influence upon family life of changes in the family cycle. Two types of influence were singled out for review and analysis: (a) aspects of urbanization and internal migration; and (b) the modernization of reproductive behaviour represented by the shift from high to low levels of fertility. Both types of influence

<sup>1</sup> See *Official Records of the Economic and Social Council, Fifty-second Session, Supplement No. 3*, para. 166.

represented the adaptation of families and of individual family members to structural changes in society. Those adaptations were responses to problems generated by social change and, in many cases, the solution adopted in turn resulted in new problems.

12. The final item of the agenda was concerned with the policy implications for population and for the family of the problems raised in the earlier discussions. In view of the changing social institutions and conditions of development in the economically less-advanced countries and of the increasingly enlarged role of the State in the care and protection of individuals in both developed and developing countries, this item was intended to provide an opportunity to assess the possible future role of the family, particularly in the context of population dynamics, but also in respect of over-all social change.

#### I. POPULATION AND THE FAMILY: CULTURAL AND HISTORICAL PERSPECTIVES

13. A great variety of forms of family organization had evolved throughout the world and many forms currently coexisted. The long perspectives of the historian and anthropologist provided a reminder that mankind, for the overwhelming part of his existence, had lived in hunting-gathering groups; agricultural man, and particularly urban man, had emerged only within the past 10,000 years. Social institutions were still being developed to organize life within that relatively new economic and social environment. While the relationship between family type and level of social and economic development was poorly understood, and differences had been observed among countries, it was significant that the developed countries were characterized by a wide prevalence of the conjugal family.

14. In light of that, an important question to which the discussion in the Symposium returned repeatedly, was whether variety and diversity in family forms and institutions as they related to the dynamics of population were, on the one hand, to be valued and preserved of themselves; or whether human society, in general, should be seen as converging under the forces of modernization towards a relative homogeneity and, in particular, towards the small nuclear family as the basic unit of society.

15. It was acknowledged in the discussions that change was a basic element in human life and experience. The nature of the family and its functions in the lives of its members and in society had varied in time and place. Economic and social development, the modernization of society and demographic changes had caused fundamental alterations in family structure and roles. Because the family was the basic intermediate variable in reproductive behaviour, its nature as an institution and the modifications in it over time had influenced demographic processes and other related phenomena.

16. There had been emerging in recent years dissatisfaction with existing knowledge, which was essentially the result of research restricted to the macro-level of analysis. That type of research, especially in the area of fertility and population dynamics, usually did not lead to findings that were an adequate basis for the implementation of policy measures designed to solve the practical problems of concern to Governments: policy in that field was ultimately implemented by individuals or couples.

17. In particular, where policy measures were designed to initiate or to accelerate some specific change in society, it required the scientific identification of options open to decision-makers and the assessment of consequences of adopting the options. Expert scientific opinion was needed to fill the wide gaps in existing knowledge as to the mechanisms by which the economic and social transformations wrought by the process of development and modernization—through their effect on the structure and functions of the family—induced significant changes in attitudes and behaviour in reproduction at the individual or micro-level. Analysis at that level, with due regard for the diverse circumstances and conditions that prevailed

throughout the world, would provide a basis for specific recommendations useful for national or regional policy.

18. There were major weaknesses in the state of knowledge about the functioning of the family and of the means whereby modernization occurred and by which it brought about modifications in family structure or behaviour. In part because of the existence of a wide variety of forms of family organization throughout the world, there was no internationally accepted definition of the family as a sociological-anthropological concept. The term "family" might refer to the nuclear form, generally considered to be confined to the husband and wife and their unmarried children; or it could refer to families variously defined by residence or descent group, which included additional relatives, such as married children and their families, and sometimes comprised several generations. While the presence of a number of generations living together under one roof might not be a typical feature of developing countries, large kinship groups often existed in which relatives living apart from the household were bound together by elaborate systems of obligation and mutual aid and were capable of exercising influence over behaviour in such matters as reproduction. For purposes of sociological analysis, those kinship groups might be more pertinent than residence groups and, as mentioned elsewhere, it was therefore important to distinguish between the two.

19. To explain the interrelationship between social change and family form and structure, a distinction was made between biological factors and non-biological factors (social, economic, cultural etc.). The human species exhibited some distinctive biological characteristics: in particular, there was a relatively long period of child dependency. All that had resulted in an organization of the human family that was based in general on a relatively stable, generally monogamous, marital union. Although norms varied, the objectives of marriage controls were to confine procreation within a stable relationship. Cultural variability was a result of the socialization of children through the family and the community. The question was whether that variability was desirable. It was claimed by some that the vigour of the human species might lie in deliberately preserving heterogeneity in its biological and non-biological characteristics. In that connexion, genetic variability was valuable to the human species, which meant that any changes that might be sought in aggregate fertility should be consistent with maintaining a reasonable variability in family size, which in turn had implications for family structure.

20. There were a large number of social, economic and cultural factors, built upon that biological foundation of the institution of the family, which contributed to the cross-cultural variation in family patterns. Among them were the mechanisms for choice of marriage partner; attitudes towards celibacy, and the status that it is given by society; social controls over reproductive behaviour outside the family unit; rules about legitimacy status and other norms concerning ownership of property and its inheritance; regulation of the marriage of widows; association with the family (such as adoption etc.), and dismissal from it; types of economic organization; and different uses of manpower and their effect upon the usefulness of children or the economic burden imposed by them.

21. The family entailed a network of rights and obligations among its members, from the care of the young to the support of the aged. Consequently, the family might be considered an adaptive institution of great strength, in the sense that most of the patterns referred to had already undergone marked changes with the arrival of industrialization and urbanization. The family had a considerable capacity to renew itself and even to readopt traditional forms. The importance of the family was significant in every culture. On the other hand, there was the view that such events as marriage and childbearing were overwhelmingly conditioned by economic and social factors, biological factors providing only broad limits as an explanation of social institutions.

22. As to whether the family could be a force for social change or whether it merely responded to changes in the larger

socio-economic context, there was a relatively wide range of opinion. At one extreme was the stress placed on the adaptability of the family, which gave it an actual or potential role as a force for social change. At the other extreme was a body of opinion which either explicitly or implicitly rejected the notion of the family as an independent source of cultural norms.

23. Important changes in family structure were generated by industrialization and modernization; extreme examples of such changes were found in cases of rural-urban migration. The latter had an important effect upon the breaking-down of traditional procreation controls, for instance, in regard to traditional periods of abstinence and to post-partum taboos. Some studies had revealed shorter birth intervals among urban than among rural women in West Africa, due to a less consistent practice of post-partum abstinence and the substitution of bottle-feeding for breast-feeding. A characteristic of the modernization process was that the State and other public institutions assumed increasingly greater responsibilities in relation to those that remained with the family unit itself. However, rather than diminishing the importance of the family, modernization created for the family new sets of obligations.

24. It also was necessary to take account of the dysfunctions of the family, such as the perpetuation of social stratification, in either its current or emerging forms. According to one school of thought, the very tenacity of the family might impede the development of individual values and hinder changes in roles which some considered to be the essential correlates, if not precursors, of the modernization process. From that point of view, the family was not an independent source of social norms; it could create some imbalances within the society because of its inherent tendency to lag behind changing conditions, that is, to maintain earlier patterns of adaptation.

25. Many of the actual changes taking place in the family institution originated in the political sphere, particularly in developing countries, where Governments played an important role in providing services and assistance of many kinds. Efficiency of the political system and of government was thus a very important factor in promoting social change. The question was the extent to which the Government should interfere without encroaching on the vitality of the family institution. For a variety of reasons, that was an area where great caution was needed in view of the possibilities of abridging individual rights and privileges.

26. Where the introduction of legislation—for example, to raise the age of marriage—merely sanctioned existing tendencies or aspirations, particularly within a context in which social conditions were already changing, the legislation could enforce trends and vice versa, permitting an acceleration of change. One view was that, because the family was not an institution that was easily regulated from outside, especially in respect to its internal dynamics, and because cultural and traditional factors were so important to its smooth functioning, it might be questioned whether legislation could be effective if it were in direct opposition to an institution as strong as the family. However, disputed examples were reported where legislation appeared to be instrumental in changing the family institution.

27. A particularly important issue related to the degree of uniformity and standardization that would be imposed by, or, alternatively, the degree of heterogeneity and deviation that would remain permissible under, the modernization of the family. The assumption of increased functions by the State in respect of the socialization of children outside the circle of the family might, in the view of some, produce conflicts between the increasing realization of the potentialities of the individual, on the one hand, and his homogenization across a broad group of important social, economic and cultural values.

## II. DEMOGRAPHIC, SOCIO-CULTURAL AND DEVELOPMENT FACTORS INFLUENCING THE FAMILY CYCLE

### A. Demographic factors

28. Most studies having as their purpose an explanation of the causes and consequences of demographic behaviour had

traditionally utilized cross-sectional data and analyses. While such macro-studies had expanded greatly the horizons of knowledge in that sphere, they had proved incapable of furnishing satisfactory answers to many vital questions, particularly questions about demographic change. In respect of fertility change, especially, there was a need to extend research to the level of the individual family where the decision-making process occurred. The family, in its socio-cultural *milieu*, went through different phases and had a variety of experiences to which it adapted or adjusted through responses that influenced fertility, mortality and migration. Analyses of family demographic experiences in those phases and of the responses to those experiences would improve the quality of knowledge about conditions of demographic change, particularly if individual families were related to their socio-cultural *milieu*, permitting the micro- and macro-phenomena to be related at a meaningful level.

29. The concept of the family life cycle had been developed as a framework for studying the different stages through which the family passed from formation to dissolution. Those stages were different for the nuclear and extended types of families. In the nuclear family system, family formation was generally considered to begin with marriage; family-building covered the stage from the birth of the first child to the birth of the last child; a "launching" stage that might overlap with the building stage covered the period during which children left home either to live apart or to marry; and the "empty nest" was the period after the last child left the family of origin. In the nuclear family system, the family might, in some respects, be considered dissolved when one spouse died; or in other respects when the surviving spouse died, if the survivor was considered to continue the existence of the family. Obviously, variations in the cycle were introduced if one of the spouses died at an early stage, before all of the children left the home. As opposed to that pattern, the extended linear family might persist forever, having no beginning or end. Such a family might temporarily become a nuclear family, for example, if both spouses died before their married child who remained with them had any married children of his or her own living in the household.

30. At any given stage of its life cycle, the family was, in fact, at a stage of transition. Each stage was affected or even determined by events of preceding stages. The family learned from its experiences and responded to demographic, economic and social situations on the basis of those experiences over the past and, within limits, in accordance with the prescriptions and constraints of society. In light of that, a longitudinal or cohort approach to the study of demographic events within the family, particularly in respect of reproduction, would afford greater insight into family decision-making and behaviour.

31. Demographic aspects of particular importance in marking different types and stages of the family life cycle as it related to reproductive behaviour were summarized as follows:

(a) Age at marriage and the proportions marrying (affected by the sex-age structure of the population);

(b) Family-building (through fertility and the preference pattern of the sex of children, infant mortality and the chances of the marriage remaining intact to the end of the woman's reproductive life), including birth spacing, timing of births in the woman's reproductive age cycle and completed family size;

(c) Premature dissolution of marriage (through separation or divorce) and widowhood (through adult mortality).

In addition, there were instances in which the family life cycle, as well as the type of family, was affected by migration.

32. The age at which females and males married and the proportions ultimately marrying depended upon cultural and modernization factors, as well as the demographic reality of the sex-age structure of the population and its impact upon the availability of marriage partners. There was ample evidence that, other things being equal, where contraception was not widely practised, age at marriage influenced completed family size. However, where the family was able to regulate fertility

successfully, age at marriage had less impact. The implications of those factors were that, in countries of high fertility, Governments desiring to induce couples to have smaller families should institute effective laws raising age at marriage significantly and should facilitate the knowledge and practice of contraception.

33. The sex ratio at different ages was an important factor in nuptiality. Men normally married women younger than themselves, and where the population was growing rapidly, the cohorts of girls reaching marriageable age tended to exceed in size the cohorts of males slightly older than themselves. That could produce competition among women for marriage partners. Variations in birth-rate levels from one year to another might result in later years in imbalances in numbers of potential marriage partners at given points in time.

34. Fluctuations in the marriage rate itself might cause later fluctuations in the birth rate. Particularly severe and far-reaching imbalances in the sex ratio, with major effects on the marriage patterns of the population and thus on its reproductive capacity, had resulted from war losses, which fell much more heavily upon males, with the result that large proportions of women never married or became widowed while still of reproductive age. Such losses had had a major effect upon the population structure of some countries. Low marriage rates and proportions of women never marrying might also prevail in countries of large-scale labour emigration.

35. An important factor affecting family size and structure in many countries was the preference of parents with regard to the sex of their children. A strong desire to have at least one child of a particular sex, or at least one child of each sex, was a factor likely to raise the number of children in a family. Surveys had suggested that, in some societies, the desire for a son might be so strong that a woman might permit her husband to marry a second wife, or to adopt a son, in order to achieve that goal. Although in many developing societies, sons were preferred to daughters, none the less daughters were also desired because of their importance in undertaking household duties or as productive members where the family was a productive economic unit. In the United States of America, one of the countries having data on sex preferences, couples were found to desire a balanced sex ratio of their own children; and if they desired an odd number of children, the proportions desiring more sons than daughters or more daughters than sons were nearly equal.

36. Results of pertinent studies suggested that, even if a new technology for the pre-determination of sex were available, its application would not markedly alter the sex ratio in developed countries. However, the patterns of family structure might be affected in that most families would have a son first, then a daughter etc. In many developing societies, where there appeared to be a high preference for sons, the effect on the population's sex ratio might be greater, but even in those areas it was believed that most parents would want to have some daughters. A possibility was that fluctuations in the sex ratio might occur as a result of changes in the popularity of boys and girls at different times.

37. Large-scale migration to the cities had often led to the increasing nuclearization of families. However, instances were noted, particularly in Africa, in which such migration in practice could strengthen the extended family. In such cases, when unmarried men migrated from the rural areas to towns, they might join relatives who were already established in the town and thereby transform the receiving household into an extended family. If married men migrated to the towns, their wives and children left behind in the rural areas might become dependent upon an extended family for their support. Thus, the effect could be in either direction depending upon the particular circumstances. Often, the wife and children left behind continued as an incomplete family on a relatively permanent basis. As previously mentioned, patterns of migration which were selective of unmarried males in the young, working ages might result in severe imbalances of the sex ratio both in areas of immigration and emigration, and influence the proportion of

persons able to find marriage partners. The situation sometimes arose in the rural areas where girls, whose parents feared that they might be deprived of the opportunity to marry because of the out-migration of young men, might marry much older men or—in polygamous societies—might marry men who were already married, with a consequent effect on fertility. In those situations, girls might experience pressure to marry early and produce children as soon as possible in order to ensure inheritance rights.

38. The large-scale emigration of males in search of employment opportunities could have adverse effects upon the family structure, frequently contributing to its effective dissolution. Even where the family remained relatively intact, the migration had the effect of lowering completed family size by curtailing reproduction. The effects were most pronounced in the country of emigration, when wives were unable or even legally prohibited from joining their husbands. In those circumstances, a social phenomenon arising in the country of immigration might be the establishment of quasi-family living. Those conditions presented policy alternatives for both the sending and the receiving countries. Purely seasonal migration might also influence family and reproduction, but its effect would be minimal when, as in some African cultures, the absence of the workers occurred while their wives were already pregnant or lactating.

39. Family size and structure were influenced by both mortality and fertility. The relatively high average household size in developing regions as compared with that in the more developed regions appeared to be due more to the higher fertility of the former than to the existence of extended families. Fertility decline was known to have been a major factor in the long-term decline of average household size in developed countries. While falling infant mortality at first had the same effect as increasing fertility in raising average family size—to the extent that it subsequently led to a fall in fertility—indirectly it caused a decrease in family size. The marked decrease in the severity of many infectious diseases, such as tuberculosis, had reduced the risk that a family would lose prematurely its head or the spouse of its head. Any change, brought about by a decline in adult mortality, in the chances of a marriage remaining unbroken to the end of the reproductive span affected completed family size. However, reduction of mortality due to degenerative diseases (cancer, heart diseases etc.) had its greatest impact in the older ages and increased the duration of the "empty nest" stage, as well as that of widowhood. It was mentioned that high morbidity at the older ages, resulting from the keeping alive through medical means of people who were no longer capable of being socially productive, could cause stresses in family life.

40. Place of residence, that is, rural or urban area, had an important effect upon fertility, and influenced family structure in some developing countries, though the effect was most evident where urban and rural occupation and educational levels were differentiated by factors of modernization. Reference was made specifically to studies that had found shorter birth intervals among urban than rural families in West Africa, apparently due to the tendency of urban families to disregard sex taboos and shorten the period of breast-feeding which, in the traditional setting, ensured the spacing of births. Many urban occupations did not permit mothers to breast-feed their babies. The discarded traditional methods of fertility regulation had not been replaced by other methods, and increases in fertility were said to result.

41. In urban areas of developing countries, a large section of the population belonged to what was called "high-risk" families. While those "high-risk" or disadvantaged families had higher mortality, it was a question whether they should be expected to have relatively high or low fertility.

42. Much remained to be known of the demographic factors influencing the family cycle; there had been comparatively little work in that area. In view of the pressing need for knowledge of the family's demographic experiences and responses, it was imperative that provisions should be made for in-depth micro-

level studies directed especially to explaining reproductive behaviour.

