POPULATION DIVISION

WORLD POPULATION AGEING: 1950-2050

United Nations New York, 2001

NOTE

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term “country” as used in the text of this publication also refers, as appropriate, to territories or areas.

The designations “more developed”, “less developed” and “least developed” countries, areas or regions are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process.

PREFACE

As the proportion of the world's population in the older ages continues to increase, the need for improved information and analysis of demographic ageing increases. Knowledge is essential to assist policy makers define, formulate and evaluate goals and programmes, and to raise public awareness and support for needed policy changes.

The Population Division of the Department of Economic and Social Affairs of the United Nations has long experience in the analysis of population ageing. In addition to preparing national estimates and projections of older populations, the Population Division has contributed to the analysis of the determinants and consequences of population ageing. The Population Division is the organizational unit of the Secretariat charged with monitoring progress towards the achievement of the goals set out in the Programme of Action of the International Conference on Population and Development, held in Cairo in 1994. The Programme of Action enunciated objectives and recommended actions concerning population ageing and older persons (United Nations, 1995).

The Population Division has also organized expert meetings on various aspects of population ageing. In 1997, for example, the Division convened a meeting on below-replacement fertility (United Nations, 2000); in 2000, two meetings on population ageing were organized: the first on the living arrangements of older persons (United Nations, 2001b), and the second on policy responses to population ageing and

population decline (United Nations, forthcoming). In 1999, the Population Division issued the first United Nations wallchart on population ageing as a contribution to the International Year of Older Persons (United Nations, 1999c).

In 1982, the United Nations adopted the International Plan of Action on Ageing at the first World Assembly on Ageing (United Nations, 1982). Then, in 1999 in its resolution 54/262, the General Assembly decided to convene the Second World Assembly on Ageing in 2002. The Second World Assembly is to be dedicated to the overall review of the outcome of the First World Assembly, and to the adoption of a new international strategy for action on ageing.

The present report was prepared by the Population Division as a contribution to the 2002 World Assembly on Ageing and its follow-up. The report provides a description of global trends in population ageing and includes a series of indicators of the ageing process by development regions, major areas, regions and countries.

Acknowledgement is due to the United States National Institute on Aging and United States Bureau of the Census, which provided partial financial support for this publication.

Comments and suggestions on this report are welcome and may be addressed to Mr. Joseph Chamie, Director, Population Division, Department of Economic and Social Affairs, United Nations Secretariat, New York, N.Y. 10017, fax number (212) 963-2147.

SOURCES, METHODS AND CLASSIFICATIONS

Data on demographic trends used in the present report are taken from the 2000 revision of the official United Nations publication of estimates and projections, *World Population Prospects: The 2000 Revision* (United Nations, 2001c). In addition, data on labour force participation were obtained from the International Labour Organization (ILO) (International Labour Organization, 1996), and on illiteracy from the United Nations Educational, Scientific and Cultural Organization (UNESCO) (United Nations Educational, Scientific and Cultural Organization, 2000).

The population estimates and projections, which are prepared biennially by the Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat, provide the standard and consistent set of population figures that are used throughout the United Nations system as the basis for activities requiring population information. In the case of the 2000 revision, the estimates were made by collecting, evaluating and adjusting, as necessary, all available data for the period 1950-2000. For the period 2000-2050, figures are the result of projections from the year 2000.

The countries and areas identified as statistical units by the Statistics Division of the United Nations and covered by the above estimates and projections, are grouped geographically into six major areas: Africa; Asia; Europe; Latin America and the Caribbean; Northern America; and Oceania. Those major areas are further divided geographically into 21 regions. In addition, the regions are summarized, for statistical convenience, into two general groups—more developed and less developed—on the basis of demographic and socio-economic characteristics. The less developed regions include all regions of Africa, Asia (excluding Japan), Latin America and the Caribbean, and Oceania (excluding Australia and New Zealand). The more developed regions include all other regions plus the three countries excluded from the less developed regions. See Annex II for further detail.

Explanatory notes

Symbols of United Nations documents are composed of capital letters combined with figures.

The following symbols have been used in the tables throughout this report:

Two dots (..) indicate that data are not available or are not separately reported.

An em dash (—) indicates that the amount is nil or negligible.

A hyphen (–) indicates that the item is not applicable.

A minus sign (–) before a figure indicates a decrease.

A point (.) is used to indicate decimals.

A slash (/) indicates a crop year or financial year, for example, 1994/95.

Use of a hyphen (–) between dates representing years, for example, 1990-1995, signifies the full period involved, including the beginning and end years.

Details and percentages in tables do not necessarily add to totals because of rounding.

Reference to “dollars” (\$) indicates United States dollars, unless otherwise stated.

The term “billion” signifies a thousand million.

Executive summary

موجز تنفيذي

قررت الجمعية العامة، في قرارها 262/54 المؤرخ 25 أيار/مايو 2000 عقد الجمعية العالمية الثانية للشيخوخة في عام 2002، كي تتزامن مع الذكرى السنوية العشرين للجمعية العالمية الأولى للشيخوخة. وستعقد الجمعية العالمية الثانية في مدريد في الفترة من 8 إلى 12 نيسان/أبريل 2002، وهي مكرسة لإجراء استعراض عام لنتائج الجمعية العالمية الأولى للشيخوخة، فضلا عن اعتماد استراتيجية العمل الدولية المقترحة للشيخوخة. وتسعى الاستراتيجية الجديدة إلى معالجة الحقائق الاجتماعية الثقافية والاقتصادية والديموغرافية للقرن الحادي والعشرين، مع إيلاء اهتمام خاص لاحتياجات البلدان النامية ومناظيرها.

وقد لعبت القضايا المتصلة بشيخوخة السكان والمسنين دورا بارزا في المؤتمرات الدولية الكبرى الثلاثة للسكان التي نظمتها الأمم المتحدة خلال ربع القرن الأخير. ومثال ذلك أن المؤتمر الدولي للسكان والتنمية المعقود في عام 1994 اعترف بأن التأثير الاقتصادي والاجتماعي لشيخوخة السكان يمثل فرصة وتحديا معا لجميع المجتمعات⁽¹⁾. وفي الأونة الأخيرة، كان من بين ما أكدته الإجراءات الأساسية المتخذة لمواصلة تنفيذ برنامج عمل المؤتمر الدولي للسكان والتنمية التي اعتمدها الجمعية العامة في دورتها الاستثنائية الحادية والعشرين في 2 تموز/يوليه 1999 حاجة جميع المجتمعات إلى التصدي للعواقب الكبرى المترتبة على شيخوخة السكان في العقود التالية⁽²⁾.

ولشعبة السكان في الأمم المتحدة باع طويل في دراسة مسألة شيخوخة السكان، بما في ذلك إعداد تقديرات وإسقاطات للسكان المسنين، وفحص العوامل المحددة لشيخوخة السكان والنتائج المترتبة على ذلك. ومنذ صدور التقرير الرائد عن شيخوخة السكان في عام 1956 الذي ركز في المقام الأول على مسألة شيخوخة السكان في البلدان الأكثر تقدما وحتى إصدار الأمم المتحدة لأول مخطط بياني لها بشأن قضايا شيخوخة السكان في عام 1999،

(1) السكان والتنمية، المجلد الأول: برنامج العمل المعتمد في المؤتمر الدولي للسكان والتنمية، القاهرة، 5-13 أيلول/سبتمبر 1994. (منشورات الأمم المتحدة، رقم المبيع: A.95.XIII.7).

(2) استعراض وتقييم التقدم المحرز في تحقيق أهداف ومرامي برنامج عمل المؤتمر الدولي للسكان والتنمية، تقرير عام 1999، (منشورات الأمم المتحدة، رقم المبيع: E.99.XIII.16).

سعت شعبة السكان على نحو ثابت إلى تنبيه المجتمع الدولي إلى مسألة شيخوخة السكان⁽³⁾.

والغرض من هذا التقرير هو تقديم أساس ديموغرافي متين لمناقشات الجمعية العالمية الثانية للشيخوخة وأنشطة متابعتها. ويبحث التقرير عملية شيخوخة السكان بالنسبة للعالم ككل، وبالنسبة لأكثر المناطق وأقلها تقدماً، والبقاع والأقاليم الرئيسية وفرادى البلدان. ويعرض التقرير موجزات ديموغرافية للفترة من 1950 حتى 2050 لكل بلد، حيث يسلط الضوء على المؤشرات ذات الصلة لشيخوخة السكان.

ويعرض التقرير النتائج الرئيسية الأربعة التالية:

1 - شيخوخة السكان ظاهرة غير مسبوقة لا نظير لها في تاريخ البشرية. ويواكب الارتفاع في نسب كبار السن (60 سنة أو أكثر) انخفاض في نسب الصغار (دون الخامسة عشرة). وبحلول عام 2050، سيتجاوز عدد كبار السن في العالم عدد الشباب لأول مرة في التاريخ. وعلاوة على ذلك، فإن هذا الانقلاب التاريخي في المعدلات النسبية للصغار والكبار قد بدأ بالفعل في المناطق الأكثر تقدماً في عام 1998.

2 - شيخوخة السكان ظاهرة عالمية منتشرة تؤثر على كل رجل وامرأة وطفل. والزيادة المطردة في الفئات العمرية المتقدمة السن بين جماعات السكان الوطنية، من حيث الأعداد المطلقة وفيما يتعلق بالسكان الذين هم في سن العمل، تؤثر تأثيراً مباشراً على عنصر المساواة والتضامن بين الأجيال المختلفة وبين أبناء الجيل الواحد، اللذين يشكلان دعائم المجتمع.

3 - شيخوخة السكان ظاهرة عميقة لها آثار ونتائج كبيرة على جميع جوانب الحياة البشرية. ففي الميدان الاقتصادي، ستؤثر شيخوخة السكان على النمو الاقتصادي والمدخرات، والاستثمار والاستهلاك، وأسواق العمل، والمعاشات التقاعدية، والضرائب وعمليات الانتقال بين الأجيال. كما ستؤثر في المحيط الاجتماعي على الصحة والرعاية الصحية، وعلى تكوين الأسرة وترتيبات المعيشة، والإسكان والهجرة. ويمكن أن تؤثر في الميدان السياسي على أنماط التصويت والتمثيل.

(3) شيخوخة السكان والآثار الاقتصادية والاجتماعية المترتبة عليها، دراسات السكان، رقم 26، (منشورات الأمم المتحدة، رقم المبيع XIII.6.1956)؛ وشيخوخة السكان، عام 1999 (منشورات الأمم المتحدة، رقم المبيع: A.99.XIII.11).

4 - شيخوخة السكان ظاهرة دائمة. فخلال القرن العشرين، استمر معدل المسنين في الارتفاع، ومن المتوقع أن يستمر هذا الاتجاه في القرن الحادي والعشرين. ومثال ذلك أن نسبة المسنين كانت 8 في المائة في عام 1950، ووصلت إلى 10 في المائة في عام 2000، ومن المتوقع أن تصل إلى 21 في المائة في عام 2050. (الشكل الأول).

الشكل الأول

نسبة السكان ممن هم في سن الستين أو أكثر، العالم، 1950-2050

ومن النتائج الهامة الأخرى التي توصل إليها التقرير ما يلي:

- إن اتجاه بلوغ السكان سن الشيخوخة من المتعذر عكسه إلى حد كبير، إذ لا يرجح أن تعود ظاهرة فتوة السكان التي سادت في الماضي.
- الارتفاع في معدل شيخوخة السكان ناشئ عن تحول ديموغرافي في معدلات الخصوبة والوفيات من الارتفاع إلى الانخفاض.
- مع بداية القرن الحادي والعشرين، بلغ عدد كبار السن بين سكان العالم 600 مليون نسمة تقريبا، أي ثلاثة أضعاف العدد الذي سجل قبل خمسين عاما. وبانتصاف القرن الحالي، سيوجد بالعالم حوالي 2 بليون مسن - أي ثلاثة أضعاف عدد أفراد هذه الفئة العمرية في فترة خمسين عاما.
- عدد السكان المسنين في العالم أخذ في الارتفاع بمعدل 2 في المائة سنويا، أي أن عددهم يزيد بسرعة تفوق معدل الزيادة السكانية ككل.

ومن المتوقع أن تستمر شيخوخة السكان في الارتفاع على مدار الخمسة وعشرين عاما التالية على الأقل بصورة أسرع من الفئات العمرية الأخرى. وسيصل معدل الزيادة بين السكان الذين هم في سن الستين أو أكثر إلى 2.8 في المائة سنويا في الفترة من 2025 إلى 2030. وسيطلب هذا النمو السريع إجراء عمليات تكيف اقتصادية واجتماعية بعيدة الأثر في معظم البلدان.

- تتفاوت أعداد ونسب المسنين من منطقة إلى أخرى تفاوتاً ملحوظاً. ففي المناطق الأكثر تقدماً، بلغت نسبة السكان ممن هم في سن الستين أو أكثر حوالي الخمس في عام 2000، ومن المتوقع أن تصل إلى الثلث بحلول عام 2050. أما في المناطق الأقل نمواً، فلا تزيد نسبة السكان ممن تجاوزوا سن الستين على 8 في المائة في الوقت الراهن؛ غير أن المسنين سيؤلفون حوالي 20 في المائة من السكان بحلول عام 2050.

- لما كان معدل شيخوخة السكان أسرع بكثير في البلدان النامية عنه في البلدان المتقدمة النمو، فقد باتت المساحة الزمنية المتاحة للبلدان النامية للتكيف مع عواقب تلك الظاهرة أقل. وعلاوة على ذلك، فإن شيخوخة السكان في البلدان النامية تحدث في ظل مستويات من التنمية الاقتصادية الاجتماعية أقل بكثير مما هو الحال في البلدان المتقدمة النمو.

- يقدر متوسط أعمار البشر في العالم اليوم بـ 26 سنة. وأعلى نسبة للشباب بين السكان هي في اليمن حيث يبلغ متوسط العمر 15 سنة، وأعلى نسبة للمسنين هي في اليابان، حيث يبلغ متوسط العمر 41 سنة. ومن المتوقع بحلول عام 2050 أن يزيد متوسط العمر في العالم بعشر سنوات حيث سيرتفع إلى 36 سنة، وسيصبح أعلى معدل للشباب بين السكان في ذلك الوقت في النيجر حسب المتوقع، حيث سيبلغ متوسط العمر 26 سنة، ومن المنتظر أن تصبح أعلى نسبة للمسنين في إسبانيا آنذاك، حيث سيصبح متوسط العمر 55 سنة.

- ومعدل التقدم في السن يزداد ارتفاعاً بين كبار السكان. وأسرع فئة عمرية نمواً هي مجموعة كبار المسنين، أي من يبلغون الثمانين أو أكثر. وهي تزيد بنسبة 3.8 في المائة سنويا في الوقت الراهن، وتؤلف أكثر من عشر مجموع عدد المسنين. وبانتصاف القرن، سيكون الخمس من عدد سكان العالم المسنين في سن الثمانين أو أكثر.

- ونسبة الدعم المحتمل (عدد الأشخاص ممن تتراوح أعمارهم من 15 إلى 64 عاما بالنسبة لكل شخص يبلغ الخامسة والستين أو أكثر) تشير إلى عبء الإعاقة على العاملين المحتملين. وأثر الشيخوخة الديموغرافية ظاهر في نسبة الدعم المحتمل، التي تراجعت وستظل تتراجع. ففي الفترة بين عامي 1950 و 2000 هبطت نسبة الدعم المحتمل من 12 شخصا إلى 9 أشخاص في سن العمل بالنسبة لكل شخص في سن الخامسة والستين أو أكثر. ومن المتوقع أن تنخفض بانتهاء القرن إلى 4 أشخاص في سن العمل بالنسبة لكل شخص في الخامسة والستين أو أكثر (الشكل الثاني). ولنسب الدعم المحتملة آثار هامة بالنسبة لخطط الضمان الاجتماعي، خاصة النظم التقليدية، التي يدفع فيها العاملون الحاليون استحقاقات المتقاعدين الحاليين.
- أغلبية كبار السن من النساء، حيث أن العمر المتوقع للمرأة أعلى من العمر المتوقع للرجل. ففي عام 2000، كان عدد النساء اللاتي يبلغن سن الستين أو أكثر يزيد على عدد الرجال في هذا العمر بمقدار 63 مليون، بينما تتراوح عددهن في المراحل العمرية المتقدمة أكثر من ضعف عدد الرجال إلى خمسة أضعافهم (الشكل الثالث).
- من المعتاد أن تتدهور صحة المسنين مع التقدم في السن، مما يزيد من الطلب على الرعاية طويلة الأجل مع زيادة أعداد المسنين. ونسبة دعم الأبوبين، أي نسبة السكان البالغين 85 سنة أو أكثر إلى السكان الذين تتراوح أعمارهم بين 50 إلى 64 سنة، تشير إلى مقدار الدعم الذي قد يتعين على الأسر أن تقدمه إلى أفرادها المسنين. وقد بلغت نسبة الأشخاص ممن هم في سن 85 في العالم إلى كل مائة شخص تتراوح أعمارهم من 50 إلى 64 سنة أقل من اثنين في عام 1950، بينما ارتفعت هذه النسبة بحلول عام 2000 إلى 4 في المائة، ومن المتوقع أن تصل إلى 11 في المائة بحلول عام 2050.
- في البلدان التي يرتفع فيها نصيب الفرد من الدخل، تنحو نسبة مشاركة العاملين من المسنين إلى الانخفاض. ففي المناطق الأكثر تقدما تبلغ نسبة الرجال البالغين من العمر ستين عاما أو أكثر ممن يشاركون في النشاط الاقتصادي 21 في المائة بالمقارنة بنسبة 50 في المائة من الرجال في المناطق الأقل تقدما. وفي بعض المناطق الأكثر تقدما، تبلغ نسبة النساء المسنات اللاتي يشاركن في النشاط الاقتصادي 10 في

المائة مقارنة بنسبة 19 في المائة في المناطق الأقل تقدماً. ويشارك المسنون بصورة أكبر في أسواق العمالة في المناطق الأقل نمواً، وذلك أساساً بسبب ضآلة حجم التغطية بخطط التقاعد وانخفاض الدخل التي يحصلون عليها منها نسبياً.

الشكل الثاني

نسبة الدعم المحتمل، العالم، 2050-1950

الشكل الثالث

نسبة النساء بين الأشخاص الذين تتراوح أعمارهم من 40 إلى 59 سنة، و 60 سنة فأكثر، و 80 سنة فأكثر، و 100 سنة فأكثر، العالم، 1950-2050

• رغم أن نسبة الإلمام بالقراءة والكتابة ازدادت بين السكان المسنين، لكن الأمية ما زالت ظاهرة شائعة. ففي عام 2000، كان حوالي نصف عدد الأشخاص ممن هم في سن الستين أو أكثر في المناطق الأقل نمواً من الأميين. بينما لا تزيد نسبة معرفة القراءة والكتابة بمستوى أساسي من الكفاءة عن الثلث بين المسنين وحوالي الثلثة أخماس بين المسنين. أما في المناطق الأكثر تقدماً، فيصل الإلمام بالقراءة والكتابة حد الشيوع في جميع البلدان إلا فيما قل منها.

وختاماً، من الواضح أن تغيرات ديموغرافية غير مسبوقه قد بدأت في القرنين التاسع عشر والعشرين، وما زالت مستمرة إلى حد بعيد في القرن الحادي والعشرين، ومن شأنها أن تبدل وجه العالم. فالانخفاض في معدل الخصوبة مصحوباً بارتفاع في معدلات طول العمر قد أدى وما زال يؤدي إلى حدوث تغيرات غير مسبوقه في هياكل جميع المجتمعات، أبرزها الانقلاب التاريخي في نسب الصغار والمسنين. والنتائج المترتبة على شيخوخة السكان، بعمقها واتساع نطاقها ودوام أثرها، تمثل فرصاً هائلة وتحديات كبيرة بالنسبة لجميع المجتمعات.

