Population Division

World Population Ageing 2007

United Nations
New York, 2007

DESA

The Department of Economic and Social Affairs of the United Nations Secretariat is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which States Members of the United Nations draw to review common problems and take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

Note

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term “country” as used in the text of this publication also refers, as appropriate, to territories or areas.

The designations “developed” and “developing” countries or areas and “more developed”, “less developed” and “least developed” regions are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process.

Preface

As the proportion of the world's population in the older ages continues to increase, the need for improved information and analysis of demographic ageing increases. Knowledge is essential to assist policy makers to define, formulate and evaluate goals and programmes, and to raise public awareness and support for needed policy changes.

The Population Division of the Department of Economic and Social Affairs of the United Nations has long experience in the analysis of population ageing. In addition to preparing national estimates and projections of older populations, the Population Division has contributed to the analysis of the determinants and consequences of population ageing. The Population Division is the organizational unit of the Secretariat charged with monitoring progress towards the achievement of the goals set out in the Programme of Action of the International Conference on Population and Development, held in Cairo in 1994. The Programme of Action enunciated objectives and recommended actions concerning population ageing and older persons (United Nations, 1995).

The Population Division has also organized expert meetings on various aspects of population ageing. In 1997, for example, the Division convened a meeting on below-replacement fertility (United Nations, 2000); in 2000, two meetings on population ageing were organized: the first on the living arrangements of older persons (United Nations, 2001), and the second on policy responses to population ageing and population decline (United Nations, 2004). More recently, in 2005, the Population Division organized an expert group meeting on the social and economic implications of changing population age structures (United Nations, forthcoming).

In 1982, the United Nations adopted the International Plan of Action on Ageing at the first World Assembly on Ageing (United Nations, 1982). Then, in 1999 in its resolution 54/262, the General Assembly decided to convene the Second World Assembly on Ageing in 2002. The Second World Assembly adopted the Madrid International Plan of Action on Ageing, marking a turning point in how the world addresses the key challenge of building a society for all ages. The Plan focuses on three priority areas: older persons and development; advancing health and well-being into old age; and ensuring enabling and supportive environments.

This new edition of *World Population Ageing 1950-2050* updates the original report released in 2002 in conjunction with the Second World Assembly on Ageing, and incorporates new variables. As in the case of the original report, this new edition provides a description of global trends in population ageing and includes a series of indicators of the ageing process by development regions, major areas, regions and countries. It is intended to provide a solid demographic foundation for the follow-up activities of the Second World Assembly on Ageing.

Comments and suggestions on this report are welcome and may be addressed to Ms. Hania Zlotnik, Director, Population Division, Department of Economic and Social Affairs, United Nations Secretariat, New York, N.Y. 10017, fax number (212) 963-2147.

Sources, methods and classifications

Data on demographic trends used in the present report are taken from the 2004 Revision of the official United Nations world population estimates and projections (United Nations, 2005a). In addition, data on labour force participation were obtained from the International Labour Organization (International Labour Office, 2006); on illiteracy from the United Nations Educational, Scientific and Cultural Organization (UNESCO Institute for Statistics, 2006); on statutory pensionable age from the United States Social Security Administration (United States Social Security Administration, 2006); and on living arrangements and marital status from two recent United Nations publications (United Nations, 2005b and 2006).

The population estimates and projections, which are prepared biennially by the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat, provide the standard and consistent set of population figures that are used throughout the United Nations system as the basis for activities requiring population information. In the case of the 2004 Revision, standard demographic techniques were used to estimate the population by age and sex for the base year (2005) as well as trends in total fertility, life expectancy at birth, infant mortality and international migration up to 2004. The resulting estimates provided the basis from which the population projections follow.

The countries and areas identified as statistical units by the Statistics Division of the United Nations and covered by the above estimates and projections are grouped geographically into six major areas: Africa; Asia; Europe; Latin America and the Caribbean; Northern America; and Oceania. Those major areas are further divided geographically into 21 regions. In addition, the regions are summarized, for statistical convenience, into two general groups—more developed and less developed—on the basis of demographic and socio-economic characteristics. The less developed regions include all regions of Africa, Asia (excluding Japan), Latin America and the Caribbean, and Oceania (excluding Australia and New Zealand). The more developed regions include all other regions plus the three countries excluded from the less developed regions. See annex II for further detail.

Chapters	
Introduction	1
I. Demographic determinants of population ageing	5
II. Magnitude and speed of population ageing	13
III. The changing balance among age groups	17
IV. Demographic profile of the older population	27
V. Socio-economic characteristics of the older population	37
VI. Conclusion.	45
References.	47
Annexes	
I. Definition of the indicators of population ageing.	53
II. Classification of major areas and regions.	55
III. Summary tables	58
IV. Profiles of ageing.	69
Figures	
1. Total fertility rate and life expectancy at birth: world, 1950-2050	5
2. Total fertility rate: world and development regions, 1950-2050	6
3. Life expectancy at birth: world and development regions, 1950-2050	7
4. Projected survival curves: world and development regions, 2005-2010 and 2045-2050.	8
5. Life expectancy at ages 60, 65 and 80: world, 2005-2050	9
6. Percentage increase in life expectancy at birth, at age 60 and at age 80 between 2005 and 2050: world and development regions.	9
7. Male and female life expectancy at birth and gender gap: world and development regions, 1950-2050	10
8. Population aged 60 or over: world and development regions, 1950-2050	13
9. Average annual growth rate of total population and population aged 60 or over: world, 1950-2050.	14
10. Proportion of population aged 60 or over: world and development regions, 1950-2050.	14
11. Average annual growth rate of population 60 or over: world and development regions, 1950-2050.	15
12. Distribution of world population aged 60 or over by development regions, 1950-2050.	16

13.	Distribution of population by broad age groups: world and development regions, 1950-2050	18
14.	Number of persons 60 or over per hundred children under 15: world and development regions, 1950-2050	19
15.	Number of persons 60 or over per hundred children under 15: major areas, 2007 and 2050	19
16.	Median age of the population: world and development regions, 1950-2050	20
17.	Total dependency ratio: world and development regions, 1950-2050	22
18.	Composition of the total dependency ratio: world and development regions, 1950-2050	23
19.	Old-age dependency ratio: major areas, 2007 and 2050	24
20.	Potential support ratio: world and development regions, 1950-2050	24
21.	Number of persons 15-64 per persons 65 or over: major areas, 2007 and 2050	25
22.	Parent support ratio: world and development regions, 1950-2050	26
23.	Average annual population growth rate at ages 60 or over, 65 or over and 80 or over: world, 1950-2050	27
24.	Distribution of population aged 60 or over by age groups: world, 1950-2050	28
25.	Population aged 80 or over: world, 1950-2050	28
26.	Distribution of world population aged 80 or over by development regions, 1950-2050	29
27.	Distribution of world centenarians by development regions, 2007-2050	29
28.	Number of men per hundred women at ages 60 or over, 65 or over and 80 or over: world, 1950-2050	30
29.	Number of men per hundred women at ages 60 or over and 80 or over: development regions, 1950-2050	31
30.	Number of men per hundred women at ages 60 or over and 80 or over: major areas, 2007	32
31.	Percentage currently married among population aged 60 or over by sex: world and development regions	33
32.	Percentage currently married among men and women aged 60 or over and gender gap: major areas	33
33.	Percentage of population aged 60 or over living alone by sex: world and development regions.	34
34.	Percentage of population aged 60 or over living alone by sex: major areas.	35
35.	Estimated average illiteracy rate at ages 65 or over by sex: 80 developing countries, 2007.	37
36.	Estimated average illiteracy rate at ages 65 or over by sex: major areas, 2007	38
37.	Total, male and female labour force participation at ages 65 or over: world, 1980-2020.	39
38.	Distribution of economically active population aged 65 or over by sex: world, 1980-2020.	39
39.	Labour force participation of population aged 65 or over: development regions, 1980-2020.	40
40.	Labour force participation of population aged 65 or over: major areas, 1980 and 2007	41
41.	Distribution of countries by statutory pensionable age of men and women: 2006 assessment.	42
42.	Percentage of countries for which the statutory pensionable age is either the same for both sexes or higher for men than for women: 2006 assessment	42
43.	Percentage of countries for which the statutory pensionable age is 65 years or higher by sex: 2006 assessment	43
44.	Distribution of countries by statutory pensionable age of men: major areas, 2006 assessment.	43

Annex tables

A.III.1.	Population aged 60 or over, 65 or over and 80 or over by sex (thousands): world, major areas and regions, 2007	60
A.III.2.	Percentage of population aged 60 or over, 65 or over and 80 or over by sex: world, major areas and regions, 2007	61
A.III.3.	Selected indicators on ageing: world, major areas and regions, 2007	62
A.III.4.	Country ranking by percentage of population aged 60 or over, 2007	64
A.III.5.	Country ranking by median age, 2005	66
A.III.6.	Country ranking by ageing index, 2007	68

Explanatory notes

Symbols of United Nations documents are composed of capital letters combined with figures.

The following symbols have been used in the tables throughout this report:

- .. **Two dots** indicate that data are not available or are not separately reported.
- **An em dash** indicates that the amount is nil or negligible.
- **A hyphen** indicates that the item is not applicable.
- **A minus sign** before a figure indicates a decrease.
- . **A point** is used to indicate decimals.
- / **A slash** indicates a crop year or financial year, for example, 1994/95.
- **Use of a hyphen** between dates representing years, for example, 1990-1995, signifies the full period involved, including the beginning and end years.

Details and percentages in tables do not necessarily add to totals because of rounding.

Reference to **“dollars”** (\$) indicates United States dollars, unless otherwise stated.

The term **“billion”** signifies a thousand million.

موجز تنفيذي

شكلت خطة عمل مدريد الدولية المتعلقة بالشيخوخة والإعلان السياسي اللذان اعتمدا بالجمعية العالمية للشيخوخة في نيسان/أبريل ٢٠٠٢^١ نقطة تحوّل في الطريقة التي يتصدى بها العالم للتحديّ الرئيسي المتمثل في بناء مجتمع لجميع الأعمار. وتركز الخطة على ثلاثة مجالات ذات أولوية: كبار السن والتنمية؛ والمحافظة على الصحة والرفاه حتى سن متقدمة؛ وضمان توافر بيئات مؤاتية وداعمة. وهي تشكل المرة الأولى التي تعتمد فيها الحكومات نهجاً شاملاً يربط بين مسائل الشيخوخة وغيرها من أطر التنمية الاجتماعية والاقتصادية وحقوق الإنسان، وعلى الأخص الأطر التي اتفق عليها في مؤتمرات الأمم المتحدة ومؤتمرات قمته التي انعقدت خلال تسعينات القرن العشرين.

وقد أيدت القضايا ذات الصلة بشيخوخة السكان وكبار السن دوراً بارزاً في المؤتمرات السكانية الدولية الكبرى الثلاثة التي نظمتها الأمم المتحدة خلال ربع القرن الماضي. فقد أقر المؤتمر الدولي للسكان والتنمية الذي عُقد عام ١٩٩٤، على سبيل المثال، بأن الأثر الاقتصادي والاجتماعي لشيخوخة السكان هو فرصة وتحدٍ على حد سواء بالنسبة لكل المجتمعات^٢. وقد أعادت الإجراءات الأساسية لمواصلة تنفيذ برنامج عمل المؤتمر الدولي للسكان والتنمية، في الآونة الأخيرة، وهي إجراءات اعتمدها الجمعية العامة في دورتها الاستثنائية الحادية والعشرين في ٢ تموز/يوليه ١٩٩٩، التأكيد على حاجة كل المجتمعات للتصدي للعواقب الهامة لشيخوخة السكان في العقود القادمة^٣. وسترکز لجنة الأمم المتحدة للسكان والتنمية أعمالها في عام ٢٠٠٧ على الهياكل المتغيرة لأعمار السكان وآثارها على التنمية، وهو الموضوع الخاص لدورها الأربعين.

ولشعبة السكان بالأمم المتحدة تاريخ عريق في دراسة شيخوخة السكان، بما في ذلك عن طريق تقدير وإسقاط حجم المجموعات السكانية الآخذة في الشيخوخة وخصائصها، ومن فحص محددات شيخوخة السكان وعواقبها. فطالما سعت شعبة السكان باستمرار إلى لفت انتباه الحكومات والمجتمع الدولي إلى شيخوخة السكان، وذلك من التقرير الرائد عن شيخوخة السكان الذي صدر عام ١٩٥٦ وركز في المقام الأول على شيخوخة السكان في البلدان الأكثر نمواً، إلى المخطط البياني الجدائي للأمم المتحدة بشأن شيخوخة السكان الذي صدر عام ٢٠٠٦^٤.

وقررت لجنة الأمم المتحدة للتنمية الاجتماعية إجراء استعراض وتقييم كل خمس سنوات للتقدم المحرز في تنفيذ خطة عمل مدريد للشيخوخة. وعلاوة على ذلك، شددت الجمعية العامة على الحاجة

^١ انظر: تقرير الجمعية العالمية الثانية للشيخوخة (منشورات الأمم المتحدة A/CONF.197/9، رقم المبيع: E.02.IV.4).

^٢ السكان والتنمية، المجلد ١: برنامج العمل الذي اعتمده المؤتمر الدولي للسكان والتنمية، القاهرة، ٥ - ١٣ أيلول/سبتمبر ١٩٩٤ (منشورات الأمم المتحدة، رقم المبيع: E.95.XIII.7).

^٣ استعراض وتقييم التقدم المحرز في تحقيق أهداف ومقاصد برنامج عمل المؤتمر الدولي للسكان والتنمية، تقرير عام ١٩٩٩ (منشورات الأمم المتحدة، رقم المبيع: E.99.XIII.16).

^٤ شيخوخة السكان وآثارها الاقتصادية والاجتماعية، دراسات سكانية، عدد ٢٦ (منشورات الأمم المتحدة، رقم المبيع: E.06.XIII.2)؛ وشيخوخة السكان ٢٠٠٦ (منشورات الأمم المتحدة، رقم المبيع: E.06.XIII.2).

إلى بيانات سكانية مفصلة على أساس العمر والجنس. ويوفر هذا التقرير الأساس الديمغرافي لأنشطة متابعة الجمعية العالمية الثانية للشيخوخة. فهو يتناول عملية شيخوخة السكان في العالم ككل، وفي المناطق الأكثر نمواً والأقل نمواً، وفي المناطق والأقاليم الكبرى، بالإضافة إلى بلدان فردية. وتتوافر لمحات ديمغرافية تغطي الفترة من عام ١٩٥٠ إلى عام ٢٠٥٠ عن كل بلد، وتسلط الضوء على المؤشرات ذات الصلة بشيخوخة السكان.

وتؤكد محتويات هذا التقرير أربع نتائج هامة:

- ١ - شيخوخة السكان ظاهرة غير مسبوقه، وعملية لا نظير لها في تاريخ البشرية. فتشيخ مجموعة سكانية حينما يصاحب ارتفاع نسبة كبار السن (أي من تبلغ أعمارهم ٦٠ عاماً فما فوق) انخفاضاً في نسبة الأطفال (الأشخاص دون سن ١٥ عاماً) ثم يصاحبها انخفاض في نسب الأشخاص في سن العمل (١٥ إلى ٥٩ عاماً). ويُتوقع أن يفوق عدد كبار السن على مستوى العالم عدد الأطفال لأول مرة في عام ٢٠٤٧. أما في المناطق الأكثر نمواً، حيث شيخوخة السكان أكثر تقدماً بكثير، انخفض عدد الأطفال عن عدد كبار السن في عام ١٩٩٨.
- ٢ - شيخوخة السكان ظاهرة منتشرة، حيث إنها تكاد تؤثر في جميع بلدان العالم. وتنشأ شيخوخة السكان أساساً عن تراجع الخصوبة على نحو صار عالمياً تقريباً. ولما ينتج عن هذا من تباطؤ في نمو عدد الأطفال، تصاحبه زيادة مطردة في عدد كبار السن، تأثير مباشر على الإنصاف والتضامن داخل الأجيال وفيما بينها، وهما يشكلان البنيان الذي يقوم عليه المجتمع.
- ٣ - شيخوخة السكان ظاهرة عميقة ولها نتائج وآثار كبيرة على جميع مناحي الحياة البشرية. فسيكون لشيخوخة السكان في المجال الاقتصادي أثر على النمو الاقتصادي، والمدخرات، والاستثمار، والاستهلاك، وأسواق العمل، والمعاشات التقاعدية، والضرائب، والتحويلات بين الأجيال. وفي الميدان الاجتماعي، تؤثر شيخوخة السكان في تركيب الأسرة وترتيبات المعيشة، والطلب على المساكن، واتجاهات الهجرة، وعلم الأوبئة، والحاجة لخدمات الرعاية الصحية. أما في المجال السياسي، يمكن أن تحدد شيخوخة السكان أنماط التصويت والتمثيل السياسي.

الشكل ١

نسبة السكان في سن ٦٠ فما فوق: العالم، ١٩٥٠ - ٢٠٥٠

٤ - شيخوخة السكان ظاهرة مستمرة. فقد ظلت نسبة كبار السن منذ عام ١٩٥٠ في ازدياد مطرد، مرتفعة من ٨ في المائة في عام ١٩٥٠ إلى ١١ في المائة في عام ٢٠٠٧، ومن المتوقع أن تصل إلى ٢٢ في المائة في عام ٢٠٥٠ (الشكل ١). وما دامت وفيات المسنين مستمرة في الانخفاض ومعدلات الخصوبة باقية على انخفاضها، ستستمر نسبة كبار السن في الارتفاع.

وفيما يلي أهم النتائج التي خلص إليها هذا التقرير:

- نظراً لأن من غير المحتمل أن ترتفع معدلات الخصوبة من جديد إلى المعدلات العالية التي كانت مألوفة في الماضي، فإن شيخوخة السكان لا رجعة فيها، كما أن من المرجح أن المجموعات السكانية الشابة المألوفة حتى وقت قريب ستصبح نادرة على مدى القرن الحادي والعشرين.
- وصل عدد السكان الذين تبلغ أعمارهم ٦٠ سنة فما فوق في عام ٢٠٠٠ إلى ٦٠٠ مليون نسمة، وهو ثلاثة أضعاف عددهم عام ١٩٥٠. وفي عام ٢٠٠٦، تجاوز عدد كبار السن الـ ٧٠٠ مليون نسمة. ومن المتوقع أن يكون هناك بليوناً مسنّ على قيد الحياة عام ٢٠٥٠، مما يفيد ضمناً بتضاعف عددهم مرة أخرى ثلاثة أضعاف على مدى ٥٠ عاماً.
- يتنامى عدد كبار السن عالمياً بمعدل ٢,٦ في المائة كل عام، وهذا أسرع بكثير من عدد السكان ككل الذي يزداد بنسبة ١,١ في المائة كل عام. ومن المتوقع أن يستمر عدد كبار السن في النمو بصورة أسرع من عدد السكان في سائر المجموعات العمرية، وذلك حتى عام ٢٠٥٠ على الأقل. وستطلب مثل هذا النمو السريع إدخال تعديلات اقتصادية واجتماعية بعيدة المدى في أغلب البلدان.
- توجد فروق واضحة بين المناطق المتقدمة النمو والمناطق النامية من حيث عدد كبار السن ونسبتهم. فبيلغ حالياً عمر أكثر من خمس سكان المناطق الأكثر نمواً ٦٠ عاماً أو أكثر، ومن المتوقع أن يكون قرابة ثلث سكان البلدان المتقدمة النمو من تلك الشريحة العمرية بحلول عام ٢٠٥٠. أما في المناطق الأقل نمواً، فسيتأثر كبار السن اليوم بما لا يزيد عن ٨ في المائة من السكان، غير أن من المتوقع أن يمثلوا، بحلول عام ٢٠٥٠، خمس السكان، مما يفيد ضمناً باحتمال وصول العالم النامي بحلول منتصف القرن إلى نفس المرحلة في عملية شيخوخة السكان التي وصلها بالفعل العالم المتقدم النمو.
- تزيد سرعة شيخوخة السكان في البلدان النامية عنها في البلدان المتقدمة النمو. ونتيجة لذلك، فإن الوقت المتاح أمام البلدان النامية للتكيف مع عواقب شيخوخة السكان سيكون أقل. وبالإضافة إلى هذا، فإن شيخوخة السكان في البلدان النامية تحدث في مستويات من التنمية الاقتصادية والاجتماعية أدنى مما هي في البلدان المتقدمة النمو.
- يبلغ العمر الوسيط في العالم اليوم ٢٨ سنة، أي أن نصف سكان العالم تقل أعمارهم عن تلك السن، بينما تزيد أعمار النصف الآخر عنها. والبلد الذي توجد فيه أصغر المجموعات السكانية سناً هو أوغندا، حيث يبلغ العمر الوسيط ١٥ عاماً، أما البلد الذي توجد فيه أكبر المجموعات السكانية سناً فهو اليابان، التي يبلغ العمر الوسيط فيها ٤٣ عاماً. ومن المرجح أن يرتفع العمر الوسيط العالمي على مدى العقود الأربعة التالية عشر سنوات ليبلغ ٣٨ عاماً سنة ٢٠٥٠. ومن المرجح أنذاك أن تصبح بوروندي وأوغندا البلدين اللذين توجد فيهما أصغر المجموعات السكانية سناً، حيث يبلغ العمر الوسيط ٢٠ عاماً، بينما يُتوقع أن توجد أكبر المجموعات السكانية سناً في منطقة ماكاو الإدارية الخاصة في الصين وفي جمهورية كوريا، حيث يُتوقع أن يصل العمر الوسيط إلى ٥٤ عاماً.