43. There had been attempts to describe the life cycle of the family by using census data to follow cohorts through time. However, the use of cross-sectional data in that way was not easy, and in general, any results achieved had many limitations. Among other things, that was because successive censuses often failed to collect or tabulate comparable data at different points in time and in the required detail. Special surveys offered the simplest, quickest and most practical way of reconstructing life histories of individuals or families, though the ability of people to recall accurately events or their timing limited what could be achieved from retrospective surveys. Prospective surveys offered in theory the best chance of collecting the desired data, but were generally a slow means of amassing evidence and presented problems through the risk of loss of contact with individuals in the survey. Longitudinal studies of vital statistics data, covering, for instance, the important events of marriages, births and deaths, were theoretically of value, but in practice were often limited by the difficulty of linking successive events. Without doubt, it was imperative that the methodological problems standing in the way of longitudinal study should be tackled and solved; it was highly important to develop the analytic techniques needed for that new field of research.

#### B. Development factors influencing the family cycle

44. There were sharp divergencies of view as to the manner in which economic factors operated on the family cycle, though it was agreed that those factors were of major significance. The lack of consensus centred around two main aspects:

(a) The degree to which there was comparability between family structures and given levels of economic organization in society;

(b) The adequacy of the economists' concepts and techniques to provide micro-economic models of the value systems existing within the family, particularly the adequacy of the costs/benefit analysis of the value of children to the family.

45. It was difficult to imagine a deterministic relationship between family structure and the equilibrium between the supply and demand of labour. Demand of labour depended upon the state of development, technology options, rate of economic growth and income distribution. There were, it was mentioned, different types of pre-modern societies. In some, an increase in output required an elastic labour supply, a situation that would tend to favour high fertility and relatively large family sizes. However, the forces that tended to work in favour of a conjugal or nuclear family appeared to be related to changes in the economic functions of the family (both its production and consumption functions). In some situations, it was claimed, the long-term interest of the State might be best served by preventing the emergence of a surplus of young people and the impact that that had on the labour market, and hence to seek to reduce fertility. Those long-term goals were the more justified when economic growth and social development were accelerated through specific policy measures initiated by Governments.

46. Relationships between social change and changes in economic function were somewhat obscure, and caution should be used in ascribing the former to the latter. There was the view that the role of the State in modifying the existing social structure was of fundamental importance when the aim was an economic organization of society capable of utilizing modern technology and achieving continuously increasing productivity. However, modification of the social structure inescapably involved, as one significant component, modification of some kind in the function and structure of the family. In the typical developing country, considerable adaptation of family structure would appear to be the consequence of modernization, permitting the degree and kinds of social mobility necessary for the efficient allocation of the labour force within the modernizing economic structure.

47. There were many ways in which Governments intervened to modify family structure and function as well as the interacting roles of family members. The most conspicuous of those ways was the assumption of a very important part in the socialization of children through the establishment of formal public institutions of education.

48. The question of governmental intervention and control of family life was a matter for serious consideration. A clear distinction was needed between the actions of Governments with regard to the regulation of the production of goods and services and attempts to regulate family life and, in particular, reproduction. The rights and obligations of Governments to act with regard to the former were broader and more acceptable than was the case with such a process as reproduction, which was in many ways personal and which involved human rights.

49. The idea that development began with the intention to create a new political system was difficult to accept. In part, it was a question of how development was initiated: by *élite* groups, or by forces of urbanization and industrialization working more widely through society. It was also necessary to consider whether the State should, or in practice did, regulate family structure. Many and diverse forms of family institutions had not only survived industrialization but, it was claimed, were actually functional for economic development. Particular patterns of inheritance, for example, might have fostered early industrialization in certain regions.

50. There was the view, too, that the development process unavoidably created stratification of society, and that when there was an insufficient rate of economic growth, social imbalances became more acute. The result was a society structure based on the cultural heterogeneity of the component elements. Two main processes that deeply affected family life could be identified. Market expansion induced mobility among the groups that participated in the growth in economic activity and hence consumption; it also led to the political mobilization of those large masses which at first were on the margins of the market economy. Both processes tended to lower reproduction rates and to reinforce secular values which emphasized the need to defer immediate gratification.

51. Micro-economic models of the family were being used to describe the determinants of fertility, but attempts made so far should be regarded as exploratory. Some economists, who had abandoned macro-economic models of reproduction and entered a field called the new home economics, were endeavouring to construct micro-models which were potentially interdisciplinary and which were designed to take into account psychological and sociological variables as well as the traditionally economic variables. It was required also that those models should differentiate between different stages of development and, perhaps, even different courses or strategies of development. Psychologically oriented studies had been or were being made that attempted to itemize and classify the demand for children from the points of view of the wide range of benefits they gave to parents, as well as the costs they imposed on parents. Those dimensions would have to be incorporated into micro-models. It was maintained, and generally accepted, that economists should be encouraged to continue in their attempts to relate fertility behaviour to models of economic behaviour at the micro-level.

52. However, the concept of micro-economic models was criticized on various grounds. For example, it was impossible in principle to formulate a model of the reproduction transition that would be valid both for the developing countries and for the developed countries during the period of their transition, the situations being so different. The applicability of economic micro-models even to developed countries in their current circumstances could be challenged. Thus, the introduction of the variables, "tastes", as a component of the demand for children was inadequate compensation for the rich psychological dimension of reproductive behaviour. The complexity of the motivations involved in the family network and its functioning

dictated an integration of social, psychological and economic theory. In addition, most models did not allow for the time lags between economic and social change and changes in fertility. Moreover, criticism could be made of the "representative household", which ignored the extremely significant effects of social stratification as it affected reproduction, and the differential access for members of families or different social strata to participation in the process of modernization and in the opportunities which that process offered.

53. The question of the employment of women outside the home arose in connexion with economic factors in the family cycle. That question was of particular importance, as employment of women in the modern sector of the economy bore directly upon factors of childbearing, whether it be age at marriage and the commencement of childbearing, number of children born, or spacing of children. As family members whose traditional role had been restricted to the domestic production unit, successful actions by Governments to draw women out from the confines of family life and to mobilize them to participate in non-family activities related to the process of modernization necessarily had implications not only for the women as individuals, but for the family unit. In that connexion, the question arose as to how women might be involved in economic activities outside the domestic production unit in countries where employment opportunities were insufficient even for the male population alone. It was suggested that success in that aspect was more likely in countries where Governments took more active roles in the planning and organization of integrated programmes for economic and social development.

54. While the importance of women assuming roles in the economy outside the family was not denied as a longer run proposition, one view held that the time lags were such that economic development, the education of women and the effects of communication of new values through the mass media might affect not the first generation to encounter them but the second, in so far as their wish for children and their reproductive behaviour were concerned.

### *C. Socio-cultural factors influencing the family cycle*

55. Culture influenced the demographic processes, viewed in terms of the family cycle, through the ways in which it prescribed norms with respect to marriage and sexual union and to the bearing and rearing of children. Further, it stipulated acceptable and unacceptable conditions in which marriage might be dissolved. Indeed, cultural prescriptions determined behaviour norms relating to all aspects of family life. Culture specified or regulated acceptable marriage terms, age at marriage, timing of reproduction, roles of the sexes in marriage and division of labour between the sexes and among different age groups. It specified the family members in whom authority and decision-making was invested, defined status and influenced the value placed upon children. The strength of marriage bonds or of ties in other sexual unions, possibilities and means for the dissolution of the family and for remarriage and the care and treatment of the widowed and aged were also culturally prescribed.

56. But those prescriptions influencing family behaviour should be viewed as norms or ideals rather than as purely deterministic rules. There was, in fact, greater or lesser rigidity or flexibility in the manner in which different cultures allowed variations or deviations from the prescribed norms, and within the same culture there was variation among different norms. Cultural norms for any specific element of behaviour were powerful because they were reinforced by numerous other aspects of the culture.

57. As stated earlier, the age of women at first marriage (or entrance into other types of sexual union) would have a significant influence upon their completed family size if contraception were not practised. In a monogamous society, other relevant things being equal, early marriage would increase exposure to risks of pregnancy. It was not well documented whether the fertility of women living in polygynous marriages

differed systematically from that of those living in monogamous unions. However, the difference in age between the husband and, in particular, the second wife was necessarily larger than in monogamous marriages. That increased the risk that those wives would become widowed before the end of their reproductive life span and was thereby likely to decrease rather than increase the number of children born to women in polygynous marriages. Exposure of the wives to the risk of pregnancy was also reduced merely by the added number of wives. Family size also could vary with the degree of stability of marital or other sexual union. Culture was one of the principal factors that determined whether a marriage would be monogamous or polygamous, and whether and in what circumstances widows could remarry and the relative stability of marital and other sexual unions.

58. Cultural factors also shaped preference for children of one sex or the other; and because those preferences influenced the treatment of the children in certain societies, there were corresponding sex differentials in infant and childhood morbidity and mortality. Mortality and its effect in dissolving families could also be influenced in some cultures by practices relating to the treatment of mothers after childbirth. Cultural patterns further intervened as part of the dynamics of the family through prescriptions for care of the aged and the amount of authority which the older members exercised over their descendants. Practices and sanctions in respect of divorce or other separations were of particular relevance to reproduction.

59. The rapidity with which change in those cultural factors bearing on population dynamics could occur, or how the processes could be accelerated, were important questions. There were interrelations between demographic, economic, social and cultural change, and the quality of life of the population was both a goal of development and the human elements in development; thus, unless there was social and economic advancement, there was not likely to be cultural and demographic transformation.

60. Much interest attached to the degree to which change might be precipitated by improving the status of women and promoting their education as a major objective of government policy. The fact that women in some countries had attained a measure of emancipation in advance of general changes in the economy and society could be used to support the view that leadership could initiate desired cultural change.

61. A counter position was that changes were precipitated by forces external to the society through an alteration of its economic base and were, therefore, not a part of a natural process. At any rate, evidence of a direct relationship between the legal status of women and their fertility was lacking. It was the complex of factors associated with women's status in any society that was related to fertility.

62. In terms of direct effects, factors that tended to be part of the transition process to lower fertility included delayed age at marriage, increased literacy, employment opportunities outside the family and participation in family decision-making. There were less obvious ways, also, by which the status of women affected the entire system of the family in such a way as to influence fertility: for example, educational and cultural factors influenced infant and childhood mortality, which in turn bore upon fertility, and extended education might delay age at marriage.

63. Although much stress had been placed upon education as a means of improving the status of women, it could be argued persuasively that that was only likely to occur, and in particular to affect reproduction, within a wider context of economic, social and cultural development. According to one position, rapid change in the position and role of women had only taken place in the context of revolutionary change in the structure of society.

64. Improvements in the status of women could, in one view, have unforeseen side-effects, as in the increased participation of women in the labour force. In a context of Western society, an example was given in which the cost of social

welfare benefits, when constituting a direct labour charge to the employer, thereby raised the unit cost of female labour. That tended to reduce the demand for female labour, or to keep women in the lower ranks of the labour force, and to act against their assuming a full role in society. However, that effect could be avoided if the community, rather than the individual employer, were to bear the costs of family support.

65. In many societies, cultural norms were such that alteration of the role and function of women would necessitate an alteration of the social-cultural structure. It was therefore necessary to recognize that women have many roles and functions in the family and in society, and that they should be given assistance in fulfilling those roles and given effective choice in respect of the roles open to them. In that connexion, it was held that elevation of the status of women was without doubt important; but of equal importance was the improvement of the rights of all disadvantaged sectors of the community, as deprived groups usually had certain common problems.

66. One view held that an insensitive emphasis on mere quantification in the analysis of social problems could be seen as a process of the depersonalization of men, which was the cause of profound social unrest and led to a resistance and hostility to modernization itself. It was essential to have positive goals for improving the lot of mankind, with which individuals could identify themselves.

67. In certain cultures, motivation for modernization was selective. For instance, a zest for education had been observed to co-exist with a negative reaction to family planning. Obviously, in such cultures, the elements of modernization that were in the long run essential to a change of attitudes, values and desires with respect to children had not led to results in the first generation to experience them in the way a simplistic theory of cause and effect would have suggested. It was necessary to give impetus to desired social change by marshalling the forces of communication so that people could understand and thereby actively participate in bringing about social change.

68. Over the past decade and a half, a number of Governments had attempted to promote changes among their populations in the practice of contraception. However, the accomplishments had been limited by many factors, including insufficient knowledge as to the key elements that operated for change within a given culture, the forces that bound society together or determined the stresses in it, and, in general, the way society changed. Problems of data and methodology had hampered the evaluation of programme effect, in spite of sophisticated efforts to use inadequate data to the greatest effect. It was essential to build evaluation procedures into any programme from the beginning; only that would lead to clear definition of goals, the monitoring of progress towards that goal and awareness of the appropriateness of particular methods and means. It was also very important that biomedical research on the methodology of contraception should proceed, so that further options might be made available to couples.

69. None the less, much change had taken place: proportions of contraceptive users had increased in some countries from 5 to 30 per cent over the comparatively short period of less than 10 years. It had been found that in some circumstances change could be generated and that the level of programme achievement was related to input or the strength of the programme. High achievement, however, appeared to be associated with high socio-economic status. Among the developing countries with family planning programmes, there was considerable variation in achievement, some of which was accounted for by economic factors.

70. In all of those aspects, it was generally implicit that no culture presented a picture of uniformity of behaviour of the family and individuals, in part because norms changed and in part because certain deviations from norms might be permitted. It was observed that changes in cultural norms might have many dimensions. They might become more or less binding, a critical factor for population change, especially fertility. Where marriage was defined mainly in terms of childbearing, for

example, introduction of a national family planning programme would tend to make the marriage norms less restrictive and reduce fertility. In that connexion it was mentioned that among the constraints to achieving the demographic transition had been the failure of countries to seek to promote social change as a component of economic development.

71. There was the question to what extent culture influenced the acceptability of different contraceptives. In practice, the choices available under family planning programmes were often dependent upon the medical profession, which tended to favour contraceptive methods that were under its direct control. In that connexion, the possibility of achieving cultural change should be viewed in terms of those special interest groups in societies which would be affected by a change in the culture. Although biomedical research and technological advance had yielded new means for family planning, the view was that there had actually been a narrowing of the range of effective choice. The constricted range of means in health-related services in some countries was attributed to the influence of medical staffs. Accordingly, there was insufficient recognition of the continuing assets of the condom, either alone or in combination with other methods. The condom had tended to be downgraded consistently and often it was not recommended even in cases where its use would be very appropriate, such as in the case of intermittent sexual activity. The experience of countries that had reduced their birth rates with the aid of condoms and other non-pill, non-medical methods (aside from abortion) was too often overlooked.

72. Because not all family planning methods were of equal acceptability, it was important that individuals should be presented with a wide variety of choices. A broadening of alternatives would make possible a continuity between traditional and modern methods. There were some family planning programmes in which there was freedom of choice among all means of family limitation, consistent with the values of the culture. Moreover, there were important benefits to be derived from that procedure whereby all non-medical methods, including condoms, were made available through normal distribution channels, particularly in the rural areas where health and medical services were limited or missing.

73. In the formulation of population policy, the family should be recognized as the intermediary between policies and the reproductive process. Social change affected family functions; a problem for research was how the change in family function produced demographic effects.

74. It was considered abhorrent to human values to withhold from any sector of society the information and services which were needed for the regulation of fertility. Social justice meant that the benefits to individuals and the family of being able to achieve goals with respect to the number and spacing of children should not be restricted to the more fortunate members of society. On the other hand, social justice also required rejection of the "malthusian" idea of limiting the number of children only among the poor.

75. Socio-cultural factors were multifaceted. In most traditional communities, religion was a crucial factor in determining the attitudes of its members. In fact, religion could be seen as the reflection of the culture. Probably equally so in modernized communities, considerations of religion still loomed large even in issues that depended on the personal judgement of the individuals. Until the current time, the issue of the means of birth control, if not the ends, had remained controversial in some religious groups, and could influence the success of family planning programmes.

76. No matter how rigid the norms, cultural patterns were capable of change. All known societies had experienced, in lesser or greater degree, at least among some of their members, changes in family behaviour patterns under the influence of changing socio-economic conditions and exposure to new ideologies. In any attempt to encourage and orient change in family life within any specific society, an understanding was needed of the existing cultural norms, their relative rigidity or flexibil-

ity, the changes that were already taking place, the factors influencing those changes and their direction; that understanding was essential for working out realistic and effective policies.

77. Most Governments of developing countries sought major economic and social changes as indicated by the preparation of development plans. It might be said that, to the extent that those plans were being realized, social and cultural change was generated which affected the family. Thus, in a number of countries, the family was experiencing appreciable change as a result of development.

### III. RELATIONSHIP OF URBANIZATION AND INTERNAL MIGRATION TO FAMILY LIFE AND STRUCTURE

78. It had been observed earlier that urbanization and industrialization were aspects of the process of modernization in which the institution of the family underwent modifications which had important implications for population change. Internal migration, as the chief mechanism for urbanization, was an element in achieving the benefits of modernization.

79. There were also the negative or dysfunctional aspects of internal migration and urbanization, as evidenced by the effects of the different types of migration on family life. With a few exceptions—generally centrally planned economies—the massive internal migration characteristic of urbanization in most developing countries had been a spontaneous migration of individuals rather than a planned and co-ordinated process. As had been the case in the process of industrialization in the nineteenth century in the currently developed countries, when there had been much suffering associated with the growth of urban centres, that spontaneous internal migration was largely a *laissez-faire* process in which the individual migrant was left to his own resources in finding his place in the town or city of destination. In some instances, however, chain migration had provided an exception to this general picture by channelling newcomers into a social setting established by earlier migrants. That was the case, for example, where the family head migrated first and lived with other kin or affinity groups until he was able to send for his family.