执行摘要

2000年5月25日大会第54/262号决议决定于2002年召开第二次老龄问题世界大会，配合第一次老龄问题世界大会二十周年纪念。这个订于2002年4月8日至12日在马德里举行的第二次世界大会将致力于通盘审查第一次老龄问题世界大会的结果，以及通过一个新的《老龄问题国际行动战略》。新战略力求正视二十一世纪的社会文化、经济及人口现实，特别是注意发展中国家的需要和观点。

在过去四分之一世纪中，联合国就与人口老龄化和老年人有关的问题举办了三个大型国际人口会议，在其中发挥了显著的作用。例如，1974年举行的人口及发展问题国际会议确认人口老龄化对经济和社会的影响对所有社会¹既是机会，也是一项挑战。最近，1999年7月2日，大会第二十一届特别会议通过了为进一步执行《国际人口与发展会议行动纲领》采取的重大行动，重申，除其他外，所有社会都必须正视未来几十年人口老龄化的重大后果。²联合国人口司在研究人口老龄化方面有长久的传统，包括估计和预测老年人口，及审查人口老龄化的决定因素及其后果。从1956年的关于人口老龄化问题的奠基性报告起，其中主要关注较发达国家的人口老龄化问题，到1999年出版的第一次联合国人口老化问题挂图，人口司一直设法使国际社会注意到人口老龄化的问题。³

本报告打算为第二次老龄问题世界大会的辩论及其后续行动在人口统计方面提供坚实的基础。报告审查整个世界、较发达及较不发达区域、主要地区与区域、以及个别国家的人口老龄化进程。对每一个国家提供1950至2050年期间的人口统计概况，突出人口老龄化的相关指标。

本报告说明下列主要调查结果：

1. 人口老龄化现象是前所未有的，在人类历史上没有发生过类似的情况。老年人（60岁以上）所占比例的增加是伴随着年轻人（15岁以下）所占比例的减少。到2050年，世界上老年人的数目将在历史上首次超过年轻人的数目。而且，1998年较发达国家已经发生了这种年轻人和老年人的相对比例的历史性扭转。
2. 人口老龄化是普遍性的，是影响每个人，男人、妇女和儿童的一种全球现象。各国人口中老年人群，就绝对数字和相对于工龄人口而言，稳步增多，对作为社会基石的世代间和世代内的平等与团结有直接的影响。

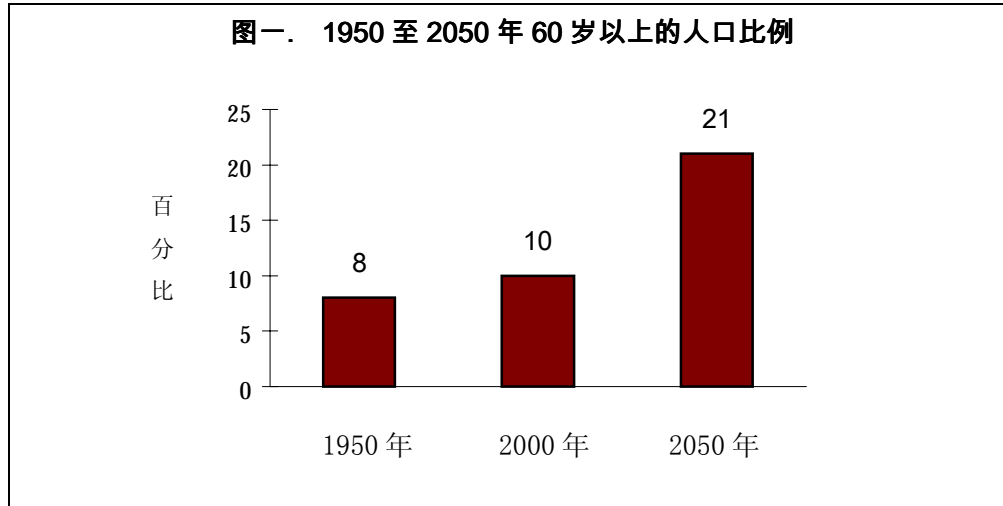

¹ 人口与发展，第一册：国际人口与发展会议通过的行动纲领，开罗，1994年9月5日至13日（联合国出版物，出售品编号：E.95.XIII.7）。

² 审查和评价在落实国际人口与发展会议行动纲领的目标与宗旨方面所得进展，1999年报告（联合国出版物，出售品编号：E.99.XIII.16）。

³ 人口老化及其经济及社会方面所涉的问题，人口研究，第26（联合国出版物，出售品编号：1956.XIII.6）；人口老化1999（联合国出版物，出售品编号：E.99.XIII.11）。

3. 人口老龄化是深刻的，对人类生活的所有方面都有重大的后果和效应。在经济领域，人口老龄化将对经济增长、储蓄、投资与消费、劳动力市场、养恤金、税收及世代间交接发生冲击。在社会层面，人口老龄化影响了保健和医疗照顾、家庭组成、及生活安排、住房与迁徙。在政治方面，人口老龄化会影响投票模式与代表性。

4. 人口老龄化是经久不衰的。在二十世纪内，老年人的比例继续增长，预期这个现象在二十一世纪将继续存在。例如，老年人的比例在 1950 年是 8%，在 2000 年是为 10%，预测在 2050 年将达到 21%（图一）。

本报告的其他关键调查结果包括如下：

人口老龄化的趋势大体上是不可倒转的，过去年轻人口的情况是不可能再度发生。

老年人口的增加是人口从高生殖率和高死亡率转变到低生殖率和低死亡率的结果。

当二十一世纪开始，世界人口有接近 6 亿老年人，为五十年前记录的数目的三倍。到世纪中叶，将有约 20 亿老年人——又一次，这一年龄组在 50 年间翻了两翻。

就全球而言，老年人口每年以 2% 增长，比整个人口增长得快很多。预期至少在今后二十五年内，老年人口将继续比其他年龄组更快速地增长。60 岁以上的年增长率在 2025 至 2030 年间将达到 2.8%。这样迅速增长在大多数国家将需要在经济和社会方面作广泛深入的调整。

在老年人口的数目和比例上，不同区域之间有显著的差距。在较发达国家，2000 年有几近五分之一的人口年龄在 60 岁或以上；预期到 2050 年这一比例将到达三分之一。在较不发达国家，目前仅有 8% 的超过 60 岁；不过，到 2050 年老年人将占几近人口的 20%。

由于发展中国家的人口老龄化的速度比发达国家快得多，发展中国家就比较没有太多时间调整适应人口老龄化的后果。而且，发展中国家的人口老龄化是发生在比发达国家更低的社会经济水平之上。

今天，世界的中位数年龄为 26 岁。人口最年轻的国家是也门，其中位数年龄为 15 岁，最年长的国家是日本，其中位数年龄是 41 岁。到 2050 年，预期世界中位数年龄将会增多十岁，到达 36 岁。届时，人口最年轻的国家预期将是尼日尔，其中位数年龄为 20 岁，预期最老的国家是西班牙，其中位数年龄为 55 岁。

老年人口本身也在老龄化。世界上增长最快的年龄组是最老的，其年龄是 80 岁或以上。他们目前是以每年 3.8% 增长，占老年人总数的十分之一以上。到本世纪中点有五分之一老年人将是 80 岁或以上。

可能支助比，PSR（每个 65 岁或更老的人有多少个 15 至 64 岁的人）显示可能工人所承担的责任。从可能支助比可以看出人口老龄化的冲击，可能支助比已经下降并将继续下跌。在 1950 至 2000 年之间，可能支助比从每个 65 岁或更老的人有 12 个工龄降至 9 个工龄的人。到本世纪中叶，预期可能支助比将下降至每个 65 岁或更老的人有 4 个工龄的人（图二）。可能支助比对社会保险计划、特别是传统的制度，在这种制度下目前的工人支付当下的退休者的福利，有重大的影响。

大多数的老年人是妇女，因为女性的预期寿命高于男人。在 2000 年，60 岁以上的人之中，妇女比男人多 6 300 万人，妇女为男人两倍至五倍（图三）。

老年人的健康状况一般随年龄增加而恶化，促使因老年人的数目增多而对长期照顾的需求增多。父母支助比，就是 85 岁以上的人口与 50 至 64 岁的人的比数，显示家庭可能必须向其最老的成员提供支助的状况。就全球而言，在 1950 年每个 100 个 50 至 64 岁的人有少于 2 个 85 岁以上的人。到 2000 年，这一比例提高至 4 比 100，预计到 2050 年将达到 11。

高人均收入国家往往是年老工人的参与率较低。在较发达国家，60 岁以上的男人有 21% 在经济上是活跃的，而较不发达国家的男人则是 50% 经济活跃的。在较发达国家，老年妇女有 10% 是经济活跃的，而较不发达国家则是 19%。较不发达国家的老年人较大程度地参与劳动力市场，主要是由于退休计划所涵盖的有限，和所提供的收入相对地说来较少。

虽然老年人口的识字率一直在增加，但文盲依然是普遍存在的。在较不发达国家，在 2000 年，60 岁以上的人约有一半是文盲。仅约三分之一的老年妇女和约五分之三的老男人会基本胜任地读和写。在较发达国家，除少数国家之外，所有国家都达到普遍识字。

图二. 1950至2050年世界可能支助比(PSR)

图三. 2000年世界40至59岁、60岁以上、80岁以上及100岁以上的人之中妇女所占的比例

总之,很显然,史无前例的人口变化,源自十九世纪和二十世纪,继续发展至二十一世纪,这种现象正在改变这个世界。生殖率降低加上日益长寿在所有社会的结构方面都产生了和继续产生了重大变动,值得注意的是在年轻人和老年人的比例上发生了历史性的倒转。人口老龄化的深远、普遍和持久地的后果向所有社会都提供了巨大机会,也提出了巨大挑战。

EXECUTIVE SUMMARY

The General Assembly, in its resolution 54/262 of 25 May 2000, decided to convene the Second World Assembly on Ageing in 2002, coinciding with the twentieth anniversary of the first World Assembly on Ageing. The Second World Assembly, to be held in Madrid from 8-12 April 2002, is dedicated to the overall review of the outcome of the first World Assembly on Ageing, as well as the adoption of the proposed international strategy for action on ageing. The new strategy seeks to address the sociocultural, economic and demographic realities of the twenty-first century, with particular attention to the needs and perspectives of developing countries.

Issues related to population ageing and older persons have played a prominent role in the three major international population conferences organized by the United Nations during the past quarter century. For example, the International Conference on Population and Development, held in 1994, recognized that the economic and social impact of population ageing is both an opportunity and a challenge to all societies.¹ More recently, the key actions for the further implementation of the Programme of Action of the International Conference on Population and Development, adopted by the General Assembly at its twenty-first special session on 2 July 1999, reiterated the need, *inter alia*, for all societies to address the significant consequences of population ageing in the coming decades.²

The Population Division of the United Nations has a long tradition of studying population ageing, including estimating and projecting older populations, and examining the determinants and consequences of population ageing. From the groundbreaking report on population ageing in 1956, which focused mainly on population ageing in the more developed countries, to the first United Nations wallchart on population ageing issues published in 1999, the Population Division has consistently sought to bring population ageing to the attention of the international community.³

The present report is intended to provide a solid demographic foundation for the debates and follow-up activities of the Second World Assembly on Ageing. The report considers the process of population ageing for the world as a whole, for more and less developed regions, major areas and regions, and individual countries. Demographic profiles covering the period 1950 to 2050 are provided for each country, highlighting the relevant indicators of population ageing.

The report presents the following four major findings:

¹*Population and Development*, vol. 1: *Programme of Action adopted at the International Conference on Population and Development, Cairo, 5-13 September 1994* (United Nations publication, Sales No. E.95.XIII.7).

²*Review and Appraisal of the Progress Made in Achieving the Goals and Objectives of the Programme of Action of the International Conference on Population and Development, 1999 Report* (United Nations publication, Sales No. E.99.XIII.16).

³*The Aging of Populations and its Economic and Social Implications*, Population Studies, No. 26 (United Nations publication, Sales No. 1956. XIII.6); and *Population Ageing 1999* (United Nations publication, Sales No. E.99.XIII.11).

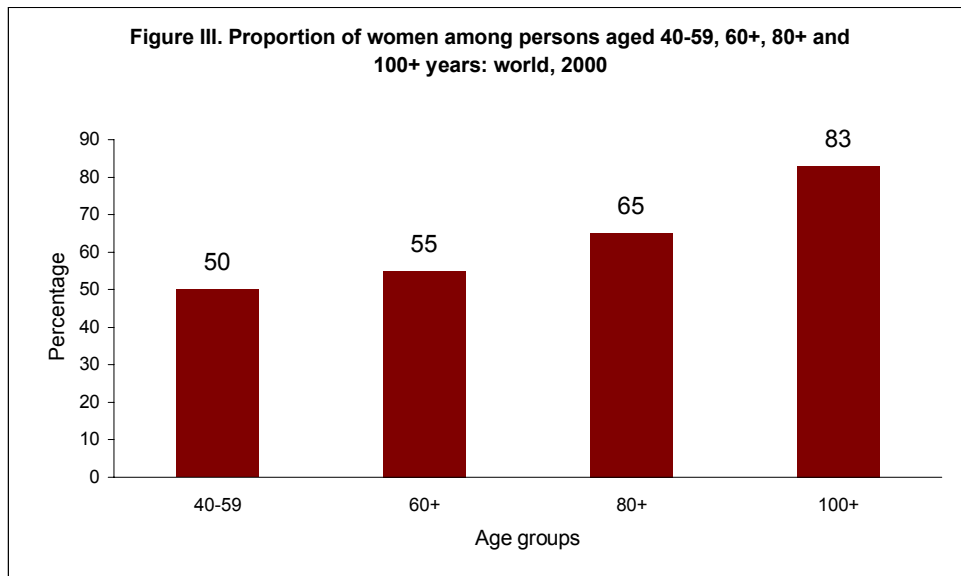

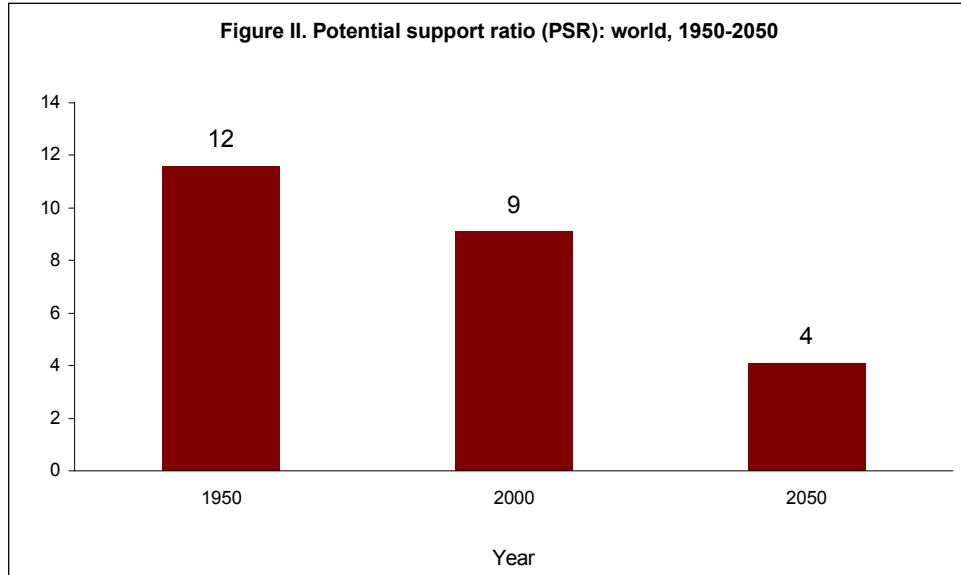

1. Population ageing is unprecedented, without parallel in the history of humanity. Increases in the proportions of older persons (60 years or older) are being accompanied by declines in the proportions of the young (under age 15). By 2050, the number of older persons in the world will exceed the number of young for the first time in history. Moreover, by 1998 this historic reversal in relative proportions of young and old had already taken place in the more developed regions.
2. Population ageing is pervasive, a global phenomenon affecting every man, woman and child. The steady increase of older age groups in national populations, both in absolute numbers and in relation to the working-age population, has a direct bearing on the intergenerational and intragenerational equity and solidarity that are the foundations of society.
3. Population ageing is profound, having major consequences and implications for all facets of human life. In the economic area, population ageing will have an impact on economic growth, savings, investment and consumption, labour markets, pensions, taxation and intergenerational transfers. In the social sphere, population ageing affects health and health care, family composition and living arrangements, housing and migration. In the political arena, population ageing can influence voting patterns and representation.
4. Population ageing is enduring. During the twentieth century the proportion of older persons continued to rise, and this trend is expected to continue into the twenty-first century. For example, the proportion of older persons was 8 per cent in 1950 and 10 per cent in 2000, and is projected to reach 21 per cent in 2050 (figure I).

Other key findings of this report include the following:

- The trend towards older populations is largely irreversible, with the young populations of the past unlikely to occur again.
- The increase in the older population is the result of the demographic transition from high to low levels of fertility and mortality.
- As the twenty-first century began, the world population included approximately 600 million older persons, triple the number recorded fifty years earlier. By mid-century, there will be some 2 billion older persons—once again, a tripling of this age group in a span of 50 years.
- Globally the population of older persons is growing by 2 per cent each year, considerably faster than the population as a whole. For at least the next twenty-five years, the older population is expected to continue growing more rapidly than other age groups. The growth rate of those 60 or older will reach 2.8 per cent annually in 2025-2030. Such rapid growth will require far-reaching economic and social adjustments in most countries.
- Marked differences exist between regions in the number and proportion of older persons. In the more developed regions, almost one fifth of the population was aged 60 or older in the year 2000; by 2050, this proportion is expected to reach one third. In the less developed regions, only 8 per cent of the population is currently over the age of 60; however, by 2050 older persons will make up nearly 20 per cent of the population.
- As the pace of population ageing is much faster in developing countries than in developed countries, developing countries will have less time to adjust to the consequences of population ageing. Moreover, population ageing in the developing countries is taking place at much lower levels of socio-economic development than was the case in the developed countries.
- Today the median age for the world is 26 years. The country with the youngest population is Yemen, with a median age of 15 years, and the oldest is Japan, with a median age of 41 years. By 2050, the world median age is expected to have increased by ten years, to 36 years. The country with the youngest population at that time is projected to be Niger, with a median age of 20 years, and the oldest is expected to be Spain, with a median age of 55 years.
- The older population is itself ageing. The fastest growing age group in the world is the oldest-old, those aged 80 years or older. They are currently increasing at 3.8 per cent per year and comprise more than one tenth of the total number of older persons. By the middle of the century, one fifth of older persons will be 80 years or older.
- The potential support ratio, or PSR (the number of persons aged 15-64 years per one older person aged 65 years or older), indicates the dependency burden on potential workers. The impact of demographic ageing is visible in the PSR, which has fallen and will continue to fall. Between 1950 and 2000, the PSR fell from 12 to 9 people in the working ages per each person 65 years or older. By mid-century, the PSR is projected to fall to 4 working-age persons for each person 65 years or older (figure II). Potential support ratios have important implications for social security schemes, particularly traditional systems in which current workers pay for the benefits of current retirees.

- The majority of older persons are women, as female life expectancy is higher than that for men. In 2000, there were 63 million more women than men aged 60 or older, and at the oldest ages, there are two to five times as many women as men (figure III).

- The health of older persons typically deteriorates with increasing age, inducing greater demand for long-term care as the numbers of the oldest-old grow. The parent support ratio, the ratio of the population 85 or older to those aged 50 to 64, provides an indication of the support families may need to provide to their oldest members. Globally, there were fewer than 2 persons aged 85 or older for every 100 persons aged

50-64 in 1950. By 2000, the ratio had increased to 4 per 100, and it is projected to reach 11 by 2050.

- Countries with high per capita incomes tend to have lower participation rates of older workers. In the more developed regions, 21 per cent of men aged 60 years or older are economically active as compared to 50 per cent of men in the less developed regions. In the more developed regions, 10 per cent of older women are economically active, compared to 19 per cent in the less developed regions. Older persons participate to a greater extent in labour markets in the less developed regions, largely owing to the limited coverage of retirement schemes and the relatively small incomes when provided.
- Although literacy has been increasing among the older population, illiteracy is still common. In the less developed regions, as of 2000, about half of all persons 60 or older were literate. Only about one third of older women and about three fifths of older men could read and write at a basic level of competence. In the more developed regions, literacy approached universality in all but a few countries.

In conclusion, it is evident that unprecedented demographic changes, which had their origins in the nineteenth and twentieth centuries and are continuing well into the twenty-first century, are transforming the world. The declines in fertility reinforced by increasing longevity have produced and will continue to produce unprecedented changes in the structure of all societies, notably the historic reversal in the proportions of young and older persons. The profound, pervasive and enduring consequences of population ageing present enormous opportunities as well as enormous challenges for all societies.

RÉSUMÉ

Dans sa résolution 54/262 du 25 mai 2000, l'Assemblée générale a décidé d'organiser la deuxième Assemblée mondiale sur le vieillissement en 2002, année qui marquera le vingtième anniversaire de la première Assemblée mondiale sur le vieillissement. La deuxième Assemblée mondiale, qui se tiendra à Madrid du 8 au 12 avril 2002, sera consacrée à un examen d'ensemble des résultats de la première Assemblée, ainsi qu'à l'adoption d'une nouvelle stratégie internationale d'action en matière de vieillissement. Cette nouvelle stratégie cherchera à intégrer les réalités socioculturelles, économiques et démographiques du XXI^e siècle, en s'attachant particulièrement aux besoins et perspectives des pays en développement.

Les questions relatives au vieillissement de la population et aux personnes âgées ont occupé une place de premier plan lors des trois grandes conférences internationales sur la population organisées par les Nations Unies au cours des 25 dernières années. Ainsi, la Conférence internationale sur la population et le développement, qui a eu lieu en 1994, a reconnu que l'incidence économique et sociale du vieillissement de la population constituait pour toutes les sociétés à la fois une chance et une gageure¹. Plus récemment, dans les principales mesures pour la poursuite de l'application du Programme d'action de la Conférence internationale sur la population et le développement qu'elle a adoptées à sa vingt et unième session extraordinaire, le 2 juillet 1999, l'Assemblée générale a souligné à nouveau que toutes les sociétés devaient, notamment, s'interroger sur les répercussions importantes qu'aurait le vieillissement de la population dans les décennies à venir².

Cela fait longtemps que la Division de la population de l'ONU étudie la question du vieillissement de la population, réalisant notamment des estimations et des projections des populations de personnes âgées et des études sur les facteurs et les conséquences du vieillissement de la population. Depuis le premier rapport sur le vieillissement de la population, datant de 1956, qui traitait surtout de la situation des pays développés, jusqu'à la première planche murale publiée par l'ONU en 1999, la Division de la population n'a cessé d'appeler l'attention de la communauté internationale sur la question du vieillissement de la population³.

Le présent rapport a pour objet d'offrir une base démographique solide aux débats et aux activités de suivi de la deuxième Assemblée mondiale sur le vieillissement. Il considère le phénomène du vieillissement de la population dans l'ensemble du monde, dans les régions développées comme dans les régions en développement, au niveau des grandes zones et des régions comme au niveau des différents pays. Un profil démographique

¹*Programme d'action adopté à la Conférence internationale sur la population et le développement, Le Caire, 5-13 septembre 1994, Population et développement, vol. 1* (publication des Nations Unies, numéro de vente : F.95.XIII.7).