- ومجموعة كبار السن ذاتها آخذة في الشيخوخة. فمن بين السكان البالغين من العمر ٦٠ عاماً أو أكثر، فإن أسرع المجموعات نمواً هم أكبر المسنين، أي الذين تبلغ أعمارهم ٨٠ عاماً فما فوق. فأعدادهم تزداد حالياً بنسبة ٣,٩ في المائة كل عام. ويستأثر الأشخاص الذين تبلغ أعمارهم ٨٠ عاماً فما فوق بحوالي ١ بين كل ٨ من كبار السن (٦٠ عاماً فما فوق). ومن المتوقع أن ترتفع هذه النسبة بحلول عام ٢٠٥٠ لتصل إلى حوالي شخصين يبلغ عمرهما ٨٠ عاماً فما فوق بين كل ١٠ من كبار السن.
- تبيّن نسبة الدعم المحتمل، ألا وهو عدد من تتراوح أعمارهم بين ١٥ و٦٤ عاماً لكل مسنّ يبلغ عمره ٦٥ عاماً فما فوق، عدد العمال المحتملين الموجودين لكل مسنّ. ومع تقدم مجموعة سكانية ما في السن، تميل قيمة نسبة الدعم المحتمل إلى الانخفاض. فقد انخفضت نسبة الدعم المحتمل في الفترة بين عامي ١٩٥٠ و٢٠٠٧ من ١٢ عاملاً إلى ٩ عمال محتملين لكل شخص يبلغ عمره ٦٥ سنة فما فوق. ومن المتوقع أن تواصل نسبة الدعم المحتمل انخفاضها بحلول عام ٢٠٥٠ لتصل إلى ٤ عمال محتملين لكل شخص يبلغ عمره ٦٥ سنة فما فوق (الشكل ٢). ولانخفاض نسب الدعم المحتمل آثار هامة على نظم الضمان الاجتماعي، لا سيما بالنسبة لنظم المعاشات التقاعدية التي تقوم على دفع الاستحقاقات أولاً بأول والتي تموّل بموجبها الضرائب المفروضة على رواتب العمال الحاليين ومعاشات المتقاعدين.
- ونظراً لأن النساء يعشن أكثر من الرجال، فإن النساء يشكلن أغلبية كبار السن. ويفوق حالياً عدد النساء عدد الرجال بحوالي ٧٠ مليون بين الأشخاص الذين تبلغ أعمارهم ٦٠ عاماً فما فوق. أما بالنسبة للذين تبلغ أعمارهم ٨٠ عاماً فما فوق، فيبلغ عدد النساء ضعفي عدد الرجال تقريباً، وبالنسبة للذين تبلغ أعمارهم مائة عام فما فوق، يتراوح عدد النساء بين أربعة وخمسة أضعاف عدد الرجال (الشكل ٣).
- عادة ما تعتل صحة كبار السن بتقدم العمر، مما يتسبب في زيادة الطلب على الرعاية طويلة الأجل مع تزايد عدد كبار السن. وتمثل نسبة دعم الوالدين، وهي نسبة السكان الذين تبلغ أعمارهم ٨٥ سنة فما فوق إلى السكان الذين تتراوح أعمارهم بين ٥٠ و٦٤ عاماً، مؤشراً

الشكل ٢

نسبة الدعم المحتمل: العالم، ١٩٥٠ - ٢٠٥٠

الشكل ٣

نسبة النساء بين الأشخاص الذين تتراوح أعمارهم بين ٤٠ و ٥٩، و ٦٠ فما فوق، و ٨٠ فما فوق، و ١٠٠ فما فوق: العالم، ٢٠٠٧

لمستوى الدعم الذي يمكن للأسر أن تقدمه لمستّيها. وعلى مستوى العالم، كان هناك عام ١٩٥٠ أقل من شخصين يبلغ عمرهما ٨٥ سنة فما فوق لكل ١٠٠ شخص تتراوح أعمارهم بين ٥٠ و ٦٤ عاماً. أما اليوم، فتتجاوز تلك النسبة بقليل ٤ أشخاص لكل ١٠٠ شخص، غير أن من المتوقع أن تصل إلى ١٢ لكل ١٠٠ شخص بحلول عام ٢٠٥٠. ويعني هذا أن الأشخاص الذين تجاوزوا هم أنفسهم بكثير فترة منتصف العمر سيتضاعف احتمال اضطلاعهم بمسؤولية رعاية الأقارب الأكبر سناً ثلاث مرات عما هو عليه اليوم.

كبار السن الذين يعيشون بمفردهم أكثر عرضة للعزلة الاجتماعية والحرمان الاقتصادي، ولذلك فقد يحتاجون إلى دعم خاص. وبسبب ارتفاع معدلات بقاء المسنات على قيد الحياة وانخفاض النزعة لديهن إلى التزوج من جديد، فإنهن أكثر عرضة من المسنين للعيش بمفردهن. وعلى مستوى العالم، تعيش نسبة تقدر بـ ١٩ في المائة من النساء اللاتي يبلغن من العمر ٦٠ عاماً فما فوق بمفردهن، بينما لا ينطبق هذا سوى على ٨ في المائة من الرجال من تلك الفئة العمرية.

تتباين السن الفعلية للتقاعد بشكل كبير بين مختلف المجموعات السكانية. فيمكن لكبار السن في البلدان التي يرتفع فيها الدخل الفردي التقاعد في سن أصغر ومن ثم تتجه معدلات مشاركتهم في القوة العاملة إلى الانخفاض في الأعمار الأكبر. ومن ثم، فإن ١٣ في المائة فقط من الرجال الذين يبلغون من العمر ٦٥ عاماً فما فوق نشطون اقتصادياً في المناطق الأكثر نمواً، بينما ينتمي ٣٩ في المائة إلى القوة العاملة بالمناطق الأقل نمواً. والفارق مماثل بين النساء. ففي المناطق الأكثر نمواً، فإن ٧ في المائة من المسنات نشطات اقتصادياً، مقارنة بـ ١٥ في المائة في المناطق الأقل نمواً. ويبقى كبار السن نشطين اقتصادياً لفترات أطول في المناطق الأقل نمواً بسبب التغطية المحدودة لبرامج المعاشات التقاعدية والدخول الصغيرة نسبياً التي توفرها.

- السن القانونية التي يمكن فيها الحصول على معاش تقاعدي كامل بشرط إتمام حد أدنى من الوقت في الإسهام في نظام المعاشات التقاعدية (أي سن التقاعد) هي ذاتها في معظم البلدان بالنسبة للنساء والرجال. إلا أن النساء في كثير من البلدان مؤهلات لتلقي استحقاقات المعاش التقاعدي الكامل في أعمار أقل من أعمار الرجال، رغم توقع أن تعيش النساء لفترات أطول من فترات الرجال بعد سن الستين. ويميل سن التقاعد بالنسبة للرجال والنساء لأن يكون أعلى في البلدان المتقدمة النمو عنه في البلدان النامية.
 - لا تزال الأمية شائعة بين كبار السن في المناطق الأقل نمواً. ويُقدر حالياً أن أكثر من نصف الأشخاص الذين يبلغون من العمر ٦٥ عاماً فما فوق في البلدان النامية أميون. ولا يحظى سوى ما يقارب ثلث المسنّات وثلاثة أخماس المسنّين في البلدان النامية باللمام بسيط بالقراءة والكتابة. أما في المناطق الأكثر نمواً، فجميع المسنّين تقريباً ملمين بالقراءة والكتابة إلا في عدد قليل من البلدان.
- إجمالاً، ونتيجة للانتقال من الخصوبة المرتفعة إلى الخصوبة المنخفضة وللتراجع المستمر في وفيات الراشدين، فإن سكان أغلب البلدان يتقدمون في العمر. وهذا التحوّل الديمغرافي غير المسبوق، الذي بدأ في العالم المتقدم النمو في القرن التاسع عشر، وظهر في فترة أقرب في البلدان النامية، أخذ بالفعل في تغيير كثير من المجتمعات. ويُتوقع أن تتسارع عملية الشيخوخة في المستقبل القريب، لا سيما في البلدان النامية. ونظراً لأن الوقت المتاح أمام حكومات البلدان النامية للتكيف مع التغيّرات المرتبطة بشيخوخة السكان قصير نسبياً، من الضروري أن تبدأ في اتخاذ خطوات لمواجهة التحديات والاستفادة بأقصى درجة ممكنة من الفرص التي تجلبها شيخوخة السكان. ويقدم هذا التقرير الأساس الديمغرافي لمعرفة مدى شيخوخة السكان وعمقها اليوم وفي السنوات المقبلة في كل بلد من بلدان العالم.

执行摘要

2002年4月第二次老龄问题世界大会通过的《马德里老龄问题国际行动计划》和《政治宣言》，¹标志着世界在迎接构建一个顾及所有年龄组的社会重大挑战方面的一个转折点。《计划》着重于三大优先领域：老年人和发展；增进老年人的健康和福祉；并确保形成有利和支助性的环境。这是各国政府第一次采取综合办法，把老龄问题同社会经济发展和人权的其他框架联系起来，这特别是指1990年代联合国大型会议和首脑会议所商定的框架。

同人口老化和老年人有关的问题在联合国过去25年间所主办的三大国际人口会议上占有显著位置。例如，1994年国际人口与发展会议承认，人口老化的经济和社会影响对所有社会而言，既是机遇，也是挑战。²最近，为进一步执行1999年7月2日联大第二十一届特别会议通过的《国际人口与发展会议行动纲领》采取的重要行动重申所有社会必须处理今后几十年内人口老化带来的重大问题。³2007年，联合国人口与发展委员会将把工作重点放在不断变化的人口年龄结构及其对社会的影响方面，而这正是该委员会第四十届会议的特别主题。

联合国人口司长期以来就有研究人口老化的传统，包括估计和预测老化人口的规模和特征，并审查人口老化的决定因素和后果。从1956年首发人口老化问题报告（侧重于较发达国家的人口老化问题）到2006年发布联合国人口老化问题挂图，人口司一直争取让各国政府和国际社会注意人口老化问题。⁴

联合国社会发展委员会决定每五年对执行《马德里老龄问题行动计划》的进展情况进行审查和评价。此外，联大强调必须按年龄和性别对人口数据进行分类。本报告从人口学角度为第二次老龄问题世界大会的后续活动奠定基础。本报告把世界人口老化的进程视为整体，各区域（无论发达程度）、主要地区和区域以及个别国家都包括在内。提供了1950年至2050年期间每个国家的人口学数据，突出人口老化的相关指标。

本报告内容强调四大定论：

1. 人口老化是前所未有的，在人类历史上没有发生过类似的进程。老年人（即达到或超过60岁者）的比例增加，而少年儿童（15岁以下者）比例减少，

1 见第二次老龄问题世界大会报告（联合国出版物A/CONF.197/9，英文出售品编号E.02.IV.4）。

2 人口与发展，第一卷，国际人口与发展会议（1994年9月5至13日，开罗）通过的行动纲领（联合国出版物，英文出售品编号E.95.XIII.7）。

3 《审查和评价实现国际人口与发展会议行动纲领各项目标和目的的进展情况，1999年报告》，（联合国出版物，英文出售品编号E.99.XIII.16）。

4 The Ageing of Populations and its Economic and Social Implications, Population Studies, No. 26(联合国出版物，英文出售品编号1956.XIII.6)； and Population Ageing 2006(联合国出版物，英文出售品编号E.06.XIII.2)。

而劳动适龄(15至59岁)人口比例也有下降,这样就形成人口老化。在世界范围内,2047年,老年人人数预期将首次超过儿童人数。在人口老化问题更突出的较发达区域,1998年,儿童人数就低于老年人人数。

2. 人口老化是渗透性的,它影响世界几乎所有国家。人口老化的原因,主要在于生育率下降这一近乎世界性的问题。由此造成儿童人数增长速度放慢,而老年人人数持续增加,这对作为社会基础的代间、代内公平和团结产生了直接影响。

3. 人口老化是影响深远的问题,对人类生活所有方面都具有重大影响。在经济领域,人口老化将对经济增长、储蓄、投资、消费、劳动力市场、养恤金、税务和代间转移产生影响。在社会领域,人口老化影响到家庭组成和生活安排、住房需求、移徙趋势、流行病以及保健服务需求。在政治领域,人口老化可能会影响投票格局和政治代表性。

4. 人口老化是长期性的。1950年以来,老年人比例持续增加,从1950年的8%增加到2007年的11%,2050年预期将达到22%(图一)。只要老年人死亡率继续下降、生育率依然很低,老年人的比例将继续增加。

本报告主要定论如下:

- 生育率不大可能恢复到过去常见的高度,所以,人口老化是不可逆转的,直到最近都常见的青少年人口群在二十一世纪期间可能变得少见。
- 2000年,60岁或60岁以上人口有6亿人,比1950年增加了两倍。2006年,老年人口超过7亿。2050年,据预测将有20亿老年人存活,也就是说,他们的人数在50年间再度增加两倍。
- 全球而言,老年人人口以每年2.6%的速率增加,这比整体人口(每年增加1.1%)的增长率要高得多。至少直到2050年,老年人口预期将继续比其他年龄组增长更快。此类迅速增长将要求大多数国家在经济和社会方面作出重大调整。

图一
60岁及60岁以上人口比例:世界,1950-2050年

- 发达区域和发展中区域在老年人人数和比例方面存在明显差异。在较发达区域，超过五分之一的人口目前达到或超过60岁，据预测到2050年，发达国家近三分之一的人口属于该年龄组。在欠发达区域，老年人今天只占人口的8%，但到2050年，预期他们将占人口的五分之一，这意味着到本世纪中叶，发展中世界人口老化进程可能进入与目前发达世界所处阶段相同的阶段。

- 发展中国家人口老化的步伐比发达国家快。因此，发展中国家适应人口老化影响的时间相对较少。此外，相对于发达国家而言，发展中国家人口老化是在社会经济欠发达的情况下发生的。

- 今天，世界中位年龄为28岁，就是说，世界人口中有一半人低于这一年龄，而另一半则高于这一年龄。人口最年轻的国家是乌干达，其中位年龄为15岁，人口最老的是日本，其中位年龄为43岁。今后40年间，世界中位年龄可能会提高十岁，2050年达到38岁。届时，人口最年轻的国家可能是布隆迪和乌干达，中位年龄均为20岁，而最老的人口预期是在中国澳门特别行政区和大韩民国，其据预测中位年龄将均为54岁。

- 老年人口本身也在老化。在60岁及60岁以上者当中，增长最快的人口是最老的老人，也就是年届80或80岁以上者。目前，该年龄段人数在以每年3.9%的速度增长。今天，80或80岁以上者约占老年人(60或60岁以上)的1/8。到2050年，预期这一比例将增加到约有十分之二老年人达到或超过80岁。

- 可能供养比率，即65岁或65岁以上人口与15至64岁人口之间的比率，表明对于每一名老年人而言，有多少可能的劳动力。随着人口的老化，可能供养比率值往往下降。1950年至2007年间，可能供养比率从有一名65岁或65岁以上者就有12名可能的劳动力，减至9名可能的劳动力。据预测，到2050年，可能供养比率将再度下降到有一名老年人就有4名可能的劳动力（图二）。可能供养比率下降对社会保障制度，尤其是对现收现付养恤金制（即以在职工人的纳税支付退休人员的养恤金）产生重大影响。

图二
可能供养比率：世界，1950-2050年

- 妇女比男子长寿，所以，老年人多为女性。目前，年届60或60岁以上者中，妇女比男性多出约7 000万人。年龄达到或超过80岁者中，女性人数几乎比男子多出一倍，而百岁老人中，女性人数约为男性人数的四至五倍(图三)。

- 随着年龄的增加，老年人的身体健康状况往往变坏，表明随着老年人数的增加，对长期看护的需求也有增加。抚养父母率，即85岁或85岁以上人口相对于50岁至64岁人口的比例，表明家庭能在多大程度上抚养其耆老。在全球范围内，1950年，相对于每100名50至64岁之间者，85岁或85岁以上者不到两人；今天，这一比率稍微高于4%，到2050年，预期达到12%。也就是说，那些本身已逾中年者要承担照料耆老亲属的可能性将比今天大两倍。

- 独居老者更有可能经历社会孤独和经济处境恶化，因而需要特别支助。老年妇女存活率较高，再婚倾向较低，因而她们比老年男子更有可能独居。在全球范围内，60或60岁以上的老嫗中，有19%独居，而该年龄组只有8%的男子独居。

- 各国人口退体的有效年龄迥然相异。在人均收入高的国家，老年人可以较早退休，这样，老人参与劳动力程度就较低。因此，在较发达区域，65岁或65岁以上男子中，只有13%仍然积极参与经济活动，而欠发达区域的此类男子有39%仍然属于劳动力成员。女性也有类似的差别。在较发达区域，7%的老年妇女积极参与经济活动；在欠发达地区，这一比例为15%。在欠发达区域，老年人积极参加经济活动的时间较长，因为养恤金方案覆盖范围有限，所提供的收入也较低。

- 在多数国家，向养恤金制度缴款的起码期间届满后即能领取全额养恤金的法定年龄（可领养恤金年龄），男女都一样。然而，在许多国家，妇女在比男子低的年龄层次就能领取全额养恤金福利，而60岁以上妇女一般比男子长寿。在发达国家，可领养恤金年龄，不分男女，往往比发展中国家要高。

- 在欠发达区域的老年人中，文盲依然普遍。目前，在发展中国家，65岁或65岁以上的所有人中，估计超过半数文盲。发展中国家只有约三分之

图三

40-59岁、60岁以上、80岁以上和百岁以上人口中女性比例：世界，2007年

一的老年妇女和约五分之三的老年男子能基本识字、写字。在较发达区域，除少数国家外，老年人口普遍都识字。

简而言之，由于从高生育率向低生育率过渡，而成年人死亡率持续降低，因此，世界大多数国家正在出现人口老化。这一史无前例的人口变化十九世纪始于发达世界，最近也出现在发展中国家；它已经改变了许多社会。预期在最近的将来，老龄化进程将加快，尤其是在发展中国家。发展中国家政府要在较短时间内适应与人口老化有关的变化，因此，它们必须立即着手采取步骤，迎接这项挑战，并充分利用人口老化所带来的机会。本报告从人口学角度为确定今天及来年世界各国人口老化的程度和深度奠定基础。

Executive summary

The Madrid International Plan of Action on Ageing and the Political Declaration adopted at the Second World Assembly on Ageing in April 2002¹ marked a turning point in how the world addresses the key challenge of building a society for all ages. The Plan focuses on three priority areas: older persons and development; advancing health and well-being into old age; and ensuring enabling and supportive environments. It represents the first time Governments have adopted a comprehensive approach linking questions of ageing to other frameworks for social and economic development and human rights, most notably those agreed to at the United Nations conferences and summits of the 1990s.

Issues related to population ageing and older persons have played a prominent role in the three major international population conferences organized by the United Nations during the past quarter century. For example, the International Conference on Population and Development, held in 1994, recognized that the economic and social impact of population ageing is both an opportunity and a challenge to all societies.² More recently, the key actions for the further implementation of the Programme of Action of the International Conference on Population and Development, adopted by the General Assembly at its twenty-first special session on 2 July 1999, reiterated the need for all societies to address the significant consequences of population ageing in the coming decades.³ In 2007, the United Nations Commission on Population and Development will focus its work on the changing age structures of populations and their implications for development, the special theme for its fortieth session.

The Population Division of the United Nations has a long tradition of studying population ageing, including by estimating and projecting the size and characteristics of ageing populations and by examining the determinants and consequences of population ageing. From the groundbreaking report on population ageing published in 1956, which focused mainly on population ageing in the more developed countries, to the United Nations wall chart on population ageing published in 2006, the Population Division has consistently sought to bring population ageing to the attention of Governments and the international community.⁴

The United Nations Commission on Social Development has decided to conduct every five years a review and appraisal of progress made in implementing the Madrid Plan of Action on Ageing. Furthermore, the General Assembly has stressed the need for population data disaggregated by age and sex. This report provides the demographic founda-

tion for the follow-up activities of the Second World Assembly on Ageing. It considers the process of population ageing for the world as a whole, for more and less developed regions, major areas and regions, as well as individual countries. Demographic profiles covering the period 1950 to 2050 are provided for each country, highlighting the relevant indicators of population ageing.

The contents of this report underscore four major findings:

1. Population ageing is unprecedented, a process without parallel in the history of humanity. A population ages when increases in the proportion of older persons (that is, those aged 60 years or over) are accompanied by reductions in the proportion of children (persons under age 15) and then by declines in the proportions of persons in the working ages (15 to 59). At the world level, the number of older persons is expected to exceed the number of children for the first time in 2047. In the more developed regions, where population ageing is far advanced, the number of children dropped below that of older persons in 1998.
2. Population ageing is pervasive since it is affecting nearly all the countries of the world. Population ageing results mainly from reductions of fertility that have become virtually universal. The resulting slowdown in the growth of the number of children coupled with the steady increase in the number of older persons has a direct bearing on both the intergenerational and intragenerational equity and solidarity that are the foundations of society.
3. Population ageing is profound, having major consequences and implications for all facets of human life. In the economic area, population ageing will have an impact on economic growth, savings, investment, consumption, labour markets, pensions, taxation and intergenerational transfers. In the social sphere, population ageing influences family composition and living arrangements, housing demand, migration trends, epidemiology and the need for health-care services. In the political arena, population ageing may shape voting patterns and political representation.
4. Population ageing is enduring. Since 1950 the proportion of older persons has been rising steadily, passing from 8 per cent in 1950 to 11 per cent in 2007, and is expected to reach 22 per cent in 2050 (figure I). As long as old age mortality continues to decline and fertility remains low, the proportion of older persons will continue to increase.

Figure I
Proportion of population 60 years or over: world, 1950-2050

The major findings of this report are the following:

- Because fertility levels are unlikely to rise again to the high levels common in the past, population ageing is irreversible and the young populations that were common until recently are likely to become rare over the course of the twenty-first century.
- In 2000, the population aged 60 years or over numbered 600 million, triple the number present in 1950. In 2006, the number of older persons had surpassed 700 million. By 2050, 2 billion older persons are projected to be alive, implying that their number will once again triple over a span of 50 years.
- Globally the population of older persons is growing at a rate of 2.6 per cent per year, considerably faster than the population as a whole which is increasing at 1.1 per cent annually. At least until 2050, the older population is expected to continue growing more rapidly than the population in other age groups. Such rapid growth will require far-reaching economic and social adjustments in most countries.
- Marked differences exist between developed and developing regions in the number and proportion of older persons. In the more developed regions, over a fifth of the population is currently aged 60 years or over and by 2050, nearly a third of the population in developed countries is projected to be in that age group. In the less developed regions, older persons account today for just 8 per cent of the population but by 2050 they are expected to account for a fifth of the population, implying that, by mid-century, the developing world is likely to reach the same stage in the process of population ageing that the developed world is already at.
- The pace of population ageing is faster in developing countries than in developed countries. Consequently, developing countries will have less time to adjust to the consequences of population ageing. Moreover, population ageing in developing countries is taking place at lower levels of socio-economic development than has been the case for developed countries.
- Today the median age for the world is 28 years, that is, half the world's population is below that age and the other half is above it. The country with the youngest population is Uganda, with a median age of 15 years, and the oldest is Japan, with a median age of 43 years. Over the next four decades, the world's median age will likely increase by ten years, to reach 38 years in 2050. At that time, the countries with the youngest populations will likely be Burundi and Uganda, with median ages of 20 years each, whereas the oldest populations are expected to be in Macao SAR China and in the Republic of Korea whose median ages are projected to be 54 years in each.
- The population of older persons is itself ageing. Among those aged 60 years or over, the fastest growing population is that of the oldest-old, that is, those aged 80 years or over. Their numbers are currently increasing at 3.9 per cent per year. Today, persons aged 80 years or over account for about 1 in every 8 older persons (60 or over). By 2050, this ratio is expected to increase to approximately 2 persons aged 80 or over among every 10 older persons.
- The potential support ratio (PSR), that is, the number of persons aged 15 to 64 per each older person aged 65 years or over, indicates how many potential workers there are per older person. As a population ages, the value of the potential support ratio tends to fall. Between 1950 and 2007, the potential support ratio declined from 12 to 9 potential workers per person aged 65 or over. By 2050, the potential support ratio is projected to drop further to reach 4 potential workers per older person (figure II). The reduction of potential support ratios has important implications for social security schemes, particularly for pay-as-you-go pension systems under which taxes on current workers pay the pensions of retirees.