80. The problems of such spontaneous migration were magnified still further because most of those countries suffered from severe unemployment and underemployment, in part as a consequence of the introduction of modern labour-saving technology and in part because of their rapid rates of population growth. In such circumstances, the receiving urban centres were unable to absorb more than a fraction of the in-flowing migrants into useful economic activities.

81. Internal migration was seen as having significance for the migrants themselves, for the place of origin and for the place of destination. Despite the absence of statistical data to provide substantiation, the effects on family life and fertility of large-scale internal migrations occurring in the post-war period must have been profound. Individual migrants to urban centres faced major social problems in their efforts at adaptation to the urban environment, including cultural isolation, the effects of broken families, and in some cases—it was claimed—higher mortality and morbidity as compared with those who remained behind in the rural places of origin.

82. While families in the rural places of origin often derived economic benefit from the monetary remittances of migratory family members, on the whole emigration was considered a conservative, non-innovating force from the point of view of the rural areas of origin. Migration, it was said, often served as an escape valve which permitted rural families from small settlements to avoid, or at least defer, making the changes in their way of life that would be required to keep them in the mainstream of economic and social development. In some countries of Europe, certain areas of continued high emigration had become trapped as exporters of low-grade labour to more economically advanced areas—a situation which was socially divisive.

83. The urban type of education given in rural schools (where those existed), or in the urban schools to which some

rural parents were able to send their children, was said to be a contributing factor to increased out-migration from the rural areas, since most of those who received such education were dissatisfied later to work in rural occupations. The net effect was thus to magnify the relative backwardness of rural areas as centres of unskilled labour and of minimal education.

84. Given the incapacity of the modern urban industrialized sector in many countries to absorb into employment a significant proportion of the migrants who came in search of improved economic status, it was necessary to make a distinction according to the measure of success achieved by different types of migrants to urban centres. Large numbers from the middle classes, but smaller numbers from the lower classes, did manage to establish themselves in highly competitive situations, with prospects for social mobility which tended to encourage a modification of family life, including a pattern of lower fertility. Those sectors of the population with unstable or non-existent employment opportunities often sought support from the extended family system or by having many children, in the hope that some could eventually make a financial contribution to the family group. It was observed that, in such cases, many migrants tended to form communities of their own so that they could provide mutual assistance to one another according to need. Those communities often tended to form subcultures which, although urban in residence, were little affected by the modernizing influences of urbanization. Thus, the family life of persons living in such conditions retained features that were more strictly rural than urban.

85. Large-scale migration to urban areas also had implications for the problem of the care of the aged, which had different aspects in urban and rural societies. The strict adoption of the nuclear family with its emphasis on the responsibilities of parents towards their children, as opposed to their traditional obligations towards their own parents, was creating difficult problems of cultural isolation for the aged. Impersonal government measures provided for an existence which, however comfortable in a material sense, was essentially isolated from cultural contacts with others. The scale of provision of services to meet that situation presented acute resource problems to developed countries where the small nuclear family was an established fact. In some developing countries, it was regarded as a community function to care for elderly or disabled people rather than a function of the nuclear family as such.

### IV. CHANGES IN THE FAMILY CYCLE RELATIVE TO FAMILY LIFE AND REPRODUCTIVE BEHAVIOUR

86. A major impediment to the understanding of demographic change, particularly in the area of fertility, was that, over the past, relatively little work had been done to improve the perception of demographic situations from the micro-level of the individual family. A valuable demonstration of the importance of the micro-analytic approach to understanding demographic and social phenomena was represented by a set of models, which illustrated important aspects of family life in three classic demographic situations. The illustrations corresponded to different stages of the demographic transition, defined as: "high equilibrium", with high mortality and high fertility; "disequilibrium", with low mortality and high fertility; and "low equilibrium", with low mortality and low fertility. In the models, a monogamous marriage system was assumed in which all women married at age 20 and all men at age 25. Model life tables and schedules of fertility rates by marriage duration were selected which appeared to correspond fairly well to observed high and low mortality and fertility conditions. The high-equilibrium model was put forward as representative of conditions before the onset of the modern decreases in mortality, the disequilibrium model epitomized the current situation in many developing countries, and the low-equilibrium model resembled the intrinsic conditions which were near those of the developed countries.

87. A number of measures of interest for demographic analysis of the family had been derived from those models,

including the probabilities of marriage dissolution by the death of one spouse, expected years of parent-child and sibling relationships within the family, the proportion of marriages surviving to the end of the fertile period, the length of family life, the incidence of orphanhood, mean family size, family dependency ratios and the like.

88. It was agreed that the models were a valuable first step towards quantified measures of the stages in the family life cycle on a multidimensional basis (rather than the mere traditional analysis of events in the life of a given individual). They represented an extension of the classic techniques of demography into wider fields relevant to broad social issues and were a valuable, useful tool for studying the micro-demography of the family. However, the models referred only to the strictly nuclear family, while it was well known—and of considerable importance in demographic behaviour—that even in societies where the nuclear family was the dominant form, additional persons were very often included in a family. That model also could not account for fissions and fusions in families and it was possible to propose more than one assumption for some variables, with different results. However, those qualifications did not detract from the usefulness of the model.

89. The applicability of the high-mortality assumption to all of human history was questioned. There had been occasional instances of very high rates of population growth before modern health measures became available. Life tables based on paleodemographic evidence and the rarity in small-scale societies of infectious diseases relying solely on a human host were cited in support of the view that life expectancy closer to 40 than to 25 years might have been common before urbanization. Doubt was expressed, however, that a crude birth rate of 25 per 1,000—to correspond to a life expectancy at birth as low as 40 years and the very slow rate of long-term population growth—could possibly have been general during those times.

90. An important finding through use of the models was the existence of a marked discrepancy between the image of the effect of rapid population growth (the disequilibrium situation), as viewed from the macro-level of society as a whole, and from the micro-level of how an individual perceived what was occurring within his own family situation. According to the models, the rapid population growth of the disequilibrium conditions yielded child-adult ratios in the family only slightly higher than the high equilibrium conditions. In those developing countries where additional land and employment were available, support of children did not necessarily impose major stresses on the economy of the individual family. However, fulfilment of responsibilities for children at their maturity, including provisions leading to fragmentation of land and other resources at inheritance, would present difficulties if the macro-demographic developments were producing insufficient employment opportunities and inadequate incomes for the increasing numbers in the maturing cohorts. In the conditions of disequilibrium, the swiftly increasing total numbers of people, the rapidly growing numbers of families and the age structure of the total population would have serious consequences for economic development, employment, housing, education etc.

91. But the dependency burden changed during the life cycle of the family, being light for a short time in the early married life of a couple, then rapidly becoming heavy, then decreasing gradually over a long period. Thus, to meet demands at each stage, each family would need to borrow resources from the future to overcome the early unfavourable period, to repay later when the burden became lighter, as the children entered the labour force one by one. In practice, however, there was often no way to redistribute resources over the life cycle of the family, and at some stages it must carry its burdens without adequate resources to maintain its standards at any given level.

92. Another finding of importance was that it was in the period of demographic disequilibrium that families in certain cultures were most likely to achieve desired family structures. For example, the probability of having a son who survived to

marriage age was greatly increased under conditions of demographic disequilibrium. The proportion of marriages failing to produce a male heir as thus defined was only 21 per cent under conditions of the disequilibrium model, that is, low mortality and high fertility, compared with 41 per cent in the high-equilibrium model. Thus, the coincidence of low mortality and high fertility permitted most families to achieve a surviving male heir and hence the economic security and generation continuity that was so important to them. In the model, and in the analysed experience of many countries, a closer accord between the demographic reality and the cultural ideal was achieved at unchanged levels of fertility. The high proportion of families with surviving sons was a product of reduced mortality rather than a strategy of fertility. In fact, the prevalence of sons might reinforce the ideals that sustained high fertility. In the circumstances, the conventional arguments for the acceptance of family planning on the basis of the disadvantages of large families might not be persuasive, and declining mortality might not represent an inducement to lower fertility. The fact was that in some contemporary cultures, the deep desire for two or more sons was a major deterrent to the acceptance of the small family ideal that some Governments might seek to inculcate through educational activities and family planning programmes.

93. Through analysis of family-cycle dynamics, by use of the models, conditions of widowhood and young adulthood were seen to vary with the conditions of demographic equilibrium or disequilibrium, though, in some societies, cultural factors intervened to ameliorate or modify experiences in those groups.

94. For widowhood, it was found that under each mortality-fertility assumption, the average duration of widowhood was 12 years, but that figure referred to widowhood after a first marriage and disregarded the possibility of remarriage. Other findings, such as the age at which widowhood occurred, the number of widows in comparison to the number of widowers and the supply of unmarried girls on the marriage market, would affect the chances of remarriage and the opportunity of resuming childbearing. Moreover, certain socio-cultural factors, such as the existence of polygyny and the levirate system, would have an important bearing on remarriage: in parts of the world, the problem of widowhood scarcely existed, since kinship systems specified who would assume responsibility for a newly widowed woman. The findings of the models nevertheless suggested that attention should be given to the fate of widows in different societies. Where their number as revealed in censuses and surveys was suspiciously small, neglect and other discriminatory practices might exist, which would lead to increased mortality.

95. The status of young adults in the society, and particularly of girls between the ages of 15 and 20, was considered to be of crucial importance. Whether a girl moved directly from the bonds of her family of orientation to those of her family of procreation, or had some period of relative freedom from family influences when she would be better able to function as an individual, was considered to be of potentially tremendous importance in determining her future fertility behaviour. In fact, opportunities available to both sexes for participation in society at the adolescent stage had potential for influencing future reproductive behaviour. In that connexion, it was necessary to examine prevailing patterns of age at marriage. Marriage was contracted, often at the age of biological maturity, if the young couple could be integrated into the economy of an extended family. If the nuclear family prevailed, marriage was more likely to take place only when the couple had reached economic maturity. In modern Western society, a pattern of entering marriage at an age of psychological maturity was apparently becoming prevalent.

96. The timing of births during the woman's reproductive years influenced both family structure and relationships among family members. For example, in certain societies, women were strongly motivated to continue childbearing as long as

possible, inasmuch as they would be regarded as "old" as soon as they ceased bearing children. By restricting fertility, the woman risked loss of status to the extent that, were polygyny permitted, her husband might take another wife. Such attitudes towards childbearing partially explained high fertility in certain societies; studies had shown that in some cultures fertility was negatively correlated with the age of the mother at birth of the first child and positively correlated with her age at the last birth.

97. Relationships between family members were seen to be influenced by intervals between births. Short birth intervals produced families in which the ages of children were close together and which were consequently more coherent, self-centred and bound together. But whether a family was "closely knit" would depend not only upon the relationships among the siblings, but also upon that between husband and wife and between parents and children. Where fertility was high, short birth intervals might be associated with a less companionate relationship between husband and wife; indeed, the status of the woman in the family unit might be inferior.

98. In individual families, decisions and behaviour with respect to childbearing might be influenced by the provisions that the State and society made for the aged. Thus, in the absence of social security schemes for assistance to the aged, young couples attempted to provide for themselves in later years through the bearing of children, who were supposed to care for their parents when they became too old to work. With the effective introduction of old-age pensions, that element in motivation for large families disappeared. Since most developing countries did not possess social security schemes including old-age pensions, from the point of view of the individual family it appeared that the larger the number of sons (if they were the ones who could be expected to support their parents in old age), the greater the expectations that they would be adequately cared for when the time came.

99. With regard to other vulnerable groups (the blind, the mentally and physically handicapped etc.) the situation was somewhat similar: in developing countries, the State was seldom in the position to afford the required aid, and either private agencies or the family must care for those in need. Again, from the point of view of the individual family, such a burden was less felt in a small than in a large family. The policy implications were clear in respect of the aged and other indigent groups: improvements in State assistance would remove the probability of experiencing such adversity as a reason for seeking security by having large numbers of offspring.

100. In conditions of economic and social development, where traditional and modern solutions to problems within the family coexisted, the current generation of adults assumed two heavy responsibilities: that of supporting their own parents (and perhaps other indigent kin); and that of providing their children with the amenities offered in the emerging conditions of modernization. In traditional societies, the primary obligation was that of the children to their parents; that was a motivation to have many children. It could be argued that, in modern societies, the primary obligation was that of parents to children, a factor in the motivation to have fewer children. In societies undergoing transition, the adult of today might thus be paying two debts in the parent-child obligation scheme, but would not derive a direct benefit from either.

101. In summary, as the family moved through time and experienced successive cycles—formation, development of family-building and dissolution—it accumulated experiences and adopted response patterns that were not easily discernible from aggregate population behaviour. Failure to recognize that was reflected in the lack of success with some family planning programmes. Many gaps in knowledge remained, particularly where the extended family was concerned and to which analytical techniques of the type referred to above had not been applied.

## V. POPULATION AND OTHER PUBLIC POLICIES FOR THE FAMILY: BENEFITS AND LIABILITIES

102. The diversity of cultures and the great differences among countries with respect to development needs were such that particular policies that might be suggested in an international setting could not be equally applicable in all parts of the world. Thus, the Symposium attempted to set forth some general principles upon which policies relating to population and the family might be based, rather than to offer specific recommendations. It was more appropriate to outline alternative measures or policies from which Governments might select those suited for their needs.

103. In that connexion, a basic principle was that, in formulating policies relative to population and the family, there should be due regard for the rights and dignity of the family and the individual, as well as for national sovereignty. That principle had been established in General Assembly resolutions 2211 (XXI) and 2542 (XXIV), and at the International Conference of Human Rights and in its Proclamation of Teheran.<sup>2</sup>

104. The modern State was therefore bound by certain basic rights of the individual, such as the right to marry, the right to determine the number and spacing of children, the right to divorce and the right to migrate within the country. While those rights had to be recognized in all circumstances, the individual should exercise the rights responsibly. It was mentioned that governmental commissions in Sweden in the 1930s and recently in the United States of America had taken essentially similar views about the objectives and means of population policies, even though their demographic concerns were completely different. Sweden would have preferred a higher birth rate, and the United States a lower one. That convergence of policy was offered as an example of the fact that there were political restraints on all demographic policy options and that the outcome, whatever the starting-point, was usually that the freedom of individual choice should be maximized.

105. In the field of social policy, States were seen as having an obligation to provide protection for all groups in society, such as minorities, women and children. Such measures as family allowances and grants for children, for example, were justified by the principle that children should have as nearly equal a start in life as possible; whether the effects, if any, of such enactments were congruent or inconsistent with population policy should not influence decisions to grant such allowances.

106. It was emphasized, therefore, that family policy and population policy *per se* should not be equated. The main purpose of family policy was to assist families in achieving their individual goals, rather than to bring about a change in the rate of population growth. Family policy was a broad design for the well-being of the family, and there was a whole complex of measures that could be taken to influence its formation, development and dissolution. It was necessary, however, that there should be a multidisciplinary approach in the matter of policies affecting the family and that special efforts should be made to ensure proper co-ordination of decisions adopted by different governmental agencies.

107. An important consideration in adopting policies and implementing measures was that the institution of the family was the primary intermediate factor between, on the one hand, the aggregated or macroscopic demographic characteristics of society as a whole, for example, as represented by birth rates and, on the other, the individuals whose decisions and actions, such as whether to use contraception, were the micro-determinants of social change. The level of individual decision to take an action or not to take it was the level at which such policy measures as allowance schemes and family programmes operated and became, or failed to become, effective.

<sup>2</sup> *Final Act of the International Conference on Human Rights, Teheran, April-May 1968* (United Nations publication, Sales No. E.68.XIV.2), pp. 2-5.

108. To achieve any desired change in the aggregate birth rate and in population growth, it was thus necessary that the family should realize that its own long-term interests were involved, and such efforts would only be successful to the extent that families accepted and understood changes as aids to development and the enhancement of the quality of human life. There were means to which no controversy was attached and whereby Governments might accomplish that goal, including education and investments in communication. However, legislation might be required as a catalyst for change. Conservative policies or approaches should not be adopted or maintained merely under the pretext of preserving culture.

109. Measures that might promote the betterment of society were not always compatible with the well-being of individual families. Consequently, flexibility was needed in the application of measures, and, where indicated, provision should be made for special requirements for individual families. Restrictive or coercive policies and measures were unlikely to succeed: they merely provoked hostility. The goal should be rather to devise policies that increased options and to relieve individuals and families of conditions which they perceived as being oppressive.

110. Policies to improve the welfare of the family embraced a wide range of provisions, including: (a) measures to facilitate marriage and the setting-up of independent domestic units; (b) economic measures geared to the elimination of disparities in the basic living conditions of family members irrespective of the size of the family to which they belonged; (c) implementation of health protection during pregnancy, childbearing and infancy; (d) measures to protect the primary rights of the couple to determine the number and the timing of the children; (e) facilitation without restrictions and discrimination, of the easy access to complete and efficient information on techniques for regulating fertility, and to the techniques themselves; and (f) the promotion of education for responsible parenthood.

111. Relatively few countries had articulated a population policy, though it was increasingly recognized that rates and patterns of population growth had important implications for human well-being. In that connexion, attention was drawn to the Declaration of Population Strategy for Development adopted by Governments in the ECAFE region at the Second Asian Population Conference at Tokyo, on 13 November 1972. That declaration, while stating broad goals in terms of improving the general welfare of the people of Asia, included the specific goal of extending the small family ideal and making available the means of achieving that ideal with ease and dignity. It was stated that the achievement of the small family ideal was a population policy goal also in a number of countries outside of the Asian region, particularly in the Caribbean, Central America and Northern Africa.