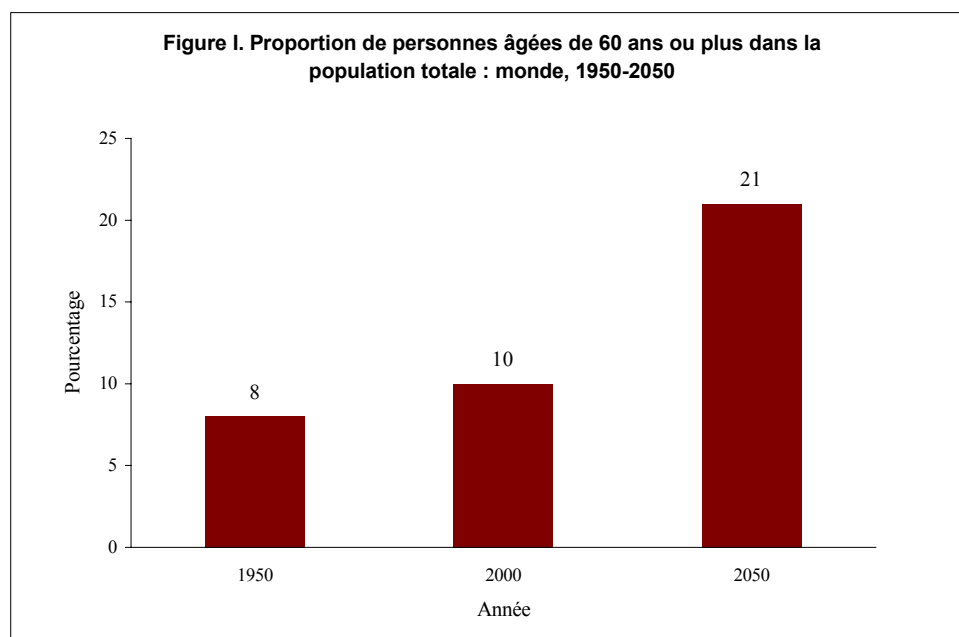

²*Examen et évaluation des progrès accomplis dans la réalisation des buts et objectifs du Programme d'action de la Conférence internationale sur la population et le développement, Rapport 1999* (publication des Nations Unies, numéro de vente : F.99.XIII.16).

couvrant la période allant de 1950 à 2050 est fourni pour chaque pays, l'accent étant mis sur les indicateurs du vieillissement de la population.

Le rapport arrive à quatre conclusions principales :

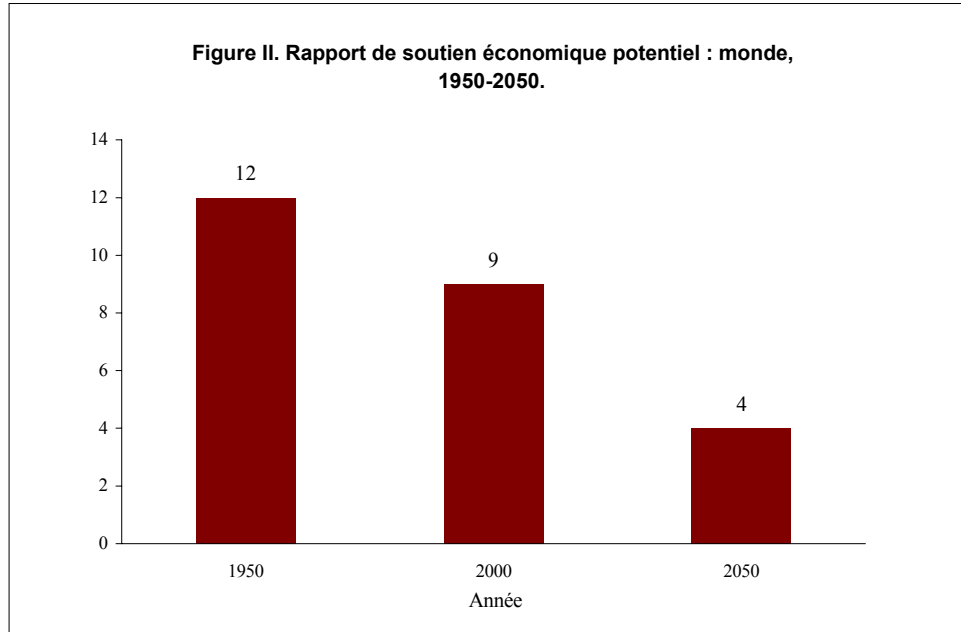

1. Le vieillissement de la population est un phénomène **sans précédent**, dont on ne connaît pas d'équivalent dans l'histoire de l'humanité. L'accroissement de la proportion de personnes âgées (60 ans et plus) s'accompagne d'une baisse de la proportion de jeunes (moins de 15 ans). D'ici à 2050, le nombre des personnes âgées dans le monde dépassera pour la première fois celui des jeunes, ce qui, dans les régions développées, était déjà le cas dès 1998.
2. Le vieillissement de la population est un phénomène **universel** qui touche chaque homme, femme et enfant dans le monde. L'accroissement régulier du groupe des personnes âgées dans les différents pays, tant en chiffres absolus que par rapport à la population d'âge actif, a des répercussions directes sur l'équité et la solidarité entre les générations et au sein des générations, qui constituent le fondement de toute société.
3. Le vieillissement de la population est un phénomène **de grande portée**, dans la mesure où il a des répercussions majeures sur tous les aspects de la vie humaine. Dans la sphère économique, il a des incidences sur la croissance économique, l'épargne, l'investissement et la consommation, le marché du travail, les retraites, la fiscalité et les transferts intergénérationnels. Dans la sphère sociale, il a une incidence sur la santé et les soins médicaux, la composition des familles, les conditions de vie, le logement et les migrations. Et dans la sphère politique, il influe sur les structures de vote et la représentation.
4. Le vieillissement de la population est un phénomène **durable**. Au cours du XXe siècle, la proportion de personnes âgées a continué à progresser et l'on prévoit que cette tendance se poursuivra au XXIe siècle. Ainsi, de 8 % en 1950, cette proportion est passée à 10 % en 2000 et devrait atteindre 21 % d'ici à 2050 (voir figure I).

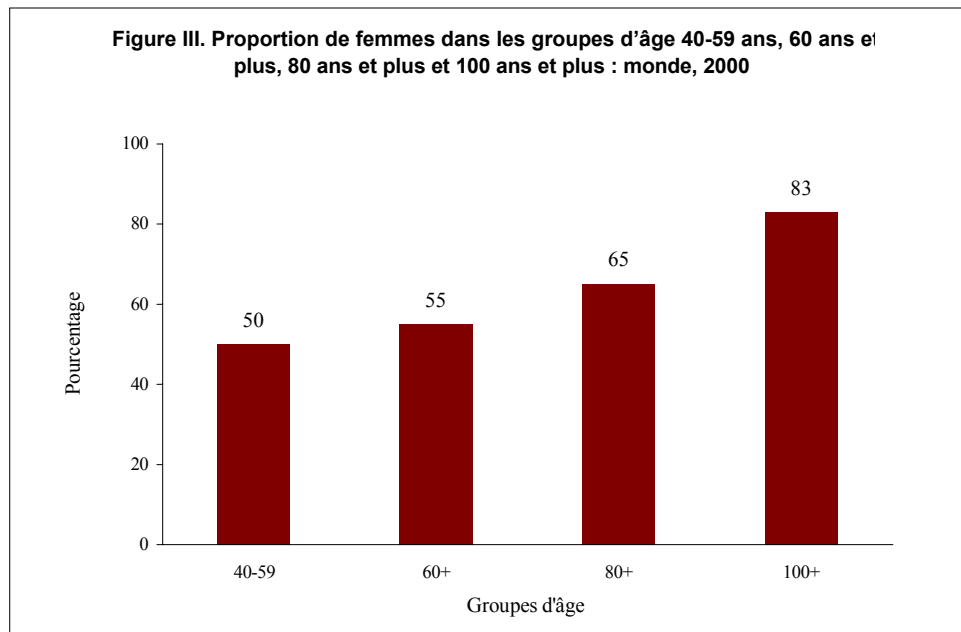

Le rapport présente plusieurs autres conclusions importantes :

- Le vieillissement des populations est un phénomène pratiquement irréversible; un retour aux populations jeunes du passé est peu probable.
- L'augmentation du nombre des personnes âgées est une conséquence d'une transition démographique correspondant au passage de taux élevés à de faibles taux de fécondité et de mortalité.
- En ce début de XXI^e siècle, les personnes âgées sont environ 600 millions dans le monde, soit trois fois plus qu'il y a 50 ans. Vers 2050, elles devraient être quelque 2 milliards, soit, là encore, une multiplication par trois en 50 ans.
- La population mondiale des personnes âgées croît au rythme de 2 % par an, soit beaucoup plus rapidement que la population dans son ensemble. Pendant les 25 ans qui viennent au moins, elle devrait continuer d'augmenter à un rythme plus rapide que les autres groupes d'âge. Le taux d'accroissement annuel de la population âgée de 60 ans et plus atteindra 2,8 % en 2025-2030. Une croissance aussi rapide exigera dans la plupart des pays des mesures d'ajustement économique et social de grande portée.
- Le nombre et la proportion des personnes âgées varient considérablement d'une région à l'autre. Dans les régions développées, les personnes âgées de 60 ans ou plus représentaient en 2000 près du cinquième de la population; d'ici à 2050, elles devraient en constituer le tiers. Dans les régions en développement, les plus de 60 ans ne représentent actuellement que 8 % de la population, mais d'ici à 2050, cette proportion atteindra près de 20 %.
- Le vieillissement de la population âgée étant beaucoup plus rapide dans les pays en développement que dans les pays développés, les premiers disposeront de moins de temps pour s'adapter aux conséquences de ce phénomène. En outre, les populations des pays en développement vieillissent dans un contexte de développement socioéconomique beaucoup moins favorable que cela n'a été le cas dans les pays développés.
- L'âge médian de la population mondiale est aujourd'hui de 26 ans. Le pays dont la population est la plus jeune est le Yémen, avec un âge médian de 15 ans, alors qu'à l'autre extrême, l'âge médian de la population japonaise est de 41 ans. D'ici à 2050, l'âge médian de la population mondiale devrait avoir augmenté de 10 années, pour se situer à 36 ans. Selon les projections, c'est alors le Niger qui aura la population la plus jeune, avec un âge médian de 20 ans, tandis que la population espagnole, dont l'âge médian atteindra 55 ans, sera la plus âgée.
- La population âgée elle-même vieillit. Le groupe d'âge qui progresse actuellement le plus rapidement dans le monde est celui des personnes les plus âgées (80 ans et plus) : il augmente de 3,8 % par an et représente plus du dixième de l'effectif total des personnes âgées. D'ici à 2050, un cinquième des personnes âgées auront 80 ans ou plus.
- Le rapport de soutien économique potentiel (nombre de personnes de 15 à 64 ans par personne de 65 ans ou plus) est un indicateur de la charge supportée par les travailleurs potentiels. Le vieillissement de la population a une incidence visible sur le rapport de soutien économique, qui a déjà baissé et continuera à baisser. Entre 1950 et 2000, le chiffre

est tombé de 12 à 9 personnes d'âge actif par personne âgée de 65 ans ou plus, et il devrait n'être plus que de 4 au milieu du siècle (voir figure II). Ce ratio a d'importantes incidences sur les régimes de retraite, en particulier les régimes traditionnels selon lesquels ce sont les travailleurs en activité qui paient les prestations de retraite en cours.

- La majorité des personnes âgées sont des femmes, celles-ci ayant une espérance de vie supérieure à celle des hommes. En 2000, il y avait 63 millions de femmes de plus que d'hommes dans le groupe des 60 ans ou plus, et dans le groupe le plus âgé, elles étaient de deux à cinq fois plus nombreuses que les hommes (figure III).

- La santé des personnes âgées se dégrade généralement lorsqu'elles avancent en âge, ce qui se traduit par une demande accrue de soins de longue durée, dans la mesure où le nombre des personnes très âgées augmente. Le coefficient de charge parentale, c'est-à-dire le rapport de la population âgée de 85 ans ou plus à celle des personnes de 50 à 64 ans, fournit une indication du soutien que les familles peuvent avoir à fournir à leurs membres les plus âgés. En 1950, on comptait dans le monde moins de 2 personnes âgées de 85 ans ou plus pour 100 personnes de 50 à 64 ans. En 2000, ce taux était passé à 4 % et il devrait atteindre 11 % en 2050.
- Dans les pays ayant un revenu par habitant élevé, le taux d'activité des travailleurs âgés a tendance à être relativement bas. Dans les régions développées, 21 % des hommes et 10 % des femmes âgés de 60 ans ou plus sont actifs, contre respectivement 50 % et 19 % dans les régions en développement. Si les personnes âgées sont plus nombreuses sur le marché du travail dans les régions en développement, c'est en grande partie à cause de la couverture restreinte des régimes de retraite et, quand une pension est servie, de son montant insuffisant.
- Bien que le taux d'alphabétisation des personnes âgées ait progressé, l'analphabétisme reste encore très répandu dans ce groupe de population. En 2000, dans les régions en développement, la moitié environ des personnes âgées de 60 ans ou plus étaient alphabétisées; seuls un tiers des femmes âgées et environ trois cinquièmes des hommes âgés savaient lire et écrire à un niveau élémentaire. Dans les régions développées, à l'exception de quelques rares pays, l'alphabétisation de la population était quasiment universelle.

En conclusion, il apparaît que des mutations démographiques sans précédent, ayant débuté aux XIXe et XXe siècles et se poursuivant au XXIe siècle, sont en passe de changer le visage du monde. La baisse des taux de fécondité, conjuguée à un accroissement de la longévité, a produit et continuera à produire des changements structurels inédits dans toutes les sociétés, comme l'inversion historique des proportions de jeunes et de personnes âgées. Le vieillissement de la population, aux conséquences de grande portée, universelles et durables, ouvre à toutes les sociétés des perspectives immenses mais leur pose également un énorme défi.

Резюме

В своей резолюции 54/262 от 25 мая 2000 года Генеральная Ассамблея постановила созвать вторую Всемирную ассамблею по проблемам старения в 2002 году, приурочив ее к двадцатой годовщине первой Всемирной ассамблеи по проблемам старения. Вторая Всемирная ассамблея по проблемам старения, которая будет проходить в Мадриде 8–12 апреля 2002 года, будет посвящена общему обзору результатов проведения первой Всемирной ассамблеи по проблемам старения, а также принятию предлагаемой международной стратегии действий по проблемам старения. Новая стратегия нацелена на решение проблем, обусловленных социальными, культурными, экономическими и демографическими реалиями XXI века, при уделении особого внимания нуждам и мнениям развивающихся стран.

Проблемы, связанные со старением населения и нуждами пожилых людей, занимали важное место в работе трех крупных международных конференций по вопросам народонаселения, организованных Организацией Объединенных Наций в последней четверти XX века. Так, например, в ходе состоявшейся в 1994 году Международной конференции по народонаселению и развитию было признано, что экономические и социальные последствия старения населения представляют собой как возможность, так и проблему для всех стран¹. Более свежим примером могут служить основные направления деятельности по дальнейшему осуществлению Программы действий Международной конференции по народонаселению и развитию, принятые Генеральной Ассамблеей на ее двадцать первой специальной сессии 2 июля 1999 года, в которых подчеркивалось, что в предстоящие десятилетия всем странам необходимо, в частности, заняться решением проблем, обусловленных серьезными последствиями старения населения².

Отдел народонаселения Организации Объединенных Наций имеет давние традиции изучения проблем старения населения, включая оценку и прогнозирование численности населения более старшего возраста, а также анализ определяющих факторов и последствий старения населения. Начиная с 1956 года, когда был впервые подготовлен доклад по проблеме старения населения, посвященный, главным образом, вопросам старения населения в более развитых странах, и вплоть до 1999 года, когда была издана первая настенная диаграмма Организации Объединенных Наций по проблемам старения

² *Review and Appraisal of the Progress Made in Achieving the Goals and Objectives of the Programme of Action of the International Conference on Population and Development, 1999 Report* (United Nations publication, Sales No. E.99.XIII.16) (*Обзор и оценка прогресса, достигнутого в реализации целей и задач Программы действий Международной конференции по народонаселению и развитию, доклад за 1999 год*).

населения, Отдел народонаселения неизменно стремился привлечь внимание международного сообщества к проблеме старения населения³.

Цель настоящего доклада состоит в том, чтобы заложить солидную документную базу по демографической проблематике для проведения дискуссий и последующей деятельности по итогам второй Всемирной ассамблеи по проблемам старения. В докладе рассматривается процесс старения населения во всем мире в целом, в более и в менее развитых регионах, в основных областях и регионах, а также в отдельных странах. По каждой стране представлены развернутые демографические данные, охватывающие период с 1950 по 2050 год, с указанием соответствующих показателей старения населения.

В докладе сделаны следующие четыре основных вывода:

1. Темпы процесса старения населения являются **беспрецедентными**, не имеющими аналогов в истории человечества. Увеличение доли пожилых людей (в возрасте 60 лет и старше) сопровождается уменьшением доли молодежи (в возрасте до 15 лет). К 2050 году число пожилых людей в мире впервые в истории превысит общую численность молодежи. Более того, к 1998 году такое кардинальное изменение соотношения доли стариков и молодежи уже произошло в более развитых регионах.
2. Процесс старения населения является **глобальным** явлением, затрагивающим всех без исключения: мужчин, женщин и детей. Неуклонное увеличение доли людей старших возрастных групп в составе населения стран как в абсолютном выражении, так и по отношению к населению трудоспособного возраста непосредственно сказывается на лежащих в основе любого общества принципах справедливости и солидарности между поколениями и внутри поколений.
3. Процесс старения населения оказывает **серьезное** воздействие на все стороны жизни человека. Что касается экономики, то старение населения скажется на экономическом росте, сбережениях, инвестициях и потреблении, рынках труда, пенсиях, налогообложении и трансфертах между поколениями. Что касается социальной сферы, то старение населения сказывается на состоянии здоровья людей и системы здравоохранения, составе семьи и образе жизни, жилищных условиях и миграции населения. В политической области старение населения способно повлиять на распределение голосов и представленность различных возрастных групп.
4. Старение населения носит **долговременный характер**. В XX веке доля пожилых людей постоянно увеличивалась, и, как ожидается, эта тенденция сохранится и в XXI веке. Так, например, доля пожилых людей составляла 8 процентов в 1950 году и 10 процентов в 2000 году и, по прогнозам, достигнет 21 процента в 2050 году (диаграмма I).

³ *The Ageing of Populations and its Economic and Social Implications*, Population Studies, No. 26 (United Nations publication, Sales No. 1956.XIII.6) (*Старение населения и его социально-экономические последствия*); and *Population Ageing 1999* (United Nations publication, Sales No. E.99.XIII.11) (*Старение населения, 1999 год*).

Кроме того, в докладе излагаются следующие основные выводы:

- тенденция старения населения, в основном, необратима, и маловероятно, что когда-либо в будущем доля молодого населения приблизится к показателям, наблюдавшимся в прошлом;
- увеличение доли пожилых людей является результатом демографических изменений: снижения уровней рождаемости и смертности;

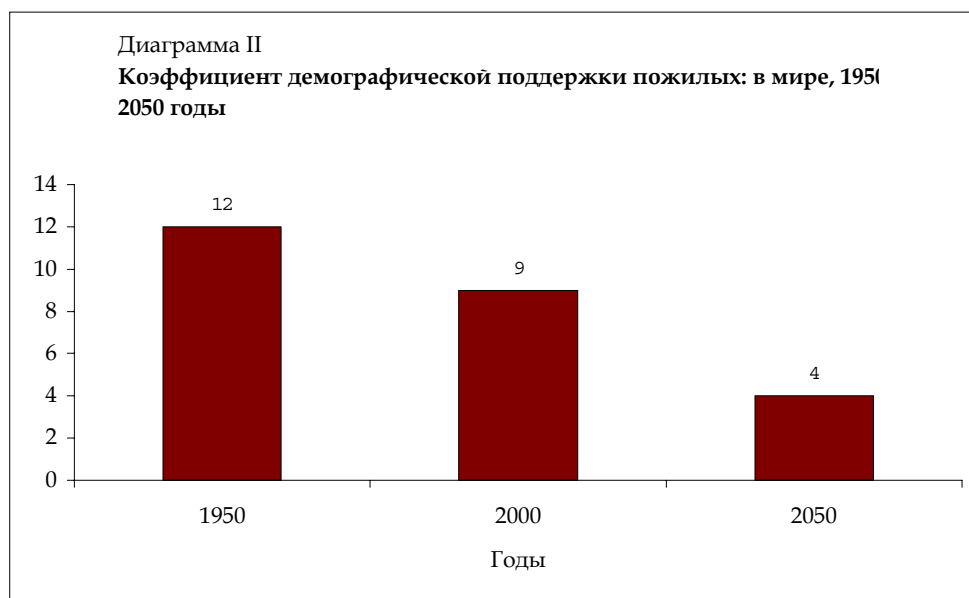

- на начало XXI века в мире проживало примерно 600 миллионов пожилых людей: втрое больше, чем 50 лет назад. К середине века пожилых людей будет насчитываться около 2 миллиардов, т.е. численность этой возрастной группы за 50 лет вновь увеличится в три раза;
- в глобальном масштабе число пожилых людей ежегодно увеличивается на 2 процента, т.е. значительно быстрее, чем численность населения в целом. Ожидается, что по крайней мере в ближайшие 25 лет число пожилых людей будет увеличиваться быстрее, чем численность других возрастных групп. В 2025–2030 годах ежегодные темпы роста населения в возрасте 60 лет и старше достигнут 2,8 процента. Столь быстрый рост обусловит необходимость проведения в большинстве стран рассчитанных на длительную перспективу экономических и социальных преобразований;
- между различными регионами существуют значительные отличия в том, что касается численности и процентной доли пожилых людей. В более развитых регионах в 2000 году лица в возрасте 60 лет и старше составляли почти пятую часть населения; ожидается, что к 2050 году доля этой возрастной группы достигнет одной трети. В

менее развитых регионах доля населения в возрасте старше 60 лет составляет в настоящее время лишь 8 процентов; однако к 2050 году доля пожилых людей в общей численности населения составит почти 20 процентов;