Figure II
Potential support ratio (PSR): world, 1950-2050

- Because women live longer than men, women constitute the majority of older persons. Currently, women outnumber men by about 70 million among those aged 60 years or over. Among those aged 80 years or over, women are nearly twice as numerous as men, and among centenarians women are between four and five times as numerous as men (figure III).
- The health of older persons typically deteriorates with increasing age, inducing greater demand for long-term care as the numbers of older persons increase. The parent support ratio, that is, the ratio of the population aged 85 or over to that aged 50 to 64, provides an indication of the level of support families may be able to provide to their oldest members. Globally, there were fewer than 2 persons aged 85 or over for every 100 persons aged 50 to 64 in 1950. Today, that ratio is slightly over 4 per 100 but it is projected to reach 12 per 100 by 2050. That is, persons who are themselves well past middle age will be three times more likely than they are today to be responsible for the care of older relatives.
- Older persons living alone are at greater risk of experiencing social isolation and economic deprivation, and may therefore require special support. Because of higher survivorship and lower propensities to remarry, older women are more likely than older men to live alone. Globally, an estimated 19 per cent of women aged 60 years or over live alone, whereas just 8 per cent of men in that age group do so.
- The effective age at retirement varies considerably among populations. In countries with high per capita incomes, older persons can retire earlier and thus tend to have lower labour force participation rates at older ages. Thus, just 13 per cent of men aged 65 years or over are economically active in the more developed regions, whereas 39 per cent are in the labour force of the less developed regions. The difference is similar among women. In the more developed regions, 7 per cent of older women are economically active, compared to 15 per cent in the less developed regions. Older persons remain economically active for longer in the less developed regions because of the limited coverage of pension programmes and the relatively small incomes they provide.
- In most countries the statutory age at which a full pension can be obtained provided a minimum period of contributions to the pension system is completed (i.e., the pensionable age) is the same for women and men. In many countries, however, women become eligible for full pension benefits at lower ages than men, even

Figure III
Proportion of women among persons aged 40-59, 60+, 80+ and 100+ years:
world, 2007

though women can expect to live longer than men after age 60. For both men and women, pensionable ages tend to be higher in developed than in developing countries.

- Illiteracy is still common among the older population of less developed regions. Currently, it is estimated that over half of all persons aged 65 or over in developing countries are illiterate. Only about a third of older women and about three fifths of older men in developing countries have basic reading and writing skills. In the more developed regions, literacy among the older population is nearly universal in all but a few countries.

In sum, as a result of the transition from high to low fertility and the continuous reduction of adult mortality, the population of most countries of the world is ageing. This unprecedented demographic change, which started in the developed world in the nineteenth century and is more recent in developing countries, is already transforming many societies. The ageing process is expected to accelerate in the near future, particularly in developing countries. Because they have a shorter time to adapt to the changes associated with population ageing, it is urgent that the Governments of developing countries begin taking steps to face the challenges and make the best of the opportunities that population ageing brings. This report provides the demographic basis for ascertaining the extent and depth of population ageing today and in the years to come in each country of the world.

Résumé

Le Plan d'action international de Madrid sur le vieillissement et la Déclaration politique adoptés à la deuxième Assemblée mondiale sur le vieillissement en avril 2002¹ ont marqué un tournant dans la façon dont le monde envisage la tâche ardue qu'est l'édification d'une société pour tous les âges. Le Plan d'action repose sur trois orientations prioritaires : les personnes âgées et le développement; la promotion de la santé et du bien-être jusque dans le troisième âge; et la création d'environnements porteurs et favorables. C'était la première fois que les gouvernements envisageaient les choses de façon globale, en reliant les questions du vieillissement à d'autres programmes de développement social et économique et de droits de l'homme, tout particulièrement ceux convenus aux conférences et réunions au sommet des Nations Unies des années 90.

Les questions relatives au vieillissement de la population et aux personnes âgées ont occupé une place de premier plan lors des trois grandes conférences internationales sur la population organisées par les Nations Unies au cours des 25 dernières années. Ainsi, la Conférence internationale sur la population et le développement, qui a eu lieu en 1994, a reconnu que l'incidence économique et sociale du vieillissement de la population constituait pour toutes les sociétés à la fois une chance et une gageure². Plus récemment, dans les principales mesures pour la poursuite de l'application du Programme d'action de la Conférence internationale sur la population et le développement qu'elle a adoptées à sa vingt et unième session extraordinaire, le 2 juillet 1999, l'Assemblée générale a souligné à nouveau que toutes les sociétés devraient, notamment, s'interroger sur les répercussions importantes qu'aurait le vieillissement de la population dans les décennies à venir³. En 2007, la Commission de la population et du développement axera ses travaux sur l'évolution de la pyramide des âges des populations et ses effets sur le développement, thème spécial de sa quarantième session.

Cela fait longtemps que la Division de la population de l'ONU étudie la question du vieillissement de la population, notamment par des estimations et des projections des populations de personnes âgées et des études sur les déterminants et les conséquences du vieillissement de la population. Depuis le premier rapport sur le vieillissement de la population, datant de 1956, qui traitait surtout de la situation des pays développés, jusqu'à la première planche murale publiée par l'ONU en 1999, la Division de la population n'a cessé d'appeler l'attention de la communauté internationale sur la question du vieillissement de la population⁴.

La Commission du développement social a décidé d'examiner et d'évaluer tous les cinq ans l'application du Plan d'action international de Madrid sur le vieillissement. L'Assemblée générale, pour sa part, a souligné la nécessité de disposer de données démographiques ventilées par âge et par sexe. Le présent rapport fournit les éléments démographiques nécessaires aux activités de suivi de la deuxième Assemblée mondiale sur le vieillissement. Le vieillissement de la population y est examiné aux niveaux du monde, des régions plus ou moins développées, des grandes régions et des pays. On y trouvera, pour chaque pays, les profils démographiques de 1950 à 2050, mettant en évidence les indicateurs du vieillissement de la population.

Quatre constatations se dégagent du présent rapport :

1. Le vieillissement de la population est un phénomène nouveau sans équivalent dans l'histoire de l'humanité. Une population vieillit lorsque l'augmentation de la proportion des personnes âgées (60 ans et plus) s'accompagne d'une diminution d'abord de la proportion des enfants (moins de 15 ans) puis de la proportion des personnes en âge de travailler (de 15 à 59 ans). Au niveau mondial, ce sera en principe en 2047 que le nombre des personnes âgées dépassera pour la première fois le nombre des enfants. Dans les régions développées où le vieillissement de la population est déjà à un stade avancé, le nombre des personnes âgées a surpassé le nombre des enfants en 1998.
2. Le vieillissement de la population est un phénomène très répandu, touchant pratiquement tous les pays. Il est principalement dû à une baisse de la fécondité qui se manifeste quasiment partout. Le ralentissement consécutif de l'accroissement du nombre d'enfants, conjugué à l'augmentation constante du nombre de personnes âgées influe directement sur l'équité et la solidarité intergénérationnelles et intragénérationnelles, sur lesquelles toute société se fonde.
3. Le vieillissement de la population est marquant et lourd de conséquences et d'incidences sur tous les aspects de la vie de l'homme. Sur le plan économique, le vieillissement de la population retentira sur la croissance économique, l'épargne, l'investissement, la consommation, les marchés du travail, les pensions, les impôts et les transferts entre générations. Sur le plan social, il modifie la composition de la famille et les modes de vie commune, la demande de logements, les tendances de la migration, l'épidémiologie et les besoins en matière de soins de santé. Sur

Graphique I

Proportion des personnes âgées de 60 ans et plus dans le monde, 1950-2050

le plan politique, il peut déterminer la répartition des votes et la représentation politique.

4. Le vieillissement de la population est un phénomène durable. Depuis 1950, la proportion de personnes âgées ne cesse de croître, passant de 8 % en 1950 à 11 % en 2007; elle pourrait atteindre les 22 % en 2050 (graphique I). Tant que la mortalité sénile continue de régresser et que la fécondité demeure faible, la proportion de personnes âgées ne cessera d'augmenter.

Les principales conclusions du rapport sont les suivantes :

- Du fait que la fécondité ne retrouvera probablement pas les hauts niveaux d'antan, le vieillissement de la population est irréversible et les populations jeunes qui étaient courantes jusqu'à il y a peu deviendront sans doute rares au XXI^e siècle;
- En 2000, le monde comptait 600 millions de personnes âgées de 60 ans et plus, soit trois fois plus qu'en 1950. En 2006, leur nombre a dépassé les 700 millions. Selon les projections, elles seront 2 milliards en 2050, c'est-à-dire que leur nombre aura encore triplé en l'espace de 50 ans;
- À l'échelle mondiale, le nombre des personnes âgées augmente de 2,6 % chaque année, c'est-à-dire beaucoup plus vite que la population dans son ensemble, dont le taux d'accroissement est de 1,1 % par an. Le nombre des personnes âgées doit en principe continuer d'augmenter plus rapidement que le nombre des personnes des autres tranches d'âge et ce au moins jusqu'à 2050. Face à une croissance aussi rapide, la plupart des pays devront faire d'importants ajustements économiques et sociaux;
- Il y a des différences marquées entre les régions développées et les régions en développement pour ce qui est du nombre et de la proportion des personnes âgées. Dans les régions développées, les personnes âgées de 60 ans et plus constituent plus d'un cinquième de la population et, en 2050, leur proportion par rapport à la population générale doit être de plus d'un tiers. Dans les régions moins avancées, les personnes âgées ne forment pour l'instant que 8 % de la population mais en 2050 leur proportion doit être d'un cinquième, ce qui veut dire que, au milieu du siècle, les pays en développement atteindront sans doute le stade de vieillissement démographique que connaissent en ce moment les pays en développement;
- Le vieillissement de la population étant plus rapide chez eux que dans les pays développés, les pays en développement auront moins de temps pour réagir. De plus, dans ces pays, le vieillissement de la population se produit à un niveau de développement socio-économique plus bas que celui que connaissaient les pays développés au moment où ils ont été touchés par ce phénomène;
- De nos jours, l'âge médian est de 28 ans dans le monde entier, ce qui veut dire que la moitié de la population mondiale a moins de 28 ans et l'autre moitié plus. Le pays à la population la plus jeune est l'Ouganda, l'âge médian y étant de 15 ans, et celui à la population la plus âgée est le Japon, où l'âge médian est de 43 ans. Au cours des 40 prochaines années, l'âge médian mondial augmentera probablement de 10 ans, passant à 38 ans en 2050. À ce moment-là, les pays à la population la plus jeune seront vraisemblablement le Burundi et l'Ouganda, où l'âge médian sera de 20 ans, tandis que les populations les plus vieilles seront probablement celle de Macao (région administrative spéciale de Chine) et celle de la République de Corée, avec un âge médian de 54 ans;
- La population de personnes âgées elle-même vieillit. Dans la tranche des 60 ans et plus, la catégorie dont l'accroissement est le plus rapide est celle des personnes très âgées, de 80 ans et plus. Leur nombre augmente actuellement au rythme de 3,9 % par an. De nos jours, une personne âgée (60 ans ou plus) sur huit a au moins 80 ans.

En 2050, cette proportion devrait encore augmenter et environ 2 personnes âgées sur 10 pourraient avoir au moins 80 ans;

- Le rapport actifs/inactifs, c'est-à-dire le nombre de personnes ayant entre 15 et 64 ans pour chaque personne âgée de 65 ans au moins, représente le nombre de travailleurs potentiels par personne âgée. Plus la population vieillit plus ce rapport baisse. Entre 1950 et 2007, il est passé de 12 à 9 travailleurs potentiels par personne de 65 ans ou plus. Selon les projections, il continuera à baisser pour n'être plus, en 2050, que de quatre travailleurs potentiels par personne âgée (graphique II). La diminution du rapport actifs/inactifs a d'importantes répercussions sur les régimes de sécurité sociale, en particulier sur les systèmes de retraite par répartition, dans lesquels les retraites sont financées par les cotisations des actifs.
- Vivant plus longtemps que les hommes, les femmes constituent la majorité des personnes âgées. Actuellement, il y a 70 millions de plus de femmes que d'hommes parmi les personnes de 60 ans et plus. Parmi les personnes âgées de 80 ans ou plus, il y a presque deux fois plus de femmes que d'hommes; parmi les centenaires, les femmes sont entre quatre et cinq fois plus nombreuses que les hommes (graphique III);
- La santé décline généralement avec l'âge, d'où l'accroissement de la demande de soins de longue durée à mesure que le nombre de personnes âgées augmente. Le ratio de dépendance par rapport à la génération suivante, c'est-à-dire le rapport entre le nombre de personnes de 85 ans et plus et le nombre de personnes ayant entre 50 et 64 ans, indique le niveau de soutien que les familles pourraient apporter aux plus âgés de leurs membres. À l'échelle mondiale, il y avait en 1950 moins de 2 personnes de 85 ans ou plus pour 100 personnes ayant entre 50 et 64 ans. Ce rapport, qui est actuellement d'un peu plus de 4 %, pourrait atteindre 12 % d'ici à 2050, ce qui veut dire que les personnes d'âge mûr et plus auront trois fois plus de chances qu'actuellement d'avoir à prendre en charge des parents âgés;
- Les personnes âgées vivant seules sont plus exposées à l'isolement social et aux privations et ont de ce fait besoin d'une aide spéciale. Ayant de plus grandes chances de survie et étant moins portées à se remarier, les femmes âgées ont une probabilité plus forte de devoir vivre seules que les hommes âgés. À l'échelle du monde, on estime que 19 % des femmes de 60 ans ou plus vivent seules, contre 8 % des hommes de la même tranche d'âge;
- L'âge réel de retraite varie considérablement d'une population à l'autre. Dans les pays ayant un revenu par habitant élevé, les personnes âgées peuvent partir plus

Graphique II
Rapport actifs/inactifs dans le monde, 1950-2050

Graphique III

Proportion de femmes parmi les personnes âgées de 40 à 59 ans, de 60 ans et plus, de 80 ans et plus et de 100 ans et plus dans le monde, 2007

tôt à la retraite, de sorte que leur taux d'activité est généralement plus faible. Ainsi, dans les régions développées, parmi les hommes de 65 ans ou plus, 13 % seulement sont économiquement actifs, contre 39 % dans les régions moins avancées. Cette différence s'observe aussi chez les femmes. Dans les régions développées, 7 % des femmes âgées sont économiquement actives, contre 15 % dans les régions moins avancées. Les personnes âgées demeurent économiquement actives plus longtemps dans les pays moins avancés en raison de la couverture limitée des régimes de retraite et du revenu assez faible qu'ils offrent;

- Dans la plupart des pays, l'âge donnant droit à une pleine retraite sous réserve d'une période minimale de cotisation au régime de pension (c'est-à-dire l'âge de la retraite) est le même pour les femmes et les hommes. Dans beaucoup de pays, toutefois, les femmes peuvent partir à la retraite plus tôt que les hommes, même si elles peuvent s'attendre à vivre plus longtemps que les hommes après 60 ans. Pour les femmes comme pour les hommes, l'âge du départ à la retraite est souvent plus élevé dans les pays développés que dans les pays en développement;
- L'analphabétisme est encore répandu chez les personnes âgées dans les pays en développement. Actuellement, dans ces pays, on estime que plus de la moitié des personnes de 65 ans ou plus seraient analphabètes. Il n'y a qu'un tiers environ des femmes âgées et trois cinquièmes des hommes âgés qui sachent lire et écrire. Dans les régions développées, pratiquement toutes les personnes âgées savent lire et écrire, et ce, dans quasiment tous les pays.

Pour récapituler, on peut dire que la fécondité ayant chuté et la mortalité adulte ne cessant de diminuer, la population vieillit dans la plupart des pays. Cette mutation démographique sans précédent, apparue dans les pays développés au XIX^e siècle, a gagné plus récemment les pays en développement; elle est en train de transformer nombre de sociétés. Le vieillissement de la population s'accélérera probablement dans un proche avenir, en particulier dans les pays en développement. Parce qu'ils ont moins de temps pour s'adapter aux problèmes liés au vieillissement de leur population, les gouvernements des pays en développement doivent commencer à prendre des mesures pour se préparer aux difficultés qu'il entraîne et en tirer avantage si possible. Les éléments présentés dans le rapport permettront d'évaluer l'étendue et la gravité de ce phénomène dans chaque pays du monde, dans sa forme actuelle et à venir.

Резюме

Мадридский международный план действий по проблемам старения и Политическая декларация, принятые на второй Всемирной ассамблее по проблемам старения в апреле 2002 года¹, перевернули представления международного сообщества о ключевой проблеме создания общества для людей всех возрастов. В Мадридском международном плане действий по проблемам старения указываются следующие три приоритетные направления деятельности: участие пожилых людей в развитии; обеспечение здравоохранения и благосостояния в пожилом возрасте; и обеспечение благоприятных и позитивных условий для людей всех возрастных групп. В этом документе правительства впервые применили комплексный подход, в соответствии с которым деятельность по вопросам старения была увязана с другими направлениями работы в области социально-экономического развития и защиты прав человека, согласованными в основном на конференциях и встречах на высшем уровне Организации Объединенных Наций в 90-е годы.

Вопросам старения населения и положения пожилых людей уделялось большое внимание на всех трех крупных международных конференциях по вопросам народонаселения, организованных Организацией Объединенных Наций за последние двадцать пять лет. Например, Международная конференция по народонаселению и развитию, проведенная в 1994 году, признала, что социально-экономические последствия демографического старения открывают перед всеми странами новые возможности и одновременно ставят перед ними новые задачи². Позднее в «Основных направлениях деятельности по дальнейшему осуществлению Программы действий Международной конференции по народонаселению и развитию», принятых Генеральной Ассамблеей на ее двадцать первой специальной сессии 2 июля 1999 года, было вновь подчеркнуто, что в предстоящие десятилетия всем странам потребуются учитывать важные последствия старения населения³. В 2007 году Комиссия по народонаселению и развитию сосредоточит внимание на специальной теме своей сороковой сессии «Изменение возрастной структуры населения и его последствия для развития».

Отдел народонаселения Секретариата Организации Объединенных Наций давно занимается проблемой демографического старения, в частности оценкой и прогнозированием численности и состава стареющего населения и изучением причин и последствий старения населения. С момента опубликования своего исторического доклада о старении населения в 1956 году, в котором в основном рассматривался вопрос о демографическом старении в наиболее развитых странах, до выхода настенной диаграммы «Старение населения мира» в 2006 году Отдел народонасе-

ления постоянно стремился привлечь внимание правительств и международного сообщества к проблеме демографического старения⁴.

Комиссия Организации Объединенных Наций по народонаселению и развитию постановила раз в пять лет проводить обзор и оценку прогресса, достигнутого в реализации целей и задач Мадридского плана действий по проблемам старения. Кроме того, Генеральная Ассамблея обратила особое внимание на необходимость сбора демографических данных, дезагрегированных по возрастному и половому признакам. В настоящем докладе содержатся демографические данные, необходимые для проведения последующих мероприятий по осуществлению решений Всемирной ассамблеи по проблемам старения. В нем рассматривается процесс демографического старения во всем мире и в масштабах отдельных в большей или меньшей степени развитых регионов, крупных территорий и районов, а также стран. По всем странам приводятся данные о демографическом составе за период 1950–2050 годов вместе с важнейшими показателями демографического старения.

Настоящий доклад позволяет сделать четыре главных вывода.

1. Процесс демографического старения сейчас приобрел беспрецедентные масштабы, которые не имеют аналогов за всю историю человечества. Старение населения характеризуется увеличением процентной доли пожилых людей (т. е. лиц в возрасте 60 лет и старше) при сокращении процентной доли детей (т. е. лиц в возрасте до 15 лет), а также сокращением процентной доли населения трудоспособного возраста (от 15 до 59 лет). Ожидается, что в 2047 году число пожилых людей в мире превысит число детей. В наиболее развитых регионах, где старение населения происходит гораздо более быстрыми темпами, в 1998 году численность пожилых людей уже превысила численность детей.
2. Демографическое старение представляет собой широко распространенное явление, так как оно происходит практически во всех странах мира. Одной из главных причин старения населения является практически повсеместное снижение рождаемости. Вызываемое этим снижение темпов роста числа детей на фоне неуклонного увеличения численности пожилых лиц непосредственно отражается на представлениях о принципах справедливости и солидарности, которые имеют основополагающее значение в жизни общества, как среди представителей одного поколения, так и среди представителей разных поколений.
3. Старение населения — глубокий процесс, который сильно сказывается на всех сторонах жизни людей. В экономической сфере старение населения отражается на экономическом росте, накоплениях, инвестициях, потреблении, занятости, пенсионном обеспечении, налоговой политике и передаче накопленных знаний и опыта из поколения в поколение. В социальной сфере старение населения сказывается на составе семьи и условиях жизни, потребностях в жилье, миграционных тенденциях, эпидемиологической обстановке и потребностях в медицинской помощи. В политической сфере старение населения может влиять на результаты выборов и систему политического представительства.
4. Демографическое старение как тенденция носит долгосрочный характер. С 1950 года доля лиц старших возрастов непрерывно увеличивалась: с 8 процентов в 1950 году в 2007 году, по прогнозам, она должна достичь 11 процентов, а в 2050 году — 22 процентов (диаграмма I). Пока имеет место тенденция к снижению смертности в пожилом возрасте и сохраняются низкие показатели рождаемости, доля населения пожилого возраста будет продолжать увеличиваться.

⁴ *The Ageing of Populations and its Economic and Social Implications*, Population Studies, No. 26 (United Nations publication, Sales No. 1956.XIII.6); и *Population Ageing 2006* (United Nations publication, Sales No. E.06.XIII.2).