112. There were a variety of means by which Governments might implement their objectives of achieving lower rates of population growth, frequently expressed as the achievement of smaller completed families. Appropriate measures for developing countries included raising the legal age at marriage, provision of family planning service and information, providing for compulsory education, family allowances, care of the aged, legislation against child labour and the promotion of youth programmes.

113. Raising age at marriage had been widely promoted as a measure to achieve smaller completed family size where family planning was not widely practised. Some doubt was raised, however, as to the effectiveness of provisions raising age at marriage, as there were often no means of enforcing such laws, and successful enforcement depended on the co-operation of many individuals and institutions. To achieve the desired effect, the passing of the appropriate law would have to be accompanied by efforts to ensure co-operation. It was also mentioned that if laws raising the legal age at marriage were to be effective, certain parallel action would be required in other spheres, for example, to provide youth with additional educational opportunities and recreational activities, which were seriously deficient or lacking, particularly in rural areas. While

age at marriage was evidently important in that context, in many countries where marriage was virtually universal and *de facto* obligatory, a useful demographic as well as humanitarian government policy would be one of ensuring individuals the freedom not to marry. On the other hand, where Governments desired to support a higher birth rate, action might be taken to facilitate marriage under the most favourable circumstances.

114. Compulsory education for children at the parents' personal expense was mentioned as a means of making children less valued by raising their "costs". There were objections, however, as parents in developing countries would be unable to bear the expense.

115. Having many children to ensure the survival of some through one's lifetime as a means of security in old age was still evident in many regions. Old-age pensions and other forms of social security would help to remove the burden of old age from the family and would lower the value of children. Such measures would constitute a heavy financial obligation for the poorer, developing countries. However, some of these costs could be discounted against the economic disadvantages of an excessively high proportion of children in the population.

116. Legislation against child labour would also increase the cost and lower the value of children. Promotion of youth programmes would be designed to open horizons for young people to develop loyalties to society as a whole. For girls, such programmes could provide the break between the family of orientation and the family of procreation, which had been mentioned earlier as having an important influence upon later reproductive behaviour.

117. The national family planning programme had been the most widely heralded measure for achieving lower fertility. There was no doubt that the programme had many advantages, in that it provided service to those who desired it and informed individuals and couples lacking such knowledge of the possibilities and advantages of spacing and limiting births. That effectiveness varied could be attributed to many factors, specifically including a lack of understanding of the conditions of fertility change, especially at the micro-level. Improved development indicators, particularly health service, would also bring about greater acceptance of government family planning programmes. With respect to the latter, it was held that there was a need to extend the service to all disadvantaged groups, as those groups were frequently not reached by existing schemes.

118. Much importance was attached to the potential impact on population and the family of measures designed to raise the status of women. In that connexion, a number of proposals contained in the report of the Regional Seminar on the Status of Women and Family Planning, held in Jakarta, Indonesia, from 20 to 30 June 1973, were mentioned as deserving the endorsement of the Symposium. Attention was also drawn to results of the Regional Seminar on the Status of Women and Family Planning for countries of the western Hemisphere, convened at Santo Domingo, Dominican Republic, from 9 to 22 May 1973. Of particular merit were the extension of education opportunities to women to enable them to play a more active role in national life and the promotion of gainful employment opportunities for women outside of the home. Other measures proposed by those seminars to which the Symposium subscribed were, in particular, the following: improvements in maternal and child health as an aid, *inter alia*, to reducing fertility; incorporation in school curricula of courses on population dynamics and family life; and the utilization of the mass media for the dissemination of information on family planning.

119. Rapid population growth in the developing countries meant that attention was focused on the need to reduce the birth rate, but, at the same time, there were other countries where natural increase was low and whose Governments sought to increase the birth rate. It was not the number of people alone that was important, but numbers in relation to resources. The goal should be to ensure a better life for all people by

adopting policies that encouraged a balance between the population and the available supply of resources. In that connexion, policies relevant to the distribution of population were important.

120. In most developing countries, the bulk of the population resided in rural areas. In response to their needs and as a part of policy with respect to internal migration and its effect upon the family, investments might be made especially to strengthen health services and educational facilities and, in general, to elevate the rural community. Where sparse population hampered development, resettlement programmes might be undertaken to ensure the best utilization of facilities and services.

121. It was not possible systematically and comprehensively to take account of the great variety of measures considered to influence the family processes. Some measures adopted as social or economic policy had a demographic impact through their influence on family decision-making relating to reproduction; other measures designed explicitly to influence fertility, such as child allowances and laws governing contraceptives, in some cases appeared to have little effect. That was an area in which research was needed to determine whether, how and why measures specifically affected or did not affect reproduction.

122. Policy-makers should take account of the effect of implicit or indirect policies, for those policies might cancel the benefits to be derived from measures designed to influence family life and decision-making. Because policies sometimes produced unforeseen and unwanted effects, it was important that they should be flexible and provision made for their review and modification.

123. An example of a measure that could have an unintended effect was the establishment of day-care centres for small children. Those centres were believed by some to have an anti-natalist influence, since the availability of centres enabled mothers to take employment outside of the home. But scholars concerned with the new home economics regarded such centres as a pro-natalist influence, since women having access to them might be encouraged to have additional children. Another example was an act that was intended to recognize the role of childbearing as a social function, and which provided that working women might remain at home for three years after the birth of a child and receive an allowance from the State. While that measure did increase period fertility (though not completed family size), it was found that women with less education and lower occupational status took advantage of the law to a much greater extent than did women in the upper strata. A possible consequence, given the decrease in *per capita* income of the families that resulted when the women of lower occupational status had an additional birth, was a further disadvantage for children born to those families. The tendencies encouraged by the law might lead to the emergence of a socially disadvantaged group of women. The desirability of attempting to foresee all possible consequences of policies was evident, as was the need for flexibility to permit change when unexpected results developed.

124. An important principle was that whatever population or family policy Governments chose to adopt should be formulated as an integral part of over-all development plans and co-ordinated with other policies in the social and economic fields. In this connexion, there was the view that many countries admitted having social and economic development problems but were reluctant to accord independent status to a population problem. That point elicited the position that population trends were of relevance only in the context of social and economic objectives, and that population policy should thus be a component of development policy. It was held that the developed countries had helped to create resistance to public recognition of population issues by over-emphasizing the "population explosion problem" among developing peoples, and that as a solution the developed countries should cease being the prime movers, thereby avoiding an international situation in which the population issue had become a pawn.

125. Another important consideration relevant to policy formulation was that the programme to implement policy should have short-term as well as long-term goals; both political and popular support would thereby be more easily marshalled and utilized effectively. In so far as possible, policies should also have measurable targets and evaluation procedures should be built into their operation from the beginning. While there was a need to give attention to the long-term implications of future population trends, there also was a need to provide for the existing population, for example, in the cases of youths and others of working age for whom employment opportunities were lacking.

126. Since Governments were required to deal with a wide variety of urgent problems at any one time and might not fully recognize the short-term as well as the long-term importance of the population factor, it was essential to relate population to other aspects of development that were accorded particularly high priority. Accordingly, agencies of government dealing, for instance, with housing, employment, health and welfare services should co-ordinate their actions, and the direct and indirect effects on population variables of any action should be the concern of them all.

127. There was some support for the view that, in respect of actions that Governments of developing countries with a market economy could adopt in order to modernize the family, the situation in the currently developing countries was vastly different from what had previously occurred in Europe. Consequently, it was no longer possible to rely on rapid progress in economic and social development as a solution to population growth problems. However, an opposing position was that in order to be realistic, one must take as given the current rates of development in those countries and determine what supplementary measures might be taken to accelerate development; there was wide variation among the developing countries in respect of development status and potential and demographic conditions and prospects, and each should be studied from the standpoint of its individual conditions and options.

## VI. CONCLUSIONS

128. In accordance with the wishes of the Population Commission, the Symposium made no effort to achieve a consensus on the various issues. It did not set forth a specific body of conclusions. What follows is a summary of the main points on which there was general agreement as being of particular relevance to the role of the family in population change.

129. In the respective disciplines, there had been insufficient attention to the role of the family in population change, and that short-coming partially explained what might be regarded as the unsatisfactory state of knowledge about the dynamics of the family cycle and its influence upon reproductive behaviour. Modern efforts in many societies to induce a "premature" transition of national fertility from high to low levels and achievements in that area were based upon perceptions of the family both as an adaptive unit and as an agent of change.

130. Alterations of family structure and function, stimulated by aspects of industrialization and modernization, might be regarded as precursors of a modification of reproductive behaviour. Changes in the character of family dynamics, particularly a decline of fertility, were deeply imbedded in the processes of social and economic development. However, certain cultural aspects favourable to lower fertility, such as the improved status of women, could be initiated with appropriate leadership. For those and other reasons, development was not necessarily indispensable for some reduction in fertility levels, though it was clear that modernization of the family could take place only in the development context. Indeed, to the extent that countries were achieving social and economic development, changes were being generated which tended to modernize the family.

131. Internal migration and urbanization were aspects of modernization that altered family function, as well as its

structure, though not necessarily in the direction of increased nuclearization, and changed the roles of its members. That evolutionary process involved provisions for the education of children, the extension of employment opportunities for women outside the home, provisions for the care of the aged and disabled, rights and responsibilities of youth and even the stability of the family itself.

132. While modernization was normally associated with lower fertility, it could in certain circumstances cause fertility to increase, at least temporarily. Such was the case in certain African countries, where internal migration and urbanization had created a new *milieu*, incompatible with traditional birth-control practices, and modern methods had not replaced them.

133. The basis of population policy and family policy and the methods used to implement them were frequently very similar. However, family policy was intended to ensure the well-being of the family and not to bring about changes in rates of national population growth. Where a conflict existed, a humanitarian policy should prevail: there should be due regard for national sovereignty, but also respect for the rights and privileges of individuals and the family. Policies should, therefore, not be coercive, but should provide options from which individuals and families might choose.

134. Within the frame of national sovereignty and human rights were broad areas susceptible to policy and to which there could hardly be any objections. Policy action in those areas might have both quantitative and qualitative implications for the family and for population dynamics. Countries and peoples everywhere might subscribe to changes in those areas, for they involved at a fundamental level the elevation of the human condition. Examples were improved conditions of health, equality of the sexes, provisions to ensure freedom to determine the number and spacing of children, universal literacy and so on. Frequently, legislation might be required as a catalyst for change.

135. While the main population policy concern of most developing countries was an excessive rate of national population growth, there were countries in which the number of inhabitants was considered to be too small and higher fertility was favoured as a matter of policy. It was of special relevance that numbers were important not in themselves, but in relation to resources, and that rates of population growth were essential facts only within the development context. In either case, the main concern was the improvement of conditions of life, which should be a guiding principle in the formulation and implementation of policy.

136. Lack of success in including changes in fertility behaviour was due in part to cultural tenacity and to the fact that culture prescribed behaviour in every aspect of family life governing fertility and maintained other institutions to support its prescriptions. Thus, it was essential to recognize the family as the intermediary between policies and the reproductive process. Accomplishments of organized family planning programmes, measures relating to contraception and other means of birth control, allowance schemes and other provisions depended in a large measure upon decisions and actions within the family.

137. The individual did not, however, perceive the effect of such conditions as rapid population growth upon his own family situation in the same way that those conditions might be seen to influence society as a whole. That discrepancy in perception at the micro- and macro-levels might have accounted for some of the failure of individual families to behave in such a way as to support what might be regarded as the common good and might explain the modest to poor achievements of programmes intended to reduce fertility. In order to overcome that discrepancy in perception at the micro- and at the macro-level, it would be necessary for the family to realize that its own long-term interests were involved. Such efforts would be successful only to the extent that families accepted and understood changes as aids to development and the enhancement of the quality of human life.

## VII. IMPLICATIONS FOR RESEARCH

138. There was wide agreement that the formulation of the objectives of population policies and for finding proper and effective means for achieving those objectives required a sound scientific basis. The contribution of research in the social sciences was seen as essential, even if limited, to formulating national policy.

139. Governments frequently lacked the factual bases for establishing rational policies concerning population and family relationships. The importance of research was shown by the KAP surveys, which had dispelled former ideas that people in developing countries were fatalistic about family size. Those surveys had helped to convince officials in a number of countries that people wished to have fewer children. Moreover, it was seen as important for Governments to be as fully aware as possible of the consequences of policies and able to adapt flexibly to situations where the effects of policy in one area were found to undermine or cancel out policy in another area. Efforts were therefore needed to relate research to the evaluation of policy.

140. It was the consensus of participants that macro-analysis of fertility behaviour, which had been the main, traditional approach to the analysis of demographic change, was not able to yield the required understanding of cause and effect in population dynamics. Questions of how change actually occurred remained unanswered, and connexions between the family structure and fertility were obscure. Moreover, interrelationships between family structure and demographic change were not well understood. Those problems required analysis with a multidimensional approach, with the family as the intermediate agent between individual behaviour and society.

141. There was a need to devise new techniques for analysing the demographic process occurring within the family cycle. Investigations of family building and dissolution within the context of the social, economic and cultural aspects of society, that is, a combined micro-macro analysis, would require a methodology that would follow the family through time. While the development of methodology for those purposes was considered to be of the first order of importance, the main agreement was the need for a general redirection of research to in-depth micro-analytical studies. That would give a new thrust in the quest for knowledge about the determinants of population dynamics.

### Appendix

#### AGENDA

1. Opening addresses
2. Election of officers
3. Adoption of the agenda
4. Modernization, population and the family: cultural and historical perspectives
5. Influence of socio-cultural, economic and demographic factors upon the family cycle
  - (a) Demographic factors
  - (b) Development factors
  - (c) Socio-cultural factors
6. Influence of changes in the family cycle upon family life
  - (a) Reproductive behaviour
  - (b) Aspects of urbanization and internal migration
  - (c) Other factors
7. Population and other public policies for the family and society: benefits and liabilities
  - (a) Types of policy measures and their influences upon family size, structure and function
  - (b) Influence of policies upon population growth and characteristics and other aspects of development
8. Overview of the Symposium
9. Adoption of the report
10. Closing of the meeting

## Annex IV

### REPORT OF THE SYMPOSIUM ON POPULATION AND HUMAN RIGHTS

#### INTRODUCTION

1. The Symposium on Population and Human Rights was held at Amsterdam from 21 to 29 January 1974. It was the last of a series of four symposia held in preparation for the World Population Conference, 1974, as recommended by the Population Commission at its sixteenth session<sup>1</sup> and endorsed by the Economic and Social Council in its resolution 1672 (LII).

2. The 1974 Conference, as endorsed by the Council in its resolution 1484 (XLVIII), is being organized as a meeting of Government representatives. It will differ from the World Population Conference, 1954, held at Rome, and the World Population Conference, 1965, held at Belgrade, which were technical meetings. Therefore, a series of scientific activities were planned in preparation for the World Population Conference, 1974, to identify and clarify critical problem areas at the technical level.

3. Among those pre-Conference activities were four symposia on: population and development; population and the family; population, resources and environment; and population and human rights. Those were technical meetings of experts participating in their personal capacity.

4. The Symposium on Population and Human Rights was organized by the Population Division in association with the Division of Human Rights and in collaboration with the Government of the Netherlands. The meeting was made possible through the financial assistance of the United Nations Fund for Population Activities.

5. The agenda adopted by the Symposium is reproduced in the appendix. Twenty-eight experts in various disciplines, invited from the various regions of the world, attended the Symposium in their professional capacity. Several scholars who were invited from developing countries, particularly those from Asia, were unfortunately unable to attend the Symposium.

6. As a basis for the discussions, participants were provided with technical papers specially commissioned for the Symposium and draft background papers prepared for the Conference.

7. The Symposium was opened by the Secretary-General of the World Population Conference, 1974, Antonio Carrillo-Flores. In his opening statement, he welcomed the participants and expressed the appreciation of the United Nations for the hospitality extended by the Government of the Netherlands. Addressing the meeting, he stated that although the determination of human rights relating to population and population policies in such fields as fertility, mortality, internal and international migrations was a complex and difficult task, it was also a very important one. He also stated that the conclusions which the Symposium would reach, as well as any differences which might arise, would be of great value to the representatives of Member States at the World Population Conference.

8. On behalf of the Government of the Netherlands, the Minister for Development Co-operation, J. D. Pronk, welcomed the participants and emphasized the importance that his Government attached to the Symposium as a preparation

for the World Population Conference. It would be a meeting which would consider the population problem in the context of the promotion and implementation of civil and political as well as economic, social and cultural rights, the realization of which would be guided by the principle of equality, both between and within nations.

9. In her address, the Assistant Secretary-General for Social Development and Humanitarian Affairs, H. Sipilä, emphasized that the differences in the enjoyment of human rights between men and women in such fields as education, employment, private law and political rights could not be considered independently of the population problem and the high fertility rate. The promotion of equal rights and opportunities, while an objective in itself, was also essential for the success of family planning and the regulation of fertility.

10. The Director of the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat, Léon Tabah, emphasized the importance of the technical discussions at the Symposium both for the World Population Conference and the World Population Plan of Action. Referring to the major findings of the three previous symposia, he stated that they had shown a convergence of ideas to the effect that the immediate solution to population problems should be sought in fields other than population, without rejecting, however, population policies which were without doubt a factor in shaping the more distant future. He said that it would be against this background that this last Symposium prior to the World Population Conference would take up the questions of population and human rights, which affected the destiny of the individual and of society.