- поскольку старение населения в развивающихся странах идет значительно более высокими темпами, чем в развитых, у развивающихся стран будет меньше времени на адаптацию к последствиям старения населения. Кроме того, старение населения в развивающихся странах происходит в условиях значительно более низкого, чем в развитых странах, уровня социально-экономического развития;
- на сегодняшний день медианный возраст мира земного шара составляет 26 лет. Самое молодое население — в Йемене, где медианный возраст составляет 15 лет, а самое старое — в Японии, где медианный возраст составляет 41 год. Ожидается, что к 2050 году медианный возраст по миру в целом увеличится на 10 лет и составит 36 лет. По прогнозам, страной с самым молодым населением на тот момент будет Нигер, где медианный возраст жителей составит 20 лет, а страной с самым старым населением — Испания, где медианный возраст жителей составит 55 лет;
- стареет и само пожилое население. Наиболее высокими темпами в мире растет группа самых старых людей, т.е. в возрасте 80 лет и старше. На сегодняшний день численность этой группы увеличивается на 3,8 процента в год и составляет более одной десятой общей численности пожилых людей. К середине века люди в возрасте 80 лет и старше будут составлять пятую часть всех пожилых людей;
- коэффициент демографической поддержки пожилых (число лиц в возрасте 15–64 лет на одного пожилого человека в возрасте 65 лет или старше) дает представление о том, какая нагрузка в плане оказания поддержки иждивенцам ляжет на плечи будущих работников. Коэффициент демографической поддержки пожилых, величина которого уменьшилась и будет уменьшаться в дальнейшем, наглядно свидетельствует о последствиях старения населения. В период 1950–2000 годов коэффициент демографической поддержки пожилых уменьшился с 12 до 9 человек трудоспособного возраста на каждого пожилого человека в возрасте 65 лет и старше. По прогнозам, к середине века он снизится до четырех лиц трудоспособного возраста на каждого пожилого человека в возрасте 65 лет или старше (диаграмма II). Коэффициент демографической поддержки пожилых имеет важное значение для планов социального обеспечения, особенно в рамках традиционных систем, предусматривающих выплату пособий нынешним пенсионерам за счет средств, вносимых нынешними работниками;
- большинство пожилых людей — женщины, поскольку продолжительность жизни женщин выше, чем мужчин. В 2000 году женщин в возрасте 60 лет и старше было на 63 миллиона больше, чем мужчин той же возрастной группы, а среди самой старшей возрастной категории число женщин в два-пять раз превышает число мужчин (диаграмма III);

- с возрастом здоровье пожилых людей, как правило, ухудшается, так что по мере увеличения численности самой старой группы населения увеличиваются потребности в обеспечении долгосрочного ухода. Коэффициент демографической поддержки родителей, т.е. соотношение численности населения в возрасте 85 лет или старше и численности населения в возрасте 50–64 лет, дает представление о том, какую поддержку семьи, возможно, должны будут оказывать своим самым старшим членам. В 1950 году по миру в целом на каждые 100 человек в возрасте 50–64 лет приходилось менее 2 человек в возрасте 85 лет или старше. К 2000 году это соотношение увеличилось до 4:100 и, по прогнозам, к 2050 году составит 11:100;

- в странах с высоким уровнем дохода на душу населения доля работающих в общей численности населения пожилого возраста обычно ниже. В более развитых регионах доля самодельного населения среди мужчин в возрасте 60 лет или старше составляет 21 процент, тогда как в менее развитых регионах этот показатель равен 50 процентам. В более развитых регионах экономически активными продолжают оставаться 10 процентов пожилых женщин, тогда как в менее развитых регионах их доля составляет 19 процентов. Пожилые люди в большей степени представлены на рынках труда в менее развитых регионах, главным образом ввиду ограниченного охвата планами пенсионного обеспечения и относительно низкого уровня дохода, который обеспечивает пенсия, если таковая предоставляется;
- хотя уровень грамотности среди пожилого населения увеличивается, неграмотность по-прежнему является распространенным явлением. В менее развитых регионах по состоянию на 2000 год неграмотным было более половины всего населения в возрасте 60 лет и старше. Лишь около трети пожилых женщин и примерно три пятых пожилых мужчин владели самыми элементарными навыками чтения и письма. В более развитых регионах почти во всех странах, за исключением нескольких, обеспечен практически всеобщий уровень грамотности.

В заключение необходимо отметить, что беспрецедентные демографические изменения, начавшиеся в XIX и XX веках, которые продолжаются и в XXI веке, несомненно, меняют наш мир. Снижение рождаемости, усугубляемое увеличением продолжительности жизни, стало и будет оставаться причиной беспрецедентных изменений в структуре общества во всех странах, особенно в том, что касается радикального изменения соотношения молодых и пожилых людей. Последствия старения населения, носящие серьезный, глобальный и долговременный характер, открывают огромные возможности, но одновременно и порождают огромные проблемы для всех стран.

RESUMEN EJECUTIVO

La Asamblea General, en su resolución 54/262, de 25 de mayo de 2000, decidió convocar la Segunda Asamblea Mundial sobre el Envejecimiento en 2002, con ocasión del vigésimo aniversario de la celebración en Viena de la Asamblea Mundial sobre el Envejecimiento. La Segunda Asamblea Mundial, que se celebrará en Madrid del 8 al 12 de abril de 2002, se centrará en la revisión global de los resultados de la Primera Asamblea Mundial sobre el Envejecimiento y en la aprobación de la propuesta de estrategia a largo plazo sobre el envejecimiento. La nueva estrategia tiene por objeto abordar las realidades socioculturales, económicas y demográficas del siglo XXI, con especial referencia a las necesidades y perspectivas de los países en desarrollo.

Las cuestiones relacionadas con el envejecimiento de la población y las personas de edad han tenido un papel destacado en las tres principales conferencias internacionales sobre población organizadas por las Naciones Unidas durante el último cuarto del siglo. Por ejemplo, en la Conferencia Internacional sobre la Población y el Desarrollo, celebrada en 1994, se reconoció que el impacto social y económico del envejecimiento de la población constituía tanto una oportunidad como un reto para todas las sociedades¹. Más recientemente, las medidas clave para seguir ejecutando el Programa de Acción de la Conferencia Internacional sobre la Población y el Desarrollo, aprobadas por la Asamblea General el 2 de julio de 1999, durante su vigésimo primer período extraordinario de sesiones, reiteraron la necesidad, entre otras cosas, de que todas las sociedades afrontasen las importantes consecuencias que el envejecimiento de la población tendría en los próximos decenios².

La División de Población de las Naciones Unidas cuenta con una larga tradición en el estudio del envejecimiento de la población, incluidas las estimaciones y proyecciones sobre poblaciones de edad, y el examen de factores determinantes y consecuencias del envejecimiento de la población. Desde el innovador informe sobre el envejecimiento de la población de 1956, que se centraba principalmente en el envejecimiento de la población en los países más desarrollados, hasta el primer diagrama mural de las Naciones Unidas sobre cuestiones relacionadas con el envejecimiento de la población publicado en 1999, la División de Población ha tratado sistemáticamente de señalar a la atención de la comunidad internacional la cuestión del envejecimiento de la población³.

El presente informe tiene por objeto establecer un sólido fundamento demográfico para los debates y las actividades complementarias de la Segunda Asamblea Mundial sobre el Envejecimiento. En el informe se estudia el proceso de envejecimiento de la población desde el punto de vista mundial, en las regiones más y menos desarrolladas, las principales zonas y regiones y los países. Respecto de cada país se presentan perfiles demográficos que abarcan el período

¹*Población y Desarrollo, vol. 1: Programa de Acción adoptado en la Conferencia Internacional sobre la Población y el Desarrollo, El Cairo, 5 a 13 de septiembre de 1994* (publicación de las Naciones Unidas, número de venta: S.95.XIII.7).

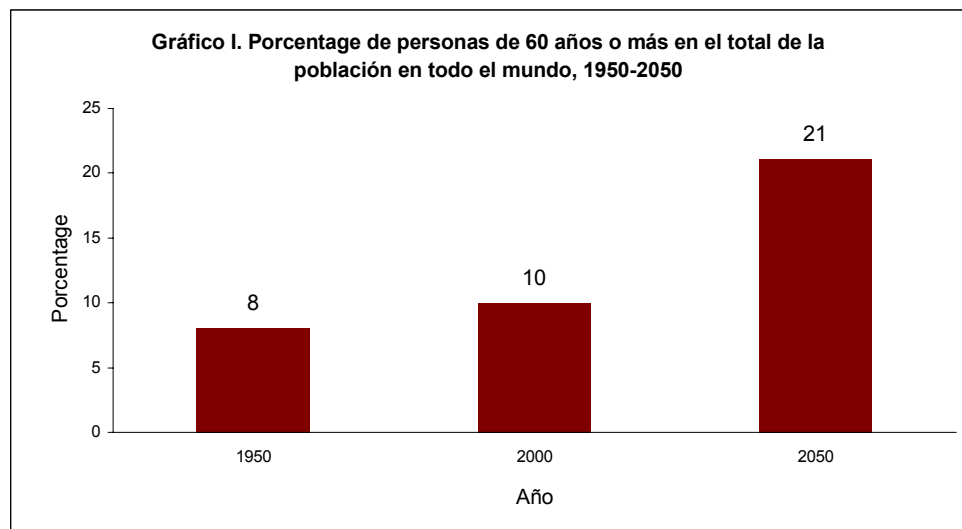

²*Examen y evaluación de los progresos realizados en la consecución de los mismos objetivos del Programa de Acción de la Conferencia Internacional sobre la Población y el Desarrollo, Informe de 1999* (publicación de las Naciones Unidas, número de venta: S.99.XIII.16).

do comprendido entre 1950 y 2050, en los que se da énfasis a indicadores que atañen al envejecimiento de la población.

En el presente informe se exponen cuatro conclusiones fundamentales:

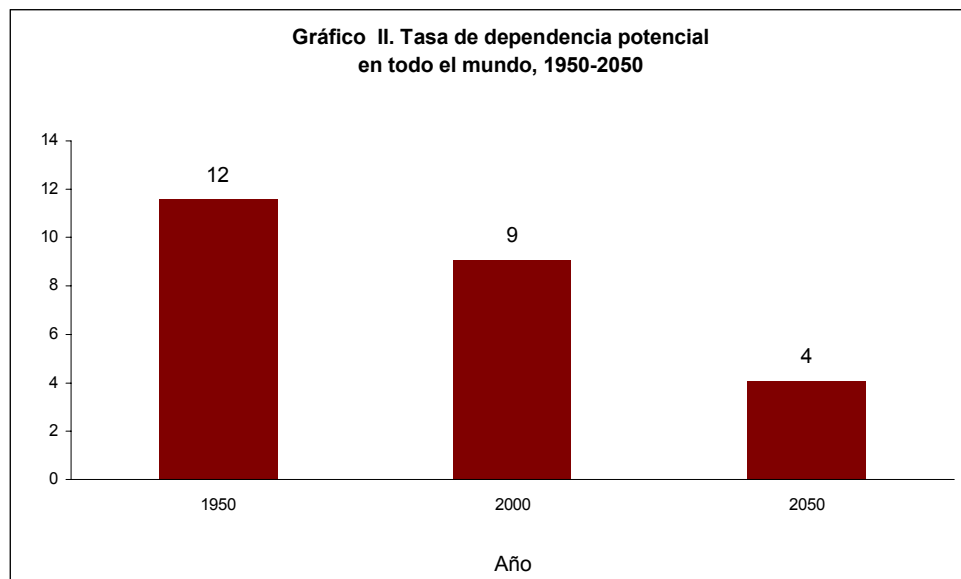

1. El envejecimiento de la población **carece de precedentes** y no tiene paralelos en la historia de la humanidad. Los incrementos en los porcentajes de personas de edad (de 60 años o más) van acompañados de descensos en los porcentajes de jóvenes (menores de 15 años). Para 2050, por primera vez en la historia, las personas de edad en el mundo superarán en número a los jóvenes. Además, en 1998 ya se había producido esta inversión histórica en los porcentajes relativos de jóvenes y las personas de edad en las regiones más desarrolladas.
2. El envejecimiento de la población es **general**, esto es, se trata de un fenómeno mundial que afecta a todos los hombres, mujeres y niños. El incremento sostenido de los grupos de más edad en las poblaciones nacionales, tanto en cifras absolutas como en relación con la población en edad de trabajar, tiene una influencia directa en la equidad y la solidaridad intergeneracionales e intrageracionales que son las bases de la sociedad.
3. El envejecimiento de la población es **profundo** y tiene importantes consecuencias y ramificaciones en todas las facetas de la vida humana. En lo económico, el envejecimiento de la población incidirá en el crecimiento económico, el ahorro, la inversión y el consumo, los mercados de trabajo, las pensiones, la tributación y las transferencias intergeneracionales. En lo social, el envejecimiento de la población incide en la salud, la atención de la salud, la composición de la familia y las condiciones de vida, la vivienda y la migración. En lo político, el envejecimiento de la población puede influir en los patrones de voto y la representación.
4. El envejecimiento es **duradero**. Durante el siglo XX, la proporción de personas de edad siguió aumentando, y se espera que esta tendencia continúe durante el siglo XXI. Por ejemplo, en 1950 el porcentaje de personas de edad era de 8% y en 2000 de 10%, previéndose que llegará a 21% en 2050 (gráfico I).

Otras conclusiones importantes de este informe son las siguientes:

- La tendencia al envejecimiento de la población es casi irreversible, y es muy poco probable que vuelvan a darse las poblaciones jóvenes del pasado.
- El aumento de la población de edad obedece a una transición demográfica de tasas elevadas a tasas reducidas de fecundidad y mortalidad.
- Al inicio del siglo XXI, la población del mundo incluía aproximadamente 600 millones de personas de edad, tres veces la cifra registrada 50 años antes. A mediados de siglo, habrá alrededor de 2.000 millones de personas de edad, lo que significa que, una vez más, este grupo de edad se habría triplicado en un lapso de 50 años.
- A nivel mundial, la población de personas de edad aumenta a razón de 2% por año, considerablemente más rápido que la población total. Al menos en los próximos 25 años, la población de edad continuaría aumentando con más rapidez que ningún otro grupo de edad. La tasa anual de crecimiento del grupo de 60 años o más será de 2,8% entre 2025 y 2030. Este crecimiento acelerado exigirá ajustes económicos y sociales de largo alcance en la mayoría de los países.
- Existen diferencias marcadas entre regiones en el número y la proporción de personas de edad. En las regiones más desarrolladas, casi una quinta parte de la población tenía 60 o más años en 2000; para 2050, se espera que esta proporción sea de un tercio. En las regiones menos desarrolladas, sólo el 8% de la población tiene actualmente más de 60 años; no obstante, para 2050, las personas de edad constituirán casi el 20% de la población.
- Como el ritmo de envejecimiento de la población es mucho más rápido en los países en desarrollo que en los países desarrollados, los países en desarrollo tendrán menos tiempo para adaptarse a las consecuencias del envejecimiento de la población. Además, el envejecimiento de la población en los países en desarrollo se produce a niveles de desarrollo socioeconómico muy inferiores a los que existían en su momento en los países desarrollados.
- Actualmente, la edad mediana en el mundo es de 26 años. El país con la población más joven es Yemen, con una edad mediana de 15 años, y el más viejo es Japón, con una edad mediana de 41 años. Para 2050, se espera que la edad mediana mundial habrá aumentado en 10 años (a 36 años). Se prevé que el país con la población más joven en ese momento será Níger, con una edad mediana de 20 años, y el más viejo España, con una edad mediana de 55 años.
- La misma población de edad está envejeciendo. El grupo de edad que crece más rápidamente en el mundo es el de las personas mayores dentro del grupo de personas de edad, es decir, el de personas de 80 años o más, que aumenta actualmente a una tasa anual de 3,8% y constituye más de una décima parte del total de personas de edad. A mediados de siglo, una quinta parte de las personas de edad tendrá 80 años o más.
- El cociente de dependencia potencial (el número de personas entre 15 y 64 años de edad por cada persona de 65 años o más) indica la carga de dependencia que afrontan los trabajadores potenciales. La incidencia del envejecimiento demográfico puede apreciarse en la tasa de dependencia

potencial, que ha disminuido y seguirá disminuyendo. Entre 1950 y 2000, el cociente de dependencia potencial disminuyó de 12 a 9 personas en edad de trabajar por cada persona de 65 años o más. A mediados de siglo, se prevé que el cociente de dependencia potencial disminuirá a cuatro personas en edad de trabajar por cada persona de 65 años o más (gráfico II). Los cocientes de dependencia potencial inciden de manera importante en los regímenes de seguridad social, especialmente en los regímenes tradicionales, en los que los trabajadores en activo pagan las prestaciones de los jubilados.

- La mayoría de las personas de edad son mujeres, ya que la esperanza de vida de las mujeres supera la de los hombres. En 2000, había 63 millones más de mujeres que de hombres de 60 años o más, y en las edades más avanzadas, hay de dos a cinco veces más mujeres que hombres (gráfico III).
- La salud de las personas de edad generalmente se deteriora con la edad, lo que se traduce en una mayor demanda de atención de largo plazo a medida que aumenta el número de los más mayores. El cociente de dependencia parental, esto es, el número de personas de 85 años o más por cada 100 personas de 50 a 64 años, da una idea del apoyo que las familias acaso tengan que brindar a sus miembros de más edad. En todo el mundo, en 1950 había menos de dos personas de 80 años o más por cada 100 personas de 50 a 64 años. En 2000, la relación había aumentado a 4 por cada 100, y se proyecta que llegará a 11 por 100 en 2050.
- Los países con ingresos per cápita elevados tienden a tener una menor tasa de participación de personas de edad en el mercado de trabajo. En las regiones más desarrolladas, el 21% de los hombres de 60 años o más son económicamente activos, en comparación con el 50% de los hombres en las regiones menos desarrolladas. En las regiones más desarrolladas, el 10% de las mujeres de edad son económicamente activas, en comparación con el 19% en las regiones menos desarrolladas. En las regiones menos desarrolladas, las personas de edad participan en mayor medida en los mercados de trabajo, debido en gran parte a la insuficien-

te cobertura de los regímenes de jubilación y, caso de haberlos, a los ingresos relativamente bajos que ofrecen.

- A pesar de que la alfabetización ha ido en aumento entre la población de edad, el analfabetismo es todavía común. En el 2000, en las regiones menos desarrolladas, aproximadamente la mitad de todas las personas

de 60 años o más eran analfabetas. Sólo alrededor del 30% de las mujeres de edad y aproximadamente el 60% de los hombres de edad sabían leer y escribir pasablemente. En las regiones más desarrolladas la alfabetización rozaba la universalidad en todos los países, con contadas excepciones.

En conclusión, es evidente que el mundo se encuentra en proceso de transformación a causa de unos cambios demográficos sin precedentes, que tienen sus orígenes en los siglos XIX y XX y que continúan todavía en el siglo XXI. Los descensos de la fecundidad, reforzados por una creciente longevidad, han producido, y continúan produciendo, cambios sin precedentes en las estructuras de todas las sociedades, en especial la histórica inversión que se ha producido en la proporción de jóvenes y personas de edad. Las consecuencias profundas, generales y duraderas del envejecimiento de la población brindan enormes oportunidades a todas las sociedades, pero también imponen enormes desafíos.

INTRODUCTION

THE DYNAMICS AND CONSEQUENCES OF POPULATION AGEING

Population ageing—the process by which older individuals become a proportionally larger share of the total population—was one of the most distinctive demographic events of the twentieth century. It will surely remain important throughout the twenty-first century. Initially experienced by the more developed countries, the process has recently become apparent in much of the developing world as well. For the near future, virtually all countries will face population ageing, although at varying levels of intensity and in different time frames.

The shift in age structure associated with population ageing has a profound impact on a broad range of economic, political and social conditions. For example, concerns are growing about the long-term viability of intergenerational social support systems, which are crucial for the well-being of both the older and younger generations (Cliquet and Nizamuddin, 1999). This is especially true where provision of care within the family becomes more and more difficult as family size decreases and women, who are traditionally the main caregivers, increasingly engage in employment outside the home.

As more people live longer, retirement, pensions and other social benefits tend to extend over longer periods of time. This makes it necessary for social security systems to change substantially in order to remain effective (Creedy, 1998; Bravo, 1999). Increasing longevity can also result in rising medical costs and increasing demands for health services, since older people are typically more vulnerable to chronic diseases (de Jong-Gierveld and van Solinge, 1995; Holliday, 1999).

This report provides an overview of the world population ageing process, focusing on five particularly relevant public policy issues. In dealing with each of the issues, attention is given to the course of the ageing process, which has not been the same in all countries. There has been considerable variation in timing, levels and patterns. Therefore, the assessment of the general

trends is disaggregated into development regions and major geographic areas whenever possible.

The first chapter, demographic determinants of population ageing, examines the worldwide decline in fertility and mortality that underlies population ageing. The analysis uses three indicators: the total fertility rate, life expectancy (at birth and at ages 60, 65 and 80) and the survival rate (to ages 60, 65 and 80).

Especially in the earlier stages of the demographic transition, fertility decline was the primary determinant of the timing and extent of population ageing. However, as the transition has gone on to later stages, mortality decline, particularly at older ages, has increasingly become the more important factor in shaping the relative size of the oldest age groups.

An important consequence of fertility decline is a progressive reduction in the availability of kin to whom future generations of older persons may turn for support. This process may have a significant impact on the well-being of older persons, especially in the less developed regions where social support for the older person is largely provided by the immediate family (Hoyert, 1991; Wolf, 1994). At the same time, improved chances of surviving to the oldest ages are likely to spur efforts to improve the health status of the older population and lead to reforms in the pension and health systems.

The second chapter of the report, the magnitude and speed of population ageing, examines regional differences in the progression of the ageing process, through the analysis of the percentages and growth rates of the older groups of the population (60 years or over, 65 years or over, and 80 years or over), in addition to their absolute sizes.