Диаграмма I

Доля населения в возрасте 60 лет и старше: в мире, 1950–2050 годы

В свете положений настоящего доклада можно сделать следующие основные выводы:

- поскольку повышение показателей рождаемости до прежних высоких уровней, характерных в прошлом, маловероятно, процесс демографического старения носит необратимый характер и доля молодежи, которая до последнего времени составляла значительную часть населения, в XXI веке, судя по всему, пойдет на убыль;
- в 2000 году численность населения в возрасте 60 лет и старше составляла 600 миллионов человек, что в три раза больше, чем в 1950 году. В 2006 году число пожилых людей превысило 700 миллионов человек, и ожидается, что к 2050 году оно составит 2 миллиарда человек, т. е. опять утроится за 50 лет;
- в мировом масштабе темпы роста численности пожилого населения составляют 2,6 процента в год, т. е. значительно опережают темпы роста населения в целом, которые составляют 1,1 процента в год. Ожидается, что по крайней мере до 2050 года численность пожилого населения будет увеличиваться опережающими по сравнению с другими возрастными категориями темпами. Столь высокие темпы роста численности пожилого населения потребуют проведения глубоких социально-экономических преобразований в большинстве стран;
- между развитыми и развивающимися регионами существуют значительные различия с точки зрения численности и процентной доли пожилого населения. В настоящее время пятую часть населения наиболее развитых регионов составляют лица в возрасте 60 лет и старше, причем, согласно прогнозам, к 2050 году лица этой возрастной категории будут составлять почти треть населения развитых стран. В менее развитых регионах доля пожилых лиц в настоящее время составляет лишь 8 процентов, однако, согласно прогнозам, к 2050 году на нее будет приходиться пятая часть всего населения, а это значит, что к середине столетия развивающиеся страны могут достигнуть такого же этапа демографического старения, на котором развитые страны находятся в настоящее время;
- в развивающихся странах процесс старения населения идет быстрее, чем в развитых странах. Соответственно, у развивающихся стран будет меньше времени на адаптацию к его последствиям. Кроме того, процесс старения населения

в развивающихся странах происходит на более низких уровнях социально-экономического развития, чем в развитых странах;

- в настоящее время средний возраст мирового населения составляет 28 лет, т. е. половину населения в мире составляют лица старше и половину — моложе 28 лет. Страной с самым молодым населением является Уганда, где средний возраст равняется 15 годам, а с самым пожилым — Япония, где он составляет 43 года. В следующие 40 лет средний возраст мирового населения, вероятно, увеличится на 10 лет и к 2050 году достигнет 38 лет. В это время странами с самым молодым населением, как представляется, будут Бурунди и Уганда, где средний возраст населения будет составлять 20 лет, а с самым старым — специальный административный район Китая Макао и Республика Корея, где средний возраст населения, по прогнозам, должен достигнуть 54 лет;
- пожилое население, в свою очередь, тоже стареет. Среди лиц в возрасте 60 лет и старше наиболее динамично увеличивается процентная доля населения самой старшей возрастной категории — лиц в возрасте 80 лет и старше. В настоящее время их численность ежегодно увеличивается на 3,9 процента. Среди лиц в возрасте 60 лет и старше сегодня каждому восьмому за 80. При этом ожидается, что к 2050 году из каждых десяти пожилых людей примерно двое будут старше 80 лет;
- коэффициент потенциальной поддержки (КПП), т. е. соотношение лиц в возрасте от 15 до 64 лет и лиц в возрасте 65 лет и старше, показывает сколько лиц трудоспособного возраста приходится на одного пожилого человека. По мере старения населения коэффициент потенциальной поддержки, как правило, снижается. За период с 1950 года по 2007 год коэффициент потенциальной поддержки сократился с 12 до 9 лиц трудоспособного возраста на одного человека в возрасте 65 лет и старше. Согласно прогнозам, к 2050 году коэффициент потенциальной поддержки должен еще больше снизиться и составит четыре человека трудоспособного возраста на одного пожилого человека (диаграмма II). Снижение коэффициентов потенциальной поддержки имеет важные последствия для механизмов социального обеспечения, в частности для пенсионных систем, в соответствии с которыми выплата пенсий производится за счет налогообложения работающих;

Диаграмма II
Коэффициент потенциальной поддержки (КПП): в мире, 1950–2050 годы

- среди лиц пожилого возраста преобладают женщины, так как у них продолжительность жизни больше, чем у мужчин. В настоящее время среди населения в возрасте 60 лет и старше женщин примерно на 70 миллионов человек больше, чем мужчин. Среди лиц в возрасте 80 лет и старше их почти в два раза больше, чем мужчин, а среди лиц в возрасте 100 лет и старше — в 4–5 раз (диаграмма III);
- здоровье пожилых лиц с возрастом как правило ухудшается, и по мере увеличения их численности увеличиваются и потребности в услугах по долгосрочному уходу за престарелыми. Коэффициент поддержки родителей, т.е. соотношение лиц в возрасте 85 лет и старше и лиц в возрасте от 50 до 64 лет, позволяет оценивать масштабы потенциальной поддержки, которую оказывают пожилым членам семьи их родственники. В 1950 году в мире насчитывалось менее 2 человек в возрасте 85 лет и старше на каждые 100 человек в возрасте от 50 до 64 лет. Сейчас этот показатель составляет чуть больше 4:100, а к 2050 году он, по прогнозам, достигнет 12:100. Это значит, что вероятность того, что нагрузка на лица, которые сами уже перешагнули рубеж среднего возраста, по выполнению обязанностей по уходу за своими престарелыми родственниками увеличится в три раза;
- одинокие пожилые люди сталкиваются с большим риском подвергнуться социальной изоляции и экономическим лишениям и, соответственно, нуждаются в особой поддержке. В связи с более высокими показателями доживаемости и более низкой вероятностью повторного вступления в брак среди пожилых одиноких женщин больше, чем мужчин. В мировом масштабе доля одиноких среди женщин в возрасте 60 лет и старше составляет 19 процентов, а у мужчин этой возрастной группы соответствующий показатель равняется лишь 8 процентам;
- между разными группами населения имеются значительные различия и с точки зрения фактического возраста прекращения трудовой деятельности. В странах с высоким уровнем дохода на душу населения пожилые люди выходят на пенсию раньше и, таким образом, в этих странах отмечаются более низкие показатели участия пожилых на рынке труда. Так, в более развитых регионах доля мужчин в возрасте 65 лет и старше среди экономически активного населения составляет лишь 13 процентов, тогда как в менее развитых регионах она

Диаграмма III
Процентная доля женщин среди населения в возрасте 40–59 лет, 60 лет и старше, 80 лет и старше и 100 лет и старше: в мире, 2007 год

достигает 39 процентов. Аналогичные различия прослеживаются и среди женщин. В более развитых регионах доля пожилых женщин среди экономически активного населения составляет 7 процентов, а в менее развитых регионах — 15 процентов. В менее развитых регионах пожилые люди продолжают дольше трудиться в силу ограниченности охвата пенсионных программ и сравнительно небольшого размера пенсионных пособий;

- в большинстве стран возраст выхода на пенсию (так называемый пенсионный возраст), при наступлении которого пенсия выплачивается в полном размере при условии выработки минимального пенсионного стажа, установлен одинаковым для женщин и мужчин. Однако во многих странах женщины имеют право на полное пенсионное обеспечение в более молодом возрасте, чем мужчины, хотя показатели доживаемости у женщин после достижения возраста 60 лет выше, чем у мужчин. В развитых странах возраст выхода на пенсию как для мужчин, так и для женщин как правило выше, чем в развивающихся;
- в наименее развитых регионах по-прежнему остро стоит проблема неграмотности пожилого населения. Согласно оценкам, в настоящее время в развивающихся странах свыше половины населения в возрасте 65 лет и старше не владеют грамотой. Лишь примерно треть пожилых женщин и примерно три пятых пожилых мужчин в развивающихся странах имеют элементарные навыки чтения и письма. В более же развитых регионах, за исключением отдельных стран, практически все пожилые люди владеют грамотой.

Итак, в результате снижения показателей рождаемости и сохраняющейся тенденции к сокращению показателей смертности среди взрослого населения в большинстве стран мира наблюдается процесс демографического старения. Это беспрецедентное демографическое явление, которое охватило развитые страны в XIX веке и которое в последнее время распространилось на развивающиеся страны, уже трансформирует облик многих стран. Ожидается, что в ближайшем будущем процесс старения населения, особенно в развивающихся странах, ускорится. Поскольку у развивающихся стран будет меньше времени для адаптации к последствиям демографического старения, правительства этих стран должны немедленно принять меры, чтобы отреагировать на этот вызов и максимально эффективно использовать возможности, которые заключает в себе процесс демографического старения. Настоящий доклад обеспечивает демографическую базу для оценки глубины и остроты проблемы старения в каждой стране мира как в настоящее время, так и на предстоящие годы.

Resumen

El Plan de Acción Internacional de Madrid sobre el Envejecimiento y la Declaración Política aprobados en la Segunda Asamblea Mundial sobre el Envejecimiento en abril de 2002¹ constituyeron un punto de inflexión en la forma de plantear en todo el mundo el crucial problema de crear una sociedad para todas las edades. El Plan está centrado en tres esferas prioritarias: las personas de edad y el desarrollo; la promoción de la salud y el bienestar hasta la vejez; y la creación de un entorno propicio y favorable. En el Plan, los gobiernos adoptaron por primera vez un enfoque global en el que se vinculaban las cuestiones del envejecimiento con otros marcos para el desarrollo social y económico y los derechos humanos, principalmente los establecidos en las conferencias y reuniones en la cumbre de las Naciones Unidas de los años noventa.

Las cuestiones relacionadas con el envejecimiento de la población y las personas de edad han desempeñado un importante papel en las tres grandes conferencias internacionales sobre la población organizadas por las Naciones Unidas en el último cuarto de siglo. Por ejemplo, la Conferencia Internacional sobre la Población y el Desarrollo celebrada en 1994, señaló que los efectos económicos y sociales del envejecimiento de la población eran tanto una oportunidad como un reto para todas las sociedades². Más recientemente, en las principales actividades organizadas para proseguir la aplicación del Programa de Acción de la Conferencia Internacional sobre la Población y el Desarrollo, aprobado por la Asamblea General en su vigésimo primer período extraordinario de sesiones el 2 de julio de 1999, se reiteró la necesidad de que todas las sociedades hicieran frente a las importantes consecuencias del envejecimiento de la población en las próximas décadas³. En 2007, la Comisión de Población y Desarrollo de las Naciones Unidas centrará su labor en el estudio de los cambios en las estructuras de las poblaciones y sus repercusiones en el desarrollo, que constituirá el tema especial de su 40° período de sesiones.

La División de Población de las Naciones Unidas cuenta con una larga tradición en el estudio del envejecimiento de la población, labor que comprende la preparación de estimaciones y proyecciones del tamaño y las características de las poblaciones de edad, y el examen de los factores determinantes y las consecuencias del envejecimiento de la población. Desde el innovador informe sobre el envejecimiento de la población de 1956, centrado principalmente en el envejecimiento de la población en los países más desarrollados, hasta el gráfico mural de las Naciones Unidas sobre el envejecimiento de la población publicado en 2006, la División de Población ha tratado sistemáticamente de señalar a la atención de los gobiernos y la comunidad internacional la cuestión del envejecimiento de la población⁴.

La Comisión de Desarrollo Social de las Naciones Unidas ha decidido realizar cada cinco años un examen y evaluación de los avances en la aplicación del Plan de Acción de Madrid sobre el Envejecimiento. Además, la Asamblea General ha destacado la necesidad de contar con datos de población desglosados por edad y sexo. En el presente informe se sientan las bases demográficas de las actividades de seguimiento de la Segunda Asamblea Mundial sobre el Envejecimiento. En él se examina el proceso del envejecimiento de la población en todo el mundo, las regiones con distintos grados de desarrollo, las principales zonas y regiones, y en los distintos países. Se presentan perfiles demográficos del período 1950-2050 para cada país, en los que se ponen de relieve los indicadores relacionados con el envejecimiento de la población.

En el presente informe se destacan cuatro conclusiones principales:

1. El envejecimiento de la población es un proceso sin precedentes ni paralelo en la historia de la humanidad. La población envejece cuando aumenta el porcentaje de personas de edad (60 años o más) al tiempo que disminuyen el porcentaje de niños (menores de 15 años) y el de personas en edad de trabajar (de 15 a 59 años). Se prevé que, a nivel mundial, el número de personas de edad superará por primera vez el de jóvenes en 2047. En las zonas más desarrolladas, en las que el envejecimiento de la población está muy avanzado, el número de niños era menor que el de personas de edad en 1998.
2. El envejecimiento de la población, que afecta prácticamente a todos los países del mundo, se debe principalmente a las reducciones de la fertilidad, que se han hecho prácticamente universales. El fenómeno ha tenido como consecuencia una disminución en el aumento del número de niños, acompañado de un aumento constante en el número de personas de edad, e incide directamente en la equidad y la solidaridad intergeneracionales e intrageneracionales, que son los fundamentos de la sociedad.
3. El envejecimiento de la población es profundo y tiene importantes consecuencias y ramificaciones en todas las facetas de la vida humana. En lo económico, el envejecimiento de la población incidirá en el crecimiento económico, el ahorro, las inversiones, el consumo, los mercados de trabajo, las pensiones, la tributación y las transferencias intergeneracionales. En lo social, el envejecimiento de la población influye en las condiciones de vida y la composición de la familia, la demanda de vivienda, las tendencias de la migración, la epidemiología y los servicios de atención de la salud. En lo político, el envejecimiento de la población puede alterar los patrones de voto y la representación.
4. El envejecimiento de la población es permanente. Desde 1950 la proporción de personas de edad ha estado aumentando regularmente; pasó del 8% en 1950 al 11% en 2007 y se calcula que llegará al 22% en 2050 (gráfico 1). Mientras la mortalidad en la edad avanzada siga disminuyendo y la fertilidad se mantenga baja, la proporción de las personas de edad seguirá aumentando.

Las principales conclusiones de este informe son las siguientes:

- No es probable que los niveles de fertilidad vuelvan a alcanzar los altos niveles que eran habituales en épocas pasadas, el envejecimiento de la población es irreversible y las poblaciones jóvenes —tan comunes hasta hace poco— se irán haciendo más escasas durante el siglo XXI.
- En 2000 había 600 millones de personas de 60 años o más, tres veces más que en 1950, y en 2006 habían sobrepasado los 700 millones. Se calcula que para 2050, habrá 2.000 millones de personas de edad, lo que significa que, una vez más, este grupo de edad se habrá triplicado en un lapso de 50 años.

Gráfico I

Porcentaje de personas de 60 años o más, de 1950 a 2050

- A nivel mundial la población de personas de edad aumenta a razón del 2,6% por año, mucho más de prisa que la población total, que aumenta en 1,1% por año. Se calcula que, al menos hasta 2050, la población de edad seguirá aumentando con más rapidez que la población de los demás grupos de edad. Ese rápido crecimiento requerirá unos ajustes económicos y sociales de gran envergadura en la mayoría de los países.
- Se observan diferencias acusadas en el número y la proporción de personas de edad de las distintas regiones. En las más desarrolladas, más de una quinta parte de la población tiene 60 años o más, y hacia 2050 cerca de un tercio de la población de los países desarrollados se encontrará en ese grupo de edad. En las regiones menos desarrolladas, las personas de edad representan actualmente tan sólo el 8% de la población, pero se calcula que hacia 2050 representarán un quinto de la población, lo que significa que, a mediados de siglo, el mundo en desarrollo puede llegar al mismo estadio en el proceso de envejecimiento de la población que los países desarrollados en la actualidad.
- Como el ritmo de envejecimiento de la población es más rápido en los países en desarrollo que en los desarrollados, los países en desarrollo tendrán menos tiempo para adaptarse a las consecuencias del envejecimiento de la población. Además el crecimiento de la población en los países en desarrollo se produce a niveles de desarrollo socioeconómico más bajos que los que existían en su momento en los países desarrollados.
- Actualmente la mediana de edad en el mundo es de 28 años, es decir, la mitad de la población tiene menos de esa edad y la otra mitad tiene más. El país con la población más joven es Uganda, con una mediana de edad de 15 años, y la población más vieja es la del Japón, con una mediana de edad de 43 años. En las cuatro próximas décadas, la mediana de edad del mundo aumentará probablemente 10 años, con lo que alcanzará los 38 años en 2050. Para entonces, los países con las poblaciones más jóvenes serán probablemente Burundi y Uganda, con medianas de edad de 20 años cada uno, y Macao (RAE de China) y la República de Corea tendrán las poblaciones más viejas, con medianas de edad de 54 años en cada país.
- La población de personas de edad, a su vez, también está envejeciendo. Entre las personas de 60 años o más, la población que crece más rápidamente es la de los más mayores —de 80 años o más—, que aumenta actualmente a una tasa anual de 3,9%. En la actualidad, una de cada 8 personas de edad (de 60 años o más) tiene

80 años o más y se calcula que, hacia 2050, la proporción será de cerca de 2 personas de 80 años o más por cada 10 personas de edad.

- El cociente de dependencia potencial, es decir el número de personas con edades comprendidas entre los 15 y los 64 años por cada persona de 65 años o más, indica cuántos trabajadores potenciales hay por cada persona de edad. A medida de que la población envejece, el cociente de dependencia potencial tiende a disminuir. Entre 1950 y 2007, el cociente de dependencia potencial se redujo de 12 a 9 trabajadores potenciales por persona de 65 o más años. Se prevé que, para 2050, el cociente de dependencia potencial se reducirá aún más y llegará a 4 trabajadores potenciales por cada persona de edad (gráfico II). La reducción de los cocientes de dependencia potencial tienen repercusiones importantes para los regímenes de seguridad social, especialmente para los regímenes de pensiones con cargo a los ingresos corrientes, en los que las pensiones de los jubilados se pagan con las aportaciones de los trabajadores en activo.
- Como las mujeres viven más que los hombres, las mujeres son mayoría entre las personas de edad. En la actualidad hay unos 70 millones más de mujeres que de hombres con 60 años o más. Entre las personas de 80 años o más, hay cerca de 2 veces más mujeres que hombres, y entre los centenarios hay entre 4 y 5 veces más mujeres que hombres (gráfico III).
- La salud de las personas de edad suele deteriorarse con la edad, lo que se traduce en un incremento de la demanda de atención de largo plazo a medida que aumenta el número de las personas de más edad. El cociente de dependencia parental, es decir, el número de personas de 85 años o más respecto de la población de entre 50 y 64 años, da una idea del nivel de apoyo que las familias pueden brindar a sus miembros de más edad. En 1950 había en todo el mundo menos de dos personas de 85 años o más por cada 100 personas de 50 a 64 años. Actualmente la relación ha aumentado a algo más de 4 por cada 100, pero se proyecta que llegará a 12 por cada 100 en 2050; es decir, que las personas que hoy ya han pasado con creces la edad madura tendrán tres veces más probabilidades que en la actualidad de tener que atender a sus parientes mayores.
- Las personas de edad que viven solas corren más riesgo de sufrir aislamiento social y privaciones económicas, por lo que pueden requerir un apoyo especial. Debido a su mayor longevidad y a su menor propensión a volverse a casar, las mujeres de

Gráfico II
Cociente de dependencia potencial en el mundo, de 1950 a 2050

Gráfico III

Porcentaje de mujeres entre los grupos de edad de 40 a 59 años, mayores de 60, mayores de 80 y mayores de 100 años en todo el mundo en 2007

edad tienen más probabilidades que los hombres de vivir solas. Se calcula que, en todo el mundo, el 19% de las mujeres de 60 años o más viven solas, mientras que solamente el 8% de los hombres se encuentra en esa situación.

- La edad efectiva de jubilación varía considerablemente entre las poblaciones. En los países con altos ingresos per cápita, las personas de edad pueden jubilarse antes y, por consiguiente, tienden a participar menos en la fuerza de trabajo en las edades más avanzadas. Así pues, sólo el 13% de los hombres de 65 años o más son económicamente activos en las regiones más desarrolladas, mientras que en las menos desarrolladas el 39% de los hombres está en la fuerza de trabajo. La diferencia es similar entre las mujeres. En las regiones más desarrolladas, el 7% de las mujeres de edad son económicamente activas, frente al 15% en las regiones menos desarrolladas. Las personas de edad son económicamente activas durante más tiempo en las regiones menos desarrolladas debido a la limitada cobertura de los programas de pensiones y a la relativa exigüidad de los ingresos que proporcionan.
- En la mayoría de los países la edad reglamentaria para poder cobrar una pensión completa, siempre que se haya cotizado durante un período mínimo al régimen de pensiones, es decir, la edad mínima de jubilación es la misma para las mujeres que para los hombres. Sin embargo, en muchos países las mujeres pueden jubilarse con prestaciones completas a edades menores que los hombres, a pesar de que la esperanza de vida de las mujeres es mayor que la de los hombres después de los 60 años. Tanto para los hombres como para las mujeres, la edad de jubilación tiende a ser más alta en los países desarrollados que en los países en desarrollo.
- El analfabetismo es todavía común en la población de más edad de los países menos desarrollados. Actualmente se calcula que más de la mitad de las personas de 65 años o más de los países en desarrollo son analfabetas. Solamente alrededor de un tercio de las mujeres de edad y unas tres quintas partes de los hombres de edad de los países en desarrollo saben leer y escribir a nivel elemental. La población de edad está alfabetizada prácticamente en todos los países de las regiones más desarrolladas.

Resumiendo, debido a la transición de una fertilidad alta a una fertilidad baja y a la constante reducción de la mortalidad de los adultos, la población de la mayor parte de los países del mundo está envejeciendo. Este cambio demográfico sin precedentes, que

comenzó en el mundo desarrollado en el siglo XIX y más recientemente en los países en desarrollo, ya está transformando muchas sociedades. Se prevé que el proceso de envejecimiento se acelerará en el futuro próximo, sobre todo en los países en desarrollo. Como estos países tienen menos tiempo para adaptarse a los cambios que conlleva el envejecimiento de la población, es apremiante que los gobiernos de los países en desarrollo empiecen a tomar medidas para hacer frente a esos retos y aprovechen las oportunidades que les ofrece el envejecimiento de la población. En el presente informe se sientan las bases demográficas para determinar el alcance y la profundidad del envejecimiento de la población actualmente y en los años próximos en cada país del mundo.

Introduction

The dynamics and consequences of population ageing

Population ageing—the process whereby older individuals account for a proportionally larger share of the total population—was a key demographic outcome of population trends during the twentieth century and will surely be the distinctive trait of populations during the twenty-first century. Starting first in the more developed countries, population ageing has now become apparent in much of the developing world and it will affect virtually all countries over the medium-term future, although its intensity and depth will vary considerably among countries.

The shift in age structure associated with population ageing has a profound impact on a broad range of economic, political and social processes. For example, concerns are growing about the long-term viability of intergenerational social support systems, which are crucial for the well-being of both the older and younger generations (Cliquet and Nizamuddin, 1999). Such concern is especially acute in societies where provision of care within the family becomes increasingly difficult as family size decreases and women, who are traditionally the main caregivers, engage in employment outside the home.

As people live longer, certain benefits, such as pensions, health care or old-age support, need to be paid over longer periods. Consequently, to remain sustainable, social security systems need to change (Creedy, 1998; Bravo, 1999). Increasing longevity may also result in rising medical costs and increasing demands for health services, since older people are typically more vulnerable to chronic diseases (de Jong-Gierveld and van Solinge, 1995; Holliday, 1999).

This report provides an overview of population ageing worldwide, focusing on five particularly relevant public policy issues. In dealing with each of these issues, attention is given to the course of the ageing process, which has not been the same in all countries. There has been considerable variation in the timing, levels and patterns of population ageing. Therefore, the assessment of trends is made on the basis of groups of countries, disaggregated according to development levels and major geographic areas.

The first chapter of this report focuses on the demographic determinants of population ageing. It examines the worldwide decline in fertility and mortality that underlies population ageing. The analysis is based on three indicators: the total fertility rate, life expectancy (at birth and at ages 60, 65 and 80), and the probability of survival (to ages 60, 65 and 80).

Especially at the earlier stages of the demographic transition, reductions in fertility are the primary determinants of the timing and extent of population ageing. However, as later stages of the transition are reached, reductions in mortality, particularly at older ages, contribute more to increasing the number of older persons and thus accelerating population ageing.

An important consequence of the reductions of fertility is a progressive reduction in the availability of kin on whom future generations of older persons may rely upon for support. This change may significantly impact on the well-being of older persons, especially in the less developed regions where social support for older persons is largely provided by the immediate family (Hoyert, 1991; Wolf, 1994). At the same time, improved

chances of surviving to the older ages are likely to spur efforts to improve the health status of the older population and lead to reforms in pension and health systems.

The second chapter of this report focuses on the magnitude and speed of population ageing, examining regional differences in the progression of the ageing process through the analysis of the share and growth rate of number of older persons (i.e., those aged 60 years or over, 65 years or over, and 80 years or over).

As the impact of population ageing on socio-economic conditions may be amplified by the speed at which it occurs, it is important to consider not only the degree but also the pace of changes in the age structure. When the proportion of older persons in the total population increases rapidly over a short period, as is currently the case in some developed and developing countries, it becomes particularly difficult for the institutions to adapt and adjust.

The third chapter considers the changing balance between age groups and analyses changes in the relative size of the older and younger groups of the population from various perspectives. Six indicators are examined: the percentage of the population in broad age groups (0-14, 15-59 and 60 or over), the ageing index, the median age, various types of dependency ratios (total, youth and old-age), the potential support ratio and the parent support ratio.

When the proportion of older persons increases, the shares of other age groups change. The shifting weights of the various age groups tend to create social and political pressures that may result in changing patterns of resource allocation among generations, sometimes giving rise to intergenerational conflict (Walker, 1990; Jackson, 1998). Complementarities may also rise. Thus, as children account for a declining proportion of the population, there may be a reduction in the number of schools just as the increasing share of the older population begins to require more long-term care facilities. A commonly used measure to assess the potential impact of the changing age composition of populations is the ageing index, that is, the ratio of those aged 60 years or over to those under age 15 (children).