11. The Director of the Division of Human Rights of the Office of the Under-Secretary-General for Political and General Assembly Affairs, Marc Schreiber, in his address, underlined the importance of the simultaneous examination of the complex and delicate problems of population and human rights. Reviewing the different points of contact between population and human rights, he expressed his hope that the Symposium would contribute substantially to the development and integration of norms pertinent to the question of human rights and population.

12. Léon Tabah served as Director of the Symposium. D. J. van de Kaa, Director of the Netherlands Inter-university Demographic Institute (NIDI), The Hague, was Co-Director. Kathleen M. Jupp, Co-ordinator, World Population Conference and World Population Year, 1974, Population Division, acted as Co-ordinator. J. A. L. Cooray, Advocate of the Supreme Court, Sri Lanka, was appointed General Rapporteur. C. A. van Peursen, Director of the Philosophy Institute, Leiden University, acted as Consultant. Gustavo Perez-Ramirez, Population Division, acted as Technical Secretary. J. van den Boomen, Population Division, and Maxime Tardu, Division of Human Rights, also serviced the meetings.

13. Owing to the nature and scope of the Symposium, there were several chairmen and discussant-rapporteurs, one each for the several items of the agenda, as described below:

#### "Fertility and human rights"

B. Afnan (Chairman)

M. L. Ernst-Henrion (Discussant-Rapporteur)

<sup>1</sup> See *Official Records of the Economic and Social Council, Fifty-second Session, Supplement No. 3*, para. 166.

"Mortality and human rights"

K. Sekyiamah (Chairman)  
L. Baumgartner (Discussant-Rapporteur)

"Internal migration and human rights"

C. Tomuschat (Chairman)  
P. O. Ohadike (Discussant-Rapporteur)

"International migration and human rights"

C. B. O. Wennergren (Chairman)  
P. Laroque (Discussant-Rapporteur)

"The implication of population trends for the formulation and exercise of human rights"

G. Dib (Chairman)  
K. C. Pant (Discussant-Rapporteur)

"The roles of the community, the state and other institutions in safeguarding and promoting human rights in the light of population trends"

K. M'Baye (Chairman)  
H. Gros-Espiell (Discussant-Rapporteur)

"The role of international organizations in safeguarding and promoting human rights in the light of population trends"

S. Y. Chikin (Chairman)  
R. N. Gardner (Discussant-Rapporteur)

"Formulation of concepts and other action required to safeguard and promote human rights in the light of population trends" (summary of conclusions)

A. V. Toteff (Chairman)  
T. Ould-Daddah (Discussant-Rapporteur)

The last two days of the Symposium were devoted to the approval of the report; A. Vanistendael chaired those meetings.

14. The general goal of the Symposium was to formulate for the World Population Conference expert scientific opinion on the interrelationships between population and human rights.

15. More specifically, the goal of the Symposium was to provide inputs for the World Population Plan of Action. The Population Commission, in setting forth the terms of reference for the Symposium, considered:

"that the human rights to be discussed should not be confined to family rights, since the international instruments on human rights which were the object of consideration were related to the rights of individuals as well; they referred to civil, political, economic, social and cultural rights. While jurists could be expected to play a distinct role in the Symposium, the interdisciplinary character of the meeting made it desirable that persons from other fields should also be included among the participants. Particular stress was placed upon the importance of the status of women as an issue in human rights. It was also mentioned that one of the questions to be discussed should be the right to family planning information and means taking into account the traditions, culture and other conditions prevailing in each country."<sup>2</sup>

16. The Symposium accordingly devoted its attention to the human rights standards which have a direct influence on the three main demographic variables, namely, fertility, mortality and migration. Although the Symposium did not reach a consensus on a number of issues that were discussed, there was, nevertheless, an area of general agreement. A summary of the main conclusions reached during the Symposium is given below.

<sup>2</sup> See *Official Records of the Economic and Social Council, Fifty-fourth Session, Supplement No. 8, para. 35.*

## I. SUMMARY OF CONCLUSIONS

### A. Basic considerations

The Symposium based its discussions on the following considerations.

17. There was acknowledgement of the necessity and importance that every State should have a population policy, directed to improving the quality of life of the country's population. Such a policy must be regarded as an essential element in an integrated plan of action for economic and social development. While it must be recognized that certain States needed measures to curb their rate of population growth, it must also be recognized that it was not possible for States or the international community to solve their current social and economic problems by relying exclusively on such measures.

18. The sovereignty of States in formulating their population policies with due regard for internationally accepted human rights was acknowledged.

19. It was acknowledged that while there was a world population problem and many countries shared a community of interest, there were great differences among countries in their states of demographic evolution and levels of economic and social development. The question of human rights in the developing and developed countries was said to differ in some crucial respects because of great disparities in levels of living which also existed to some extent among the so-called "marginal populations" in some industrial societies.

20. There was acknowledgement of the impossibility of exercising fundamental human rights without the creation of adequate economic and social conditions for their enjoyment.

21. There was reaffirmation of the value and importance of international human rights instruments, as they were essential to safeguard the life, liberty and dignity of the individual and to ensure the full development of his personality. All the human rights relating to population problems contained in international instruments would be implemented more fully and rapidly, if the struggle against under-development included the promotion of an independent socio-economic policy and change of the internal structures of society, based on the principle of the dignity and worth of the human person.

### B. Main conclusions

22. The Symposium reaffirmed the right of couples to determine the number and spacing of their children freely and responsibly, as stated in the Teheran Declaration, and the right of persons to have access to the relevant information, means and methods for the implementation of such decisions. The Symposium stressed, however, that a population policy should not be limited to matters affecting family formation, but should also deal with such matters as population distribution and international migration.

23. The Symposium recognized the importance of the right to procreate and drew attention to the necessity of defining the scope of that right as well as the right not to procreate. It was said that sex education and information should be made universally available and integrated with the education necessary to implement the right of the couple to determine the number and spacing of their children freely and responsibly. It was pointed out that in the case of children and young persons, care should be taken that such education be imparted under proper and qualified guidance and supervision.

24. Concerning the difficult and delicate problem of abortion, the Symposium discussed the various human rights aspects, particularly in relation to the right to life and to the right of the woman and family to decide freely on such matters as those relating to physical integrity and mental health. It was considered desirable that the State and the international community should try to reconcile the rights involved in that matter. Whatever solution might be adopted, a system of control designed to protect human rights and involving the participation of parents, doctors, judges, social

workers and others would be required. Any recommendations relating to abortion should have the fullest regard to the needs and socio-cultural values of the various countries, and should take into consideration complete medical knowledge of the implications and consequences of abortion, both for the mother and for her future children.

25. The participants agreed that the advancement of women, enabling them to control their own lives more fully, and the promotion of their enjoyment of equal rights with men were important factors to be considered in the formulation and execution of population policies. The improvement in the legal position of women, who were becoming increasingly aware of their influence and destiny, might bring about considerable changes in the life of society, but in the absence of rights and opportunities in the field of labour and socio-economic activity, legal formulations were frequently empty words. The Symposium therefore considered it desirable that the necessary international instruments should be adopted and national legislation be updated so that women's rights in the various aspects of life mentioned above would be supported by proper enforcement. It was essential to ensure to women full equality with men, especially equal access to education and employment, so that they would not be inclined to find fulfilment solely in motherhood.

26. The Symposium reaffirmed the importance of the right to the enjoyment of the highest attainable standard of health as recognized in United Nations instruments and the constitution of the World Health Organization. It was recommended that services to the whole population be expanded, and particularly the training of physicians and supporting staff, to reach people at the "grass-roots" level.

27. The Symposium also reaffirmed the right of everyone to adequate food and nutrition. It stressed, in particular, the necessity for the elimination of hunger and malnutrition as a general priority objective in the attainment of economic development and social justice. It was pointed out that in some countries agricultural development, particularly food production, needed to be accelerated by such means as land reform and the availability to developing countries of agricultural research and technology.

28. The Symposium also reaffirmed the right to life of populations threatened by hunger and of ethnic minorities threatened by the encroachment of so-called "modernization".

29. The participants agreed on the need to remove obstacles to a desirable international outflow of people, capital and technology (including "know-how") and resources (particularly food), as might be necessary for the establishment of a just international social order directed to the solutions of population problems, while having regard for human rights and respect for the sovereignty of States and the requirements of social progress and economic development.

30. Concerning internal migration, the Symposium recommended that States should promote adequate legal measures and set up practical machinery for the implementation of measures to ensure the exercise of migrants' rights. Local authorities might play an important role in that respect.

31. In view of the relation between the condition of rural areas and population questions, especially in relation to migration to cities and towns, the Symposium emphasized the need for social, economic and cultural development of such areas. Some participants considered that such development would also lead to a lowering of fertility rates in rural areas.

32. When examining international migration, the Symposium did not think it realistic in the current state of international affairs to suggest specific measures to enlarge the scope of international legislation in that field. It was noted, however, that the study of the situation in developing countries showed that the compelling interests of those countries might lead, in certain circumstances, to restrictions of the freedom to migrate across national boundaries, with full respect, however, for the relevant provisions in the Universal Declaration and

the international instruments. With respect to international migration, the Symposium considered the "brain-drain", which deprived the developing countries of some of their most technically qualified and useful citizens. While recognizing the difficult situation resulting for developing countries from such movement and the general need to slow down the "brain-drain" in the interest of those countries, participants held different views as to the strategies which were, in the light of basic human rights, suitable and acceptable.

33. Concerning the rights of the migrants in the receiving countries, the international instruments showed important gaps which it was desirable to fill. It was deemed necessary that after a certain period of residence and work any differential treatment between foreigners and nationals concerning employment or the choice of residence be reconsidered. It was suggested that consideration should be given to the progressive equalization of the treatment between foreigners and nationals concerning access to professional training and any other form of education. In that connexion, qualifications obtained in the home country should be given due weight. It was felt that the right of the migrants to be reunited with their families should be implemented. That implied an obligation by the Government of the host country to provide the immigrant family with adequate living conditions, especially as regards housing.

34. The Symposium called attention to the link existing between the rights of migrants and the settlement of tensions between migrants and nationals. The emigrant's country and the host country should co-operate in helping the migrant to adjust to the new society, while at the same time retaining as many elements as possible of his national culture.

35. It was considered necessary to make adequate provisions for dealing with the migrant's vulnerability regarding the protection of his rights at national and international levels. At the national level, it appeared desirable to provide for representation for the immigrant in his new locality and new enterprises. Since bilateral negotiations between immigrant and emigrant countries might reflect economic and political concerns to the prejudice of the human approach, it was suggested that a suitable international body should be available to lend its good offices as a third party in those negotiations, with a view to ensuring that the human rights of migrants should be safeguarded.

36. It was considered that prior education of migrants in the culture of the host country, as well as a corresponding education of the people of the host country, could reduce prejudices and help the immigrants to exercise their rights effectively.

37. The Symposium recalled the right of individuals and groups to participate actively in the elaboration as well as in the implementation of population policies in the context of development policies. It emphasized the necessity of imparting civic and political education to assist individuals to understand population problems and to motivate them to act in furtherance of the welfare of the community.

38. On the other hand, the Symposium emphasized the need for the active popular participation of all elements of society, individually and through associations, in the formulation and implementation of population policies, especially those affecting human rights and the general economic, social, cultural and political life of their countries. It was also considered essential to promote the role of associations, such as labour unions, women's groups and religious and cultural and humanitarian organizations, in speeding up the development of general awareness of population problems and other relations to human rights.

39. Concerning the role of the State, it was recognized that Governments should exercise their authority as regards population and human rights through various channels, especially through voluntary organizations oriented towards information and education in the field of demographic policy. State action might also be exercised directly through legislation and regu-

lation directed to influencing population trends, with full respect for human rights and fundamental freedoms as defined in international instruments. In that respect, it was considered important for the population to have easy access to effective legal remedies.

40. A large measure of agreement was reached on the right and duty of States to ensure that the population, at all levels and without discrimination, should be aware of the means to regulate fertility and have access to such means and services. It was emphasized by many participants that the means offered should be socially and culturally acceptable. Without adequate information and without effective access to means of contraception, couples could not exercise with full responsibility their right to decide on the number and spacing of their children.

41. The Symposium considered that the State had considerable leeway in implementing a family planning policy through education, instruction and persuasion and that such measures were preferable to coercion.

42. It was, none the less, stated that population problems in many developing countries were so acute that harsh alternatives might have to be considered for the implementation of policies, necessitating intervention by the State. It was, however, agreed that the right to decide the family size freely and responsibly ruled out duress or coercion on the part of the State. Moreover, in the application of family planning measures, there should be no discrimination against any particular group in the community. Couples, in determining the size of their families, should take fully into account the interests of the children and the general welfare of the community, as well as the requirements of economic and social development in the light of current population trends.

43. Aware of the complexity of international relations, that the policies of one country might affect other countries, and that human rights and population questions were linked with environment problems, as well as with the excessive and irrational use of the capital represented by the world's non-renewable natural resources, the Symposium recommended that interdisciplinary research should be developed at the national and international levels, and that co-ordination be strengthened among all those involved in economic and social development and population planning and human rights, such as economists, sociologists, demographers, jurists, doctors, planners and civil servants. Due regard should be given to the involvement of government planners in the implementation of such interdisciplinary research at the national level.

44. At the international level, attention was drawn to the need for the expansion of genuine development assistance, greater international solidarity, the transfer of technology and capital to developing countries and a more equitable regulation of international trade. The results of negotiations at the various international conferences being held on political matters, such as disarmament, and on socio-economic problems would have an important impact on demographic trends in connexion with the formulation and implementation of human rights.

45. It was recommended that all international and regional agencies concerned, primarily those which were competent in the field of human rights and in population matters, should intensify their efforts and strengthen their co-ordination in order to carry out, in particular, the following functions:

(a) Collection and dissemination of information concerning human rights in relation to population matters;

(b) The offer of assistance for the training of qualified personnel, which should include imparting to such personnel a knowledge and awareness of human rights standards;

(c) In view of the scattered formulation of human rights relating to population problems, the preparation of studies the objective of which would be the clarification and systematization of such rights, as well as at the effective implementation of existing human rights instruments in relation to population problems.

## II. DEMOGRAPHIC VARIABLES AND HUMAN RIGHTS

### A. Fertility and human rights

46. It was noted that in recent times and especially in the past two decades, the continuing high (and sometimes rising) fertility in many parts of the world, and the control of mortality, especially of infant mortality, had presented the prospect of almost doubling the world's population by the year 2000. In fact, by the end of the century, the total world population would be nearly 6.5 thousand million people, which contrasted with a population at the beginning of this century of 1.5 thousand million and the current population of 3.8 thousand million.

47. It was further stated that despite some diversity among particular regions and individual countries, the differentiation between more developed and less developed regions was very sharp when expressed in terms of the crude birth rate, and that the same observation could be made in terms of more refined measures. The birth rate of less developed regions was nearly double that of more developed regions in the 1930s and 1950s, and the gap had continued to widen. In the more developed regions, reliable data showed a gradual decline in the average birth rate, but it must be pointed out that trends differed among particular regions, with marked fluctuations in some. Most recently, there had been a tendency for birth rates in more developed regions and countries to converge more closely towards a fairly low average. In the more developed regions, an average woman currently bore between 2 and 3 children, while in the less developed ones, she gave birth to between 5 and 7 children.

48. In order to evaluate fully what underlay that phenomenon, it was recognized by the participants that there was an interrelation between population growth, on the one hand, and economic and social development, on the other, and that the increasing rate of population growth was one of the factors which made it difficult to accomplish goals of economic and social advancement and full realization of human rights and fundamental freedoms.

49. The Symposium took as a basis for its discussion of the human rights aspects of fertility the series of relevant standards established in international instruments. Although the right to procreate was not included as such in the Universal Declaration of Human Rights or in the Covenants on Human Rights, participants were generally of the view that it was implied in the right of men and women to marry and to found a family, which was recognized, *inter alia*, in article 16 of the Universal Declaration of Human Rights.

50. The Symposium recalled that the United Nations General Assembly, while recognizing the sovereignty of nations in the planning and implementation of their own demographic policies, had introduced the principle that each family must be able to determine freely the number of its children (General Assembly resolution 2211 (XXI)).

51. It was also recalled that two years later, in 1968 at Teheran, the International Conference on Human Rights had expressly stressed the existence of a link between population growth and human rights (General Assembly resolution 2442 (XXIII)). In its resolution XVIII (12 May 1968), the Conference had recognized that if population growth in some areas followed a more moderate pace, it would enhance the conditions for offering greater opportunities for the enjoyment of human rights and the improvement of living conditions for each person.

52. It was further recalled that the International Conference on Human Rights considered that couples had a basic human right to decide freely and responsibly on the number and spacing of their children, and also a right to adequate education and information in that respect.

53. The Symposium observed that resolution XVIII of the International Conference on Human Rights made the following changes from provisions in General Assembly resolution

2211 (XXI): the right of each family to determine the number of its members was raised to a fundamental right; the word "family" was replaced by the word "couple"; and the right to information and education in the field of family planning was expressly laid down as a corollary of the right to decide on the number and spacing of children.

54. A suggestion was made that the provision existing in the Universal Declaration of Human Rights and the International Covenant should be made more comprehensive by supplementary provisions which might set out new rights, possibly including a more explicit mention of the right to procreation. Some participants were of the view that the world situation had changed to a large extent since the Universal Declaration had been adopted in 1948. According to some participants, one of the difficulties encountered was insufficient co-ordination between various United Nations bodies, which resulted in a certain gap between the instruments relating to development and those dealing with human rights.

55. The Symposium saw a need for some clarification and systematization of all provisions relating to human rights as they affected fertility in instruments dealing with the right to procreation, in order to define more precisely the essence and limitations of the relevant rights.