As the impact of population ageing on the society's socio-economic conditions may be amplified by the speed with which it occurs, it is important to consider not only the degree but also

the pace of the changes in the age structure. When the proportion of older persons in the total population increases dramatically in a short period of time, as is currently occurring in some countries in both the more developed and the less developed regions, it becomes particularly difficult for the social and economic institutions to adjust.

The third chapter, the changing balance between age groups, highlights, from various perspectives, the changes in the relative size of the older and younger groups of the population. Six indicators are examined: broad age groupings (percentages in age groups 0-14, 15-59 and 60 or over), the ageing index, median age, dependency ratios (total, youth and old-age), the potential support ratio and the parent support ratio.

An increasing proportion in the older ages necessarily affects the relative importance of the other segments. These changes in age composition can dramatically affect society's political, economic and social structures. The shifting weights of the various age groups tend to create social and political pressures on a society to change its pattern of resource distribution, generating conditions that may give rise to intergenerational conflict (Walker, 1990; Jackson, 1998). In effect, demographic ageing may lead to calls for fewer schools but more long-term care facilities. The ageing index (the ratio of those 60 or older to those less than 15) provides a commonly used measure for assessing this process.

Similarly, the widespread decrease of the potential support ratio (which means a widespread growth of the old-age dependency ratio) indicates a situation where an increasing number of beneficiaries of health and pension funds (those aged 65 and over) are supported by a relatively smaller number of contributors, mainly those in the economically active ages of 15-64. This tends to impose heavier demands on the working-age population (in the form of higher taxes and other contributions) in order to maintain a stable flow of benefits to the older groups. Even a sharp decline in youth dependency that normally accompanies the increase in old-age dependency may not be enough to offset the increased costs, since the

relative expense of supporting the old is, in general, higher than that of supporting the young (United Nations, 1988; Baldacci and Lugaesi, 1997).

However, support to the old is only partially provided through public transfers of resources. The family remains an important source of support to older persons, especially in the less developed regions where social security systems are generally less adequate (United Nations, 1994). Family support is particularly crucial in the case of the oldest-old, whose physical and economic needs are usually greater. The parent support ratio gives an indication of the overall demand for family support of the oldest-old. The continuing increase of this ratio implies that more and more frequently the young old will find themselves responsible for the care of one or more oldest-old family members.

The fourth chapter of the report, a demographic profile of the older population, draws attention to two important features of the ageing process: the progressive ageing of the older population itself and its feminization.

The rapid growth of the oldest groups among the older population is of special relevance in terms of public policy. In most parts of the world, the 80-and-over age group is growing faster than any other, and is expected to continue as the fastest growing segment of the population for at least the next 50 years. Although this group still constitutes a small proportion of the total population, its numbers are becoming increasingly important, especially in the less developed regions. Increased age normally brings considerable change in individual needs. For instance, health conditions typically decline with advancing age, and this suggests an escalation in the demand for long-term care (Pollard, 1995; Crimmins, 1997).

The increasing female share of the older population is also relevant to public policy. Because mortality rates are usually higher among men than among women, even at older ages, the percentage female tends to increase with advancing age. In most countries, older women greatly outnumber older men. The implications of

this gender imbalance for social support and public planning can be great since older women are more likely to be widowed. They also have less education, less work experience and less access to public assistance and other private income sources (Higuchi, 1996; United Nations, 1999b). Indeed, the concerns of the oldest-old population should be viewed primarily as the concerns of older women.

The fifth chapter, the socio-economic characteristics of the older population, focuses on two dimensions that can greatly affect the well-being of older individuals: labour force participation and literacy.

In most countries of the more developed regions, where social security coverage is nearly universal, declines in labour force participation at older ages primarily reflect changes in public policies regarding early retirement (Gruber and Wise, 1999). In many countries of the less developed regions, on the other hand, there are large concentrations of older workers in agriculture and other sectors of the economy (notably the informal sector) who have little or no social security coverage (International Labour Office, 2000).

Although lower levels of labour force participation at older ages are generally associated with higher levels of social security coverage, the decline in the labour force participation of the older population in both the more and the less developed regions may also be related, at least in part, to other factors such as a shortage of

employment opportunities and to the obsolescence of skills and knowledge (Drury, 1994; Taylor and Walker, 1996).

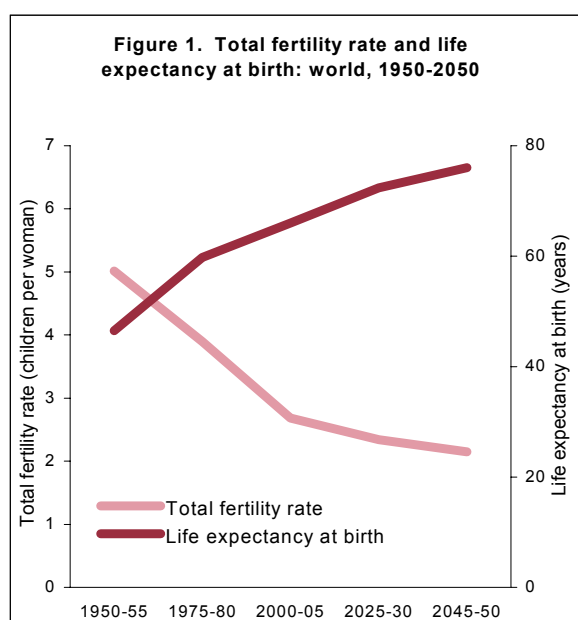

Finally, there appears to be general agreement on the benefits of higher levels of education for the health and economic status of the older generations. Improvements in the educational attainment of the older population may also alleviate any cultural gap between generations that may have widened over the past century. Particularly in the case of the less developed regions, where illiteracy is generally high at all ages but especially among older groups, higher levels of literacy are likely to substantially affect the interests, needs and abilities of future older generations, and improve the quality of their lives.

The annex tables present profiles of ageing, including estimates and projections of numbers of older persons and the summary indicators that are discussed in the main text. The indicators are defined in annex I. Indicators are presented for the world and for geographic and development regions, and for all countries and areas for which detailed estimates and projections of the age and sex distributions are provided in *World Population Prospects: The 2000 Revision* (United Nations, 2001c). For inclusion of age and sex detail in the *2000 Revision*, the inhabitants of a country or area must have numbered at least 140,000 in the year 2000. The composition of the regions is shown in annex II. Profiles for regions and individual countries are presented in annex III.

Chapters

I. DEMOGRAPHIC DETERMINANTS OF POPULATION AGEING

Underlying global population ageing is a process known as the “demographic transition” in which mortality and then fertility decline from higher to lower levels. Decreasing fertility along with lengthening life expectancy (figure 1) has reshaped the age structure of the population in most regions of the planet by shifting relative weight from younger to older groups. The role of international migration in changing age distributions has been far less important than that of fertility and mortality (Lesthaeghe, 2000).

A. FERTILITY DECLINE

Fertility decline has been the primary determinant of population ageing. Over the last half century, the total fertility rate decreased globally by almost half, from 5.0 to 2.7 children per woman. Over the next half century, it is expected to drop to the replacement level of 2.1 children per women.

Fertility is well below the replacement level in the more developed regions

As a result of the sustained decline that occurred during the twentieth century, the average total fertility rate in the more developed regions has dropped from an already low level of 2.8

children per woman in 1950-1955 to an extremely low level of 1.5 children per woman in 2000-2005. Presently, the total fertility rate is below the replacement level in practically all industrialized countries. In 19 of those countries the rate is under 1.3 children per woman.

Fertility decline in the less developed regions started later and has proceeded faster

Major fertility reductions in the less developed regions occurred, in general, during the last three decades of the twentieth century. Over the last 50 years, the average total fertility rate in those regions dropped by more than 60 per cent, from 6.2 children per woman in 1950-1955 to 2.9 in 2000-2005 (figure 2).

However, great disparities persist. In the least developed countries, the average total fertility rate is now 5.2 children per woman. In particular, in Eastern, Western and Middle Africa, it remains in excess of 5.5 children per woman. Meanwhile, current rates are 2.5 children per woman or less in South-central Asia, South America and the Caribbean. In 18 developing countries, the total fertility rate is estimated to be under replacement level already.

Regional differences in fertility are expected to decrease

As the transition towards lower fertility levels continues in the less developed regions, and as levels in the more developed regions are projected to increase slightly, differences in fertility among regions will tend to decrease in the future. The average total fertility rate in the less developed regions is expected to drop from the current 2.9 children per woman to 2.4 by 2025-2030, and to 2.2 by 2045-2050. The average total fertility rate in the more developed regions is projected to rise from the current 1.5 children per woman to 1.7 and 1.9 children per woman by those same periods. A particularly sharp reduction is expected for the least developed countries, where the average total fertility rate may reach 2.5 children per woman in 2045-2050, down from 5.2 in 2000-2005 and 3.6 in 2025-2030 (figure 2).

B. MORTALITY DECLINE

As fertility rates move towards lower levels, mortality decline, especially at older ages, assumes an increasingly important role in population ageing. Particularly in developed countries, where low fertility has prevailed for a significant period of time, relative increases in the older population are now primarily determined by improved chances of surviving to old ages (Grundy, 1996; National Research Council, 2001).

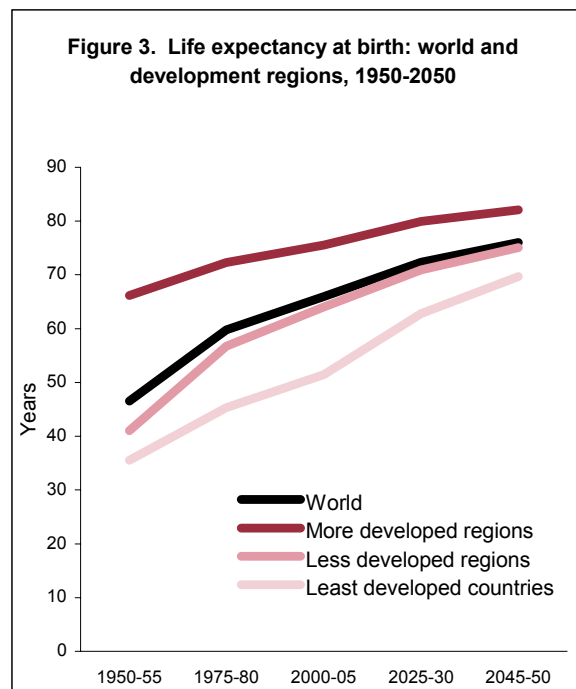

People are living longer, but large variations remain

Over the last five decades, life expectancy at birth increased globally by almost 20 years, from 46.5 years in 1950-1955 to 66.0 years in 2000-2005 (figure 3). On average, the gain in life expectancy at birth was 23.1 years in the less developed regions and 9.4 years in the more developed regions (figure 3). Nevertheless, a considerable advantage still persists in favour of the latter. On average, at current mortality rates an individual born in the more developed regions is now expected to outlive by almost 12 years an individual born in the less developed regions. If the individual is born in the group of least

developed countries, the disadvantage doubles to more than 24 years.

Great variations in life expectancy exist within the less developed regions

While in some countries and areas of the less developed regions, such as Israel, Martinique and Macao Special Administrative Region (SAR) of China, life expectancy at birth is around 79 years, in others, such as Botswana, Mozambique and Swaziland, it does not surpass 39 years. In many countries, mostly in the group of the least developed countries, low levels of life expectancy at birth are in part due to the spread of HIV. On average, life expectancy in the least developed countries lengthened by 16 years over the last half century, which is substantially less than the average for the less developed regions (figure 3).

Within the more developed regions, variation in life expectancy is significantly lower than in the less developed regions. Apart from the Eastern European countries, where life expectancy at birth is currently, on average, lower than 69 years, the range in life expectancy within the more developed regions is only 11 years, from 71 years in Latvia to 82 years in Japan.

Regional differences in life expectancy at birth are expected to decrease

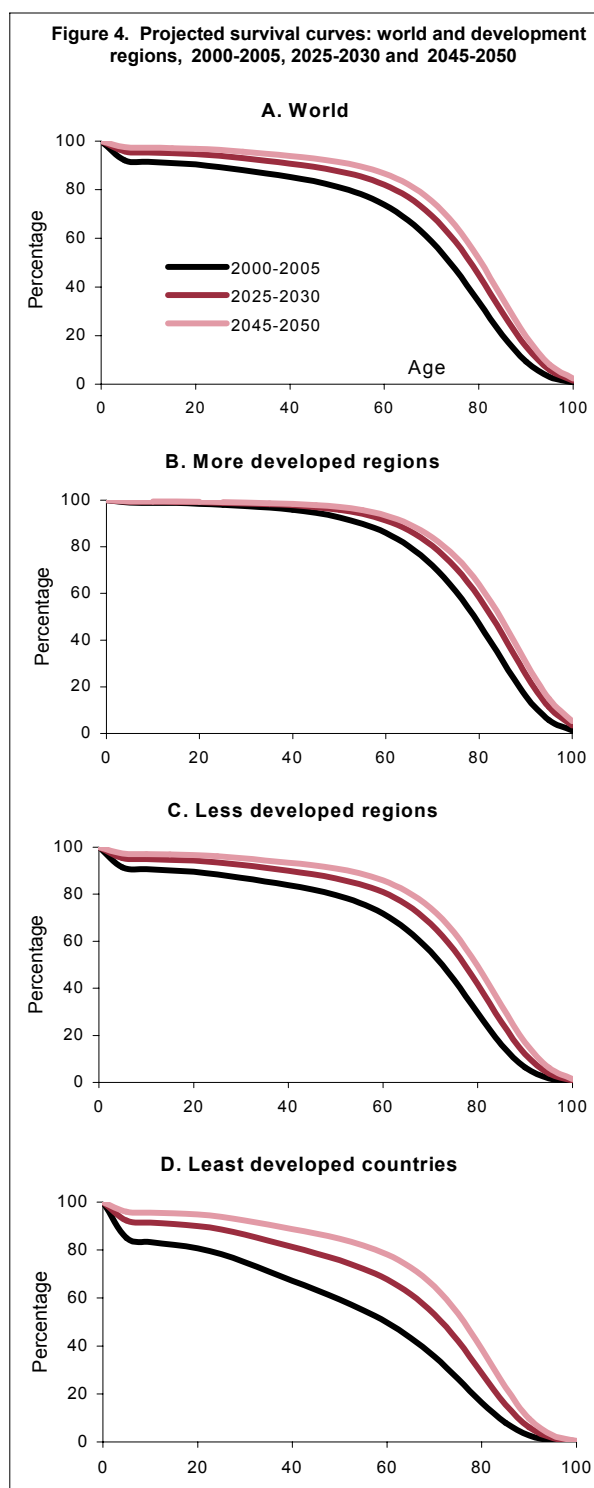

Over the next 50 years, life expectancy at birth is projected to increase globally by 10 years, to reach 76 years in 2045-2050 (figure 3). As mortality becomes more concentrated at older ages of the population, the gap in life expectancy among regions will tend to decrease. By the end of the next quarter century, life expectancy at birth is expected to reach, on average, 80 years in the more developed regions and 71 years in the less developed regions. By 2045-2050 it is expected to have risen to 82 years in the more developed regions and to 75 years in the less developed regions. Thus, an interregional gap of about 7 years is expected by 2045-2050, down from approximately 9 years in the period 2025-2030 and from almost 12 years at present.

More people will survive to older ages

As a result of the generalized shift in the age distribution of mortality towards older groups, the survival curve is expected gradually to approach a more rectangular shape in all regions of the world (figure 4). Under current mortality conditions, almost 3 of every 4 newborns in the world will survive to age 60, and about 1 of every 3 to age 80. Under the mortality conditions projected for the period 2045-2050, approximately 7 of every 8 newborns would survive to age 60, and more than half to age 80.

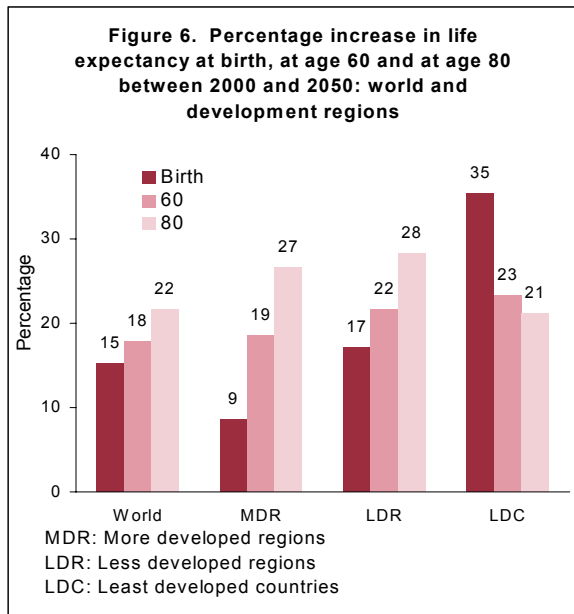

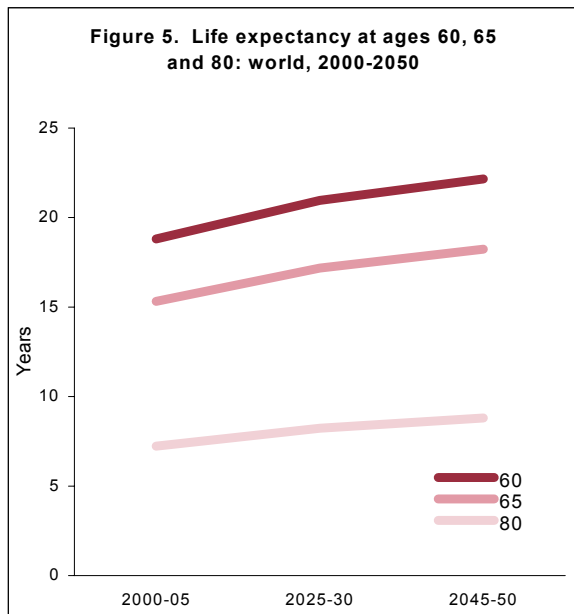

In proportional terms, gains in life expectancy are expected to be higher at older ages

Not only are more people surviving to old age, but once there, they tend to live longer. Over the next 50 years global life expectancy at age 60 is expected to increase from 18.8 years in 2000-2005 to 22.2 years in 2045-2050 (an 18 per cent gain), from 15.3 to 18.2 years (19 per cent) at age 65 and from 7.2 to 8.8 years (22 per cent) at age 80 (figure 5). Those figures show that, in fact, the older the age group, the more remarkable are the expected relative gains in life expectancy. In the more developed regions, average life expectancy at age 80 is projected to increase by 27 per cent over the next half century as compared with 19 per cent at age 60 and 9 per cent at birth.

Average life expectancy at age 80 in the less developed regions is expected to increase by 28 per cent as compared with 22 per cent at age 60 and 17 per cent at birth (figure 6). In the case of the least developed countries, where mortality levels at young ages remain high, proportional

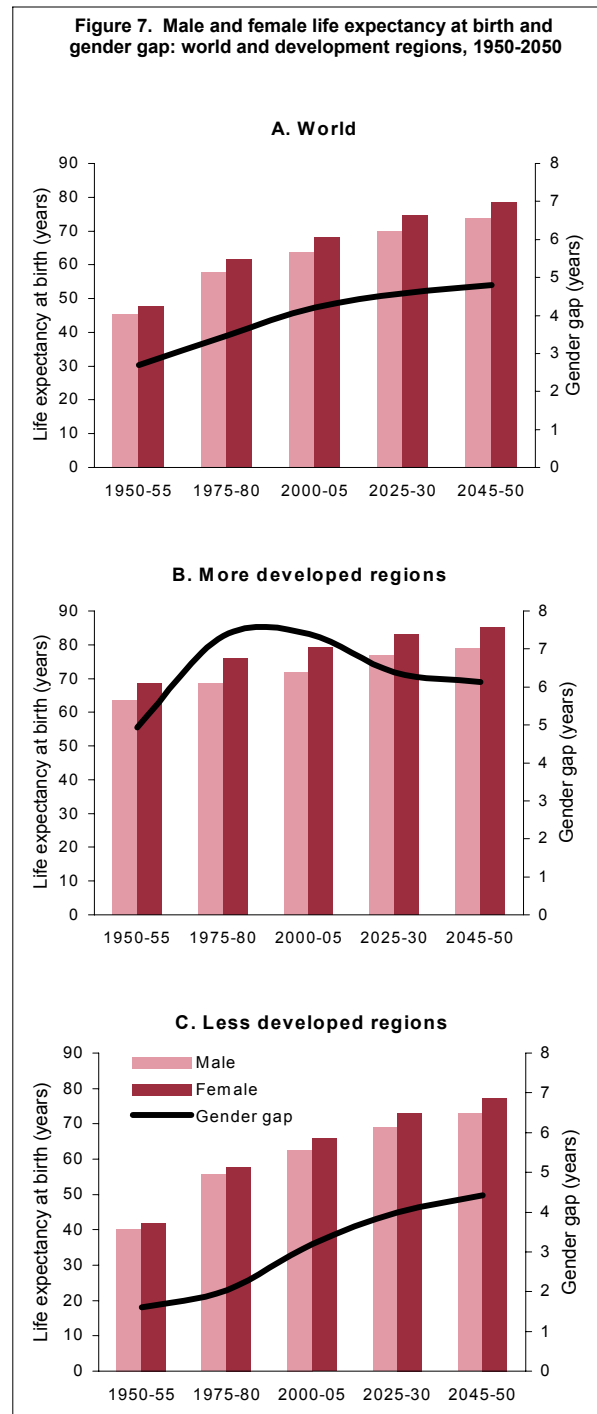

improvements in life expectancy during the next 50 years are still expected to be higher at birth than at older ages.

The female advantage in life expectancy at birth has widened; future trends are expected to follow different paths

Except for a small number of countries, where cultural factors have contributed to lower female life expectancy, reductions in mortality

have been substantially higher among females than males, in practically all age groups. As a result, the female advantage in life expectancy at birth increased from 2.7 to 4.2 years globally over the past 50 years. By the end of the next 50 years, the global gap is expected to increase slightly to 4.8 years (figure 7a).