A decrease of the potential support ratio, which implies a rise in the old-age dependency ratio, indicates in most societies that an increasing number of beneficiaries of health and pension systems (that is, persons aged 65 years or over) have to be supported by a relatively smaller number of contributors (that is, persons of working age, usually between the ages of 15 and 64). Such a change is likely to pose heavier demands on the working-age population, whether in the form of higher taxes or other contributions, so as to maintain a stable flow of benefits to the older population. Even though there may also be a sharp decline in the youth dependency ratio, this reduction may not be sufficient to offset the increased costs related to an ageing population because the costs involved in supporting older persons are, in general, higher than those involved in supporting children and adolescents (United Nations, 1988; Baldacci and Lugaresi, 1997).

In most societies, support to the elderly is only partially provided through public resource transfers. The family remains an important source of support to older persons, especially in developing countries where social security systems often have a very restricted coverage (United Nations, 1994). Family support is particularly crucial in the case of very old persons, whose physical and economic needs are usually greater. The parent support ratio provides an indication of the overall demand on families to provide support for their oldest members. The continuing increase of this ratio implies that, increasingly, persons aged 50 to 64 will find themselves responsible for the care of one or more family members aged 85 years or over.

The fourth chapter of this report presents a demographic profile of the older population, drawing attention to two important features of the ageing process: the progressive

ageing of the older population itself and its feminization. It also examines the significant gender differences with regard to marital status and living arrangements of older persons.

The rapid growth of the oldest groups among the older population is of special relevance in terms of public policy. In most parts of the world, the group aged 80 years or over is growing faster than any other age group and is expected to continue growing at very rapid rates until at least 2050. Although this group constitutes a small proportion of the total population, the number of persons involved is increasingly significant, especially in developing countries. Because health status typically declines with advancing age, higher numbers of oldest-old imply a growing demand for long-term care (Pollard, 1995; Crimmins, 1997).

The increasing female share of the older population is also relevant to public policy. Because mortality rates are usually higher among men than among women, even at older ages, the percentage female among the population by age group tends to increase with advancing age. In most countries, older women greatly outnumber older men. The implications of this gender imbalance for public support and planning can be significant because older women typically have less education, less work experience and less access to public assistance and other private income sources than older men (Higuchi, 1996; United Nations, 1999b). Older women are also more likely to be living without a spouse either because they are widowed or separated or because they never married. Hence, they are also more likely to live alone than older men. As a result, older women are less likely than older men to receive assistance from close relatives, including spouses. In most countries, the major concern about providing adequate support to the oldest-old centres primarily on the need of support by older women.

The fifth chapter focuses on the socio-economic characteristics of the older population, considering several dimensions that can greatly affect the well-being of older individuals: their labour force participation, the statutory pensionable age, and the literacy status of older persons.

Labour force participation among the older population is considerably higher in developing countries than in developed countries, mainly because of the lack of adequate pension and retirement programmes in most developing countries. Furthermore, in many developing countries there are still large concentrations of older workers in agriculture and in the informal sector, both of which are generally not covered by social security systems or pensions (International Labour Office, 2000). In terms of gender, labour force participation rates have dropped among older men and have risen among older women, resulting in a relatively high female share among the older work force.

Although lower levels of labour force participation at older ages are generally associated with higher levels of social security coverage, the decline in the labour force participation of older men in both developed and developing countries is likely to be related to factors such as a shortage of employment opportunities, skill obsolescence and deficient knowledge and training to keep abreast of new developments (Drury, 1994; Taylor and Walker, 1996).

Lastly, there appears to be general agreement that higher levels of educational attainment result in better health and economic status among older persons. Improvements in the educational attainment of older persons may also alleviate any cultural gap between generations that may have widened over the past century. In developing countries, in particular, illiteracy is still high at all ages but especially among older persons. Higher levels of literacy among younger generations are expected to improve their prospects as they age and thus result in a better quality of life for those reaching old age.

Annexes III and IV to this report present detailed statistics on population ageing, including estimates and projections of the number of older persons and all the summary

indicators discussed in the report. Definitions for each indicator can be found in annex I. Indicators are presented for the world as a whole, for the major development groups, and for geographic major areas and regions, as well as for each country or area with at least 100,000 inhabitants in 2005, as presented in *World Population Prospects: The 2004 Revision* (United Nations, 2005a). For the composition of the geographic major areas or regions used, see annex II. Summary tables displaying selected indicators by region and country are presented in annex III. Profiles for regions and countries are also presented in annex IV.

Chapter I

Demographic determinants of population ageing

The process underlying global population ageing is known as the “demographic transition”, a process whereby reductions in mortality, particularly at young ages, are followed by reductions in fertility. Decreasing fertility along with increasing life expectancy (figure 1) has reshaped the age structure of the population in most regions of the planet by shifting the relative weight of the population from younger to older groups. The role of international migration in changing age distributions has been far less important than that of fertility and mortality (Lesthaeghe, 2004; United Nations, 2005c).

A. Reductions in fertility

Decreasing fertility has been the primary cause of population ageing because, as fertility moves steadily to lower levels, people of reproductive age have fewer children relative to those of older generations, with the result that sustained fertility reductions eventually lead to a reduction of the proportion of children and young persons in a population and a corresponding increase of the proportions in older groups.

The reduction of fertility has been dramatic since 1950. At the world level, total fertility has dropped almost by half, from 5.0 children per woman in 1950-1955 to 2.7 in 2005-2010, and it is expected to keep on declining to reach 2.1 children per women in 2045-2050.

As a result of the sustained decline in fertility that occurred in developed countries during the twentieth century, total fertility in the more developed regions has dropped from an already low level of 2.8 children per woman in 1950-1955 to an extremely low level of 1.6 children per woman in 2005-2010. This level is well below that needed to

Fertility is well below replacement level in the more developed regions

Figure 1
Total fertility rate and life expectancy at birth: world, 1950-2050

Fertility decline in the less developed regions started later and has proceeded faster

Regional differences in fertility are expected to decrease

ensure the replacement of generations (about 2.1 children per woman). In fact, practically all developed countries are currently experiencing below-replacement fertility. In 14 developed countries total fertility is currently under 1.3 children per woman, levels that are unprecedented in human history.

Major fertility reductions in the less developed regions occurred, in general, during the last three decades of the twentieth century. From 1950-1955 to 2005-2010, the total fertility in the developing world dropped by almost 60 per cent, from 6.2 to 2.7 children per woman (figure 2).

However, great disparities persist. In the least developed countries, total fertility is now 4.7 children per woman. In particular, in Eastern Africa, Middle Africa and Western Africa, total fertility is still in excess of 5.2 children per woman. Yet, in Eastern Asia, South-eastern Asia, the Caribbean and South America, total fertility is currently 2.4 children per woman or less. In 33 developing countries, the total fertility rate is estimated to be already below replacement level.

Since the transition towards lower fertility levels is expected to continue in developing countries and fertility levels in developed countries are expected to increase slightly, differences in fertility among regions are expected to decrease in the future. Total fertility in the less developed regions is expected to drop from the current 2.7 children per woman to 2.3 children per woman by 2025-2030, and to 2.1 by 2045-2050. Fertility in the more developed regions is projected to rise from the current 1.6 children per woman to 1.7 children per woman in 2025-2030 and 1.8 children per woman in 2045-2050. A particularly sharp reduction is expected for the least developed countries, where total fertility may reach 2.6 children per woman in 2045-2050, down from 4.7 children per woman in 2005-2010 and 3.5 children per woman in 2025-2030 (figure 2). These projected values for the least developed countries are contingent on the occurrence of major changes regarding desired family size and the use of contraception in those countries.

B. Reductions in mortality

As fertility levels drop, mortality has also continued to decline, especially at older ages. When fertility reaches low levels and remains low, reductions in mortality at older ages gain importance as a cause of population ageing. In developed countries, in particular,

Figure 2
Total fertility rate: world and development regions, 1950-2050

where low fertility has prevailed for at least two decades, increases in the proportion of the older population are now primarily caused by increasing survival to advanced ages (Grundy, 1996; National Research Council, 2001; United Nations, 2005c).

Since 1950, life expectancy at birth increased globally by 20 years, from 46.6 years in 1950-1955 to 66.5 years in 2005-2010 (figure 3). On average, the gain in life expectancy at birth was 23.5 years in the less developed regions and 10.1 years in the more developed regions (figure 3). Nevertheless, a considerable advantage still persists in favour of the latter. At current mortality rates an individual born in the more developed regions is now expected to outlive an individual born in the less developed regions by almost 12 years. If the individual is born in the group of least developed countries, this disadvantage doubles to almost 25 years.

While in some developing countries or areas, such as Israel, Hong Kong Special Administrative Region (SAR) of China and Macao Special Administrative Region (SAR) of China, life expectancy at birth is currently higher than 80 years, in others, such as Botswana, Lesotho and Swaziland, it does not surpass 35 years. In many countries, especially those classified as least developed, low levels of life expectancy at birth are partly due to the spread of HIV. On average, life expectancy in the least developed countries lengthened by 16 years since 1960, substantially less than the average gain recorded by developing countries as a whole (figure 3).

Among developed countries, the range of variation in life expectancy is significantly narrower than among developing countries. Apart from a few countries in Eastern Europe where life expectancy at birth is currently between 65 and 69 years, the range in life expectancy among the rest of the developed countries is just 10 years in length: from 72 years in Romania to 82 years in Japan.

Over the next four decades, life expectancy at birth is projected to increase globally by about 9 years, to reach 75 years in 2045-2050 (figure 3). As mortality becomes more concentrated at older ages, the difference in life expectancy among regions will tend to decrease. By 2025-2030, life expectancy at birth is expected to reach, on average, about 80 years in the more developed regions and 70 years in the less developed regions. By 2045-2050 it is expected to have risen to 82 years in the more developed regions and to 74 years in the less developed regions. Thus, the gap between the two is expected to remain at about 8 years by 2045-2050, down from approximately 10 years in 2025-2030 and from almost 12 years at present.

People are living longer, but large variations remain

Great variations in life expectancy exist within the less developed regions

Regional differences in life expectancy at birth are expected to decrease

Figure 3
Life expectancy at birth: world and development regions, 1950-2050

More people will survive to older ages

In proportional terms, gains in life expectancy are expected to be higher at older ages

As a result of the generalized shift of mortality to older ages, the survival curve is expected gradually to approach an almost rectangular shape in all regions of the world (figure 4). Under current mortality conditions, almost 3 out of every 4 newborns in the world are expected to survive to age 60, and about 1 out of every 3 to age 80. Under the mortality conditions projected for the period 2045-2050, approximately 7 out of every 8 newborns would survive to age 60, and more than half would survive to age 80.

Not only are more people surviving to old age, but once there, they tend to live longer. Over the next four decades, global life expectancy at age 60 is expected to increase from 19.6 years in 2005-2010 to 22.4 years in 2045-2050 (a 14 per cent gain); from 16.0 to 18.5 years (by 16 per cent) at age 65, and from 7.7 to 9.0 years (by 17 per cent) at age 80 (figures 5 and 6). According to these figures, the higher the starting age, the higher the relative gain in life expectancy. The same holds for the more developed regions, whose average life expectancy at age 80 is projected to increase by 23 per cent over the next four decades as compared with 16 per cent at age 60 and 8 per cent at birth. Similarly, average life expectancy at age 80 in the less developed regions is expected to increase by 22 per cent as compared with 18 per cent at age 60 and 15 per cent at birth (figure 6).

In contrast, for the least developed countries, where mortality levels at young ages remain high, proportional improvements in life expectancy during the next four decades are expected to be higher at birth than at older ages.

Except for a small number of countries, where cultural factors have resulted in lower life expectancy for females than for males, reductions in mortality have been substantially

Figure 4
Projected survival curves: world and development regions: 2005-2010 and 2045-2050

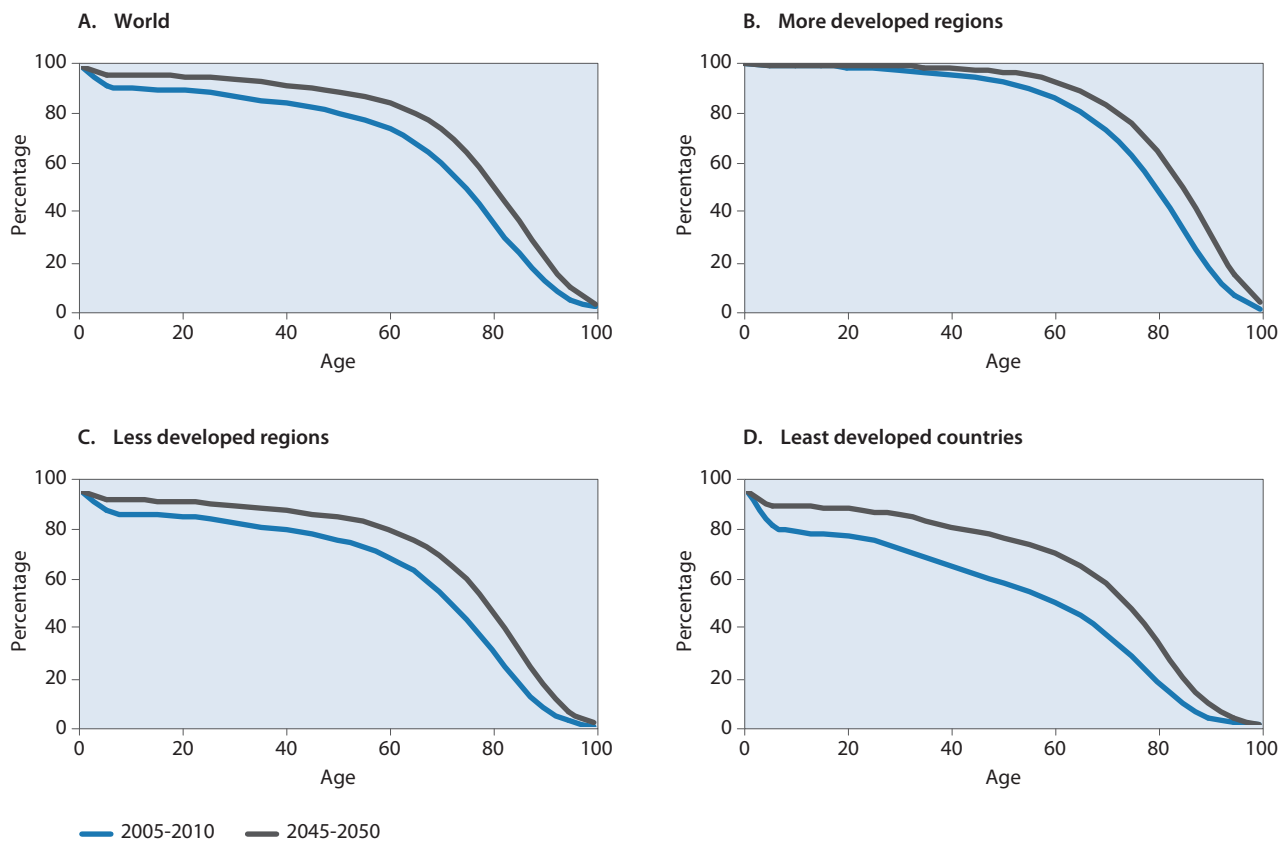

Figure 5
Life expectancy at ages 60, 65 and 80: world, 2005-2050

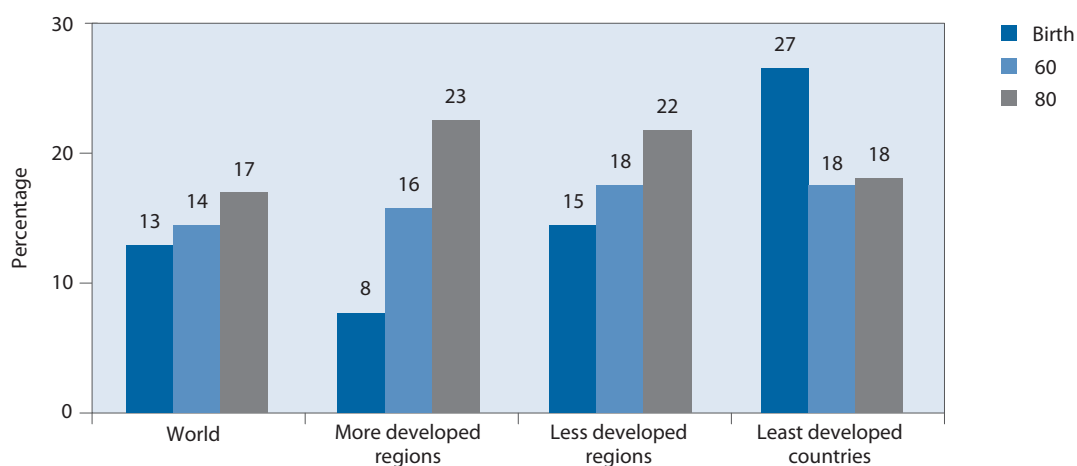

Figure 6
Percentage increase in life expectancy at birth, at age 60 and at age 80 between 2005 and 2050: world and development regions

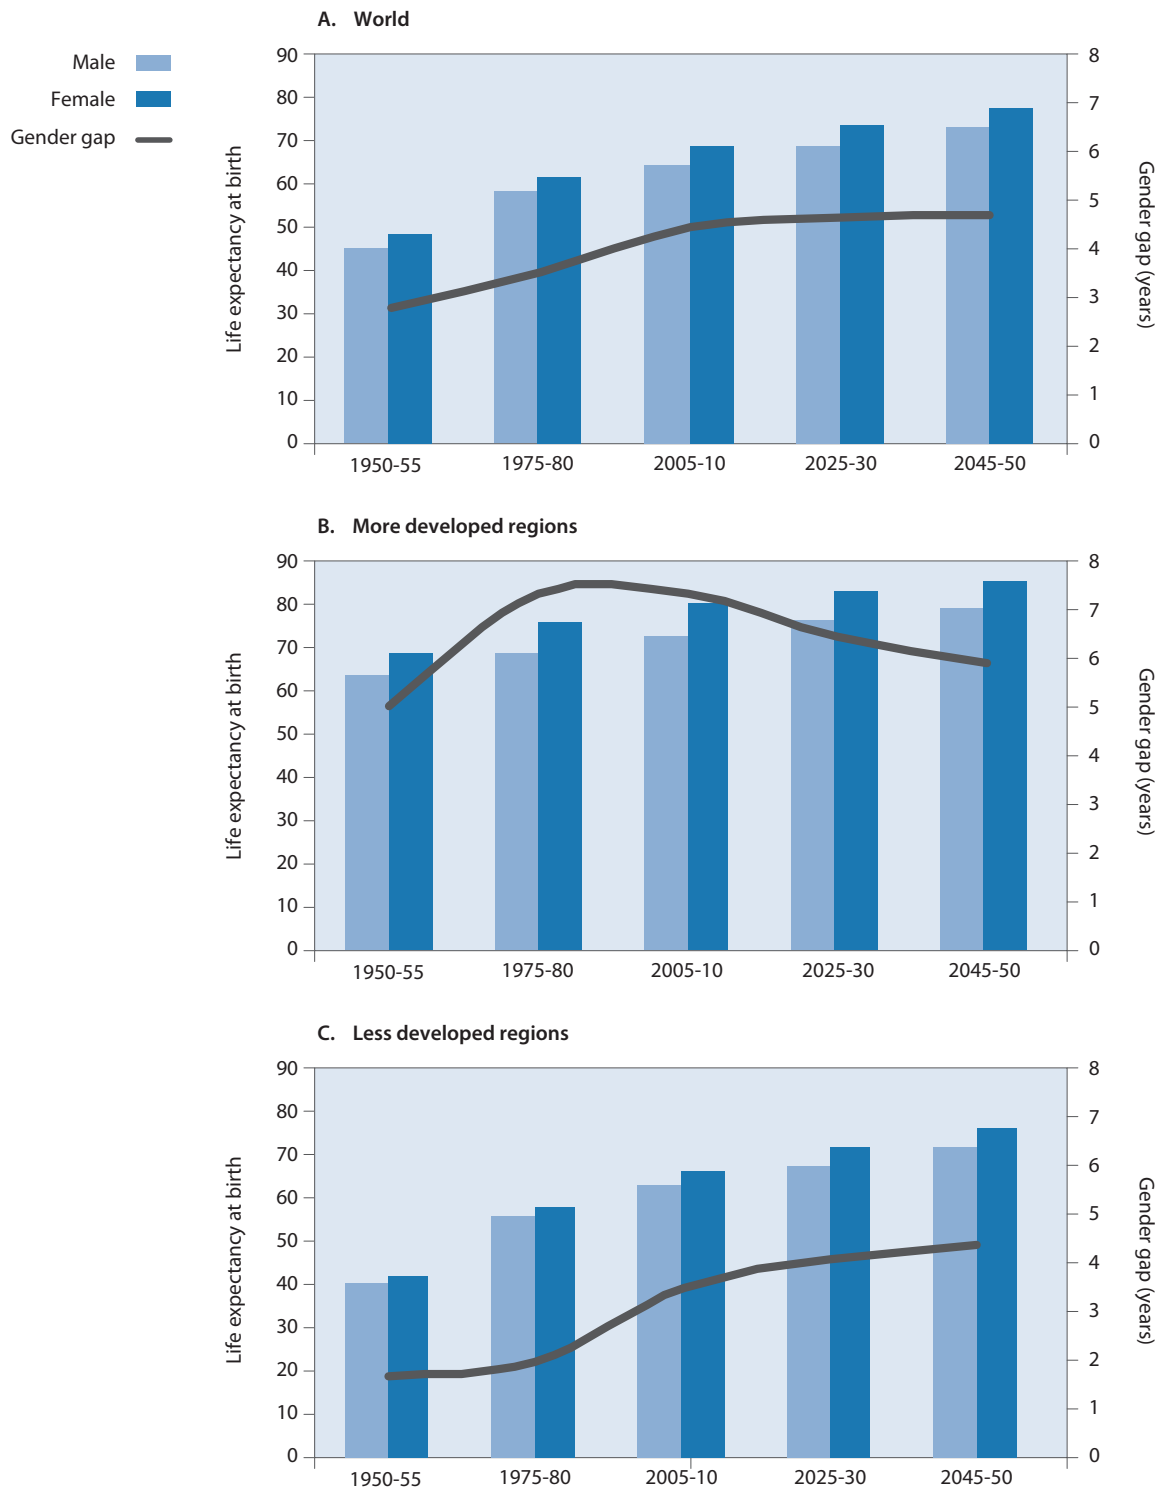

higher among females than males in practically all age groups. As a result, the female advantage in life expectancy at birth increased from 2.8 years in 1950-1955 to 4.4 years in 2005-2010 globally. By 2045-2050, the female to male difference in life expectancy at birth is expected to increase to 4.7 years at the world level (figure 7a).

In the more developed regions, where women currently outlive men by 7.3 years on average, the gender gap in life expectancy at birth is expected to narrow gradually to reach 5.9 years by 2045-2050 (figure 7b). In the less developed regions, where the female to male difference in life expectancy at birth has been stable, it is expected to continue increasing, passing from 3.5 years in 2005-2010 to 4.4 years by 2045-2050 (figure 7c).

In Japan, women have a life expectancy at birth of 86 years, the highest in the world. In 32 other countries, female life expectancy at birth now exceeds 82 years. These countries include the following seven developing countries or areas: Hong Kong SAR China, Israel, Macao SAR China, and the United Arab Emirates in Asia, as well as Guadeloupe, Martinique and the U.S. Virgin Islands in the Caribbean.