56. The majority of the participants of the Symposium expressed the view that in matters of family planning the final decision should lie with parents rather than with the State. Some participants referred to the Declaration on Social Progress and Development of 1969, which stated that the right to decide freely and responsibly on the number and spacing of births was an "exclusive right" of parents (General Assembly resolution 2542 (XXIV)). That instrument explicitly recommended the dissemination of not only the necessary knowledge, but the means to render the exercise of that right effective.

57. It was stressed by some participants that the dissemination of family planning information should be carried out in the context of an understanding and sensitive approach to social customs and cultural beliefs of the people, if it was to be successful. Popular participation at the "grass-roots" level on the part of men and women could have considerable impact on the solution of demographic problems as they applied to the general welfare of the community. It was also necessary that family planning work should be integrated into the over-all plan of social and economic development and particularly into maternal and child health services.

58. The couple's responsibility towards the child was stated to derive directly from the rights of the child as recognized in the Declaration of the Rights of the Child: in particular, the right to parental love, education, health, well-being and protection against all forms of cruelty and exploitation. The view was expressed that if parents were unable to give to their children what was essential to their physical, emotional, intellectual and moral development, they had behaved in an irresponsible way by procreating them. It was said, on the other hand, that such an interpretation of the responsibility of parents towards their children would lead to the poor being prevented from procreation and would amount to socio-economic discrimination.

59. It was also said that, in the field of procreation, the question of the weight to be accorded, respectively, to the opinion of the man, the woman, the couple or the family as a whole was a complex one, which required further study as part of the elucidation of the concept of "responsibility" enunciated in resolution XVIII of the International Conference on Human Rights (Teheran, 1968). Several participants believed that where there was disagreement, there were strong grounds for leaving the decision to procreate or not to procreate in the last resort to the woman because of her predominant biological role and the health hazards which she might experience in procreation.

60. Attention was drawn by several speakers to the value placed on fertility in some societies, where it strengthened those

family ties which formed the basis of the security of the members of the extended family.

61. Persons entrusted with the functions of education and information in the field of family planning should take account of that concept in traditional societies while attempting to make couples understand that the common interest required that they should control their rates of fertility. It appeared preferable in the rural areas to elicit the active co-operation of those who naturally exerted an influence in the community as being those most likely to influence attitudes towards family size.

62. The question whether the right to procreate existed also out of wedlock was answered affirmatively by several participants on the basis of such resolutions of the United Nations as the Programme of Concerted International Action for the Advancement of Women (General Assembly resolution 2716 (XXV)). However, some participants qualified that view on the ground that the child had a right to paternal presence and care as a prerequisite of his harmonious psychological development. It was observed that recognition of the right to procreate did not place anyone under an obligation to do so. Some participants expressed the view that it was necessary to express that right not to procreate more explicitly.

63. It was the view of the Symposium that an obligation existed to care for the child of an unwanted pregnancy. It was also the view of some participants that unmarried women, such as workers or young students, should be protected from unwanted pregnancies.

64. The influence of legislation on fertility was stressed by many participants; for example, raising the minimum age for marriage, registration of marriage, restriction of child marriages and betrothal of young girls before puberty, minimum working age and age requirements for compulsory education could all affect fertility. Some participants said, however, that the impact of such laws on population trends was difficult to assess and that hasty generalizations should be avoided.

65. It was generally believed that equality under the law was one of the prerequisites of free and responsible decision-making in all fields, including the planning of family size. Many studies showed that women would prefer fewer children than they actually had if they had a choice. Birth rates were very low in all countries in which the law provided for equal rights and responsibilities for men and women, and where conditions were otherwise favourable for independent decision-making.

66. It was further stated that marked differences persisted between men and women in the enjoyment of various human rights. Those differences were, to a great extent, caused, it was said, by economic, social and cultural factors that determined sex roles and led to discrimination against women. In many societies, women were still viewed only as dependants on their husbands and were not considered in need of the education, training and access to economic opportunities normally provided for men. Equal rights of women to education, health and well-being and to the development of their personalities through education was stressed by many participants. Unpaid work at home, early marriages and early childbearing, often decided by parents and husbands, deprived them of other opportunities, and the only roles remaining to them were those of wife and mother whose prestige grew with the number of her children. On the other hand, the implementation of women's rights and participation of women in the life of the community had a wholesome impact on the exercise of their right in determining the size of their families.

67. Because of the correlation between women's education, gainful occupation, access to health services, and legal and factual position in the family and society, on the one hand, and family size, on the other, it was not surprising that high birth rates were normally found in societies where women lacked educational opportunities and hence other options than a role as a mother.

68. Participation in the political, social and cultural life of the society gave women alternative roles; they did not thereafter derive their identity and value from their roles as mothers of large families. Where women participated in decision-making in a society, they often became a strong force for social change. Their impact was shown especially in areas of education, employment and the family, including questions of health, maternity and child care.

69. It was suggested by a few participants that the developed countries should be urged to achieve a zero rate of population growth. The majority of the participants did not agree with that suggestion, stating that the attitude of each country in respect to population growth was necessarily dictated by the economic and social situation prevailing in that country, and that in a developed country, the betterment of the situation of the poor and aged might necessitate population growth. Some other participants, on the other hand, stated that certain developed countries might find it beneficial to have a period of population decline for the well-being of their populations in view of the high rate of consumption of natural resources in those countries.

#### B. Mortality and human rights

70. The Symposium considered the interrelationship between morbidity, mortality and the exercise of basic human rights to life, adequate food, enjoyment of the highest attainable level of physical and mental health and necessary medical care.<sup>3</sup>

71. High morbidity and death rates, malnutrition, starvation and inadequate health services were considered to be obstacles to sustained development and adequate fulfilment of specific human rights.

72. It was stated that in many areas of the world, a reduction in the death rate following the expanded application of modern public health measures and improvement of living conditions unaccompanied by a corresponding reduction of the rate of fertility, had resulted in a sharp increase of their rates of population growth with diverse economic, social and cultural effects. It was further noted that differences still persisted among countries at different stages of economic, social and political development; that there were also differences in that respect between urban and rural populations, among social classes, ethnic groups and the sexes; that infant mortality was still high among poor populations (about 140 per 1,000 as an average in developing countries against 27 per 1,000 in more developed regions).

73. It was considered a matter for concern that expectation of life at birth (which was a better index of national well-being than mortality rates) in developing countries still lagged far behind the average of the more developed countries.

74. It was further stated that levels and patterns of food consumption were also different among countries at different levels of development and culture (with a preponderance of foods of low nutritional value among people who were deficient in the consumption of proteins), and that starvation and malnutrition were still contributing causes of morbidity and mortality for millions of people in the world.

75. The participants also were of the opinion that health services were still inaccessible to large segments of people and that the provision of free health services to the whole population envisaged in the Declaration on Social Progress and Development was still far from being a reality in the majority of the countries of the world.

76. Difficulty was encountered in the discussion with regard to the question of when human life began. Some participants said that it was questionable whether real and meaningful human existence began before approximately from 4 to 6 weeks

after fertilization. Intervention before that time might be classified as contraceptive rather than distinctly abortifacient.

77. Several participants took the view that there could be a conflict between the rights of the pregnant woman and those of the child to be born. Those participants felt that a balance must be found between the child's right to life, on the one hand, and the protection of the woman and the family, on the other. Some participants considered that if the birth was detrimental to the mother or the family, a balance could be reached by considering abortion to be justifiable in cases where: (a) the life or health of the mother was endangered; (b) the pregnancy was the result of rape; (c) there was a high risk that the child would be born physically or mentally abnormal, thus compromising the equilibrium of the family; (d) the mother or the family were in such a psychological, social or material situation that the birth would jeopardize the existence of the family. That meant that freedom of abortion would not be recognized in general and absolute terms. It was also said that in any case a system of control would be required involving parents, doctors, judges and social workers.

78. Some participants stated that abortion had been practised for ages and that it was a reality which could not be ignored. One of the participants maintained that restrictive abortion laws were created in the Western world and, in his opinion, spread throughout the world by colonialism. Others contested that statement.

79. Some participants were of the view that it was premature to formulate international norms with regard to abortion. Action could be taken at national or local levels. The position to be adopted depended on many factors, particularly those of humanitarian character. Care must be taken so that in any event cultural and national groups were not discriminated against. The adverse effects of repeated abortions on the health of the mother and the health status of her unborn children were also mentioned as matters for concern.

80. There was consensus that those countries which decided to legalize abortion should so formulate their laws as to take into consideration full medical knowledge of the implications and consequences of abortion, both for the mother and for her future children. The problem was raised, with some anxiety, of the negative effects of abortions, particularly repeated abortions, on the health of the mother and the health of as yet unborn children.

81. It was pointed out that even those strongly against legalized abortion were very perturbed by the large number of abortions performed under unsatisfactory and unhygienic conditions by poorly trained practitioners. That resulted in great suffering and extensive maternal morbidity and mortality, with consequent heavy demands on all health institutions and personnel to the detriment of services and families.

82. Note was taken of the prevalence of discriminatory practices with respect to abortion based on income levels and socio-economic status. For example, rich women crossed the borders of their countries, had legal abortions abroad and returned home safe, physically and legally.

83. Some participants were of the opinion that effective family planning programmes could not be readily established until families realized that too large a number of children created difficulties for their education and that, because of declines in infant mortality, families no longer needed a large number of births to have a few children survive.

84. Reference was made by some participants to allegations concerning certain practices which might amount to genocide against various ethnic and social groups. Strong condemnation of any practice amounting to genocide was voiced by the participants.

85. The problems associated with increasing life span and particularly with the extraordinarily costly methods currently available for keeping persons "alive" were a subject of discussion. The question was raised as to the criteria to be adopted when deciding who should receive that costly medical care, but no specific conclusion was reached.

<sup>3</sup> *Universal Declaration of Human Rights*, articles 3 and 25; *International Covenant on Economic, Social and Cultural Rights*, articles 11 and 12 (General Assembly resolution 2200 A (XXI), annex).

86. The question was also raised whether the individual should have the right to die with dignity or whether physicians should be asked to continue to utilize extraordinary means of treatment of no permanent benefit to patients with terminal illness. No consensus was reached on the matter. Some delegates expressed concern at the far-reaching implications from the ethical, emotional and scientific points of view of any attempt to prolong life and advised great caution in the making of such attempts.

87. Questions were also raised concerning the ethical problem of experimenting with human beings. Many feared that even with full understanding of the experiments and their significance, and even with the consent of the person concerned, those experiments were fraught with possible threats to basic human rights. On the other hand, the banning of all such activity would hamper research which might result in the saving of lives. On that widely discussed subject, an attempt should be made to formulate conditions under which controlled trials and individualized studies might be done with full respect for human rights and fundamental freedoms.

88. Studies had revealed that large numbers of the world's people were hungry and undernourished. Millions of people, especially in the developing countries, were victims of malnutrition and starvation. The Declaration on Social Progress and Development acknowledged that one of the main goals for the attainment of social progress and development was the elimination of malnutrition and hunger. Intensified international co-operation was urgently needed to help deal with the problem.

89. The Symposium noted that recent scientific data indicated that malnutrition (*in utero* and in the first years of life) could result in irreversible mental retardation. The social and economic cost to society of maintaining the mentally inadequate was large. In addition, the individual's human rights, as well as those of the family, were affected.

90. The Symposium observed that the nutrition gap was widening between rich and poor countries and between rich and poor individuals. The world was faced with shortages of food and a rapid depletion of resources. If there was to be equality in the enjoyment of human rights, various measures were required. Scientific and technological co-operation and international economic assistance could play a useful role in making the results of agricultural research and the benefits of increased agricultural efficiency available to developing countries. The creation of food reserves and improvements in the regulation of their distribution and transportation could make it possible to assist areas where shortages due to droughts or crop failures occurred. Land reform could play an important role by increasing agricultural productivity and raising the general level of living. Some participants further stated that since the right to an adequate level of living, including food, as recognized in article 25 of the Universal Declaration of Human Rights, would remain a distant ideal for many developing countries unless their economic growth was accelerated, developed countries had the responsibility to provide assistance to developing countries on favourable terms and to offer equitable and stabilized prices for their primary commodities.

91. Although the right of everyone to the enjoyment of the highest attainable level of physical and mental health was a fundamental human right, that right had not yet been achieved by many of the world's peoples. It had been defined as more than the reduction of preventable mortality and morbidity or the provision of institutions and professional personnel for the treatment of the sick. It was the assistance given to a person, a family or a community which helped them to attain what the World Health Organization had described as "a state of complete physical, mental and social well-being".

92. Health was thus dependent upon a wide spectrum of measures. Those measures concerned the prevention of disease, maintenance of adequate nutrition, income and communications and the provision of education and leisure so that every individual could maintain his own health, have an adequate level

of living and enjoy the basic human rights that fostered optimal development of each individual's innate capacity for growth.

93. Basically, the degree of economic, social and cultural development combined with genetic factors determined longevity. Currently nutrition was probably the most important single factor influencing health and mortality, apart from the ignorance of specific measures to control many diseases and the inability to implement fully those measures already known and understood.

94. The relationship of mortality to human rights was a constantly changing one. The past two decades had seen the emergence of many new concepts, scientific and technological breakthroughs, solutions to some problems and the emergence of others. As science and technology resolved a specific problem, it appeared imperative that ways should be found promptly to carry the new formulae into effect, rather than to make resounding resolutions on the subject. There were often political, economic and cultural, technical and emotional reasons why action was difficult, but reasonable, rational efforts at implementation could usually lead to some success—if the problem had been properly analysed and a workable solution adopted.

### C. Internal migration and human rights

95. It was generally acknowledged by the Symposium participants that in the current century of increasing industrialization and population growth, there had occurred a significant intensification of internal migration. Population growth and industrial progress had combined to speed up, in particular, the momentum of movements from rural to urban areas. That trend was reflected in the rapid pace of urbanization. The world's urban population, it was estimated, had nearly doubled between 1950 and 1970, from somewhat over 700 million to more than 1,350 million. Even more rapid had been the increase in the developing regions, in which the urban population in 1970 was two and a half times as large as in 1950. Having grown at an average rate of 4.6 per cent per annum, the proportion of urban population in the developing countries had risen from 16 per cent in 1950 to 26 per cent in 1970.

96. It was also pointed out that with possibly half of the urban growth in those countries due to the influx of migrants into the cities, the economic and social dimensions of internal migration had acquired great significance. Among the motivations to migrate, economic and social factors were known to be paramount. That second exodus, which had become a characteristic of the majority of the developing countries, was largely due to a growing demand for agricultural land and to low levels of agricultural productivity. Those facts were linked to disparities in the system of land distribution and to the economic attraction derived from the growing industrialization of the cities.

97. It was recognized that to look upon those migrations only in negative terms and to conclude that the process of urbanization was detrimental to all progress would be an oversimplification of the problems involved. The transformation of a society from a predominantly rural-agricultural to an urban-industrial one had been, and was likely to continue to be, one of the basic correlates of development. From the point of view of the individual migrant, the city offered increased opportunities for economic, social and political participation, as compared with rural areas. Likewise, urban residence might be conducive to changes in traditional modes of life, leading towards the emancipation of women and the adoption of more appropriate reproductive patterns. Many participants stated that the evidence also suggested that, as bad as they were, the living conditions of the rural migrant in the city were, at least in certain aspects, superior to those prevailing in the rural areas. However, those potential or relative advantages of urbanization contributed little towards resolving the more immediate and tangible effects on human rights of large-scale migration and rapid urbanization.

98. Apart from the personal and social disorganization which might be associated with migration and which found its expression in different forms of anti-social behaviour, affecting in many instances particularly the young, rapid urbanization did create problems in a number of areas, including housing, health, nutrition, transportation, other social services and amenities, and environmental conditions. Migrants unable to find adequate employment or any employment at all were forced to live in squatter settlements or inner-city slums lacking even the most basic facilities. The pressure on residential land and housing caused land speculation and excessive rents and generally tended to depress levels of living further. Those conditions gave rise to what, in the Latin American context, was often referred to as "marginality" in an economic, social or political sense, where the persons affected did not participate adequately in those spheres of life. Migration to the cities did not leave the rural areas unaffected: the selectivity of the migration process could not only draw away the most dynamic elements of the rural society, but could divert capital and other financial resources as they were required by the rapidly growing cities.

99. The basic standard provisions of international instruments relating to the problems of internal migration recognized only freedom of movement and residence within the territory of any State, as proclaimed in article 13 (1) of the Universal Declaration of Human Rights and in article 12 (1) of the International Covenant on Civil and Political Rights (General Assembly resolution 2200 A (XXI), annex). The right of the individual to work, including his right to make a living by his free choice of employment, was recognized in article 23 of the Universal Declaration and article 6 of the International Covenant. Those rights had an important bearing on matters relating to internal migration. Among international instruments concerned with the elimination of discriminatory practices should also be mentioned, in particular, article 5 of the International Convention on the Elimination of all Forms of Racial Discrimination. It was mentioned, however, that at the time the Declaration had been adopted, in 1948, problems of internal migration as socio-economic phenomena had not been as conspicuous as in recent years. On the basis of the examination of the implications of internal migration, it appeared to many participants to be desirable to try to reaffirm and develop human rights pertaining to that area so that they fully reflected the socio-economic nature of the problems involved. It might be pertinent to mention that some aspects relevant to those problems were already contained in the Declaration on Social Progress and Development (General Assembly resolution 2542 (XXIV)), which called for taking into due account "the diversity of the needs of developing and developed areas, and of urban and rural areas" in social development planning (article 8) and for "measures to overcome the adverse social effects which may result from urban development and industrialization, including automation; maintenance of a proper balance between rural and urban development, and in particular, measures designed to ensure healthier living conditions, especially in large industrial centres" (article 17 (a)), and for "comprehensive rural development schemes to raise the levels of living of the rural populations and to facilitate such urban-rural relationships and population distribution as will promote balanced national development and social progress" (article 17 (c)).