In the more developed regions, where women currently outlive men by 7.4 years, the gender gap is expected gradually to decline to 6.1 years over the next half century (figure 7b). In the less developed regions, where the gender gap has been significantly smaller, the gap is expected to continue to increase, from the current 3.2 years to 4.4 years by the middle of the century (figure 7c).

In Japan, the near 85 years' life expectancy at birth for women is currently the highest in the world. In 30 other countries female life expectancy at birth now exceeds 80 years, including eight countries and areas from the less developed regions: Hong Kong Special Administrative Region (SAR) of China, Israel, Macao

SAR of China and Singapore in Asia, Guadeloupe, Martinique and Puerto Rico in the Caribbean, and French Guiana in Latin America. Over the next 50 years, female life expectancy at birth is expected to surpass 92 years in Japan and 85 years in 26 other countries. Under the mortality conditions projected for the middle of this century for the world as a whole, 59 per cent of the world's female newborns would survive to the age of 80, up from 41 per cent under current mortality conditions. In 40 countries, including 14 from the less developed regions, this proportion is projected to exceed 70 per cent. However, in 20 countries, mostly in Eastern and Western Africa, this proportion is expected to remain lower than 40 per cent by the year 2050.

II. MAGNITUDE AND SPEED OF POPULATION AGEING

The number of older persons has tripled over the last 50 years; it will more than triple again over the next 50 years

In 1950, there were 205 million persons aged 60 or over throughout the world (figure 8). At that time, only 3 countries had more than 10 million people 60 or older: China (42 million), India (20 million), and the United States of America (20 million). Fifty years later, the number of persons aged 60 or over increased about three times to 606 million. In 2000, the number of countries with more than 10 million people aged 60 or over increased to 12, including 5 with more than 20 million older people: China (129 million), India (77 million), the United States of America (46 million), Japan (30 million) and the Russian Federation (27 million). Over the first half of the current century, the global population 60 or over is projected to expand by more than three times to reach nearly 2 billion in 2050 (figure 8).

By then, 33 countries are expected to have more than 10 million people 60 or over, including 5 countries with more than 50 million older people: China (437 million), India (324 million),

the United States of America (107 million), Indonesia (70 million) and Brazil (58 million).

The older population is growing faster than the total population in practically all regions of the world—and the difference in growth rates is increasing

In the period 1950-1955, the global average annual rate of increase in the number of persons aged 60 years or over was only slightly higher than the rate for the total population (both around 1.8 per cent) (figure 9).

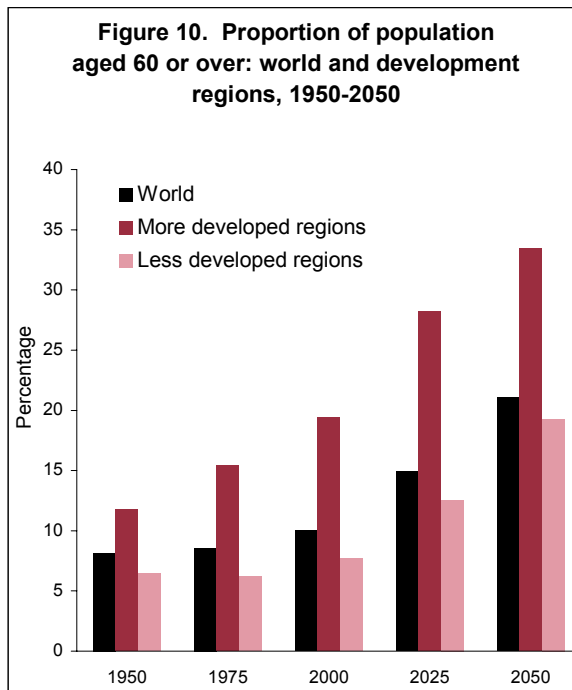

Currently, the growth rate of the older population (1.9 per cent) is significantly higher than that of the total population (1.2 per cent). In the near future, the difference between the two rates is expected to become even larger as the baby boom generation starts reaching older ages in several parts of the world. By 2025-2030, projections indicate that the population over 60 will be growing 3.5 times as rapidly as the total population (2.8 per cent compared to 0.8 per cent) (figure 9). Even though the growth rate of the 60 or over age group is expected to decline to 1.6 per cent in 2045-2050, it still will be more than 3 times the growth rate of the total population (0.5

per cent) by the end of the second quarter of this century.

The proportion of older persons is projected to more than double worldwide over the next half century

As the older population has grown faster than the total population, the proportion of older persons relative to the rest of the population has increased considerably. At the global level, 1 in every 12 individuals was at least 60 years of age in 1950 (figure 10), and 1 in every 20 was at least 65. By the year 2000, those ratios had increased to 1 in every 10 aged 60 years or older and 1 in every 14 aged 65 or older. By the year 2050, more than 1 in every 5 persons throughout the world is projected to be aged 60 or over, while nearly 1 in every 6 is projected to be at least 65 years old.

More developed regions have relatively high proportions of older persons

The more developed countries are in general in a more advanced stage of the demographic transition; thus, the proportions of older persons there are projected to remain significantly higher than the proportions in the less developed regions

well into the twenty-first century. Almost one fifth of the population in the more developed regions, but only 8 per cent in the less developed regions, was aged 60 or older in 2000, up from 12 per cent and 6 per cent respectively in 1950 (figure 10). Although the regional differences in the percentage of older people are expected to decrease over the next 50 years, the difference will remain large through mid-century. By 2050, 1 in every 3 persons living in the more developed regions is likely to be 60 or older (figure 10), and about 1 in every 4 is projected to be 65 or older. In the less developed regions, nearly 1 in every 5 is projected to be over 60, while 1 in every 7 is projected to be over 65.

High proportions of older persons in Europe; low proportions in Africa

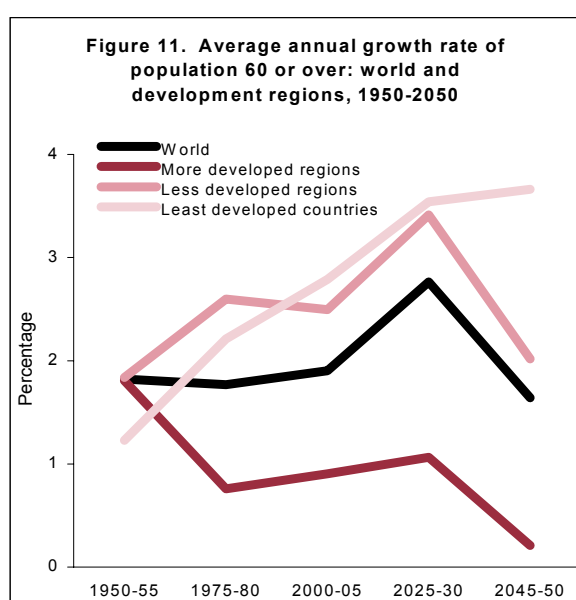

Europe is currently the world's major area with the highest proportions of older persons and is projected to remain so for at least the next 50 years. About 37 per cent of the European population is projected to be 60 or over in 2050, up from 20 per cent in 2000. Almost 30 per cent is projected to be 65 or over, up from 15 per cent in 2000. In contrast, only 10 per cent of the population of Africa is projected to be over 60 in 2050, up from 5 per cent in 2000. The proportion 65 or over is projected to rise from 3 per cent in 2000 to 7 per cent in 2050.

More than two in five persons will be 60 or over in some countries

People aged 60 or over currently constitute from one fifth to nearly one fourth of the population of Austria, Czech Republic, Greece, Italy, Japan, Slovenia and Spain. By 2050, more than two in every five persons are projected to be at least 60 years of age in those seven countries. Except for the Czech Republic, more than one in every three people in these countries is projected to be aged 65 or older in 2050. In addition to these countries, persons over 60 will constitute more than one third of the population in another 30 countries, including 6 from the less developed regions, while individuals 65 or over will constitute between one fourth and one third of the population of 39 additional countries, including 10 from the less developed regions.

The older population is growing at a faster rate in the less developed regions

In contrast with the slow process of population ageing experienced in the past by most countries in the more developed regions, the ageing process in most of the less developed regions is taking place in a much shorter period of time, and it is occurring on relatively larger population bases. In 1950-1955, the average annual growth rate of persons aged 60 years or over was practically the same in the more and in the less developed regions (near 1.8 per cent) (figure 11).

From that time on, the rates have tended to decline in the more developed regions and to increase in the less developed regions. Currently, the average annual growth rate of the population of persons 60 years or over in the less developed regions (2.5 per cent) is almost three times that of the more developed regions (0.9 per cent) (figure 11). Over the second quarter of this century, the growth rate of people over 60 is expected to decline in both more and less developed regions. Still, in 2045-2050, the growth rate in the less developed regions (2 per cent) is projected to be ten times as high as in the more developed regions (0.2 per cent). In the least developed countries, the growth rate of the older population is projected to continue increasing at least until the end of the coming half-century. In 2045-2050, the

population 60 years or older in this group of countries is projected to be growing at a rate (3.7 per cent) more than eighteen times as high as the corresponding age group in the more developed regions (0.2 per cent).

The older population will be increasingly concentrated in the less developed regions

Although the percentages of older persons are significantly greater in the more developed regions, the number of older people is increasingly larger in the less developed regions. Over the last half century, the number of people aged 60 or older increased globally by an average of 8 million persons every year. Of this increase, 66 per cent occurred in the less developed regions and 34 per cent in the more developed regions. As a result, the proportion of the world's population over 60 living in the less developed regions rose from slightly over half (54 per cent) in 1950 to 62 per cent in the year 2000 (figure 12).

Over the next half century, this trend will intensify. In the more developed regions the number of persons aged 60 or over will increase by about 70 per cent, from 231 million in 2000 to 395 million in 2050. In contrast, in the less developed regions the older population will more than quadruple during this same period, from 374 million to 1.6 billion. By 2050, nearly four fifths of the world's older population will be living in the less developed regions (figure 12).

III. CHANGING BALANCE BETWEEN AGE GROUPS

A. BROAD AGE GROUPS

The young-old balance is shifting throughout the world

The increasing proportions of aged persons have been accompanied, in most populations, by steady declines in the proportion of young persons. Over the last half century, the proportion of children (0-14 years old) dropped worldwide from 34 per cent in 1950 to 30 per cent in 2000 (figure 13a). Over the next 50 years, the proportion of children is projected to decline by almost one third, so that by the year 2050, the share of persons aged 60 or over in the population will, for the first time in history, match that of persons younger than 15 (about 21 per cent each). During this period, the proportion of persons between the ages of 15 and 59 will change only slightly, from 60 per cent in 2000 to 58 per cent in 2050.

In the more developed regions, the proportion of older persons already exceeds that of children; by 2050 it will be double

In 2000, the proportion of persons aged 60 or over in the more developed regions (19 per cent) was slightly higher than the proportion of children below 15 years (18 per cent) (figure 13b). By the year 2050, the proportion of children is projected to decline to 16 per cent, while the proportion of older persons is projected to increase to 34 per cent. As the baby boom generations reach old age and the inflow of young people shrinks, the proportion of persons aged 15 to 59 in the more developed regions is also expected to decline substantially over the coming half century, from 62 per cent in 2000 to 51 per cent in 2050.

Age-distribution changes in less developed regions have been slow, but will accelerate over the next 50 years

From 1950 to 2000, the proportion of people aged above 60 years in the less developed regions increased only slightly, from 6 per cent to 8 per cent, while the proportion of children under 15

years of age declined from 38 per cent to 33 per cent (figure 13c).

Substantially greater changes are expected to occur during the period between 2000 and 2050. The proportion of older persons will increase by a

factor of 2.5 to reach 19 per cent, and the proportion of children will fall by about one third to reach a projected 22 per cent. Nevertheless, during this period the share of the population aged 15-59 years will remain practically unchanged at around 59 per cent.

B. AGEING INDEX

The ageing index will triple over the next half century

Over the last 50 years, the ratio of people aged 60 or over to children younger than 15 increased by about half, from 24 per hundred in 1950 to 33 per hundred in 2000 (figure 14). Over the next 50 years, this ratio is projected to triple. By the year 2050, there will be 101 people 60 years or older for every one hundred children 0-14 years in the world. As observed in the introduction to the present report, this trend may lead to compelling demands for changes in the way a society's resources are shared between the generations.

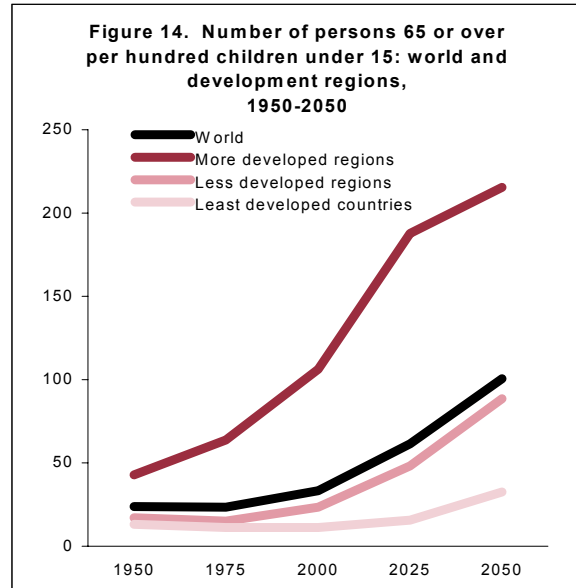

The ageing index is significantly higher in the more developed regions but will grow faster in the less developed regions

In 2000, there were only 23 people 60 years or older for every hundred children under 15 in the less developed regions. Over the next 50 years, this ratio is projected to become almost four times as large. It is expected to reach 89 in 2050 (figure 14). During this same period, the ageing index in the more developed regions is projected to grow from 106 to 215 per hundred children.

Regional differentials in ageing indices are substantial

By the year 2000, the ageing index in Europe (116 per hundred) was practically ten times that of Africa (12 per hundred) (figure 15). Between 2000 and 2050, the ageing index is expected to rise significantly in all six major areas. Asia and Latin America and the Caribbean, in particular, are projected to experience remarkable increases in the ageing index, which will more than quadruple. However, the index for Europe will remain the highest. By 2050, the ageing index is

projected to range from a high of 263 per hundred in Europe to a low of 37 per hundred in Africa. This means that by the end of the first half of this century, there will be almost three persons aged 60 or over for every child under 15 years in Europe, and almost three children under 15 years for every person aged 60 or over in Africa.

Ageing index disparities are even greater at the country level

In the year 2000, there were already 27 countries with an ageing index above 100; all of

them were in Europe except Japan. In six countries—Bulgaria, Germany, Greece, Italy, Japan, and Spain—the index was above 130 persons. In that same year, the ageing index in 18 countries, mostly in Africa, was below 10. By the year 2050, there will be more than 3 persons aged 60 or over per child (ageing index above 300) in 10 countries or areas, including 1 from the less developed regions, China, Macao SAR. In Italy and Spain, this ratio is expected to reach nearly 4 older persons per child (ageing index above 360). At the same time, the index is projected to remain under 25 (more than 4 children per older person) in 16 countries or areas, mostly in Africa.

C. MEDIAN AGE

The median age of the world's population is projected to increase by about 10 years over the next half century

During the last 50 years, the median age of the world's population increased by only about 3 years, from nearly 24 years in 1950 to nearly 27 years in 2000 (figure 16). Over the next half century, the increase will be approximately 10 years. By 2050, half of the world's population is projected to be more than 36 years old.

The median age in the more developed regions is more than 13 years higher than in the less developed regions and almost 20 years higher than in the least developed countries

The median age of the population in the more developed regions was about 37 years in 2000, up from 29 years in 1950. In the less developed regions, the median age changed much less over the last half century, from 21 years in 1950 to 24 years in 2000. In the least developed countries, the median age decreased over the same period, from nearly 20 years in 1950 to 18 in 2000 (figure 16).

Over the next half century, the median age of the population is projected to reach a remarkable level of 46 years in the more developed regions. In the less developed regions, the median age will increase by more than 10 years to reach 35 in 2050, a level approaching that currently observed in the more developed regions. During this

period, the median age is also projected to increase significantly in the least developed countries, although its level in 2050 (26 years) will still be 20 years lower than that of the more developed regions.

The median age of Europe is double that of Africa

By the year 2000, the median age of Europe was 38 years, more than twice as high as the median age of 18 years found in Africa. By 2050, the median age in Europe is projected to rise to 49, a level 22 years higher than that projected for Africa. At the country level, the median age in 2000 ranged from 41 years in Japan to 15 years in Yemen. Just below Japan were Italy, Switzerland, Germany and Sweden, all with median ages around 40 years.

By 2050, the oldest population is expected to be that of Spain, where one in every two persons is projected to be at least 55 years old. Slovenia, Italy and Austria will come next, all with median ages around 54 years. Thirteen other countries or areas, mostly from Europe, will also have populations where persons over 50 years of age will predominate. At the opposite extreme, in 15 countries, mostly in Africa, persons under 25 years of age are expected to be the majority of the population.

D. DEPENDENCY RATIO

The total dependency ratio is a commonly used measure of potential social support needs. It is based on the simple notion that all persons under 15 and those 65 or older are likely to be in some sense dependent on the population in the working ages of 15-64. Those in the working ages are assumed to provide direct or indirect support to those in the dependent ages (Kinsella and Gist, 1995). Such support may be provided within the family, through religious or communal institutions, or by the State.

However, it must be recognized that the dependency ratio gives no more than a rough approximation of the burden of dependency. Not all young and old persons require support, nor do all working-age persons actually provide direct or indirect support (Taeuber, 1992). On the contrary, evidence exists that older persons in many societies are providers of support to their adult children (Morgan, Schuster and Butler, 1991; Saad, 2001). Thus, although a useful indicator of trends in the level of potential support needs, the dependency ratio, and particularly the old-age dependency ratio, should be used cautiously.

The global ratio between “dependent” and working age populations has decreased; it will increase in the future

From 1950 to 1975, the total dependency ratio increased globally from 65 to 74 (figure 17). This change was mainly due to the substantial increases in the proportion of children observed in most of the countries of the less developed regions, which in turn resulted from the combination of high fertility and declining infant and child mortality. Then, as fertility declined sharply over the more recent decades, the total dependency ratio also went down (to 58 in the year 2000).

This decline in the ratio occurred despite the increasing proportion of older “dependants” over the period. The tendency to decrease is projected to continue at least through the next quarter century, before the total dependency ratio starts increasing again. By 2025, the ratio will fall to 53, but by 2050 it will return to the year 2000

level of 58. However, in the more developed regions, the increase in the total dependency ratio is expected to start earlier, so that by 2025 the ratio will rise to 57, up from 48 in 2000, and by 2050 it will climb further to 73.

A profound shift is expected in the composition of the total dependency ratio

Although the world’s total dependency ratio in 2050 is projected to remain at almost the same level as in 2000, the composition of the ratio will undergo important changes over the next 50 years. Currently, the younger population accounts for the large majority of the world dependent-age population. In the future, the balance between the youth component of the dependency ratio and the old-age component will become more equal. This shift will be the result of the combined effects of longevity increases and fertility declines. In the year 2000, the old-age component contributed less than 20 per cent of the world’s total dependency ratio. By 2050, this share is projected to more than double, to 43 per cent (figure 18a).

In the more developed regions, where the share of older persons in the dependent ages is already large (44 per cent in 2000), the old-age component is projected to rise by the year 2050 to 63 per cent of the total dependency ratio (figure 18b). In the less developed regions, on the other

hand, the old-age component at mid-century will still account for much less than half (39 per cent) of the total (figure 18c).

The old-age dependency ratio will almost double in Northern America, Africa and Oceania; it will more than double in Europe; and more than triple in Asia and in Latin America and the Caribbean

Although current regional differentials in the old-age dependency ratio are expected to persist well into the foreseeable future, all six world major areas will experience remarkable growth in this ratio over the next half-century. From 2000 to 2050, the ratio of persons aged 65 or over to those of working age is projected to grow from 6 per hundred to 11 per hundred in Africa, from 9 to 26 in both Asia and Latin America and the Caribbean, from 15 to 29 in Oceania, from 19 to 35 in Northern America and from 22 to 51 in Europe (figure 19).

The world's highest old-age dependency ratio will almost triple in the next 50 years

In 2000, Sweden had the world's highest old-age dependency ratio of 27, followed closely by Italy and Greece, where the ratios were between 26 and 27. Over the next 50 years, the old-age dependency ratio is projected to increase substantially in most countries of the world. By 2050, Spain, at 74, will have the world's highest ratio, followed by Japan (71) and Italy (68). In another 18 countries, mostly in Europe, the ratio is projected to be over 50. At the same time, in 32 countries or areas, mostly in Africa, the

population aged 65 years or over will be less than one tenth the size of the working-age population.

E. POTENTIAL SUPPORT RATIO

The potential support ratio is an alternative way of expressing the numerical relationship between those more likely to be economically productive and those more likely to be dependants. It is the inverse of the old-age dependency ratio, that is, the number of people in the working ages of 15-64 per every person 65 or older.

The number of working-age people per older person is expected to drop globally by more than 50 per cent over the next 50 years

During the past 50 years, the ratio of people aged 15-64 to persons 65 or older decreased globally by a little more than 20 per cent, from 11.6 in 1950 to 9.1 in 2000. The decrease was larger in the more developed regions, where the ratio dropped by almost half, from 8.2 in 1950 to 4.7 in 2000. During this same period, the potential support ratio decreased by under 20 per cent in the less developed regions (from 14.9 in 1950 to 12.2 in 2000) and increased slightly in the least developed countries (from 16.8 in 1950 to 17.2 in 2000) (figure 20).

Large decreases, however, are expected to take place over the next half century. By 2050, the number of people in the working ages for every person 65 or older is projected to be 4.1 globally (a decrease of 56 per cent relative to the year 2000), 2.2 in the more developed regions (a decrease of 55 per cent), 4.6 in the less developed regions (a decrease of 63 per cent), and 10.2 in the least developed countries (a decrease of 41 per cent).