The female advantage in life expectancy at birth has widened; future trends are expected to follow different paths

Figure 7
Male and female life expectancy at birth and gender gap:
world and development regions, 1950-2050

By 2045-2050, female life expectancy at birth is expected to surpass 92 years in Japan and 86 years in 28 other countries. Under the mortality conditions projected for the middle of this century, 59 per cent of the world's female newborns would survive

to age 80 if they were subject during all their lives to the mortality projected for 2045-2050, up from 43 per cent under current mortality conditions. In 40 countries, including 16 developing countries, this proportion is projected to exceed 73 per cent. However, in 25 countries, mostly located in Eastern Africa and Western Africa, this proportion is expected to remain below 35 per cent even by 2050.

Chapter II

Magnitude and speed of population ageing

In 1950, there were 205 million persons aged 60 or over throughout the world (figure 8). At that time, only 3 countries had more than 10 million people aged 60 or over: China (42 million), India (20 million), and the United States of America (20 million). By 2007, the number of persons aged 60 or over had increased three and a half times to 705 million and there were 11 countries with more than 10 million people aged 60 or over, including China (152 million), India (92 million), the United States (52 million), Japan (36 million), the Russian Federation (24 million) and Germany (21 million). By 2050, the population aged 60 or over is projected to increase again nearly threefold to reach 2 billion (figure 8).

Also by 2050, 32 countries are expected to have more than 10 million people aged 60 or over, including five countries with more than 50 million older people: China (432 million), India (330 million), the United States (104 million), Indonesia (67 million) and Brazil (63 million).

In 1950-1955, the average annual growth rate of the number of persons aged 60 years or over was only slightly higher than the rate of growth for the total population (both were around 1.8 per cent, as is shown in figure 9).

In 2005-2010, the growth rate of the older population at 2.6 per cent annually is more than twice that of the total population (1.1 per cent). Over the mid-term future, the difference between those two growth rates is expected to increase as the baby boom generation reaches age 60 in several parts of the world. By 2025-2030, projections indicate that the population aged 60 or over will be growing 3.7 times more rapidly than the total population (at an annual growth rate of 2.7 per cent compared to 0.7 per cent for the total population, as is shown in figure 9). Although the growth rate of the popu-

The number of older persons has more than tripled since 1950; it will almost triple again by 2050

The older population is growing faster than the total population in practically all regions of the world and the difference in growth rates is increasing

Figure 8
Population aged 60 or over: world and development regions, 1950-2050

Figure 9
Average annual growth rate of total population and population aged 60 or over: world, 1950-2050

The proportion of older persons in the world will more than double by 2050

More developed regions have relatively high proportions of older persons

lation aged 60 or over is expected to decline to 1.7 per cent in 2045-2050, it will still be more than 4 times the growth rate of the total population at that time (0.4 per cent).

Since the older population has grown faster than the total population, the proportion of older persons relative to the rest of the population has increased considerably. At the global level, 8 per cent of the population was at least 60 years of age in 1950 (figure 10), and just over 5 per cent was at least 65 years of age. By 2007, those proportions had increased to 11 per cent and just under 8 per cent, respectively. By 2050, 22 per cent of the world population is projected to be 60 years or over, and just under 17 per cent will likely be 65 years or over.

Already by 1950, developed countries as a whole had a higher proportion of their population aged 60 years or over than developing countries (12 per cent vs. 6 per cent). Developed countries continue being at a more advanced stage of the demographic transition and have populations that are already showing strong signs of ageing. Furthermore, their populations are projected to remain considerably older than those of developing countries as a whole. Currently, 21 per cent of the population in the more developed regions is aged 60 years or over, whereas just about 8 per cent of that in the less developed

Figure 10
Proportion of population aged 60 or over: world and development regions, 1950-2050

regions is in that age group (figure 10). By 2050, 32 per cent of the population of the more developed regions is projected to be 60 years or over, whereas the equivalent proportion will likely be 20 per cent in the less developed regions (figure 10). A large difference is also evident regarding the proportions aged 65 years or over which are projected to be 25 per cent in the more developed regions and 14 per cent in the less developed regions.

Europe is currently the major area with the highest proportions of older persons and is projected to remain so until 2050. About 35 per cent of the population of Europe is projected to be 60 years or over in 2050, up from 21 per cent in 2007. About 28 per cent is projected to be 65 or over, up from 16 per cent in 2007. In contrast, only 10 per cent of the population of Africa is projected to be 60 or over in 2050, up from 5 per cent in 2007. The proportion aged 65 or over in Africa is projected to rise from 3 per cent in 2007 to 7 per cent in 2050.

People aged 60 years or over currently constitute more than 25 per cent of the population of Germany, Italy and Japan, and there are 24 other countries with proportions of older persons ranging from 20 per cent to 25 per cent. By 2050, more than 40 per cent of the population is expected to be 60 years or older in six countries or areas: Macao SAR China, Italy, Japan, Martinique, the Republic of Korea and Slovenia. In addition to these countries, persons aged 60 or over will constitute more than 33 per cent of the population in another 28 countries, including six developing countries. In Italy, Japan, the Republic of Korea and Spain, 33 per cent of the population will be aged 65 years or over in 2050, and in 38 additional countries, including 11 developing countries, individuals aged 65 years or over will constitute between 25 per cent and 33 per cent of the population.

In contrast with the relatively slow process of population ageing experienced so far by most developed countries, the ageing process in the majority of developing countries is occurring at a faster pace and, therefore, over a shorter period. Furthermore, with the large populations that characterize many developing countries, large numbers of older persons live in those countries even if they constitute still relatively low proportions of the total population.

In 1950-1955, the average annual growth rate of the number of persons aged 60 years or over was practically the same in the more developed regions as in the less developed regions (close to 1.8 per cent, as shown in figure 11).

From that time on, the growth rates of the older population increased in the less developed regions but declined at first in the more developed regions, only to increase

High proportions of older persons in Europe; low proportions in Africa

In some countries, more than 40 per cent of the population will be 60 years or over in 2050

The older population is growing at a faster rate in the less developed regions

Figure 11
Average annual growth rate of population 60 or over:
world and development regions, 1950-2050

markedly in recent times. Currently, the average annual growth rate of the population aged 60 years or over is 3 per cent in the less developed regions and 1.8 per cent in the more developed regions (figure 11). By 2025-2030, this rate is expected to rise to 3.4 per cent in the less developed regions and to decrease to 1.1 per cent in the more developed regions. After 2030, the growth rate of the population aged 60 years or over is expected to decline in both the more developed regions and the less developed regions. Yet, by 2045-2050, the growth rate of the older population in the less developed regions is projected to be almost seven times as high as that in the more developed regions (2 per cent vs. 0.3 per cent).

In the least developed countries, the growth rate of the older population is projected to continue increasing at least until 2050. By 2045-2050, the population aged 60 years or over in the least developed countries is projected to be growing at a rate of 3.5 per cent per year, more than eleven times that of the more developed regions (0.3 per cent annually).

The older population will increasingly be concentrated in the less developed regions

Although the proportion of older persons is higher in the more developed regions, their number is increasingly larger in the less developed regions. From 1950 to 2007, the number of persons aged 60 years or over increased globally by an average of 9 million persons per year. Sixty-nine per cent of that increase occurred in the less developed regions and 31 per cent in the more developed regions. As a result, the proportion of all persons aged 60 years or over living in the less developed regions rose from 54 per cent in 1950 to 64 per cent in 2007 (figure 12).

Over the next four decades, the concentration of older persons in the less developed regions will intensify. The number of people aged 60 years or over living in the less developed regions is expected to increase more than threefold, passing from 453 million in 2007 to 1.6 billion in 2050. In contrast, the number of older persons in the more developed regions is projected to increase by about 60 per cent, passing from 252 million in 2007 to 400 million in 2050. Consequently, by 2050 nearly 80 per cent of the world's older population is expected to live in developing countries (figure 12).

Figure 12
Distribution of world population aged 60 or over by development regions, 1950-2050

Chapter III

The changing balance among age groups

A. Distribution of the population by broad age groups

In most populations, the increasing proportions of older persons have been accompanied by steady reductions in the proportion of young persons. At the world level, the proportion of children (that is, persons under 15 years of age) dropped from 34 per cent in 1950 to 28 per cent in 2007 (figure 13a). By 2050, the proportion of children is projected to decline by almost one third and the proportion of persons aged 60 years or over (22 per cent) will, for the first time in history, exceed that of children (20 per cent). During 2007-2050, the proportion of persons whose ages range from 15 to 59 will change slightly, passing from 62 per cent in 2007 to 58 per cent in 2050.

In 2007, the proportion of persons aged 60 years or over in the more developed regions (21 per cent) is already higher than the proportion of children (17 per cent), as is shown in figure 13b. By 2050, the proportion of children is projected to decline slightly to 16 per cent, while the proportion of older persons is projected to reach 32 per cent. As the baby boom generations reach old age and there is a declining inflow of young people, the proportion of persons aged 15 to 59 in the more developed regions is also expected to decline substantially over the coming four decades, from 63 per cent in 2007 to 52 per cent in 2050.

From 1950 to 2007, the proportion of people aged 60 years or over in the less developed regions increased only slightly, from 6 per cent to 8 per cent, while the proportion of children (persons under 15 years of age) declined from 38 per cent to 30 per cent (figure 13c).

In future, the change in age distribution in the less developed regions is expected to be more marked. The proportion of older persons will increase by a factor of 2.5 to reach 20 per cent in 2050 and the proportion of children will fall by about a third to reach a projected 21 per cent. The share of the population aged 15 to 59 is projected to change slightly, passing from 62 per cent in 2007 to 59 per cent in 2050.

B. Ageing index

The ageing index is the ratio of the population aged 60 years or over to that under age 15. Between 1950 and 2007, the ageing index increased by more than half at the world level, passing from 24 older persons per 100 children to 39 per 100 (figure 14). Over the next four decades, the ageing index is projected almost to triple. By the year 2050, there will be 107 older persons for every 100 children in the world. As observed in the introduction to the present report, this trend may lead to compelling demands for changes in the way a society allocates resources among generations.

In 2007, there are only 28 older persons per 100 children in the less developed regions but over the next decades this ratio is projected to increase markedly, reach-

The balance between young and old is shifting in favour of the old throughout the world

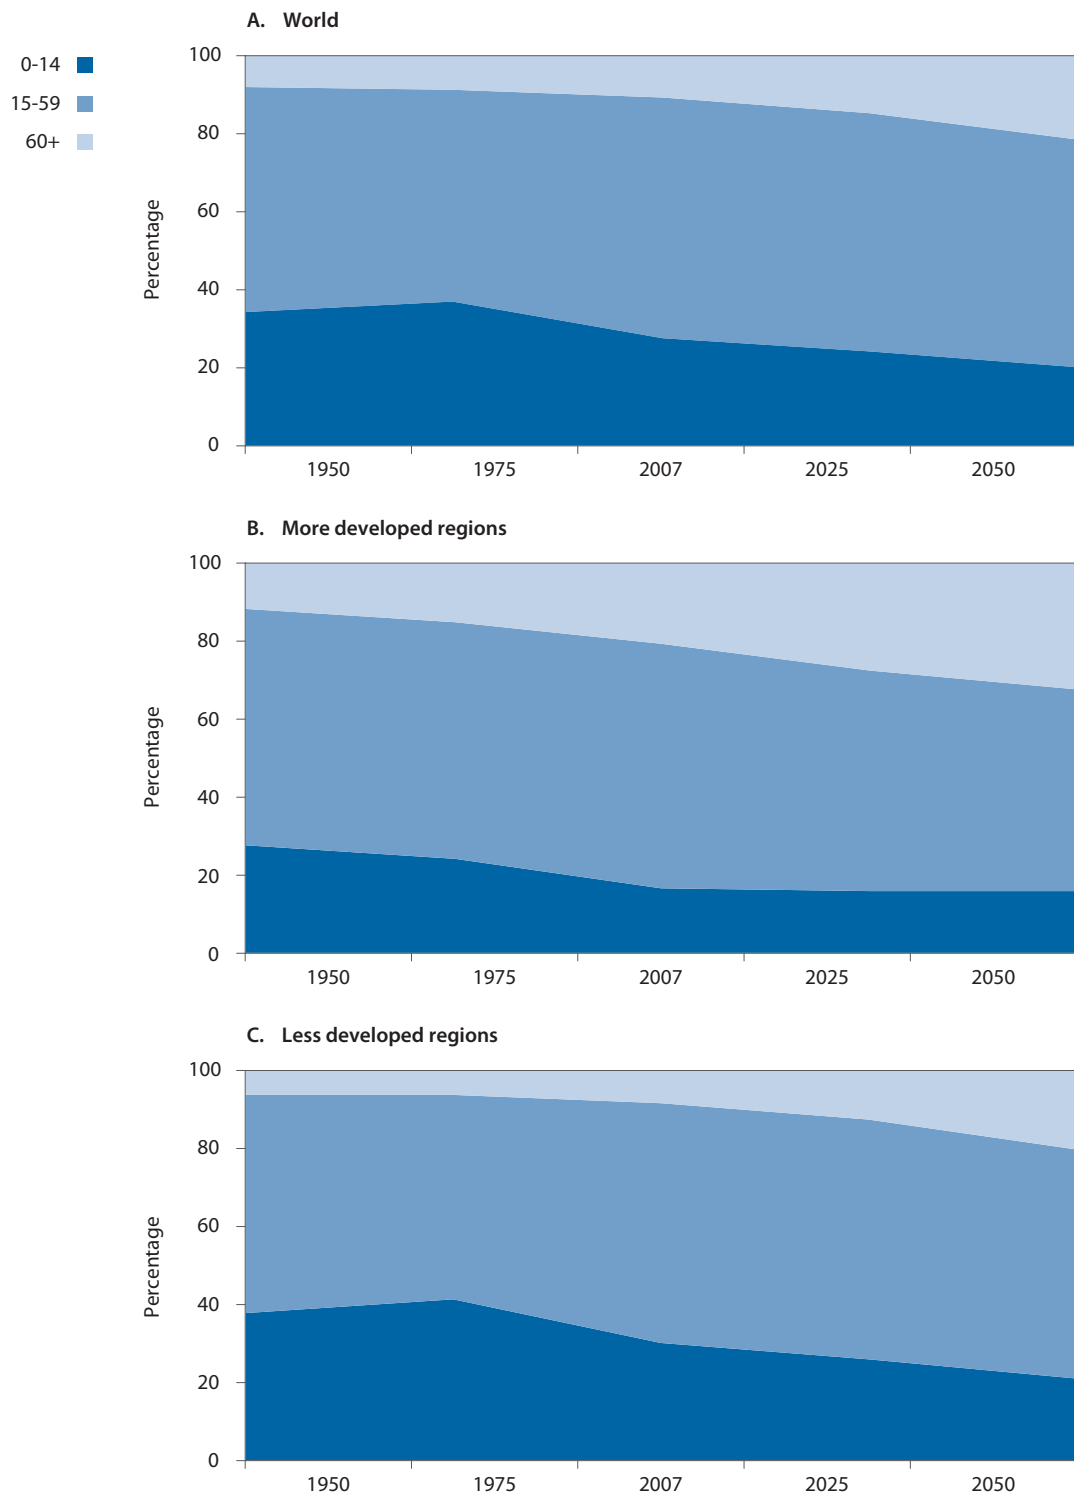

In the more developed regions, the proportion of older persons already exceeds that of children; by 2050 it will be double that of children

Changes in the age distribution of the less developed regions have been slow, but will accelerate over the coming decades

The ageing index will triple by mid-century

The ageing index is significantly higher in the more developed regions but will grow faster in the less developed regions

Figure 13
**Distribution of population by broad age groups:
 world and development regions, 1950-2050**

ing 96 per 100 in 2050 (figure 14). During 2007-2050 the ageing index in the more developed regions is projected to rise from 124 older persons per 100 children to 207 per 100.

Figure 14
**Number of persons 60 or over per hundred children under 15:
 world and development regions, 1950-2050**

Currently, the ageing index in Europe, at 136 older persons per 100 children, is ten times that of Africa, which is still a low 13 older persons per 100 children (figure 15). Between 2007 and 2050, the ageing index is expected to rise significantly in all six major areas. Asia as well as Latin America and the Caribbean are expected to experience remarkable increases in their respective ageing indices, which are projected nearly to quadruple. However, the ageing index for Europe will remain the highest. By 2050, the ageing index is projected to range from a high of 230 older persons per 100 children in Europe to a low of 35 per 100 in Africa. That is, by mid-century, Europe will have almost two older persons for every child while Africa is likely to have still almost three children for every older person and thus remain the region with the youngest population.

In 2007, there are already 26 countries with an ageing index higher than 120 older persons per 100 children. With the exception of Japan, all of them are located in Europe. In six countries—Bulgaria, Germany, Greece, Italy, Japan and Latvia—the ageing index

Regional differentials in ageing indices are substantial

Disparities in the ageing index are even more marked at the country level

Figure 15
**Number of persons 60 or over per hundred children under 15:
 major areas, 2007 and 2050**

is higher than 160 older persons per 100 children. At the other end of the distribution, there are 20 countries, most located in Africa, with an ageing index lower than 10 older persons per 100 children.

By 2050, ten countries or areas are expected to have more than 3 persons aged 60 or over per child (i.e., their ageing indices will be higher than 300). These include five developing countries or areas, namely, Hong Kong SAR China, Macao SAR China, Martinique, the Republic of Korea and Singapore. In Macao SAR China, there will be nearly 4 older persons per child (its ageing index is projected to be 375). At the other end of the distribution, 18 countries, most located in Africa, are projected to have still an ageing index lower than 25 older persons per 100 children, that is, they will likely have more than 4 children per older person.

C. Median age

During 2007-2050, the median age of the world population is projected to increase by about 10 years

The median age in the more developed regions is 13 years higher than in the less developed regions and 20 years higher than in the least developed countries

The median age is the age that divides the population into two equal parts, one with ages below the median age and the other with ages above the median age. From 1950 to 2005, the median age of the world population increased only by 4 years, from nearly 24 years to nearly 28 years (figure 16). From 2005 to 2050, it is expected to increase by nearly 10 years. That is, in 2050, half of the world population is projected to be older than 38 years.

The median age of the population in the more developed regions was about 39 years in 2005, up from 29 years in 1950. In the less developed regions, the median age was 26 years in 2005, just 5 years higher than in 1950 when it was 21 years. In the least developed countries, the median age decreased from 1950 to 2005, from 20 years to 19 years, as a result of their continued high fertility (figure 16).

From 2005 to 2050, the median age of the population of the more developed regions is projected to reach an unprecedented level of 45 years. In the less developed regions, the median age will increase by more than 10 years to reach 37 years in 2050, a level approaching that currently observed in the more developed regions. During 2005-2050, the median age is also projected to increase significantly in the least developed countries, although its level in 2050 (27 years) will still be 10 years lower than that for the less developed regions as a whole.

Figure 16
Median age of the population: world and development regions, 1950-2050 (years)

In 2005, the median age of Europe was 39 years, more than twice as high as the median age of 19 years in Africa. By 2050, the median age in Europe is projected to rise to 47, a level 20 years higher than that projected for Africa. At the country level, the median age in 2005 ranged from 15 years in Niger and Uganda to 43 years in Japan. Italy and Germany, with median ages of 42 years, follow and are in turn followed by eight European countries with median ages above 40.

The median age of Europe is double that of Africa

By 2050, the oldest populations are expected to be those of Macao SAR China and the Republic of Korea, where half the population is projected to be at least 54 years old. Martinique and Italy will come next, with median ages around 53 years. Thirteen other countries or areas, including six located in Eastern Europe, will also have populations where persons over 50 years of age will predominate. At the opposite extreme, in 17 countries, most located in Africa, persons under 25 years of age are expected to be the majority of the population.

D. Dependency ratio

The total dependency ratio is a commonly used measure of potential social support needs. It is calculated as the ratio of the number of children (persons under age 15) and older persons (persons aged 65 years or over) to the number of persons in the working ages (that is, those aged 15 to 64) expressed per 100 population. The interpretation of the ratio is based on the notion that all persons under 15 and those aged 65 or over are likely to be in some sense dependent on the population in the working ages. Those in the working ages are assumed to provide direct or indirect support to those in the dependent ages (Kinsella and Gist, 1995). Such support may be provided within the family, through religious or communal institutions, or through the State.

It must be recognized, however, that the dependency ratio provides at best only a rough approximation of the actual dependency burden in a society. Not all children and older persons require support, nor do all persons of working age provide direct or indirect support to children and older persons (Taeuber, 1992). In fact, evidence indicates that older persons in many societies are often providers of support to their adult children (Morgan, Schuster and Butler, 1991; Saad, 2001). Thus, although it is a useful indicator of trends in potential support needs, the dependency ratio and, more specifically, the old-age dependency ratio, should be interpreted with caution.

At the world level, the total dependency ratio increased from 65 in 1950 to 74 in 1975 (figure 17). This change was mainly due to the substantial increases in the proportion of children observed in most developing countries, which in turn resulted from declining infant and child mortality and continued high fertility. Then, as fertility dropped, the total dependency ratio also declined, to reach 54 in 2007. This decline in the total dependency ratio occurred despite the increasing proportion of older persons over the period. The tendency for the total dependency ratio to decrease is projected to continue at least until 2025. By that time, the total dependency ratio is projected to reach 53, but it will start increasing soon after to reach 58 in 2050, a level similar to that observed in 2000.

At the global level, the ratio between the “dependent” and the working age populations has decreased since 1950 but is expected to increase in the future

In the more developed regions, the increase in the total dependency ratio is expected to start earlier, so that it will likely rise from 47 in 2007 to 58 in 2025 and keep on rising to reach 71 in 2050.

Although the world’s total dependency ratio is projected to change little between 2007 and 2050, the composition of the ratio will undergo important changes over the period. Currently, the child population accounts for the large majority of the world’s dependent population. In the future, the contribution of the child component of the dependency ratio will become similar to that of the old-age component. This shift will

A profound shift is expected in the composition of the total dependency ratio

Figure 17
Total dependency ratio: world and development regions, 1950-2050

be the result of the combined effects of fertility reduction and increasing longevity. Currently, the old-age component contributes about 21 per cent of the world's total dependency ratio. By 2050, its share will more than double to reach 44 per cent (figure 18a).

In the more developed regions, where the share of older persons in the numerator of the dependency ratio is already large (48 per cent in 2007), the old-age component is projected to rise to 62 per cent by 2050 (figure 18b). In the less developed regions, the old-age component will still account for less than half (41 per cent) of the total dependency ratio by 2050 (figure 18c).

The old-age dependency ratio is the ratio of the population aged 65 or over to the population aged 15 to 64 expressed per 100 population. Although the current differences among major areas in the old-age dependency ratio are expected to persist until 2050, all major areas will experience remarkable increases in that ratio. From 2007 to 2050, the ratio of persons aged 65 or over to those of working age is projected to grow from 6 per 100 to 10 per 100 in Africa, from 10 to 27 in Asia, from 10 to 29 in Latin America and the Caribbean, from 16 to 31 in Oceania, from 19 to 34 in Northern America and from 23 to 48 in Europe (figure 19).

Currently, Japan has the world's highest old-age dependency ratio of 32 older persons per 100 persons of working age. It is followed closely by Italy and Germany, where the old-age dependency ratios are 31 and 29 respectively. Over the next four decades, the old-age dependency ratio is projected to increase substantially in most countries of the world. By 2050, Japan, with an old-age dependency ratio of 71, will still have the world's highest level of old-age dependency, followed by Italy (69) and Spain (66). In another 20 countries, most located in Europe, the old-age dependency ratio is projected to be higher than 50 older persons per 100 persons of working age. At the same time, in 36 countries or areas, most located in Africa, the population aged 65 years or over is expected to be less than one tenth the size of the working-age population.

