World Population Prospects 1988

United Nations New York, 1989

NOTE

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term "country" as used in the text of this publication also refers, as appropriate, to territories or areas.

The designations "more developed" and "less developed" regions are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process.

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

PREFACE

The estimates and projections of population presented in this report are based on the eleventh round of the global demographic estimates and projections undertaken by the United Nations Secretariat. The year 1988 appearing in the title of the present report refers to the year in which the substantive work was completed. In the previous reports, such as "Estimates and Projections as Assessed in 1984" which was published in 1986, the year "1984" referred to the time at which the assessment work began. Therefore, despite the apparent four-year gap between the two successive publications, the real interval was two years between the tenth and eleventh rounds of the assessment. As in the past, the figures presented in this report supersede those that were previously published by the United Nations.*

The responsibility for this report rests with the Population Division of the Department of International Economic and Social Affairs of the Secretariat; however, the assessment was facilitated to a great extent by the close co-operation among United Nations bodies, particularly the regional commissions and the Statistical Office of the Department of International Economic and Social Affairs.

A magnetic tape containing the major results of the present population estimates and projections can be provided upon request for a nominal charge. Inquiry about the tape should be addressed to the Director of the Population Division, Department of International Economic and Social Affairs, United Nations, New York, N.Y. 10017.

---

* The last revision (tenth round) of the United Nations population estimates and projections was published as World Population Prospects: Estimates and Projections as Assessed in 1984 (United Nations publication, Sales No. E.86.XIII.3). Those estimates and projections were also shown in World Demographic Estimates and Projections, 1950-2025 (ST/ESA/SER.R/79).

TABLES IN PART ONE

Chapter I

No.		
1.1	Classification of development regions, major areas and regions of the world, 1988 and 1984 classifications	6
1.2	Composition of special country groupings	8
1.3	Average quinquennial increment in life expectancy at birth according to the level of mortality from selected low-mortality populations	15
1.4	Working model for mortality improvement, quinquennial gains (in years) in life expectancy at birth ($^{o}e_{o}$) acccording to initial level of mortality	16
1.5	Probability of dying by age and sex selected from countries with lowest mortality and constructed for the working life table	19
1.6	Assumed period to reach the replacement level in medium-variant projections, Africa	23
1.7	Assumed period to reach the replacement level in medium-variant projections, Asia	24

CONTENTS (continued)

Chapter II

No.		Page
2.1	World population and average annual growth rate, medium, high and low variants, 1950-2025	28
2.2	Growth rate, crude birth rate and crude death rate for the world, more developed regions and less developed regions, medium variant, 1950-2025	29
2.3	Average annual population increment for the world, more developed regions and less developed regions, medium, high and low variants, 1950-2025	34
2.4	Population size and rate of increase for the world, more developed regions and less developed regions, medium variant, 1950-2025	35
2.5	Size, percentage distribution and annual rate of increase of population by major areas of the world, medium variant, 1950-2025	37
2.6	The 25 most populous countries, ranked by size, medium variant, 1985, 2000 and 2025	38
2.7	Countries and areas with 1980-1985 growth rates higher than 3.5 per cent	39
2.8	Total population, medium variant, as assessed in 1963, 1973, 1982 and 1988, world and major regions, 1985 and 2000	41
2.9	Growth rates, medium variant, as assessed in 1963, 1973, 1982 and 1988, world and major regions, 1980-1985 and 1995-2000	42
2.10	Crude birth rate and total fertility rate for world and major areas, medium variant, 1950-2025	44
2.11	Crude death rate, life expectancy and infant mortality rate for world and major areas, medium variant, 1950-2025	47
2.12	Sex ratio for the world and by major areas, medium variant, 1950-2025	50
2.13	Estimated and projected sex ratio by age groups, more developed regions and less developed regions, medium variant, 1950-2025	52
2.14	Median age for the world and by major areas, medium variant, 1950-2025	53
2.15	Child population (aged 0-14 years): size, growth rate and percentage of the total population, for major regions of the world, 1950-2025, medium variant	56
2.16	Youth population (aged 15-24 years): size, growth rate and percentage of the total population, for major regions of the world, 1950-2025, medium variant	58
2.17	Elderly population (aged 60 years or more): size, growth rate and percentage of the total population, for major regions of the world, 1950-2025, medium variant	60
2.18	Dependency ratios for total, young (under age 15) and old (aged 65 and over) population, medium variant, for major regions of the world, 1950-2025	61

EXPLANATORY NOTES

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document.

The term "billion" signifies a thousand million.

Annual rates of growth or change refer to annual exponential rates, unless otherwise stated.

A point (.) in a number is used to indicate decimals.

The following symbols have been used in the tables:

Two dots (..) indicate that data are not available or are not separately reported.

A dash (--) indicates that the amount is nil or negligible.

A hyphen (-) indicates that the item is not applicable.

A minus sign (-) before a number indicates a deficit or decrease, except as indicated.

Details and percentages in tables do not necessarily add to totals because of rounding.