Currently, there are fewer than 5 persons in the working ages for every person 65 or older in Europe; by 2050, there will be fewer than 2

In 2000, there were 4.6 persons aged 15-64 per person 65 or over in Europe, the lowest potential support ratio among the major areas. Relatively low ratios could also be found in Northern America (5.4) and Oceania (6.6). In Asia, Latin America and the Caribbean, and Africa the ratios were higher: 10.9, 11.6, and 16.6 respectively (figure 21).

Over the next 50 years, the ratio is projected to drop substantially in all major areas, particularly in Asia and Latin America and the Caribbean. By 2050, the ratio is projected to drop to under 2 in Europe, to under 3 in Northern America, and to under 4 in Asia, Latin America

and the Caribbean, and Oceania. In Africa, there will still be almost 10 persons in the working ages for every person 65 or older by the end of the next half century.

Important variations in the potential support ratio will remain at the country level

In 2000, the ratio of persons aged 15-64 to those 65 or older was under 5 in 23 European countries, plus Japan and Uruguay. In 5 countries—Belgium, Greece, Italy, Japan and Sweden—the ratio was under 4. At the same time, the ratio was above 20 in 17 countries, mostly in Eastern Africa and Western Asia. In 3 of them—Kuwait, Qatar and United Arab Emirates—the ratio was above 25.

By 2050, the potential support ratio is projected to be below 5 in 114 countries and to remain above 20 in only one, Djibouti. In 21 countries, including 3 from the less developed regions—Barbados, China, Hong Kong SAR and China, Macao SAR—the ratio is expected to decline to under 2 persons aged 15-64 for each aged 65 or older. In Italy, Japan and Spain, the ratio is expected to be under 1.5. At the other extreme, 20 countries are expected to remain with potential support ratios above 12 by mid-century.

F. PARENT SUPPORT RATIO

The parent support ratio is a measure that has been commonly used to assess the demands on families to provide support for their oldest-old members. It relates the oldest-old to their presumed offspring, who were born when the older persons were in their twenties and thirties. However, since the people in the numerator and those in the denominator are not necessarily related by kinship ties, the parent support ratio should be taken only as a rough indicator of changes in the family support system required for the oldest-old (Kinsella and Taeuber, 1993).

More and more people in their fifties and sixties are likely to have surviving parents or other very old relatives

Because people are living longer and thus are more likely to experience multiple chronic

diseases, more and more adults are expected to face the need to care for very old and sometimes frail relatives. An indicator of this trend is found in the parent support ratio, which shows the number of persons aged 85 years or over in relation to those between 50 and 64 years. At the global level, there were fewer than 2 persons over 85 years per hundred persons 50-64 in 1950. By 2000, this ratio had more than doubled to reach 4 per hundred, and by 2050 it is projected nearly to triple (figure 22).

Remarkably high levels of parent support ratio are projected in the more developed regions, particularly in Japan

In 2050, the parent support ratio in the more developed regions is projected to reach 28, up from 9 in the year 2000 (figure 22). At 13, France currently has the world's highest parent support ratio. By 2050, Japan is projected to have by far the world's highest ratio, of 56. In that same year, the number of people aged 85 or over for every hundred people aged 50-64 is expected to surpass 30 in another 15 countries or areas, mostly in Europe.

On the other hand, the parent support ratio is projected to remain significantly lower in the less

developed regions. It is expected to rise from 2 in 2000 to 8 in 2050. Thus, by the end of the next 50 years there will still be approximately 12 people

aged 50-64 for every person above 85 in the less developed regions as compared with fewer than 4 people in the more developed regions.

IV. DEMOGRAPHIC PROFILE OF THE OLDER POPULATION

A. AGE COMPOSITION

Older populations themselves are ageing

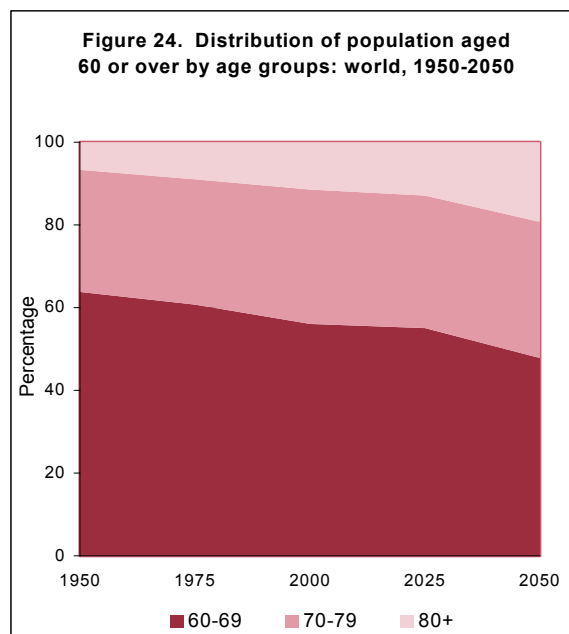

A notable aspect of the global ageing process is the progressive demographic ageing of the older population itself. For most nations, regardless of their geographic location or developmental stage, the 80 or over age group is growing faster than any younger segment of the older population.

At the global level, the average annual growth rate of persons aged 80 years or over (3.8 per cent) is currently twice as high as the growth rate of the population over 60 years of age (1.9 per cent) (figure 23).

Although the growth rates of both age groups are expected to decline over the next 50 years, by 2045-2050 the growth rate of the over-80s (3.0 per cent) will still be almost double that of the over-60s (1.6 per cent). In 1950, 1 in 15 persons aged 60 or older was 80 or above; in 2000, this ratio increased to 1 in 9 and by 2050 it is expected to increase to approximately 1 in 5 (figure 24). The most remarkable increase is expected to occur in Japan where, in 2050, more than 1 in every 3

persons aged 60 or over will be at least 80 years old.

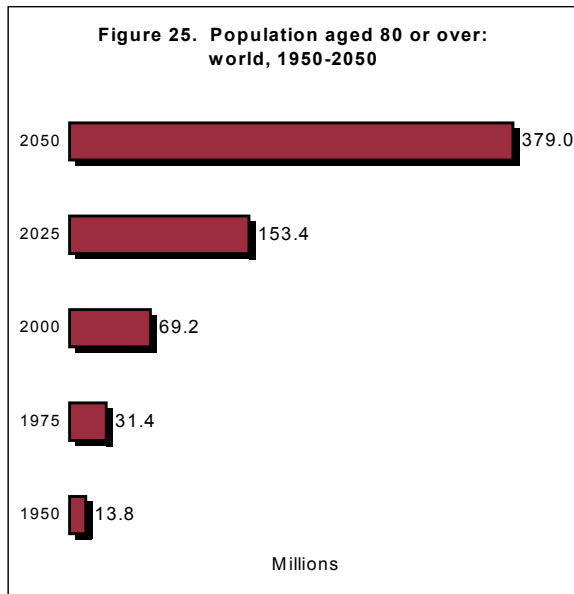

Numbers of persons aged 80 or over are increasing substantially

Those 80 or over are now only slightly more than 1 per cent of the total human population. This proportion is projected to increase almost fourfold over the next 50 years, to reach 4.1 per cent in 2050. Currently, only one country, Sweden, has more than 5 per cent in this age group. By 2050 the over-80 age group is projected to number almost 379 million worldwide, about 5.5 times as many as in 2000 (69 million persons). In 1950, persons over 80 numbered less than 14 million (figure 25).

Six countries contain more than half of the world's oldest-old population

Currently, six countries account for 54 per cent of the total number aged 80 years or over. They are China, with the largest number (12 million), United States of America (9 million), India (6 million), Japan (5 million), Germany (3 million) and Russian Federation (3 million). In 2050, six countries will have more than 10 million

people aged 80 years or over: China (99 million), India (48 million), United States of America (30 million), Japan (17 million), Brazil (10 million) and Indonesia (10 million). Together they will account for 57 per cent of all those 80 or over in the world.

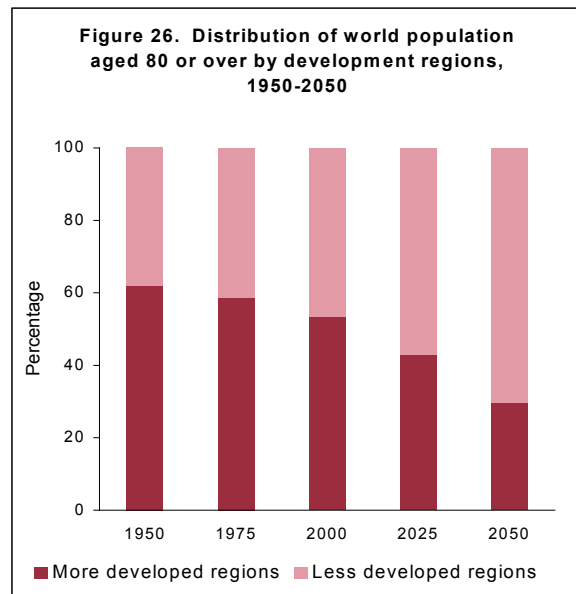

The proportion of persons over 80 is significantly higher in the more developed regions

People 80 or older currently constitute more than 3 per cent of the population of Northern America and almost 3 per cent of the population of Europe, compared with less than 0.9 per cent in Asia and in Latin America and the Caribbean, and less than 0.4 per cent in Africa. A regional difference is projected to persist over the next 50 years. By 2050, about 1 in 10 individuals will be aged 80 or older in the more developed regions, while the corresponding ratio will be 1 in 30 in the less developed regions. In the least developed countries only 1 in 100 persons will be 80 or over. In 2050, 19 countries, mostly in Europe, are projected to have at least 10 per cent of their population aged 80 years or over.

Most people above 80 years now live in the more developed regions; soon the majority will live in the less developed regions

In the year 2000, the majority of people over 80 in the world (53 per cent) lived in the more

developed regions (figure 26). In the course of the next half century, however, the population aged 80 years or over is expected to grow significantly faster in the less developed regions. In some developing countries such as Republic of Korea and Singapore, the number 80 years or older is projected to increase by a factor of about ten from 2000 to 2050. As a consequence, by 2025, 57 per cent of the world's population aged 80 years or older will be living in the less developed regions. By 2050, this proportion will increase to more than 70 per cent (figure 26).

By 2050, the number of centenarians is expected to increase eighteen times

Although the proportion of people who live beyond the age of 100 is still very small, their number is growing rapidly. In 2000, there were an estimated 180,000 centenarians throughout the world. By 2050 they are projected to number 3.2 million, an increase of about eighteen times (figure 27). Currently, the great majority of centenarians (78 per cent in 2000) live in the more developed regions, and a substantial majority of them (68 per cent) are projected to be living in the more developed regions by the year 2050.

Despite the smaller proportion of centenarians in the less developed regions, a significant increase in the absolute number of persons in this age group is projected to take place

in these regions over the next 50 years, from 40,000 in 2000 to more than 1 million in 2050. Within the more developed regions, Japan, in particular, will experience a remarkable increase in the number of centenarians over the next half century, from less than 13,000 in 2000 to almost 1 million in 2050. By the end of this period, Japan is expected to have by far the world's largest number and proportion of centenarians. Nearly 1 per cent of Japan's population will be 100 years old or older.

B. SEX RATIO

Women make up a significant majority of the older population; the female share increases with age

Because their life expectancy is greater than men's, women comprise a significant majority of the older population. In the year 2000, the global sex ratio of the population aged 60 or over was 81 males per hundred females (figure 28). Thus, there were approximately 63 million more women aged 60 years or older than there were men of the same age. Since female mortality rates are lower than male rates at older ages, the proportion of women in the older population grows substantially with advancing age. In 2000, women outnumbered men by almost 4 to 3 at ages 65 or older, and by almost 2 to 1 at ages 80 or above.

Sex ratios at older ages are expected to rise globally over the next half century

The sex ratios of the world population aged 60 or over and 65 or over remained practically the same in 2000 as they were in 1950. After a slight decline, from 80 men per hundred women in 1950 to 78 in 1975 at ages 60 or over, and from 76 to 74 at ages 65 or over, the world's sex ratios returned in 2000 to the original levels of 1950 (figure 28). In the case of the population aged 80 or over, however, the sex ratio consistently declined over the whole 50-year period, from 61 in 1950 to 58 in 1975 and to 53 in 2000.

Over the next half-century, the sex ratio of the older population is expected to increase. The evidence on which the projections are based suggests a somewhat faster growth in life expectancy among men than among women, particularly in the more developed regions. In 2050, the global number of men per hundred women is projected to rise to 85 at ages 60 or over, to 81 at ages 65 or over, and to 61 at ages 80 or over.

Sex ratios at older ages are significantly lower in the more developed regions than in the less developed regions

In the more developed regions, large gender differences in longevity translate into very low

sex ratios among the older population. Currently, in these regions, there are an average of 71 men per every hundred women in the 60 or over age group and only 44 men per hundred women in the 80 or over age group (figure 29).

In the less developed regions, older women do not outnumber older men to the same extent since gender differences in life expectancy are generally much smaller. Current sex ratios in these regions average 88 men per hundred women among persons aged 60 or over, and 65 among those aged 80 years or older (figure 29).

Trends in sex ratios at older ages are expected to differ between the more developed and the less developed regions

Over the next 50 years, the sex ratio of the older population is projected to increase in most of the more developed regions as a result of a faster decline in mortality rates among older men. By 2050, the average sex ratio in these regions is projected to be 78 among people over 60 and 56 among people over 80, up from 71 and 44 respectively in 2000 (figure 29).

In the less developed regions, mixed trends are projected over the next half-century. Women are expected to make up an increasing share of the

older population in most countries of these regions. However, the sex ratio will increase at ages 60 or over in several African countries. An increase is also expected at ages 80 or over in several Asian countries where proportions of older persons are already relatively high. By 2050, the average sex ratio in the less developed regions is projected to be 87 among people over 60, and 63 among those over 80, only slightly lower than the 2000 levels of 88 and 65 respectively (figure 29).

As a result of the differing trends projected for the more and the less developed regions, the gap between sex ratios at age 60 or over in the two regions will decrease from 17 points in 2000 to 9 points in 2050. During this same period, the gap between sex ratios at age 80 or over will decrease from 20 to 7 points.

Sex ratios at older ages vary greatly among major areas and countries

Among the world's major areas, Europe now has the lowest sex ratio at older ages (67 among people aged 60 or over, and 41 among persons aged 80 or above) owing to the combination of large gender differentials in life expectancy and the remaining effects of the Second World War. Asia, on the other hand, has the highest sex ratio among persons aged 60 or over (89), while Africa

has the highest sex ratio (69) among persons aged 80 or over (figure 30).

In several countries, mostly in Eastern and Northern Europe, women currently outnumber men by more than 5 to 3 among the population aged 60 or over. There are 10 countries with a sex ratio at ages 60 or over that is less than 3 men for each 5 women. Among the population aged 80 or over the balance (or rather the imbalance) of the sexes reaches 2 men for every 5 women; there are 18 countries with sex ratios below that ratio. At the same time, in other countries, mostly in Western Asia, men outnumber women at older ages. Sex ratios above 100 are found in 20

countries for the population aged 60 or over, and in 9 countries for the population aged 80 or over.

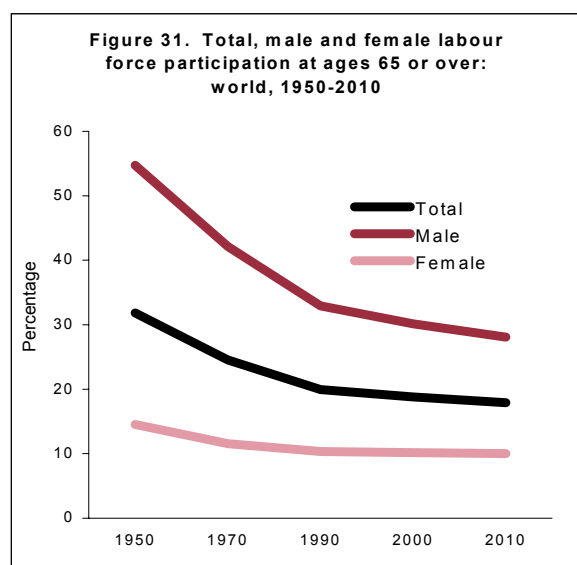

The range of sex ratios at older ages is particularly striking within the less developed regions. While countries such as Pakistan, Qatar, and United Arab Emirates report more men than women at older ages, countries where the proportion of older population is relatively high such as Argentina, Republic of Korea and Uruguay have a higher proportion of women at older ages than many European countries. The huge international variation is expected to lessen over the next 50 years.

V. SOCIO-ECONOMIC CHARACTERISTICS OF THE OLDER POPULATION

A. LABOUR FORCE PARTICIPATION

Labour force participation of the older population has declined worldwide over the last decades

Older people today are significantly less likely to participate in the labour force than they were in the past. Over the past 50 years, labour force participation of persons aged 65 or over declined by more than 40 per cent at the global level. In 1950, about 1 in every 3 persons aged 65 or over was in the labour force. In 2000, this ratio decreased to just less than 1 in 5.

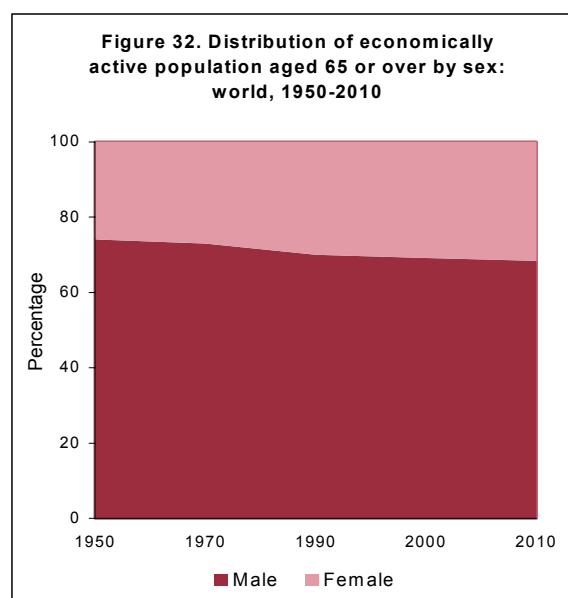

Among men, the reduction in labour force participation was from 55 per cent in the labour force in 1950 to 30 per cent in 2000. Among women, the reduction was considerably smaller, from 14 per cent in the labour force in 1950 to 10 per cent in 2000. By 2010, the total participation rate is projected to decrease slightly to 18 per cent, owing to the drop in the male rate to 28 per cent. Among older women, the participation rate is projected to remain stable over the next 10 years (figure 31).

The female share of the older work force is increasing

Traditionally, the proportion of older men who are economically active has been notably

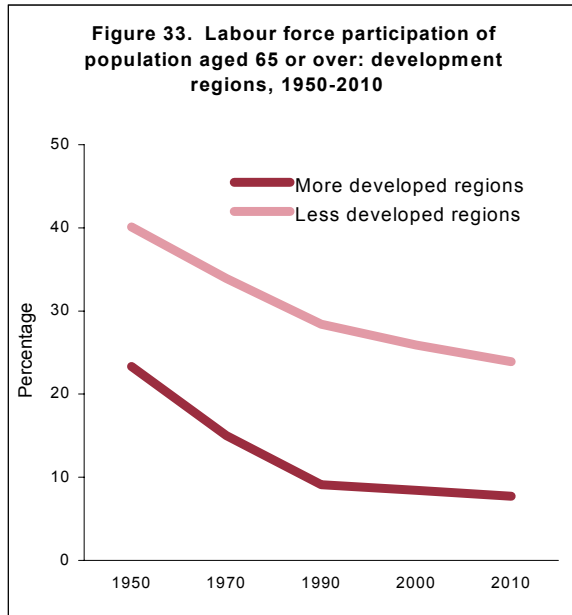

higher than the proportion of older women. However, as participation in the labour force at older ages has dropped faster among men than among women, the female share of the older labour force has steadily increased over the last decades, especially in the more developed regions. In 1950, 26 per cent of the workers aged 65 or over were women in both the more and less developed regions. By 2000, this proportion had increased to 29 per cent in the less developed regions and to 41 per cent in the more developed regions. At the global level, the percentage of older workers who were women increased from 26 in 1980 to 31 in 2000 (figure 32).

Participation rates of older persons are higher in the less developed regions

Old-age support systems in the form of pension and retirement programmes are much less prevalent in the less developed regions than in the more developed regions. It is not surprising, therefore, to find higher proportions of older persons in the labour force in the less developed regions. In 1950, the labour force participation rate among people 65 or older was about 40 per cent in the less developed regions and 23 per cent in the more developed regions. Over the following 50 years, the participation rate decreased considerably faster in the more

developed regions (by about 64 per cent) than in the less developed regions (by about 35 per cent). As shown in figure 33, by 2000, the rate in the less developed regions (26 per cent) was more than triple the rate in the more developed regions (8 per cent).

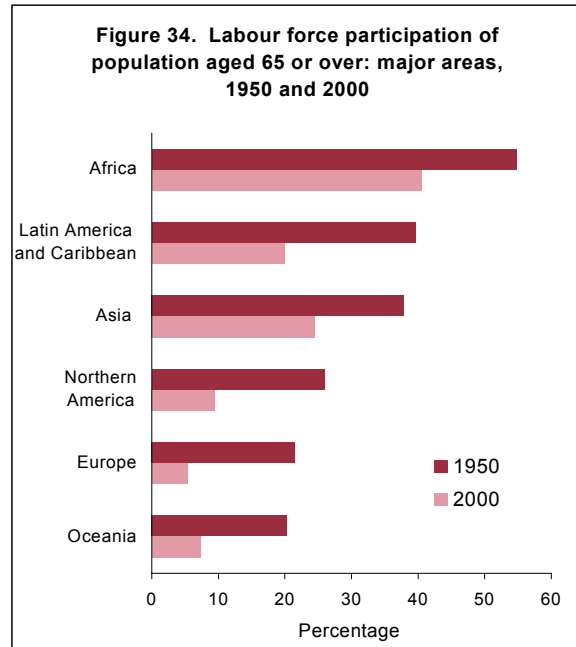

The employment rate is lowest in Europe and highest in Africa

Among the world's major areas, Africa has by far the highest proportion of economically active people among those 65 or older, while Europe has the lowest. Between these two extremes, labour force participation rates among the older population are lower in Oceania and Northern America and higher in Asia and in Latin America and the Caribbean.