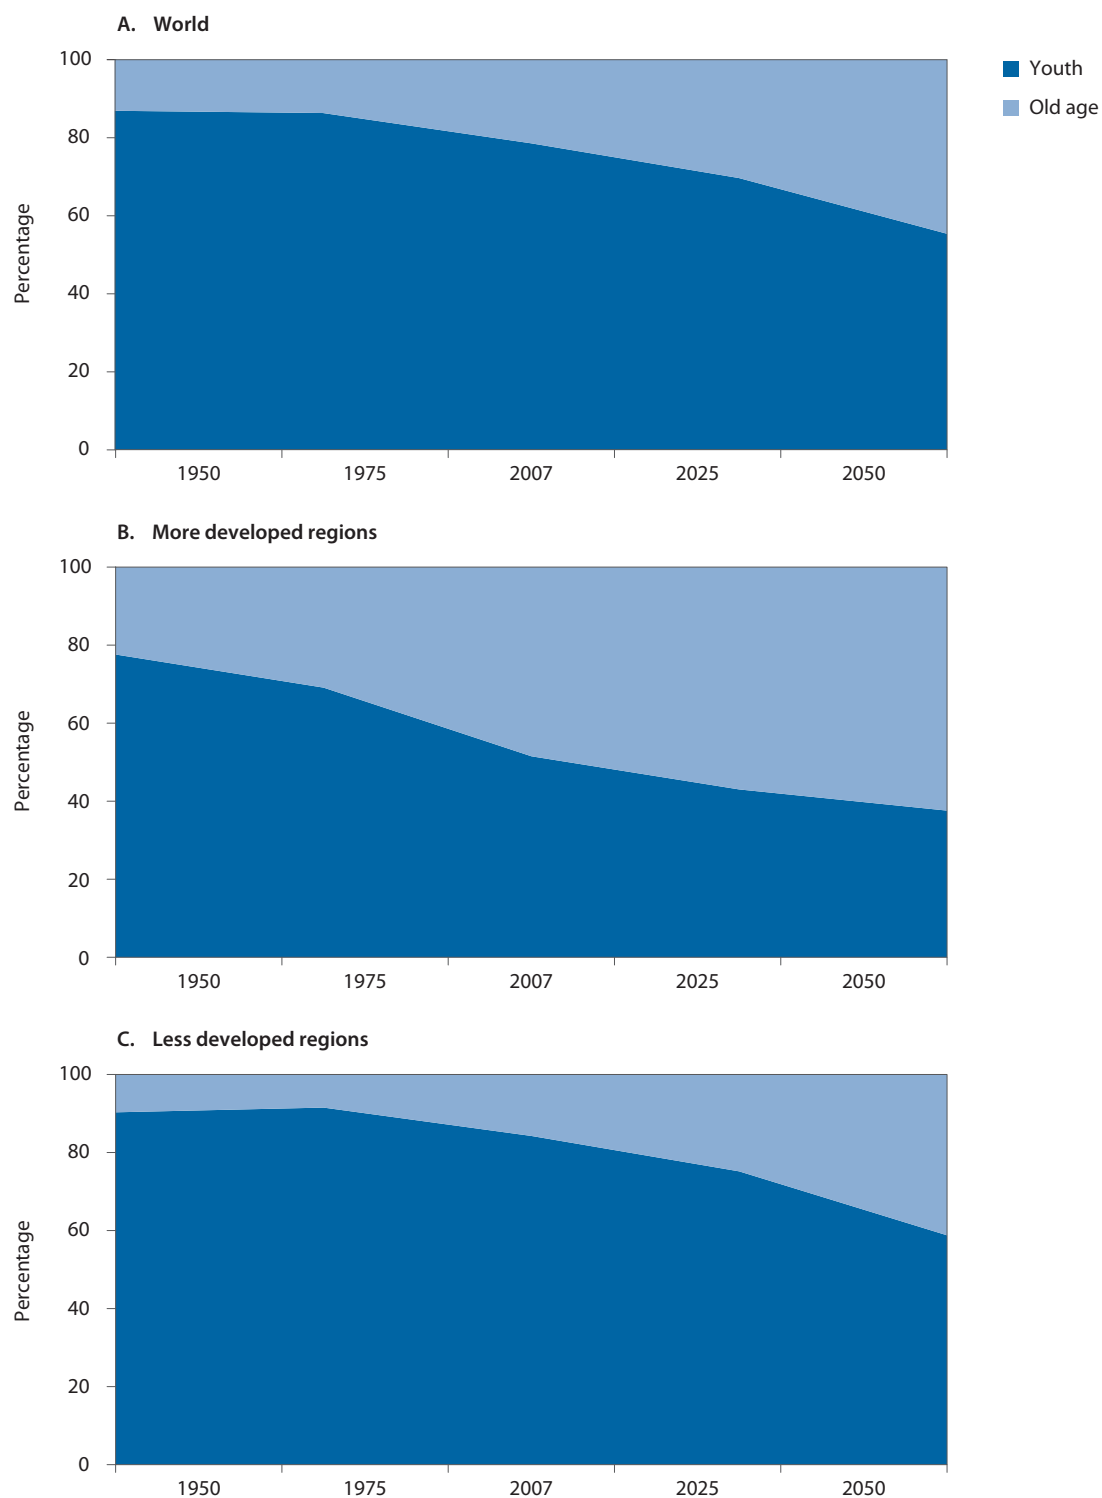

E. Potential support ratio

The potential support ratio is an alternative way of expressing the numerical relationship between those more likely to be economically productive and those more likely to be dependants. It is the inverse of the old-age dependency ratio, that is, the number of persons of working age (i.e., aged 15 to 64) per person aged 65 or over.

The old-age dependency ratio will almost double in Africa, Northern America and Oceania; it will more than double in Europe, and almost triple in Asia as well as in Latin America and the Caribbean

The world's highest old-age dependency ratio will more than double in the next four decades

Figure 18
Composition of the total dependency ratio: world and development regions, 1950-2050

Between 1950 and 2007, the ratio of people aged 15-64 to persons 65 or older decreased globally by 25 per cent, from 11.6 to 8.7. The decrease was particularly important in the more developed regions, where the ratio dropped by almost half, from 8.2

The number of working-age people per older person is expected to drop globally by more than 50 per cent over the next four decades

Figure 19
Old-age dependency ratio: major areas, 2007 and 2050

in 1950 to 4.4 in 2007. During this same period, the potential support ratio decreased by under 25 per cent in the less developed regions (from 14.9 in 1950 to 11.3 in 2007) and increased slightly in the least developed countries (from 16.8 in 1950 to 17 in 2007) (figure 20). Large decreases, however, are expected to take place over the first half of this century. By 2050, the number of persons in the working ages per older person is projected to be 3.9 globally, a decrease of 55 per cent relative to 2007; 2.3 in the more developed regions, implying a decrease of 49 per cent relative to 2007, and 4.4 in the less developed regions, representing a decrease of 61 per cent with respect to the level reached in 2007. The decline will be smallest in the least developed countries as a whole, amounting to 42 per cent and leading to a support ratio of 9.8 persons of working age per older person in 2050.

Currently, there are little more than 4 persons of working age per older person in Europe and by 2050 their number will have decreased to little more than 2

In Europe, there are 4.3 persons aged 15-64 per person aged 65 or over in 2007, the lowest potential support ratio among the major areas. Relatively low potential support ratios also characterize Northern America (5.4) and Oceania (6.4). In Asia, Latin America and the Caribbean, and Africa the potential support ratios are higher, at 10.1, 10.2 and 16.2, respectively (figure 21).

Figure 20
Potential support ratio: world and developing regions, 1950-2050

Figure 21
Number of persons 15-64 per persons 65 or over: major areas, 2007 and 2050

Over the next four decades, the potential support ratio is projected to drop substantially in all major areas, particularly in Asia and Latin America and the Caribbean. By 2050, that ratio is projected to drop to about 2 in Europe, to under 3 in Northern America, and to under 4 in each, Asia, Latin America and the Caribbean, and Oceania. In Africa, there will still be almost 10 persons of working age for every person aged 65 or over by 2050.

In 2007, the potential support ratio is under 5 in 31 European countries as well as in Georgia, Japan and Uruguay. In three of those countries, namely, Germany, Italy and Japan, the potential support ratio is under 3.5. At the same time, the potential support ratio is above 20 in 16 countries, most of which are located in Eastern Africa and Western Asia.

By 2050, the potential support ratio is projected to be below 3.5 in 82 countries and to remain above 20 in only two, Liberia and Swaziland. In 23 countries, including 7 developing countries, the potential support ratio is expected to decline to under 2 persons of working age for every older person. In Italy and Japan, the potential support ratio is expected to drop below 1.5. At the other extreme of the distribution, 22 countries are expected still to have potential support ratios above 12 by 2050.

F. Parent support ratio

The parent support ratio is the number of persons aged 85 years or over divided by the number aged 50 to 64 and expressed per 100 persons. This measure has been commonly used to assess the demands on families to provide support for their oldest members. It relates those aged 85 or over to their presumed offspring, who were born when the older persons were in their twenties and thirties. However, because the persons included in the numerator are not necessarily related by kinship ties to those in the denominator, the parent support ratio is only a rough indicator of changes expected in the family support system available for the very old (Kinsella and Taeuber, 1993).

Because people are living longer and thus are more likely to experience multiple chronic diseases, an increasing number of adults are expected to face the need to care for very old and sometimes frail relatives. An indicator of this trend is found in the parent support ratio. At the global level, there were fewer than 2 persons aged 85 or over per 100 persons aged 50-64 in 1950. By 2007, that ratio had more than doubled to reach 4.5 per 100, and by 2050 it is projected almost to triple (figure 22).

Important variations in the potential support ratio will remain at the country level

An increasing number of persons in their fifties and sixties will have surviving parents or other very old relatives

Figure 22
Parent support ratio: world and development regions, 1950-2050

Remarkably high levels of the parent support ratio are projected in the more developed regions, particularly in Japan

In 2050, the parent support ratio in the more developed regions is projected to reach 29, up from 9 in 2007 (figure 22). With a parent support ratio of 13, Sweden currently has the world's highest such ratio in the world. By 2050, Japan is projected to have the world's highest parent support ratio, at 58 persons aged 85 or over per hundred persons aged 50-64. Also in 2050, the parent support ratio is expected to surpass 30 in another 18 countries or areas, most located in Europe.

The parent support ratio is projected to remain significantly lower in developing countries. In the less developed regions as a whole, it is projected to rise from 3 in 2007 to 9 in 2050. Thus, by 2050, there will still be more than 10 people aged 50-64 for every person aged 85 or over in the less developed regions as compared to fewer than 4 in the more developed regions.

Chapter IV

Demographic profile of the older population

A. Age composition

A notable aspect of the global ageing process is the progressive demographic ageing of the older population itself. In most countries, regardless of their geographic location or developmental stage, the population aged 80 or over is growing faster than any younger segment of the older population.

At the world level, the average annual growth rate of the number of persons aged 80 or over, 3.9 per cent per year, is currently 50 per cent higher than the growth rate of the population aged 60 or over, which averages 2.6 per cent per year (figure 23). Although the growth rates of both age groups are expected to decline over the next four decades, by 2045-2050 the growth rate of the population aged 80 or over, at 3.0 per cent per year, will still be almost double that of the population aged 60 or over, which is expected to be 1.7 per cent per year.

In 1950, 1 in 15 persons aged 60 or over was aged 80 or over but by 2007, that ratio had increased to 1 in 8, and by 2050 it is expected to increase further to reach nearly 1 in 5 (figure 24). The most remarkable increase is expected to occur in Japan where, in 2050, more than 1 in every 3 persons aged 60 or over will be at least 80 years old.

Persons aged 80 or over constitute today less than 2 per cent of the population but their share is projected to reach 4.3 per cent in 2050. Currently, the population aged 80 or over accounts for more than 5 per cent of the population in four countries: France, Italy, Japan and Sweden.

Older populations are themselves ageing

The number of persons aged 80 or over is increasing substantially

Figure 23
Average annual population growth rate at ages 60 or over, 65 or over and 80 or over: world, 1950-2050

Figure 24
**Distribution of population aged 60 or over by age groups:
 world, 1950-2050**

In 1950, persons aged 80 or over numbered less than 14 million. By 2007 their number had risen to 94 million persons and it is expected nearly to quadruple by 2050, to reach 394 million (figure 25).

Five countries are the home of half of the world's population aged 80 or over

Currently, five countries account for 50 per cent of the population aged 80 or over. They are: China with 16 million, the United States with 11 million, India with 9 million, Japan with 7 million, and Germany with 4 million. In 2050, five countries will have more than 10 million people aged 80 or over: China with 101 million, India with 53 million, the United States with 29 million, Japan with 17 million and Brazil with 14 million. Together they will account for 54 per cent of the population aged 80 or over.

The proportion of persons aged 80 or over is significantly higher in the more developed regions than in the less developed regions

People aged 80 or over currently constitute almost 4 per cent of the population of Europe and more than 3 per cent of the population of Northern America. The proportion of persons aged 80 or over is considerably lower in the major areas of the developing world. Thus, they constitute 1.3 per cent of the population of Latin America and the Caribbean, 1 per cent of that of Asia and 0.4 per cent of that of Africa. Such regional differences are projected to persist until 2050.

Figure 25
Population aged 80 or over: world, 1950-2050

By mid-century, about 1 in every 10 individuals will be aged 80 years or over in the more developed regions, compared with about 1 in 30 in the less developed regions. In the least developed countries as a whole, only about 1 in every 100 persons is projected to be aged 80 or over in 2050. By then, 20 countries, most located in Europe, are projected to have at least 10 per cent of their population aged 80 years or over.

Currently, slightly more than half of all persons aged 80 years or over (51 per cent) live in the more developed regions (figure 26). In the course of the next four decades, however, the population aged 80 years or over is expected to grow significantly faster in the less developed regions. As a consequence, by 2025, 58 per cent of the population aged 80 or over will live in the less developed regions and by 2050 that proportion will rise to 71 per cent (figure 26).

Although the proportion of people who live to be a hundred is still very small, their number is growing rapidly. There are currently an estimated 310,000 centenarians in the world. By 2050 their number is projected to rise to 3.7 million, a twelvefold increase (figure 27). Currently, the great majority of centenarians (71 per cent) live in the more developed regions and, although that proportion is projected to decrease

Most people aged 80 years or over now live in the more developed regions but soon the majority will live in the less developed regions

By 2050, the number of centenarians is expected to increase twelve times

Figure 26
Distribution of world population aged 80 or over by development regions, 1950-2050

Figure 27
Distribution of world centenarians by development regions, 2007-2050

to 64 per cent by 2050, still by that time developed countries will be the home of the majority of centenarians on earth.

In the less developed regions, a significant increase in the number of centenarians is projected to occur during 2007-2050, when their numbers will rise from 91,000 to 1.3 million. Nevertheless, developing countries will continue having a smaller proportion of all centenarians than developed countries.

Within the more developed regions, Japan will experience a remarkable increase in the number of centenarians, which are projected to pass from less than 37,000 in 2007 to almost a million in 2050. Consequently, by mid-century Japan is expected to have the world's largest number and proportion of centenarians, since nearly 1 per cent of Japan's population will be aged 100 years or over.

B. Sex ratio of the older population

Women constitute a majority of the older population and their share of the older population increases with age

Sex ratios at older ages are significantly lower in the more developed regions than in the less developed regions

Trends in sex ratios at older ages are expected to differ between the more developed and the less developed regions

Because women's life expectancy is greater than that of men, they constitute a majority of the older population. At the global level, the sex ratio of the population aged 60 or over is 82 males per 100 females (figure 28). Thus, women aged 60 or over outnumber men of the same age by approximately 70 million. Assuming that past mortality trends will continue, by 2050 it is expected that there will be 85 men per 100 women aged 60 or over and 80 men per 100 women aged 65 or over. Among the population aged 80 or over, the sex ratio is projected to be 61 men per 100 women.

In the more developed regions, large gender differences in longevity translate into low sex ratios among the older population. In 2007, there are 73 men per 100 women among persons aged 60 or over in the more developed regions and just 47 men per 100 women among those aged 80 or over (figure 29).

In the less developed regions, older women outnumber older men by smaller margins because the sex differentials in life expectancy are generally smaller. Thus, there are currently 88 men per 100 women among persons aged 60 or over in the less developed regions and 66 men per 100 women among those aged 80 or over (figure 29).

Over the next decades, the sex ratio of the older population is projected to increase in most of the more developed regions as a result of a faster decline in mortality among older men than among older women. By 2050, the average sex ratio in the more devel-

Figure 28
Number of men per hundred women at ages 60 or over, 65 or over and 80 or over: world, 1950-2050

Figure 29

Number of men per hundred women at ages 60 or over and 80 or over: development regions, 1950-2050

oped regions is projected to be 78 men per 100 women among persons aged 60 or over and 57 men per 100 women among persons aged 80 or over, implying a significant increase with respect to the levels estimated for 2007 (73 among those aged 60 or over and 47 among those aged 80 or over), as is shown in figure 29.

In the less developed regions, mixed trends are projected over the next four decades. As a result, women are expected to constitute an increasing proportion of the older population in most developing countries. However, in several countries in Africa, the share of men in the population aged 60 or over is expected to increase. An increase is also expected in the share of men in the population aged 80 or over in several countries in Asia where the proportions of older persons are already relatively high. Consequently, the average sex ratio in the less developed regions in 2050 is projected to be 86 men per 100 women among persons aged 60 or over and 63 among those aged 80 or over, only slightly lower than the levels estimated for 2007, namely, 88 and 66 men per 100 women, respectively (figure 29).

As a result of the differing trends projected for the more developed and the less developed regions, the difference in the sex ratios of their populations aged 60 or over is expected to decrease from 15 points in 2007 to 8 points in 2050. During that period, the difference between the sex ratios of the population aged 80 or over in the more developed and the less developed regions is projected to decrease from 21 to 6 points.

Among the major areas, Europe has today the lowest sex ratio at older ages (69 men per 100 women among people aged 60 or over and 43 men per 100 women among persons aged 80 or over) owing both to its large sex differentials in life expectancy and to the effects of the Second World War. Asia, in contrast, has the highest sex ratio among persons aged 60 or over (88 men per 100 women), while Africa has the highest sex ratio among persons aged 80 or over (67 men per 100 women), as is shown in figure 30.

In several countries, most of which are located in Eastern Europe and Northern Europe, women currently outnumber men by more than 5 to 3 among the population aged 60 or over. In nine countries, the sex ratios at ages 60 or over are lower than 60 men per 100 women. In 13 countries, the sex ratio of the population aged 80 or over is below 40 men per 100 women. At the other extreme of the distribution, men outnumber women at older ages in several countries, most located in Western Asia. In 17 countries, the sex ratio of the population aged 60 or over surpasses 100 men per 100 women and in 6 countries, sex ratios higher than 100 are found among the population aged 80 or over.

Sex ratios at older ages vary greatly among major areas and countries

Figure 30
**Number of men per hundred women at ages 60 or over and
 80 or over: major areas, 2007**

The range of variation of sex ratios at older ages is particularly wide among developing countries. While there are more older men than older women in Kuwait, Qatar, and the United Arab Emirates, countries such as Argentina, Kazakhstan and South Africa have a higher proportion of women at older ages than many European countries. However, the range of variation is expected to narrow over the next fourth decades.

C. Marital status

The majority of older men are married but most older women are not

Marital status can strongly affect the emotional and economic well-being of older persons, particularly those with an illness or disability, as it determines living arrangements and the availability of caregivers. In general, older men are more likely to live with a spouse than older women because of a combination of factors, including the higher life expectancy of women, the tendency of men to marry women who are younger than they are, and the higher remarriage rates among older widowed men than among widowed women. The implication of such situation is that older men are more likely than older women to receive assistance from their spouses, especially when their health fails.

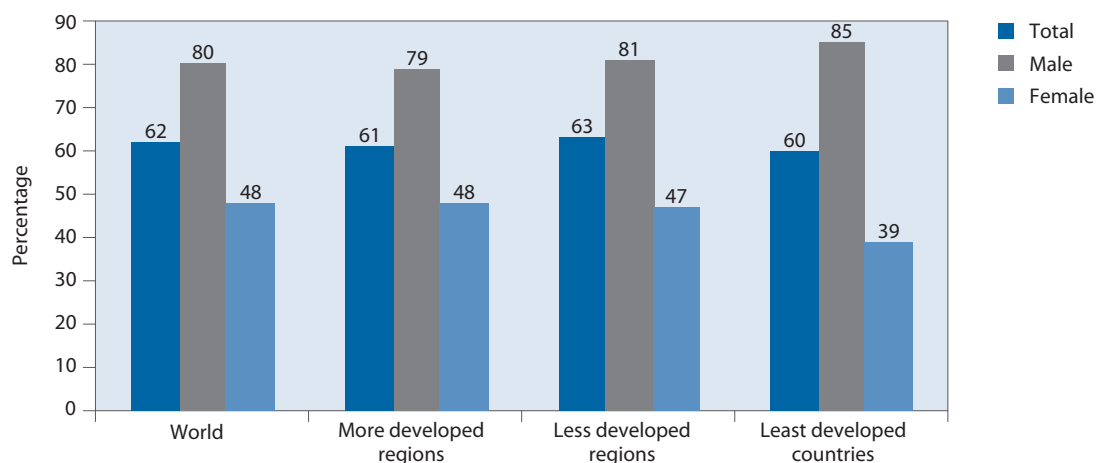

At the global level, an estimated 62 per cent of the population aged 60 years or over is married. There are marked differences between men and women. Among older women, 48 per cent are married and living with a spouse, while among older men the proportion married reaches 80 per cent. On average, there are only 31 older men without a spouse per 100 older women in the same situation.

The general pattern whereby older men are more likely to have a spouse than older women is observed in both the more developed and the less developed regions, where the corresponding figures are practically the same (figure 31). For the group of least developed countries, however, the proportion of men with spouses is higher than at the world level (85 per cent) and that of older women with spouses is lower than the world average (39 per cent).

The proportions of older men with spouses are considerably higher than those of older women with spouses in all major areas

The proportion of persons aged 60 or over who are still married varies from 57 per cent in Latin America and the Caribbean to 64 per cent in Asia. The gender gap in the percentage married among older persons is highest in Africa, where older men are more than twice as likely as older women to still have a spouse (85 per cent among older men versus 39 per cent among older women), and lowest in Northern America

Figure 31
**Percentage currently married among population aged 60 or over by sex:
 world and development regions**

and Oceania, where the corresponding proportions are about 75 per cent among older men and 50 per cent among older women (figure 32).

The proportion still married among persons aged 60 or over ranges from 37 per cent in French Guiana to 78 per cent in Swaziland. In the majority of countries, more than half of older persons are still married. The few countries where that is not the case are located mostly in the Caribbean. At the high end of the distribution, there are seven countries in Africa and Asia where more than 70 per cent of the older population is still married. In no country did the proportion married among older women surpass that of older men, and in only one, French Guiana, were less than half of older men still married. The gender gap in the percentage married varies from 11 percentage points in Belize to 69 percentage points in Chad. In 20 countries, the gap is lower than 25 percentage points while in another 18, the gap is higher than 50 percentage points.

The proportions of older men and women who are still married varies considerably among countries

Figure 32
**Percentage currently married among men and women aged 60 or over
 and gender gap: major areas**

D. Living arrangements

About one out of every seven older persons, approximately 90 million people, live alone

Older persons are more likely to live alone in the more developed regions than in the less developed regions

At the country level, the proportion of older persons living alone varies considerably

Older persons living alone constitute a group that is of natural social and policy concern. Those living alone are more likely to need outside assistance in the case of illness or disability, are at greater risk of social isolation and, even in countries with well-developed systems of social security, are disproportionately likely—especially if they are older women—to be poor (Casey and Yamada, 2002). For the world as a whole, the proportion of the population aged 60 or over who live alone is estimated to be 14 per cent (figure 33).