100. In view of the serious problems caused by the large influx of migrants into the cities, the participants examined the possibility of a need for and justification of coercion in the implementation of policies designed to curb that influx. It was suggested that some provision for coercion should be made if and when it should become necessary, and that the State might deem it desirable to formulate legal norms for the regulation of migration in the interest of the general welfare of the community. Those views did not, however, find favour with a majority of the participants. Another view expressed by some participants was that coercive measures might often be impracticable and indeed counterproductive. It was urged that legal or administrative impediments to freedom of movement might

retard long-term development. Non-coercive measures designed to absorb the impact of internal migration and to influence the volume and direction of its flow would be more appropriate. Such measures would not infringe on the right to freedom of movement and residence within the borders of each State.

101. It was suggested that measures to absorb the impact of migration and to implement and safeguard human rights should be taken in areas both of the destination of migration and of its origin. Programmes for urban reform should be considered in that context. Regional planning for the location of industry, development and improvement of sanitation, housing, transportation, schools, hospitals, recreation and other social services should form part of such a programme. It should also embrace measures to end exploitation through excessive rents for housing or exorbitant prices for urban land. Laws should be revised which make possible such exploitation, allow *de facto* segregation to be effected through zoning and similar devices and establish unrealistically high construction standards. The improvement of squatter settlements and slum areas, as opposed to slum clearance, should be actively considered. As an alternative to the eradication of shanty-towns, their improvement should be considered, if cost and urgency permitted.

102. Centres of advice, recreation and training and machinery for the organization and integration of migrants should be established. Those measures and programmes should be complemented by rural development. Programmes designed to make agricultural land accessible to as many persons as possible and to bring about a more equitable distribution of land were of high priority. Some participants stated that steps could be taken in some countries to set a ceiling to the amount of land an individual could own, and that a system of progressive taxation on the potential value of the land be imposed. It was also suggested that measures should be taken to decentralize industry, giving special consideration to industries for the processing and transformation of agricultural products and production of agricultural implements. The importance of using appropriate technology both in agriculture and handicrafts was also stressed.

103. There should also be an emphasis on social investment in rural areas so that rural populations would not have to migrate to urban centres for education or health services. It was considered that educational systems in many countries had contributed to urban migration and should be reformed to emphasize skills useful for rural activities.

104. Since regions beyond major metropolitan areas were not able to offer the benefits of modern social amenities available in the cities, it was suggested that the Symposium should propose the formulation of a right of deprived regions to adequate compensation. Such compensation would provide benefits to those regions analogous to those prevailing in the more privileged areas.

105. A special case was made for temporary migrant workers, who probably constituted one of the most deprived and exploited groups. Special provisions might be formulated to guarantee protection and services to them, including housing, schooling, sanitation and social security benefits.

106. In many instances, migration posed serious threats to the rights of the family, especially where urban wages were based on the needs of a single person and poor housing facilities discouraged a worker's family from joining him.

107. The need for mass mobilization and the involvement and participation of migrants in social and political life through such means as non-governmental associations was stressed. Workers' organizations should play an important role especially in the cities; obstacles to the establishment of workers' organizations in rural areas—such as dispersed settlements, small populations and paternalistic relations in rural firms and establishments—should be removed. There should be a constant search for dynamic leaders and pressure groups to work on local authorities.

108. The participants recognized that the execution of such programmes and the implementation of the corresponding human rights would be a considerable task and would involve huge financial and organizational costs. The developing countries, which were most affected by these problems, would not always have the necessary resources. Nevertheless, the enjoyment of and participation in the basic human rights involved were fundamental issues for the countries concerned. It was therefore necessary that those policies should be integrated into national development plans in those countries. Concern for social justice within those countries and between the developed and the developing countries led participants to think that active consideration should be given to the desirability of international study and co-operation for the development of those programmes through such means as information and assistance.

109. Lastly, the need to develop effective migration policies was stressed. It was observed that demographic policies affecting migration had been in use in most west European countries. Those policies had been essential for implementing physical planning programmes directed to preserving social and environmental settings conducive to the full enjoyment of life.

#### D. International migration and human rights

110. International migration had been viewed in the past as a means for bringing about a better balance between population and resources. Emigration was thought to relieve population pressure on limited resources, while in countries of immigration, an influx of people was held to permit a more efficient use of abundant resources. Although international migration might once have been as important as those theoretical arguments implied, its current capacity for solving the population problem was negligible. In the first place, restrictions on immigration, which had made their appearance around the turn of the century, had become almost universal. Secondly, the high rate of population growth, especially in recent decades, and the absolute magnitude of the numbers involved made international migration impractical on the scale required to have any significant effect on population size and growth in those countries where there was a pressure on resources.

111. Economic and political factors continued to induce large numbers of people to leave their homelands. In the past decade and even earlier, three types of international migration had become particularly important and had drawn widespread attention. The first type was the emigration, particularly from developing countries, of workers without special qualifications, who, faced with the impossibility of finding adequate and reasonably well-paid jobs in their own countries, moved to the industrialized countries where employment opportunities were better and wages much higher. The problem of those migrant workers was becoming increasingly acute. The second type of international migration was one of political origin and raised the problem of refugees. That problem had, to a great extent, found a solution in relation to human rights through the existing international instruments, such as the Convention of 1951 relating to the status of refugees and the institutional structure provided for in the Convention (General Assembly resolution 538 (VI)). The third type was the so-called "brain-drain" from the developing countries, involving the emigration of highly qualified workers who sought better opportunities in the more developed countries. That phenomenon had caused widespread concern, particularly in developing countries.

112. It was noted that the United Nations had not recognized any right to migrate *per se*. However, among States Members belonging to certain regional intergovernmental organizations, labour's freedom of movement had been established. Existing international standards relating to migration included in particular:

(a) The right to leave any country, including one's own, and to return to one's country, as recognized in article 13 (2) of the Universal Declaration of Human Rights and article 12 (2), (3) and (4) of the International Covenant on Civil and Political

Rights (General Assembly resolution 2200 A (XXI), annex). That right, as in the case of others embodied in the Covenant, was recognized in article 2 as applicable to all individuals within a country "without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status";

(b) The rights to seek and to enjoy in other countries asylum from persecution. Those rights were recognized in article 14 of the Universal Declaration of Human Rights and in the United Nations Declaration on Territorial Asylum;

(c) The Symposium took note of the close connexion between nationality and international migration and drew attention to the various conventions on nationality and statelessness. It emphasized the importance for each person to have a nationality and in that context considered that arbitrary deprivation of nationality and the denial of the right to change one's nationality were not only contrary to the Universal Declaration of Human Rights (article 15) and other international instruments, but caused great hardship to migrants, often negating their rights relating to migration. The International Convention on the Elimination of All Forms of Racial Discrimination recognized the right to effective protection and remedies against discrimination on the grounds of race, colour or ethnic origin. Attention was also paid in that connexion to the relevant instruments of the specialized agencies of the United Nations, particularly those of the International Labour Organisation (ILO).

113. The examination of international standards and their confrontation with actual conditions and practices led the Symposium to consider separately the following two main issues:

(a) The gaps in the acknowledged human rights of migrants, distinguishing between the freedom to migrate and the rights of the migrants in the course of their journey and in the country of immigration;

(b) The degree of implementation of those recognized rights.

114. There is a notable contrast between developed and developing countries with respect to international migration. It was said by some participants that while in the developed countries immigrant workers frequently lived in conditions inferior to those of national workers, immigrants in many of the developing countries sometimes occupied a dominant or privileged economic position. It was considered by some participants that in order to prevent an undue influence of immigrants in the latter case, consideration might have to be given to the desirability of restricting immigration. It was suggested by one participant that restrictions might also be imposed on the emigration of workers in their own interest, if living conditions in the countries of immigration prove to be below acceptable standards. Some developing countries, it was noted, had already taken steps in the direction of discouraging emigration. The Symposium pointed out that there had been cases in recent times in which immigrants had been expelled, and that there was a need in such cases to carry out necessary legal and administrative measures to ensure that immigrants should suffer minimum inconvenience with regard to their living conditions and those of their families.

115. The Symposium recognized that the rights of the migrant worker in the course of his travel and in his country of destination were defined in various international conventions, particularly the covenants on human rights and the ILO conventions and recommendations. The migrant had a right to be protected at the time of his recruitment, during his journey and after his arrival in the country of immigration. Discrimination between the immigrant and the national worker, as far as wages, working conditions, social security, housing, taxes and recourse to legal remedies were concerned, was prohibited under provisions in those instruments. Although the norms which had been adopted related to important rights, the Symposium considered that there were important gaps in the protection of the rights of the migrant worker. In particular, participants were of

the opinion that the desirability of new or more elaborate norms with respect to the following areas needed to be emphasized:

(a) The elimination of all forms of discrimination with regard to choice of employment and residence after a certain period of time and the adoption of standards relating to equality of opportunity and treatment of migrant workers. The Symposium observed that such workers were not infrequently required to take up a given employment in a particular industry and locality which deprived them of free choice of employment and residence. Although in certain circumstances economic reasons might call for such restrictions, their continuation after a certain period of residence or employment appeared to the Symposium to be unjustifiable;

(b) The elimination of all forms of discrimination relating to opportunities for the migrant's occupation training and access to all types of education for the migrant's children. The Symposium considered that whenever possible the training and education of migrants should be such as would suit manpower needs of their country of origin, were they to decide to return;

(c) The affirmation of the right of the migrant to be joined by his family or to be followed by his family with a minimum of delay. That right, which was a corollary of the right of the family to protection by society, implied an obligation on the Government of the country of immigration to ensure, as in the case of its own nationals, satisfactory living conditions and especially housing for the migrant and his family;

(d) The social protection of migrant workers and the harmonization of social security systems in view of the fact that differences between such systems often deprived such workers of their rights. It was pointed out by some participants that by admitting foreign workers, States took a clear responsibility vis-à-vis such persons, who had a right to a certain stability in their life situation. Any migrant worker, therefore, should be advised of how long he was entitled to stay. Residence permits, if restricted in point of time, should be made renewable after a reasonable period;

(e) The easing of restrictions on the acquisition of nationality of the country of immigration. It was recognized that acquisition of citizenship was in several respects a prerequisite of the full exercise by migrant workers of their human rights in the receiving countries. National legislation appeared to be excessively restrictive as far as the conditions for obtaining nationality were concerned, particularly for foreign workers and their children who had been resident for a long period in the country of immigration. It was said that while all facilities for a rapid assimilation of the migrant should be provided, the migrant should also be offered ample opportunities to maintain and develop his own cultural identity;

(f) The grant, subject to reasonable conditions, of citizenship to the migrant's children who were born in the receiving country and who opted for such citizenship on the attainment of majority.

116. Although allowance had to be made for the gap between standards and actual conditions, the disparity between the human rights of migrant workers and the realization of their rights appeared to many participants to be exceptionally great. According to those participants, the reasons for that restricted exercise of their rights were, *inter alia*: (a) a lack of knowledge of their rights on the part of the migrant workers; (b) their general lack of familiarity with conditions in the country of immigration; (c) the presence of a language barrier; and (d) fear of losing their employment and of a confrontation with public authorities. Those problems were aggravated because of the absence of suitable machinery for the protection of migrant rights. Migrants often hesitated to avail themselves of existing machinery which failed to take into account their unfamiliarity with the language and the legal system of the country of residence. The Symposium recognized that several courses of action, at the national level as well as through bilateral co-operation, were open to remedy that situation. Among the most important was the establishment of migrant associations of

facilities for their representation before local and national public authorities and before employers. The minimum requirements in that regard included procedures for consultation between migrant workers, on the one hand, and public authorities, on the other. It was suggested by some participants that consideration might be given to the grant of certain civil and political rights to migrants at the local level. Foreign workers should as far as possible be given equal rights in trade unions, and it would be desirable if they could be elected to union leadership. Considerable improvements in the implementation of migrant rights could be effected through joint efforts by the Governments of the countries of emigration and immigration. Traditionally, negotiations on the status of migrants had been dominated by economic considerations, and questions relating to the implementation of human rights had been largely neglected. Several participants were of the opinion that the necessary co-operation and negotiation between the countries involved would be greatly facilitated if an international agreement were to be formulated establishing the necessary basic principles and guidelines. Within the context of these agreements, bilateral negotiations could be conducted between Governments. The Symposium was of the view that a suitable international body might be entrusted with the function of making available its advice and good offices for the protection of the human rights of migrant workers.

117. The Symposium recognized that the measures previously referred to, which had the objective of promoting the human rights of migrant workers, should be supplemented by intensive educational efforts. Before leaving their country or upon arrival in the country of destination, migrants should receive the information and instruction necessary for their rapid integration into and active participation in their new communities. The people of the country of immigration should also be informed about the problems posed by immigrants, their contributions to the country and the need to help them take their proper place in the community.

118. The Symposium also recognized that the migration of workers was to a great extent, the result of economic conditions and particularly of disparities in levels of living between countries of immigration and emigration. Although the precise contribution of migration to the development of the receiving countries was not known, there appeared to be little doubt that it had made a considerable contribution. The same was not necessarily true for the countries of emigration. Although the emigration of workers might alleviate population pressures, there were increasing doubts in such countries about its benefits. Many participants were of the view that a change in the international distribution of labour by creating additional employment opportunities in countries of emigration through investments and joint ventures would provide a more acceptable solution for the developing countries. Although the economic and other advantages of emigration for the individual worker were substantial, the displacement involved in migration caused certain disadvantages to the parties involved, even if the rights of the migrant were well protected.

119. While the principle of the right of emigration was not questioned, the view was expressed by some participants that under certain conditions that individual right might have to be made subject to certain conditions. Such a situation, it was argued, could exist in the case of the "brain-drain". The emigration of highly qualified and trained personnel, usually educated at great cost to the society, especially where education was free, not only signified a loss of investment in human capital, but deprived the country of the substantial contribution those workers could make to its development. The impact of the "brain-drain" on the economic and social development of a developing country could be substantial. Although some participants suggested that there might be arguments in favour of some degree of control, it was recognized that it would not be advisable to prohibit that type of emigration.

120. It was suggested that more attention should be given to alternative ways of discouraging the emigration of highly

trained specialists and scientists. One such scheme, addressed to those going for study abroad, would be to introduce, with the co-operation of both Governments involved, a legally binding contract for those students to return after the completion of their studies. Since the agreement would be voluntary, that solution would not affect human rights. It was, however, doubted whether such a scheme would be effective, as it was mostly the children of the rich, not in need of financial assistance, who went for study abroad. The strengthening of education, the undertaking of manpower planning and other similar measures taken in the country of emigration were stressed by several participants as one way of reducing the "brain-drain".

### III. IMPLICATIONS OF POPULATION TRENDS FOR THE FORMULATION AND EXERCISE OF HUMAN RIGHTS

121. While participants of the Symposium agreed in broad and general terms that there was some relationship between the inadequate realization of human rights and the current population situation, there was considerable disagreement on the importance of the population factor in explaining the poverty and misery of the mass of the people, especially but not exclusively in the third world.

122. The disagreement centred largely on the question of the extent to which rapid population growth was an obstacle to development. That disagreement was important in view of the almost unanimous opinion that the full realization of human rights, especially social, cultural and political, could be achieved in conditions of poverty and ignorance. The attainment of human dignity and the fulfilment of human personality and its potential could only be realized when a person was not haunted by fears of unemployment, was not stricken with disease and had at least the minimum necessities of life for himself and his family. Human rights were no longer conceived in a passive sense as requiring the State to abstain from certain acts and forms of behaviour. They were understood in a broad and dynamic sense, in which the attainment of minimum standards of economic, social and cultural life was basic.

123. The variety of historical and cultural backgrounds, of political, social and economic structures and of situations relating to population had led to differences in interpretation of the interrelationship between population problems, human rights and development. That, in turn, accounted for different approaches in the field, which were not necessarily mutually exclusive.

124. One view that received wide support was that whatever the socio-economic and political systems might be, excessive rates of population growth constituted a serious impediment for the effective exercise of basic human rights and should therefore be checked by family planning measures short of coercion. At the same time, positive measures should be adopted to integrate such measures into development programmes with full regard for all human rights.

125. Another view was that although there was an interrelation among population problems, denial of human rights and socio-economic structures, the best solution would consist in changing those structures in the direction of a just social and political order through participation of such voluntary groups as trade unions and youth movements. Simultaneously, measures should be adopted to cut an excessive rate of population increase.

126. While conceding that population increases rendered the task of development more difficult, still another view stated that the real causes of under-development are to be found largely in the nature of the international economic and political system, with its precursors of colonialism and imperialism. That system, which had been responsible for the exploitation of many countries, was still draining off their resources to the richer countries. The greatest gains for human rights would therefore follow from fundamental changes in the structure of international relations and a reorientation of development strategies towards greater self-reliance, autonomy and selective disengage-

ment from the current economic system on the part of developing countries. Those who held that view were of the opinion that even if rapid declines in fertility could be achieved, it was unlikely that the conditions of the mass of people would improve appreciably unless, at the same time, those necessary structural transformations were to be effected.

127. Many participants held the view that the international community had a duty to strive towards an equitable and just distribution and use of world resources, including capital. Such a distribution of goods and services was necessary to make human rights a living reality, particularly in developing countries. It would facilitate the use of resources in developing States for further development and increase their industrial and agricultural productivity.