Over the half-century from 1950 to 2000, the gap in participation rates between major areas has increased, as those with the lowest rates in 1950 have experienced sharper reductions (figure 34). In Europe, the rate declined by three fourths, from 22 per cent in 1950 to 5 per cent in 2000. The reduction between 1950 and 2000 was nearly two thirds in Oceania, (from 20 to 7 per cent) and Northern America (from 26 to 10 per cent). Over the same period, the participation rate decreased by half in Latin America and the Caribbean (from 40 to 20 per cent); by more than one third in Asia

(from 38 to 24 per cent) and by over one fourth in Africa (from 55 to 40 per cent). In all major areas, the reduction in labour force participation rates was greater for males than for females.

In some developed nations, fewer than 1 per cent of persons aged 65 or over are in the labour force

In at least 21 countries in 2000, fewer than 5 per cent of people over 65 were currently working; in two of them (Hungary and Belgium) this figure was under 1 per cent. At the other end of the scale, more than half of all people above 65 years continued to work in at least 24 countries. The participation rate in Mozambique was particularly high, where more than three in every four persons aged 65 or over were reported to be in the labour force.

For older men, the rates in the year 2000 ranged from less than 2 per cent in some European countries (Austria, Belgium, Hungary and Luxembourg) to more than 80 per cent in some African countries (Central African Republic, Guinea-Bissau, Malawi, Mozambique and United Republic of Tanzania). For women, the rates ranged from less than 0.5 per cent in Belgium, Hungary, Kuwait and Netherlands, to more than 60 per cent in Central African Republic, Ghana, Malawi and Mozambique.

Some countries show dramatic declines in the labour force participation of older people

Labour force participation of older people has declined in practically all countries of both more and less developed regions. In 35 countries, the participation rate of persons aged 65 or over dropped by more than 70 per cent over the last half-century; in 11 countries the reduction was over 90 per cent. The rate for Hungary dropped the most, from 39 per cent in the labour force in 1950 to less than 0.5 per cent in 2000. By contrast, the reported participation rates in 9 other countries increased over this 50-year period.

B. ILLITERACY RATES

Literacy among the older population is nearly universal in the more developed regions

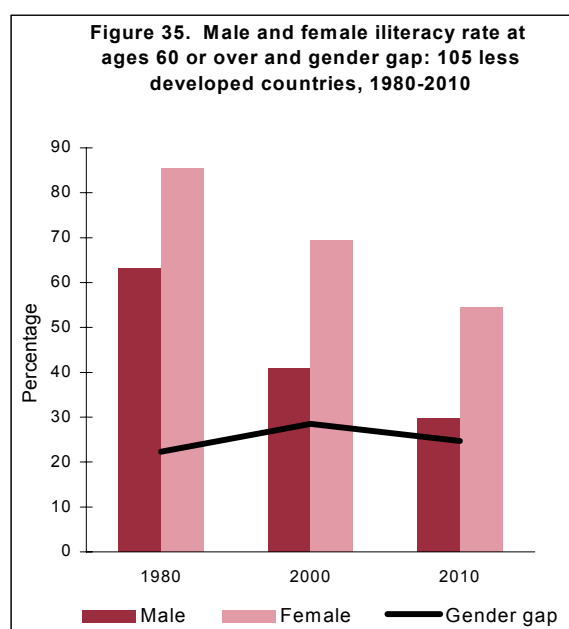

The widespread attainment of at least primary education has been established for a long time in the more developed regions. As a result, literacy in these regions is assumed to be nearly universal even among the older population, and most countries no longer produce statistical information on this subject. In some of the small number of developed countries for which age-specific data on literacy are available, however, the illiteracy rates are quite high at older ages. In Portugal, for instance, more than 1 in 4 persons aged 70 or over were illiterate in 2000, and for those aged 60 to 64 the ratio was more than 1 in 7. In Malta, the illiteracy rate in that same year was 14 per cent among those aged 60-64 and 23 per cent for those above 70. For the remaining developed countries with available data on illiteracy rates, the figures for 2000 ranged from 0.2 per cent in Latvia for both age groups 60-64 and 70 or over, to 5 per cent for persons aged 60-64 and 9 per cent for persons aged 70 or over in Greece.

Illiteracy remains high among older people, especially women, in the less developed regions

Although illiteracy among older persons has consistently declined in most of the less developed regions over the last two decades, it still remains generally high. Combining the data from the 105 less developed countries for which

information is available, 56 per cent of persons aged 60 or over were illiterate in 2000, down from 75 per cent in 1980. Over the decade 2000-2010, the illiteracy rate among older people is projected to continue decreasing in virtually all countries. By 2010, the aggregate rate for the 105 less developed countries with available information is expected to decrease to 43 per cent.

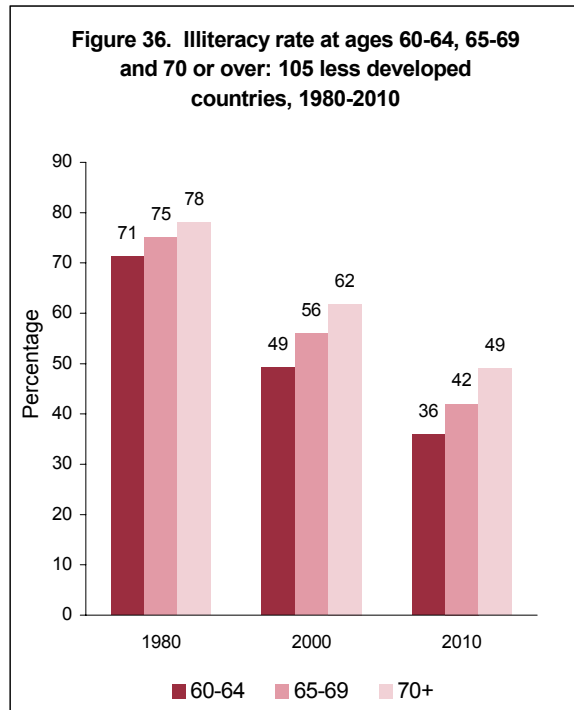

The reduction in illiteracy rates among older persons in the less developed regions was greater among males than females; as a result, the gender gap in literacy increased over the last 20 years. In 1980, the illiteracy rate among women aged 60 or over (85 per cent) was 22 percentage points higher than among men at the same age (63 per cent). By 2000, this difference increased to 28 percentage points as the aggregate rate decreased to 69 per cent among older women and to 41 per cent among older men (figure 35). Over the next decade, however, the gap is projected to decrease to 25 percentage points, as the aggregate rate decreases to 55 per cent among older women and to 30 per cent among older men.

Illiteracy among older people increases with age

In general, education levels have improved for each generation over the last century. Therefore, it is common to find important differences in the educational attainment of

younger and older segments of the older population. Not surprisingly, illiteracy among older people in the less developed regions is particularly high among those in the most advanced age groups.

Considering the aggregate population of the 105 less developed countries for which literacy rates are available, 62 per cent of persons aged 70 or over were illiterate in 2000, compared with only 49 per cent of persons aged 60 to 64. In 1980, the corresponding illiteracy rates were 78 per cent and 71 per cent. In 2010, the rates are projected to be 49 per cent and 36 per cent respectively for persons aged 70 or over and for persons aged 60 to 64 (figure 36).

Variations in illiteracy rates are marked within the less developed regions

Huge differences in illiteracy levels among older persons exist among the less developed countries for which information on illiteracy is available. In some African countries such as Benin, Burkina Faso, Gambia, Mali and Niger, more than 90 per cent of persons aged 60 to 64 and more than 95 per cent of persons aged 70 or over were illiterate in the year 2000, compared with less than 6 per cent of persons aged 60 to 64 and less than 8 per cent of persons aged 70 or over in such countries as Argentina, Tajikistan and Uruguay. This disparity between countries is expected to decrease in the future as educational attainment continues to improve.

VI. CONCLUSIONS

Global population ageing is a by-product of the demographic transition in which both mortality and fertility decline from higher to lower levels. Currently, the total fertility rate is below the replacement level in practically all industrialized countries. In the less developed regions, the fertility decline started later and has proceeded faster than in the more developed regions. Yet, in all regions people are increasingly likely to survive to older ages, and once there they are tending to live longer, as the gains in life expectancy are relatively higher at older ages.

The older population is growing at a considerably faster rate than that of the world's total population. In absolute terms, the number of older persons has tripled over the last 50 years and will more than triple again over the next 50 years. In relative terms, the percentage of older persons is projected to more than double worldwide over the next half century. However, notable differences exist between regions in the numbers and proportions at higher ages. Although the highest proportions of older persons are found in the more developed regions, this age group is growing considerably more rapidly in the less developed regions. As a consequence, the older population will be increasingly concentrated in the less developed regions.

The young-old balance is shifting throughout the world. In the more developed regions, the proportion of older persons already exceeds that of children, and by 2050 it is expected to be double that of children. In the less developed regions, age-distribution changes have been slow but will accelerate over the next 50 years. Currently, the median age in the more developed regions is more than 13 years higher than in the less developed regions and almost 20 years higher than in the least developed countries.

An increase in the old-age dependency ratio indicates a situation in which an increasing number of potential beneficiaries of health and pension funds (mainly those aged 65 and over) are supported by a relatively smaller number of potential contributors (those in the economically

active ages of 15-64). This trend tends to impose heavier demands on the working-age population (in the form of higher taxes and other contributions) in order to maintain a stable flow of benefits to the older groups. Even the sharp decline in youth dependency that has accompanied the increase in old-age dependency may not be enough to offset the increased costs, since the relative expense of supporting the old is, in general, higher than that of supporting the young.

The continuing increase of the parent support ratio, on the other hand, implies that more and more frequently the young-old will find themselves responsible for the care of one or more oldest-old family members. Parent support ratios are lower in the developing regions, where public institutions for the support of the very old tend to be less fully developed. However, the ratio is rising quite rapidly in the developing regions as well.

As the numbers and relative proportions of the older population increase, their demographic characteristics are also changing. For instance, the older population is itself undergoing a process of demographic ageing. At the global level, the most rapidly growing age group is that aged 80 and over. Although the oldest-old still constitute a small proportion of the total population, their numbers are becoming increasingly important, especially in the less developed regions.

In most countries, older women greatly outnumber older men. In many cases, the difference is so large that the concerns of the older population should in fact be viewed primarily as the concerns of older women. This is especially true in the case of the oldest-old populations, as the female share increases markedly with age.

Labour force participation among the older population has been declining worldwide. The participation rates remain considerably higher in the less developed than in the more developed regions, but the trend is towards lower levels of economic activity among older persons nearly everywhere. Worth noting is the increasing

female share of the older work force as participation rates have decreased among older males. Although lower levels of labour force participation at older ages are usually a sign of higher levels of social security coverage, they may also result from other factors such as a shortage of employment opportunities and obsolescence of skills and knowledge.

Illiteracy remains high in the less developed regions among older people, especially women and the oldest groups. Available evidence suggests that, as of the year 2000, only about half of all persons 60 and older in those regions were literate. However, a trend towards increasing literacy among older people can be observed for both sexes in virtually all countries of the world. This is a favourable development for the well-being of future older generations, since higher levels of education are associated with better health and economic status within the older population.

As the twentieth century drew to a close, population ageing and its social and economic consequences were drawing increased attention from policy-makers worldwide. By that time, many countries, especially in the more developed regions, had already achieved population structures older than any ever seen in human history. In most cases, the ageing societies also experienced rapid economic growth during the second half of the twentieth century. While major shortcomings and unmet needs remained, most developed countries expanded and diversified their systems of social security and health care

and, on the whole, the standard of living of the old as well as the young improved as populations aged. However, strains were building in those support systems, as the older population continued to grow much more rapidly than that of younger adults and as earlier withdrawal from the labour force added to the demands on public pension systems.

The twenty-first century will witness even more rapid population ageing than did the century just past. Worldwide, the percentage of the population aged 60 years or older increased by 2 points—from 8 to 10 per cent—in the second half of the twentieth century. During the first half of the twenty-first century, that percentage is projected to increase by 11 points, to 21 per cent. By 2050, the population of the less developed regions will have the same percentage of persons aged 60 years and over as the more developed regions did in 2000. The developing countries will also reach that stage over a much shorter period of time than that required by the more developed regions. In many cases, rapid population ageing will be taking place in countries where the level of economic development is still low. The challenge for the future is “to ensure that people everywhere will be enabled to age with security and dignity and continue to participate in their societies as citizens with full rights”. At the same time, “the rights of older persons should not be incompatible with those of other age groups, and the reciprocal relationships between the generations must be nurtured and encouraged” (United Nations, 2001a, paras. 9 and 14).

Annexes

ANNEX I

DEFINITION OF THE INDICATORS OF POPULATION AGEING

A. AGEING INDEX

The **ageing index** is calculated as the number of persons 60 years old or over per hundred persons under age 15.

B. DEPENDENCY RATIO

The **total dependency ratio** is the number of persons under age 15 plus persons aged 65 or older per one hundred persons 15 to 64. It is the sum of the youth dependency ratio and the old-age dependency ratio.

1. The **youth dependency ratio** is the number of persons 0 to 14 years per one hundred persons 15 to 64 years.

2. The **old-age dependency ratio** is the number of persons 65 years and over per one hundred persons 15 to 64 years.

C. GROWTH RATE

A population's **growth rate** is the increase (or decrease) in the number of persons in the population during a certain period of time, expressed as a percentage of the population at the beginning of the time period. The **average annual growth rates** for all ages as well as for particular age groups are calculated on the assumption that growth is continuous.

D. ILLITERACY RATE

The **illiteracy rate** of a particular age group indicates the proportion of persons in that group who cannot read with understanding and cannot write a short simple statement on their everyday life.

E. LABOUR FORCE PARTICIPATION

The **labour force participation rate** consists of the economically active population in a particular age group as a percentage of the total population of that same age group. The active population (or labour force) is defined as the sum of persons in employment and unemployed persons seeking employment. This definition of employment is the one adopted by the Thirteenth International Conference of Labour Statisticians (Geneva, 1982). National definitions may in some cases differ. For information on the differences in scope, definitions and methods of calculation used for the various national series, see International Labour Organization, *Sources and Methods: Labour Statistics* (formerly *Statistical Sources and Methods*), vol. 2, *Employment, Wages, Hours of Work and Labour Cost (Establishment Surveys)*, 2nd edition (Geneva, 1995); vol. 3, *Economically Active Population, Employment, Unemployment and Hours of Work (Household Surveys)*, 2nd edition (Geneva, 1990); and vol. 4, *Employment, Unemployment, Wages and Hours of Work (Administrative Records and Related Sources)* (Geneva, 1989).

F. LIFE EXPECTANCY

Life expectancy at a specific age is the average number of additional years a person of that age could expect to live if current mortality levels observed for ages above that age were to continue for the rest of that person's life. In particular, **life expectancy at birth** is the average number of years a newborn would live if current age-specific mortality rates were to continue.

G. MEDIAN AGE

The **median age** of a population is that age that divides a population into two groups of the same size, such that half the total population is younger than this age, and the other half older.

H. PARENT SUPPORT RATIO

The **parent support ratio** is the number of persons 85 years old and over per one hundred persons 50 to 64 years.

I. POTENTIAL SUPPORT RATIO

The **potential support ratio** is the number of persons aged 15 to 64 per every person aged 65 or older.

J. SEX RATIO

The **sex ratio** is calculated as the number of males per one hundred females in a population. The sex ratio may be calculated for a total population or for a specific age group.

K. SURVIVAL RATE

The **survival rate** to a specific age X is the proportion of newborns in a given year who would be expected to survive at age X if current mortality trends were to continue for at least the next X years. Survival rates are derived from the life table, which is an analytic procedure designed to produce estimates of life expectancies and other measures of mortality, based on prevailing age-specific death rates.

L. TOTAL FERTILITY RATE

The **total fertility rate** is the average number of children a woman would bear over the course of her lifetime if current age-specific fertility rates remained constant throughout her childbearing years (normally between the ages of 15 and 49). The current total fertility rate is usually taken as an indication of the number of children women are having at the present.

ANNEX II

CLASSIFICATION OF MAJOR AREAS AND REGIONS

Africa

<i>Eastern Africa</i>	<i>Middle Africa</i>	<i>Northern Africa</i>	<i>Western Africa</i>
Burundi	Angola	Algeria	Benin
Comoros	Cameroon	Egypt	Burkina Faso
Djibouti	Central African Republic	Libyan Arab Jamahiriya	Cape Verde
Eritrea	Chad	Morocco	Côte d'Ivoire
Ethiopia	Congo	Sudan	Gambia
Kenya	Democratic Republic of the Congo	Tunisia	Ghana
Madagascar	Equatorial Guinea	Western Sahara	Guinea
Malawi	Gabon		Guinea-Bissau
Mauritius	Sao Tome and Principe*	<i>Southern Africa</i>	Liberia
Mozambique		Botswana	Mali
Réunion		Lesotho	Mauritania
Rwanda		Namibia	Niger
Seychelles*		South Africa	Nigeria
Somalia		Swaziland	St. Helena*
Uganda			Senegal
United Republic of Tanzania			Sierra Leone
Zambia			Togo
Zimbabwe			

Asia

<i>Eastern Asia</i>	<i>South-central Asia</i>	<i>South-eastern Asia</i>	<i>Western Asia</i>
China	Afghanistan	Brunei Darussalam	Armenia
China, Hong Kong SAR	Bangladesh	Cambodia	Azerbaijan
China, Macao SAR	Bhutan	East Timor	Bahrain
Democratic People's Republic of Korea	India	Indonesia	Cyprus
Japan	Iran (Islamic Republic of)	Lao People's Democratic Republic	Georgia
Mongolia	Kazakhstan	Malaysia	Iraq
Republic of Korea	Kyrgyzstan	Myanmar	Israel
	Maldives	Philippines	Jordan
	Nepal	Singapore	Kuwait
	Pakistan	Thailand	Lebanon
	Sri Lanka	Viet Nam	Occupied Palestinian Territory
	Tajikistan		Oman
	Turkmenistan		Qatar
	Uzbekistan		Saudi Arabia
			Syrian Arab Republic
			Turkey
			United Arab Emirates
			Yemen

Europe

<i>Eastern Europe</i>	<i>Northern Europe</i>	<i>Southern Europe</i>	<i>Western Europe</i>
Belarus	Channel Islands	Albania	Austria
Bulgaria	Denmark	Andorra*	Belgium
Czech Republic	Estonia	Bosnia and Herzegovina	France
Hungary	Faeroe Islands*	Croatia	Germany
Poland	Finland	Gibraltar*	Liechtenstein*
Republic of Moldova	Iceland	Greece	Luxembourg
Romania	Ireland	Holy See*	Monaco*
Russian Federation	Isle of Man*	Italy	Netherlands
Slovakia	Latvia	Malta	Switzerland
Ukraine	Lithuania	Portugal	
	Norway	San Marino*	
	Sweden	Slovenia	
	United Kingdom of Great Britain and Northern Ireland	Spain	
		The former Yugoslav Republic of Macedonia	
		Yugoslavia	

Latin America and the Caribbean

<i>Caribbean</i>	<i>Central America</i>	<i>South America</i>
Anguilla*	Belize	Argentina
Antigua and Barbuda*	Costa Rica	Bolivia
Aruba*	El Salvador	Brazil
Bahamas	Guatemala	Chile
Barbados	Honduras	Colombia
British Virgin Islands*	Mexico	Ecuador
Cayman Islands*	Nicaragua	Falkland Islands (Malvinas)*
Cuba	Panama	French Guiana
Dominica*		Guyana
Dominican Republic		Paraguay
Grenada*		Peru
Guadeloupe		Suriname
Haiti		Uruguay
Jamaica		Venezuela
Martinique		
Montserrat*		
Netherlands Antilles		
Puerto Rico		
Saint Kitts and Nevis*		
Saint Lucia		
Saint Vincent and the Grenadines*		
Trinidad and Tobago		
Turks and Caicos Islands*		
United States Virgin Islands*		

Northern America

Bermuda*
 Canada
 Greenland*
 St. Pierre and Miquelon*
 United States of America

Oceania

Australia/New Zealand

Australia
 New Zealand

Melanesia

Fiji
 New Caledonia
 Papua New Guinea
 Solomon Islands
 Vanuatu

Micronesia

Guam
 Kiribati*
 Marshall Islands*
 Micronesia

List of least developed countries^a

Afghanistan	Guinea	Niger
Angola	Guinea-Bissau	Rwanda
Bangladesh	Haiti	Samoa
Benin	Kiribati	Sao Tome and Principe
Bhutan	Lao People's Democratic Republic	Sierra Leone
Burkina Faso	Lesotho	Solomon Islands
Burundi	Liberia	Somalia
Cambodia	Madagascar	Sudan
Cape Verde	Malawi	Togo
Central African Republic	Maldives	Tuvalu
Chad	Mali	Uganda
Comoros	Mauritania	United Republic of Tanzania
Democratic Republic of the Congo	Mozambique	Vanuatu
Djibouti	Myanmar	Yemen
Equatorial Guinea	Nepal	Zambia
Eritrea		
Ethiopia		
Gambia		

NOTES: Countries or areas with a population of less than 140,000 in 2000 are indicated by an asterisk (*). These countries or areas are included in the regional totals, but are not shown separately.

^aAs of 28 February 2001, when the estimates and projections used in the present publication were finalized (United Nations, 2001b), the group of least developed countries comprised 48 countries. On 12 April 2001, the General Assembly added Senegal to the list of least developed countries.