On average, one out of every 14 persons aged 60 or over (7 per cent) lives alone in the less developed regions, whereas in the more developed regions, one out of every four (25 per cent) lives alone (figure 33). In Africa, Asia and Latin America and the Caribbean, the levels of solitary living among persons aged 60 or over range from 7 per cent to 9 per cent, whereas in Europe, Northern America and Oceania, they range between 25 per cent and 26 per cent (figure 34). Within Europe, the different regions show markedly different proportions of older persons living alone, ranging from 19 per cent to 24 per cent in Southern Europe and Eastern Europe, respectively, to 32 per cent and 34 per cent in Western Europe and Northern Europe, respectively.

Among the 134 countries or areas for which data are available, the proportion of the population aged 60 or over living alone ranges from less than 1 per cent in Bahrain in 1991 to almost 40 per cent in Denmark in 1994. In general, the proportion living alone is lowest in countries or areas of Africa and Asia and highest in Europe or in countries whose populations are mainly of European origin. Proportions of older persons living alone tend to be higher in Latin America and the Caribbean than in the other major areas of the developing world. However, there is considerable variation within regions and a few developing countries have values more typical of European countries. For instance, although the average proportion of older persons living alone is just 8 per cent in Africa, in Ghana, 22 per cent of older persons live alone. Several Caribbean countries and Israel also have more than 20 per cent of their older population living alone. Conversely, in about a quarter of all European countries the proportion of older persons living alone is below 20 per cent, with the lowest values, ranging from 10 per cent to 15 per cent, found in Malta, Spain and Serbia and Montenegro. In general, within Europe, Southern European countries display the lowest proportions of older persons living alone.

Figure 33
Percentage of population aged 60 or over living alone by sex:
world and development regions

Figure 34
Percentage of population aged 60 or over living alone by sex:
major areas

At the global level, the average proportion of women aged 60 or over living alone is 19 per cent, more than double the proportion of older men living alone (8 per cent). Gender differences are significantly larger in the more developed regions, where levels of solitary living are relatively higher than in the less developed regions (figure 33). More older women than older men live alone because older women are more likely to be widowed and hence less likely to be living with a spouse (figure 31). Among persons without spouses, however, older men are more likely than older women to live alone in most countries; that is, if a man survives to old age without a spouse, he often has a higher risk of living alone (United Nations, 2005b).

The gender gap in solitary living is particularly high in Western Europe where the proportion of older women who live alone (43 per cent) is almost triple that of older men (15 per cent). In Africa and Asia, the proportion of older women living alone (11 per cent in Africa and 9 per cent in Asia) is about 80 per cent higher than among older men (6 per cent in Africa and 5 per cent in Asia). In Latin America and the Caribbean, 10 per cent of older women live alone, compared to just 7 per cent of older men (figure 34). Only in the Caribbean does a higher proportion of older men live alone than that of older women (10 per cent of older men compared to 9 per cent of older women).

In most countries, the proportion of older persons living alone is higher among women than among men. The exceptions are mostly found in Central America and the Caribbean. The gender difference in the proportion of older persons living alone ranges from 6 percentage points in favour of men in Panama to 30.5 percentage points in favour of women in the Netherlands.

Older women are usually more likely than older men to live alone

Gender differences in solitary living vary greatly among both regions and countries

Chapter V

Socio-economic characteristics of the older population

A. Illiteracy rates

The attainment of universal primary education has been a reality in most developed countries for a long time. As a result, literacy in these regions is assumed to be nearly universal even among the older population and most developed countries no longer gather information on this subject. However, some of the few developed countries having age-specific data on literacy, most of which are located in Eastern Europe and Southern Europe, still show high levels of illiteracy at older ages. In Malta, for instance, 28 per cent of persons aged 65 or over were illiterate in 1995. In Bosnia and Herzegovina, 17 per cent of the population aged 65 or over was illiterate in 2000 and the equivalent proportion was 18 per cent in TFYR Macedonia in 2002. Among the remaining developed countries having the required data, illiteracy levels among older persons vary from 0.4 per cent in Estonia in 2000 to 14 per cent in Serbia and Montenegro in 2003.

In developing countries, levels of educational attainment have generally improved over time, with the result that younger generations are better educated than older ones. However, even for younger generations, levels of educational attainment remain low in many developing countries. Combining the data available for 80 developing countries, it is estimated that, on average, 53 per cent of persons aged 65 or over living in developing countries are illiterate. With the exception of Costa Rica, the proportion of illiterate persons in the developing countries with data is higher among older women than among older men. It is estimated that, on average, 65 per cent of women and 42 per cent of men aged 65 years or over are illiterate in developing countries, a gap of 23 percentage points (figure 35).

In developed countries, literacy among the older population is nearly universal

In developing countries, illiteracy remains high among older people, especially among older women

Figure 35
Estimated average illiterary rate at ages 65 or over by sex:
80 developing countries, 2007

Levels of illiteracy among older persons vary markedly among major areas of the developing world

The gender gap in levels of illiteracy among older persons is lower in Latin America and the Caribbean than in either Africa or Asia

There is considerable variability in illiteracy levels among the older population in developing countries

At the world level, labour force participation among the older population has remained stable since 1980

Data on illiteracy levels by age are available for 32 countries in Africa, 31 in Asia and 16 in Latin American and the Caribbean. On the basis of those data, it is estimated that, in Africa, 70 per cent of the population aged 65 or over is illiterate. The equivalent estimate is 58 per cent for Asia and 29 per cent for Latin American and the Caribbean (figure 36). That is, there are major differences in levels of illiteracy among the older population in the major areas of the developing world.

The estimated average level of illiteracy among women aged 65 or over in Africa is 84 per cent and it is 71 per cent in Asia, levels that are 27 to 28 percentage points higher than those estimated among older men (57 per cent in Africa and 43 per cent in Asia). In Latin America and the Caribbean the gender gap is just 5 percentage points, since the illiteracy level among older women is estimated at 31 per cent compared to 26 per cent among older men (figure 36).

There are huge differences in illiteracy levels among older persons in the developing countries having the required data. In some countries in Africa, such as Benin, Burkina Faso, Chad and Mali, over 90 per cent of persons aged 65 years or over were illiterate around 2000, with illiteracy levels being higher among older women (above 96 per cent) than among older men (above 87 per cent). At the other end of the distribution, in countries such as Armenia, Cuba and Tonga, less than 5 per cent of persons aged 65 or over are illiterate, though illiteracy still tends to be higher among older women than among older men. This wide range of variation is expected to decrease in the future as educational attainment continues to improve in most countries.

B. Labour force participation

Older people today are as likely to participate in the labour force as they were in 1980: about 20 per cent of older persons are economically active worldwide. However, this stability over time masks important changes in labour force participation rates by sex. Among older men, the labour force participation rate decreased from 35 per cent in 1980 to 30 per cent in 2007, and is expected to decline further to 27 per cent by 2020. Among older women, the labour force participation rate has been increasing, passing from 10 per cent in 1980 to 12 per cent in 2007, and is projected to reach 14 per cent by 2020 (figure 37). By that time, the overall labour force participation rate of older persons is projected to decrease slightly from the current 20 per cent to 19 per cent.

Figure 36
Estimated average illiteracy rate at ages 65 or over by sex:
major areas, 2007

Figure 37
**Total, male and female labour force participation at ages 65 or over:
 world, 1980-2020**

Traditionally, the proportion of older men who are economically active has been markedly higher than the proportion of older women. However, because labour force participation at older ages has dropped among men and risen among women, the female share of the older labour force has increased over the past decades, especially in the more developed regions. In 1980, women accounted for 37 per cent of the workers aged 65 or over in the more developed regions and 25 per cent of those in the less developed regions. By 2007, their share had increased to 43 per cent in the more developed regions and to 31 per cent in the less developed regions. At the global level, women’s share of the older work force rose from 28 per cent in 1980 to 33 per cent in 2007 (figure 38).

The female share of the older work force is increasing

Old-age support systems in the form of pension and retirement programmes are less prevalent in developing countries than in developed countries. Consequently, people are compelled to continue working into old age in developing countries for lack of alternative support, with the result that the labour force participation rates at older ages tend to be higher in developing countries than in developed countries. Thus, in 1980, the labour force participation rate among people aged 65 or over was about 28 per cent in the

The labour force participation rates of older persons are higher in the less developed regions

Figure 38
**Distribution of economically active population aged 65 or over by sex:
 world, 1980-2020**

less developed regions and close to 10 per cent in the more developed regions. However, labour force participation rates at older ages have been declining and are currently 26 per cent in the less developed regions and 9 per cent in the more developed regions. By 2020, they are projected to decrease further in the less developed regions, to 24 per cent, and to remain stable in the more developed regions. As is shown in figure 39, the labour force participation rate among older persons in the less developed regions remained about triple that in the more developed regions during 1980-2020.

The labour force participation rate among older persons is lowest in Europe and highest in Africa

Among the world's major areas, Africa has by far the highest proportion of economically active people among those 65 or over, while Europe has the lowest. Between these two extremes, labour force participation rates among the older population are lower in Oceania and Northern America and higher in Asia and in Latin America and the Caribbean.

During 1980-2007, the labour force participation rate among older persons decreased in Europe, remained stable in Latin America and the Caribbean and slightly increased in Northern America and Oceania (figure 40). In Europe, the labour force participation rate of persons aged 65 or over declined by about one third, from 8 per cent in 1980 to 5 per cent in 2007. The reduction between 1980 and 2007 was about 10 per cent in Africa (from 45 per cent to 40 per cent) and Asia (from 27 per cent to 24 per cent). Over the same period, the participation rate increased by about 10 per cent in Oceania (from 9 per cent to 10 per cent), by almost 20 per cent in Northern America (from 12 per cent to 14 per cent), and remained practically constant at around 24 per cent in Latin America and the Caribbean. In most major areas, the labour force participation rates of older men declined while those of older women increased. However, the female labour force participation rate among the older population decreased slightly in Africa and Europe.

In some countries, less than 1 per cent of the population aged 65 or over is in the labour force

In at least 21 countries, fewer than 4 per cent of persons aged 65 or over are currently working. In four of them (France, Luxembourg, Réunion and Slovakia), the proportion of older persons in the labour force is lower than 1 per cent. At the other end of the distribution, over half of all persons aged 65 or over continue to work in at least 30 countries. In Mozambique, the labour force participation rate among older persons is particularly high, at more than 80 per cent.

Labour force participation rates among older men in 2007 range from less than 1.5 per cent in some European countries (France, Luxembourg and Slovakia) and in Réunion to more than 86 per cent in some African countries (e.g., Congo, Sierra Leone

Figure 39
Labour force participation of population aged 65 or over: development regions, 1980-2020

Figure 40
**Labour force participation of population aged 65 or over:
 major areas, 1980 and 2007**

and Somalia). Among older women, labour force participation rates range from less than 0.5 per cent in Luxembourg and Réunion, to more than 70 per cent in Burundi, Malawi and Mozambique.

The labour force participation of older persons has declined in the majority of countries. In 15 countries, the participation rate of persons aged 65 or over has declined by more than 70 per cent since 1980 and in five of them the reduction has been over 80 per cent. The largest decrease was observed in Slovakia, where the labour force participation rate of older persons dropped from 11 per cent in 1980 to 0.8 per cent in 2007.

In about a third of all countries, however, the reported labour force participation rates of older persons have increased since 1980. In four countries with economies in transition—Georgia, Kazakhstan, Kyrgyzstan and Romania—the participation rates more than tripled. In Romania, in particular, the labour force participation rate among those aged 65 or over increased more than sixfold, from 5 per cent in 1980 to 31 per cent in 2007.

C. Statutory pensionable age

Although in some countries pension benefits are payable at any age after a certain period of employment, most commonly ranging from 30 to 40 years of continuous employment, qualifying for a benefit in most countries is conditional on both attaining a specified age and completing the specified period of contributions. In recent years, the minimum age required before a pension entitlement can be claimed has increased in several countries, mainly in response to the budgetary constraints arising from population ageing.

In many countries, women become eligible for full pension benefits at lower ages than men, although women generally survive longer than men. Based on information for 159 countries, the statutory pensionable age as of 2006 was 65 years or higher for men in 31 per cent of the countries with data and for women in 18 per cent of the 159 countries. The pensionable age for men was lower than 60 years in 22 per cent of the countries with data and for women in 47 per cent of those countries (figure 41).

Although the norm has been for a difference of about 5 years between the pensionable age of men and women, there is an emerging trend toward equalizing the statutory pensionable age between the sexes. As of 2006, men and women had the same statutory

Some countries have experienced dramatic declines in the labour force participation of older people

The statutory pensionable age is often higher for men than for women

In most countries the pensionable age is the same for women as for men

Figure 41
Distribution of countries by statutory pensionable age of men and women:
2006 assessment (N=159)

pensionable age in 60 per cent of countries with data available (figure 42). The same pensionable age for men and women was particularly common in the developing world where 65 per cent of the countries with information had the same pensionable age for both. In 56 per cent of developed countries, the pensionable age remained higher for men than for women.

For both men and women, pensionable ages tend to be higher in developed countries than in developing countries

Men become eligible for full pension benefits at age 65 or over in 61 per cent of developed countries, but the pensionable age is 65 or over in only about 20 per cent of developing countries (figure 43). In no developed country is the pensionable age for men lower than 60 years, whereas that is the case in almost 30 per cent of developing countries. For women, the pensionable age is 65 years or over in 39 per cent of developed countries and in only 11 per cent of developing countries (figure 43). In more than 40 per cent of developing countries the pensionable age for women is 55 years or lower, a situation that is similar in less than 5 per cent of developed countries. These differences reflect, to a certain extent, differences in life expectancy, which is lower in developing countries.

Figure 42
Percentage of countries for which the statutory pensionable age is either the same for both sexes or higher for men than for women:
2006 assessment

Figure 43
Percentage of countries for which the statutory pensionable age is 65 years or higher by sex: 2006 assessment

In 60 per cent of countries in Latin American and the Caribbean the statutory pensionable age for men is higher than 60 years, while only 7 per cent of countries in this major area have a pensionable age below 60 years (figure 44). In contrast, the pensionable age for men is below 60 years in 41 per cent of the countries in Africa, while it is higher than 60 years in just 12 per cent of African countries. In Asia, the proportion of countries with a pensionable age for men that is below 60 years is lower than the corresponding proportion in Africa but higher than that in Latin America and the Caribbean. In addition, the proportion of Asian countries with a pensionable age for men above 60 (32 per cent) is higher than the corresponding proportion in Africa and lower than that in Latin American and the Caribbean (figure 44).

Among developing countries, pensionable ages tend to be higher in Latin America and the Caribbean and lower in Africa

Figure 44
Distribution of countries by statutory pensionable age of men: major areas, 2006 assessment

Chapter VI

Conclusion

Global population ageing is a by-product of the demographic transition in which both mortality and fertility decline from higher to lower levels. Currently, the total fertility rate is below the replacement level in practically all industrialized countries. In the less developed regions, the fertility decline started later and has proceeded faster than in the more developed regions. Yet, in all regions people are increasingly likely to survive to older ages, and once there they are tending to live longer, as the gains in life expectancy are relatively higher at older ages.

The older population is growing at a considerably faster rate than that of the world's total population. In absolute terms, the number of older persons has more than tripled since 1950 and will almost triple again by 2050. In relative terms, the percentage of older persons is projected to more than double worldwide by the middle of this century. However, notable differences exist between regions in the numbers and proportions at higher ages. Although the highest proportions of older persons are found in the more developed regions, this age group is growing considerably more rapidly in the less developed regions. As a consequence, the older population will be increasingly concentrated in the less developed regions.

The young-old balance is shifting throughout the world. In the more developed regions, the proportion of older persons already exceeds that of children, and by 2050 it is expected to be double that of children. In the less developed regions, age-distribution changes have been slow but will accelerate over the coming decades. Currently, the median age in the more developed regions is more than 13 years higher than in the less developed regions and almost 20 years higher than in the least developed countries.

An increase in the old-age dependency ratio indicates a situation in which an increasing number of potential beneficiaries of health and pension funds (mainly those aged 65 and over) are supported by a relatively smaller number of potential contributors (those in the economically active ages of 15-64). This trend tends to impose heavier demands on the working-age population (in the form of higher taxes and other contributions) in order to maintain a stable flow of benefits to the older groups. Even the sharp decline in youth dependency that has accompanied the increase in old-age dependency may not be enough to offset the increased costs, since the relative expense of supporting the old is, in general, higher than that of supporting the young.

The continuing increase of the parent support ratio implies that more and more frequently the young-old will find themselves responsible for the care of one or more very old family members. Parent support ratios are lower in the developing regions, where public institutions for the support of the very old tend to be less fully developed. However, the ratio is rising quite rapidly in the developing regions as well.

As the numbers and relative proportions of the older population increase, their demographic characteristics are also changing. For instance, the older population is itself undergoing a process of demographic ageing. At the global level, the most rapidly growing age group is that aged 80 and over. Although the oldest-old still constitute a small proportion of the total population, their numbers are becoming increasingly important, especially in the less developed regions.

In most countries, older women greatly outnumber older men. In many cases, the difference is so large that the concerns of the older population should in fact be viewed primarily as the concerns of older women. This is especially true in the case of the oldest-old populations, as the female share increases markedly with age.

Older men are much more likely to be married than are older women due to a combination of factors that include the higher female life expectancy, the tendency for men to marry slightly younger women, and the higher remarriage rates among older widowed men than women. As a consequence, older men are in general more likely than older women to receive assistance from a spouse, especially when health fails.

Because older women are less likely than older men to be married, mainly because of widowhood, a significantly higher proportion of older women than older men live alone, particularly in the more developed regions. Older women living alone constitute a group of special social and policy concern as they are at greater risk of social isolation and economic deprivation. It is worth noting, however, that among the unmarried, older men are more likely than older women to live alone in most countries.

Labour force participation of the older population has remained stable worldwide over the last decades and is considerably higher in the less developed than in the more developed regions. Nearly everywhere, however, the trend has been towards lower levels of economic activity among older men and higher levels among older women, thus increasing the female share of the older work force. Although lower levels of labour force participation at older ages are usually a sign of higher levels of social security coverage, they may also result from other factors, such as a shortage of employment opportunities and obsolescence of skills and knowledge.

Illiteracy remains high in the less developed regions among older people, especially women. Available evidence suggests that only slightly more than half of all persons 65 and older and less than 35 per cent of women in this age group are literate in those regions. This situation is of special concern as higher levels of education are generally associated with better health and economic status within the older population.

As the twentieth century drew to a close, population ageing and its social and economic consequences were drawing increased attention from policy makers worldwide. Currently, many countries, especially in the more developed regions, have already achieved population structures older than any ever seen in human history. In most cases, the ageing societies also experienced rapid economic growth during the second half of the twentieth century. While major shortcomings and unmet needs remained, most developed countries expanded and diversified their systems of social security and health care and, on the whole, the standard of living of the old as well as the young improved as populations aged. However, strains were building in those support systems, as the older population continued to grow more rapidly than that of younger adults and as earlier withdrawal from the labour force added to the demands on public pension systems.

The twenty-first century will witness even more rapid population ageing than did the century just past. Worldwide, the percentage of the population aged 60 years or over has increased by 3 points—from 8 to 11 per cent—since the middle of the twentieth century. Until the middle of the twenty-first century, that percentage is projected to increase by 11 points, to 22 per cent. By that time, the population of the less developed regions will have about the same percentage of persons aged 60 years or over as the current percentage in the more developed regions. The developing countries will reach that stage over a shorter period than that required by the more developed regions. In many cases, rapid population ageing will be taking place in countries where the level of economic development is still low. The challenge for the future is “to ensure that persons everywhere are able to age with security and dignity and to continue to participate in their societies as citizens with full rights” (United Nations, 2002, para. 10).

Annexes

Annex I

Definition of the indicators of population ageing

A. Ageing index

The **ageing index** is calculated as the number of persons aged 60 years or over per hundred persons under age 15.

B. Dependency ratio

The **total dependency ratio** is the number of persons under age 15 plus persons aged 65 or over per one hundred persons 15 to 64. It is the sum of the youth dependency ratio and the old-age dependency ratio.

The **youth dependency ratio** is the number of persons 0 to 14 years per one hundred persons 15 to 64 years.

The **old-age dependency ratio** is the number of persons aged 65 years or over per one hundred persons 15 to 64 years.

C. Growth rate

A population's **growth rate** is the increase (or decrease) in the number of persons in the population during a certain period of time, expressed as a percentage of the population at the beginning of the time period. The **average annual growth rates** for all ages as well as for particular age groups are calculated on the assumption that growth is continuous.

D. Illiteracy rate

The **illiteracy rate** of a particular age group indicates the proportion of persons in that group who cannot read with understanding and cannot write a short simple statement on their everyday life. National definitions of literacy may in some cases differ. A list of literacy definitions for different countries can be found at the UNESCO Institute for Statistics (UIS) website (<http://stats.uis.unesco.org>).

E. Labour force participation

The **labour force participation rate** consists of the economically active population in a particular age group as a percentage of the total population of that same age group. The active population (or labour force) includes persons in paid or unpaid employment, members of the armed forces (including temporary members) and the unemployed (including first-time job-seekers.). This definition is the one adopted by the Thirteenth International Conference of Labour Statisticians (Geneva, 1982). National definitions may differ in some cases. For information on the differences in scope, definitions and methods of calculation used for the various national series, see International Labour Organization, Sources and Methods: Labour Statistics (formerly Statistical Sources and

Methods), vol. 2, Employment, Wages, Hours of Work and Labour Cost (Establishment Surveys), 2nd edition (Geneva, 1995); vol. 3, Economically Active Population, Employment, Unemployment and Hours of Work (Household Surveys), 2nd edition (Geneva, 1990); and vol. 4, Employment, Unemployment, Wages and Hours of Work (Administrative Records and Related Sources) (Geneva, 1989).

F. Life expectancy

Life expectancy at a specific age is the average number of additional years a person of that age could expect to live if current mortality levels observed for ages above that age were to continue for the rest of that person's life. In particular, life expectancy at birth is the average number of years a newborn would live if current age-specific mortality rates were to continue.

G. Median age

The **median age** of a population is the age that divides a population into two groups of the same size, such that half the total population is younger than this age, and the other half older.

H. Parent support ratio

The **parent support ratio** is the number of persons aged 85 years or over per one hundred persons aged 50 to 64 years.

I. Potential support ratio

The **potential support ratio** is the number of persons aged 15 to 64 per every person aged 65 or over.

J. Sex ratio

The **sex ratio** is calculated as the number of males per one hundred females in a population. The sex ratio may be calculated for a total population or for a specific age group.

K. Survival rate

The **survival rate** to a specific age X is the proportion of newborns in a given year who would be expected to survive at age X if current mortality trends were to continue for at least the next X years. Survival rates are derived from the life table, which is an analytic procedure designed to produce estimates of life expectancies and other measures of survivorship, based on prevailing age-specific death rates.

L. Total fertility rate

The **total fertility rate** is the average number of children a woman would bear over the course of her lifetime if current age-specific fertility rates remained constant throughout her childbearing years (normally between the ages of 15 and 49). The current total fertility rate is an indicator of the level of fertility at a given time.