128. The imbalance in *per capita* consumption of non-renewable natural resources between developed and developing countries was noted as aggravating disparities. The highly industrialized countries were depleting the world's non-renewable resources at a staggering rate; apart from environmental consequences, that process caused a continuous rapid increase in the price of commodities vital for the development of the third world. As the latter could scarcely compete with the richer countries for those resources, its development was further retarded.

129. None of the participants argued that the adoption of population policies was an end in itself. It was agreed that they must form part of a broader, credible strategy of human development and full implementation of human rights. Indeed, many participants argued that population policies should seek fertility control by paying more attention to social and economic changes in which rational choices in family planning become both desirable and feasible.

130. In many countries, family planning had come about as a result of a transformation of social structures and institutions, and particularly as a result of the improvement in the status of women. In other words, population control had come about as a consequence of social progress and development. The integration of population policies into strategies of general development, which demonstrated both a will and ability to improve the general human condition, might also help to allay the suspicions of and resistance to fertility control that currently existed especially in the third world.

131. The Symposium discussed whether it was desirable to adopt a new charter of declaration on human rights in the context of population problems and policies, since many profound changes had occurred in the international community since the drawing-up of the Universal Declaration of Human Rights. Many participants pointed out that the Declaration illustrated the impact of values for which the free countries had fought the Second World War. It had also been drafted and adopted at a time when many countries had still been under colonial rule. Some members went on to state that the different human rights relating to population problems should be listed in that context. The task of reviewing the relevant international standards with a view to their clarification should be entrusted to the United Nations organs competent in the field of human rights, in close co-operation with the Population Commission and the specialized agencies and regional bodies concerned. Some participants emphasized, however, that it was more important at that stage to concentrate on the implementation of the rights that were already incorporated in existing declarations. In their view, the elaboration of further rights by the United Nations before effective strategies of action were devised to realize the rights which the international community had already proclaimed during a period of 25 years, would damage the credibility of the United Nations and might result in widespread cynicism regarding the whole process of the formulation of human rights. Viewed against the declarations and other instruments of the United Nations and various international agencies which have set forth the inalienable and fundamental rights and freedoms of the individual, the disparity between aspiration and reality was, according to one participant, so

overwhelming as to make the formulation and recognition of such declarations "sarcastic".

132. Throughout the course of the Symposium, there was concern among some participants about the possibilities and dangers of States using coercion. Most participants considered that coercive policies were unjustified and would amount to a serious denial of important human rights. Certain individual rights were so fundamental and inalienable, such as the right to life, freedom from degrading treatment and freedom of conscience, that any interference with them would be intolerable. Other participants argued that it was impossible to take a categorical position on that matter. There was first the problem of defining coercion. Some forms of action, like compulsory sterilization, might well be regarded as unjustifiable coercion, but it might be otherwise with fiscal and other measures which penalized parents of large families. Secondly, coercion might be applied in different areas; and it was impossible to say that it was unjustified in all circumstances. Some participants were not willing to agree, for example, that a State was never justified in restricting or qualifying the right of movement or emigration in order to mitigate problems of unplanned urbanization or to deal with losses that arose from the "brain-drain". Thirdly, some participants felt that it was possible to exaggerate the conflict of interests between the individual and the State. In many countries, it was realistic to look at the State as interposing itself between the individual and powerful forces, both external and internal, which were exploiting national resources for the benefit of a privileged few. Nevertheless, the Symposium was unanimous in its view that it was of the utmost importance to insist that all population policies must pay particular attention to avoid violation of the fundamental rights of the individual, family and community.

133. Several participants stressed the importance of the inherent dignity of all members of the human family. Population growth, greater industrialization and increasing urbanization should not be allowed to lead to the "insectification" of man. People everywhere should have greater and more direct participation in decision-making at local levels. Appropriate means of ensuring real participation of all citizens should be available at all levels of the national life.

134. Population and development policies must seek to restore to people the full dignity of their personality by providing for a more meaningful life in which important decisions concerning themselves are made with their consent and participation. Some participants cautioned against a situation where basic human rights might be trampled on in a single-minded pursuit of economic development.

135. There were important implications also for the manner in which policies were formulated and implemented. Organizations of marginal people must be promoted and mobilized as important agencies for generating awareness on the part of their members and for the elimination of marginal conditions in their communities.

136. On the international level, so it was suggested, it was necessary to redefine the set of basic principles underlying "models" of development to which the peoples of the world could aspire, particularly those of the third world. Models of prosperity as achieved by many industrial societies might not be relevant to every country, since they might not correspond to the basic values of all peoples. New models must emphasize social and cultural values which were important to the lives of diverse communities.

#### IV. ROLES OF THE COMMUNITY, STATE AND OTHER INSTITUTIONS IN SAFEGUARDING AND PROMOTING HUMAN RIGHTS IN THE LIGHT OF POPULATION TRENDS

137. The Symposium was in agreement that community and state action in the population field should be formulated and implemented within a broad framework of economic and social policy, and that population problems and their solutions should be considered in the context of over-all development policies.

138. It was generally recognized that the State should play an active role in several respects in order to resolve or mitigate problems, including population problems, which in many countries make it very difficult to ensure the realization of economic, social and cultural rights. In that connexion, mention was made of various resolutions of the General Assembly and the Economic and Social Council, in particular General Assembly resolution 2211 (XXI) on population growth and economic development, which acknowledged "the sovereignty of nations to formulate and promote their own population policies". Several participants stressed their opinion that the State had the right as well as the obligation to formulate and carry out population policies with optimal targets, as part of a global attack against under-development and poverty. It was said that the individual had a corresponding right to expect that the State would take such an active role in achieving the realization of his economic, social and cultural rights.

139. Several participants emphasized the need for the State, especially in developing countries, to provide adequate education in population matters, adjusted to local traditions, and to carry out an effective policy of public information, since those were measures which advanced, without coercion, the development of an adequate individual and social consciousness of population matters.

140. Some participants attached great importance to the training of skilled personnel in the field of population and in general to the improvement of public administration in developing countries. In their view, the State should give high priority to measures designed to achieve those objectives.

141. Participants recognized that the State, which was primarily responsible for the achievement of social progress and development in each country, had a resultant responsibility to provide adequate health medical services to which the whole population had free access. The State thus had an obligation to adopt the necessary measures in that respect. The State was the only body with the capacity to undertake all necessary measures to that end. The view was expressed by several participants that the State also had a responsibility to make sure that safe and effective means of family planning were offered to all persons on the basis of adequate information in accordance with the recommendations contained in international instruments, particularly the Declaration on Social Progress and Development (General Assembly resolution 2542 (XXIV)). Several participants stressed the need to undertake all measures, including clear and objective information, so that individuals could effectively exercise their free choice in respect to family planning matters. The view of those participants was that the State should take appropriate measures to prevent all forms of discrimination, including discrimination based on socio-economic status, as regards the availability of such means and their access to the people.

142. The role of law as a means of changing attitudes on population problems was discussed. One view was that the impact of law on behavioural patterns and mores was often exaggerated, and that legislation was only a subsidiary means of effecting social changes, especially as regards deeply rooted family and cultural traditions. Other participants were of the opinion that the role of the law might be significant in various fields connected even indirectly with population matters, for instance, family relationships, minimum age and other requirements for marriage, the legal status of married and unmarried women, inheritance, tax policy and family subsidies and allowances. Reference was further made to various forms of direct intervention which the State might contemplate in order to correct undesirable population trends and structures, for instance, laws and regulations relating to health, mortality, methods of family planning, abortion, sterilization and mobility.

143. While acknowledging the central role of competent public authorities in advancing economic and social rights through adequate population policies, many participants stressed the obligation of the State, in implementing such policies, to ensure respect for civil and political rights and fundamental

freedoms, in accordance with the Universal Declaration of Human Rights, the international covenants on human rights and other relevant international instruments, as well as widely recognized principles of general international law. Some of the most fundamental principles mentioned in that connexion concerned the right to life, liberty of the person, protection against torture and inhuman or degrading treatment, the right not to be subjected to scientific or medical experiments without free and informed consent, and freedom of thought, conscience and religion.

144. A number of participants attached great importance to the duty of the State to prevent discrimination on the grounds recognized by the United Nations Charter, the Universal Declaration of Human Rights and other United Nations instruments, while attempting to resolve population problems and to carry out population policies. Various measures might prove necessary to ensure that all classes of persons, regardless of income and socio-economic status, should have equal access to the relevant education and social services. It was also said that care should be taken to adapt information on population, including family planning, to the needs of linguistic and vulnerable groups, such as rural population, racial or religious groups, migrant workers and indigenous populations, and to protect them effectively against practices derogatory to their dignity or dangerous to their health. Some participants considered that the use of financial and other incentives in the implementation of population policies, especially family planning policies, should be subject to strict control in order to prevent abuses to the prejudice of less privileged classes.

145. It was generally agreed that some of the most effective guarantees of human rights and fundamental freedoms were those which could be built into the machinery established to formulate and implement population policies. In that connexion, many participants considered it essential that such policies should be elaborated, carried out and reviewed periodically with the active participation and under the control of all persons and groups involved or of their representatives. That was in accordance with the principles relating to the right to take part in the conduct of public and governmental affairs recognized in article 21 of the Universal Declaration of Human Rights and article 25 of the International Convention on Civil and Political Rights. In the view of some participants, it was particularly important to promote the participation of the peoples concerned in the activities of local institutions competent in the field of population. It was also considered that decisions taken by public authorities affecting individual or family rights should be arrived at only after a thorough and fair hearing before persons most directly concerned, and after those persons had been informed in clear language of all aspects of the matters at issue.

146. Stress was placed by many participants on the fundamental need for an effective system of remedies and control by judicial or other competent, independent and impartial authorities as regards decisions or measures taken in implementation of population policies. It was considered that the scientific or technical character of the reasons which might be adduced to justify decisions or measures complained against should never constitute a ground for denying to the persons concerned or to their representatives the benefit of adequate appeals procedures. It was necessary for the State to facilitate access to such procedures, regardless of educational levels and financial means, through assistance measures and legal and technical advice. The proceedings before appeals bodies should be conducted in accordance with the principles and safeguards set forth in relevant United Nations instruments, such as article 14 of the Covenant on Civil and Political Rights. It was suggested that studies might be requested from international organizations on questions which might arise concerning the adaptation of certain traditional recourse procedures to the characteristics of issues involved in human rights and population.

147. Several participants were of the opinion that non-governmental organizations, such as trade unions, women's associations, youth movements and religious bodies, could,

because of their direct contact with the people, play a significant role in the formulation and implementation of population policies and in the carrying-out of public information activities. It was important that such voluntary organizations should have access to juridical institutions so that they could fulfil the important function of controlling public authorities through a close watch on the implementation of population policies and by expressing public disapproval of shortcomings and abuses.

148. It was also considered important that non-governmental organizations should have full access to the appropriate juridical channels in order to fill the gap caused by the frequent hesitancy of individuals to claim their rights.

#### V. ROLE OF INTERNATIONAL ORGANIZATIONS IN FORMULATING HUMAN RIGHTS CONNECTED WITH POPULATION MATTERS

149. It was recognized by all participants that international organizations and the United Nations system in particular had a vital role to play in assisting Governments to implement their population policies as an integral part of their efforts to enlarge the general welfare and the human rights of their citizens. International agencies could help promote a broad consensus on the nature of population problems and on what ought to be done about them.

150. There was general agreement on the types of assistance on population matters as they related to human rights which international organizations might be requested by Governments to render:

(a) Collecting and analysing demographic data (including census-taking registration of vital statistics and publication of laws, judicial decisions and administrative decrees, national and regional);

(b) Developing a population policy as an integral part of the national development plan, setting national population targets wherever possible and identifying the measures necessary to meet those targets with full respect for human rights and fundamental freedoms as recognized in international instruments of the United Nations;

(c) Providing family planning information and services to all persons who wanted them in accordance with the principles set forth in resolution XVIII of the Teheran International Conference on Human Rights (General Assembly resolution 2442 (XXIII)), Economic and Social Council resolution 1672 A (LII) and other relevant provisions;

(d) Including material on family life and population dynamics at all levels of the educational system, including adult education;

(e) Research on various population problems, which should include research by competent United Nations organs on the interrelationship between population trends and human rights;

(f) Training of the personnel needed for all aspects of population policy, such as demographers, lawyers, doctors, health and social workers, educators and administrators; such training to impart an adequate knowledge of human rights according to international standards and an awareness of the human rights aspect of population problems;

(g) Reviewing national legislation in the light of both population policy and human rights;

(h) Establishing or strengthening national institutions to develop, implement and evaluate population policies and programmes, and ensuring that such functions should be carried out with the active participation and under the control of the persons and groups involved or their representatives. Reviewing judicial and administrative procedures to ensure that they should afford effective protection of all the human rights connected with population problems, including protection against all forms of discrimination.

151. The performance of those and other services to Governments would require a significant increase in budgetary support for the relevant programmes at the national, regional and international levels.

152. The Symposium recommended that an international agency should be entrusted with the representation of migrants for the protection of their rights, vis-à-vis national authorities.

153. Most participants were of the opinion that it would not be necessary to create a new international agency to deal with population problems. The need was rather for strengthening existing institutions and for better co-ordination of their activities. There was need for closer co-operation among UNDP, the Population Division, the Human Rights Division, the Centre for Social Development and Humanitarian Affairs, UNFPA, UNICEF, the regional economic commissions, the specialized agencies, particularly the ILO, WHO, FAO, UNESCO, and IBRD, the regional development banks, and the regional demographic centres. Non-United Nations intergovernmental agencies, such as the European Community, OECD and regional organizations in the developing world, also had an important role to play in multilateral population programmes. Learned societies, such as the International Union for the Scientific Study of Population (IUSSP) and the Committee on International Co-ordination for National Research in Demography (CICRED), also had useful parts to play.

154. It was generally considered that effective international efforts concerning population in its relationship with human rights should also involve non-governmental organizations to the fullest extent. Some private agencies might be permitted by Governments to carry out certain population programmes. International professional associations, such as those of doctors, lawyers, demographers, economists and social workers, could make significant contributions, especially in the elucidation of the human rights aspects of population matters. Much more should be done to involve religious organizations to whom millions of persons looked for guidance on questions of private morality and family life.

155. Some participants were of the view that the need for action to reduce fertility was particularly urgent in certain countries because of the enormous momentum built into current population growth rates. In the opinion of those participants, international agencies should assist those Governments on request to carry out voluntary family planning programmes as an integral part of national development plans and with full respect for human rights and fundamental freedoms. Other participants stressed that in their view international organizations should formulate and carry out integrated and comprehensive programmes in the field of population without singling out any particular aspect.

156. It was generally agreed by the Symposium that the United Nations should promote population policies not as an end in themselves, but as a means of advancing the great objectives of the Organization, namely, peace, economic and social development and human rights. It was also recognized that development could do as much for population policy as population policy could do for development. Measures to improve, for example, education, health services, nutrition, employment and women's and children's rights were desirable not only in their own right; they also assisted in the solution of population problems. Therefore, the United Nations and other international organizations should be especially concerned with development, population policies and human rights as interrelated matters of common interest to all countries. All aspects should be integrated in a comprehensive international approach towards the achievement of international co-operation in solving population problems and in harmonizing the actions of countries for the promotion of human rights and fundamental freedoms for all.

## Appendix

### AGENDA

1. Opening addresses
2. Appointment of officers
3. Adoption of agenda
4. Fertility and human rights
5. Mortality and human rights
6. Internal migration and human rights
7. International migration and human rights
8. The implication of population trends for the formulation and exercise of human rights
9. The roles of the community, State, international organizations and other institutions in safeguarding and promoting human rights in the light of population trends
10. Formulation of concepts and other action required to safeguard and promote human rights in the light of population trends
11. Adoption of the report
12. Closing of the symposium

---

### كيفية الحصول على منشورات الأمم المتحدة

يمكن الحصول على منشورات الأمم المتحدة من المكتبات ودور التوزيع في جميع أنحاء العالم. استعلم عنها من المكتبة التي تتعامل معها أو اكتب إلى : الأمم المتحدة، قسم البيع في نيويورك أو في جنيف.

#### 如何购取联合国出版物

联合国出版物在全世界各地的书店和经售处均有发售。请向书店询问或写信到纽约或日内瓦的联合国销售组。

#### HOW TO OBTAIN UNITED NATIONS PUBLICATIONS

United Nations publications may be obtained from bookstores and distributors throughout the world. Consult your bookstore or write to: United Nations, Sales Section, New York or Geneva.

#### COMMENT SE PROCURER LES PUBLICATIONS DES NATIONS UNIES

Les publications des Nations Unies sont en vente dans les librairies et les agences dépositaires du monde entier. Informez-vous auprès de votre libraire ou adressez-vous à : Nations Unies, Section des ventes, New York ou Genève.

#### КАК ПОЛУЧИТЬ ИЗДАНИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЕННЫХ НАЦИЙ

Издания Организации Объединенных Наций можно купить в книжных магазинах и агентствах во всех районах мира. Наводите справки об изданиях в вашем книжном магазине или пишите по адресу: Организация Объединенных Наций, Секция по продаже изданий, Нью-Йорк или Женева.

#### COMO CONSEGUIR PUBLICACIONES DE LAS NACIONES UNIDAS

Las publicaciones de las Naciones Unidas están en venta en librerías y casas distribuidoras en todas partes del mundo. Consulte a su librero o dirijase a: Naciones Unidas, Sección de Ventas, Nueva York o Ginebra.