INTRODUCTION

1. One of the major activities of the Population Division of the Department of International Economic and Social Affairs of the United Nations Secretariat in the past four decades has been to provide up-to-date and internationally comparable estimates and projections of population and other major demographic variables for all countries, areas and regions of the world. Between the years 1951 and 1984, following the early attempts in the 1940s, 10 rounds of population estimates and projections were published - that is, those assessed in 1951, 1954, 1957, 1963, 1968, 1973, 1978, 1980, 1982 and 1984. 1/

2. In all those instances, the years mentioned referred to the beginning date (mostly data collection) of each assessment, but the actual completion of revisions was a few years later. The present report is based on the eleventh-round revision, which began in early 1986 (data collection) and was completed in the middle of 1988. Instead of following the past practice to label it "the 1986 assessment", it is now called "the 1988 revision" to place emphasis on the year of actual completion of the revision.

3. The present population estimates and projections have been prepared for the world, the more developed and less developed regions, seven major areas, 22 regions, and 210 countries and areas. The estimates and projections for the major areas, regions, less developed regions, more developed regions and the world as a whole are the weighted sums of the derived figures for the individual countries and areas that make up the particular grouping. The population estimates and projections are provided for each quinquennial year or each quinquennial period of the 75 years between 1950 and 2025.

4. Most of the statistics presented are derived from available national data that have been evaluated and, whenever necessary, adjusted for deficiencies and inconsistencies. For those countries for which data are lacking or insufficient, the estimates assumed are those that are believed to be reasonable for the population in question and are in agreement with any existing reliable information. The age and sex structure of the population for each country is determined for the base year of 1985 in such a way that it is internally consistent and in line with its past trends of fertility, mortality and migration.

5. For the period from 1985 to 2025, four variants of projections were prepared in the 1988 revision: the high, medium, low and constant fertility variants. The major differences among the four variants are largely due to the assumed future fertility rates; however, varying assumptions were also adopted on future patterns of migration and mortality when such differentiations seemed appropriate. The high and low variants indicate the plausible range of future demographic trends. It is not exhaustive, however, since future fertility, mortality and migration rates can follow different courses outside the range. The medium variant falls between the high and the low variants. The constant-fertility variant presents a hypothetical

projection, showing the possible course of population growth if the fertility rates were to remain unchanged at the 1985 level. Selected results of the constant-fertility variant, including projected population totals, rate of growth, crude birth rates, crude death rates, etc., are also presented in table 17 in part two of the present report, but more details of the constant-fertility variant projections are available on a computer tape.

6. A description of the methods, data, assumptions and major findings of the 1988 revision is given in chapters I and II of part one of this report. Part two presents the revised population estimates and projections in tabular form. There are 17 tables: tables 1 to 16 are arranged by subject for all countries and regions and table 17 is arranged by region (table 17-A) and by country (table 17-B) for selected demographic indicators. There are a few groups of countries for which the aggregated data are not presented in tables 1 to 16 but are included in table 17-A. These groups are the least developed countries, sub-Saharan African countries, and the five regional groups associated with the respective five regional commissions of the United Nations.

7. More detailed estimates and projections of population by sex and five-year age groups for the world, regions and countries will be published shortly in a separate report.*

---

* The report will supersede Global Estimates and Projections of Population by Sex and Age, The 1984 Assessment (ST/ESA/SER.R/70).

Part One

METHODOLOGY AND RESULTS

Chapter I

METHODS, DATA AND ASSUMPTIONS

8. The 1988 revision of the United Nations population estimates and projections, like previous revisions, covers the estimation of past world demographic changes and the projection of future population growth. The estimates provide a consistent series of demographic parameters for each country and area of the world for each quinquennium in the estimation period, which, in this revision, is from 1950 to 1985. The basic data estimated for 1985, the base year of the projection, have been used to project various demographic parameters for the period from 1985 to 2025. Those demographic parameters include the size of total population, its age and sex structure, its growth rate, and basic measures of fertility, mortality, urbanization and international migration.

A. Classification of countries by major areas or regions

9. For demographic and statistical purposes, countries and areas have been classified into seven major areas and 22 regions of the world. Over the past 40 years there have been some changes in many of the regions in terms of their political composition, demographic characteristics and the availability of population statistics, and this classification has gone through many changes. The first classification was introduced in 1949. At that time the world was classified into five continents and a number of intracontinental subdivisions that were considered to be fairly homogeneous from a demographic point of view. "The subdivisions are based chiefly on available information regarding rates of population increase, fertility, mortality and age composition of the population. In addition, attention has been paid to the availability and quality of statistics." 2/

10. A more elaborate delineation of the world's regions into five continents, 18 regions and subregions was made in 1954 in order to provide better information for the understanding of the regional patterns and trends of population growth. 3/ This classification was soon replaced by the 19 regional groupings given in the report entitled The Future Growth of World Population (United Nations publication, Sales No. 58.XIII.2). These "nineteen world regions have been delimited in accordance with widely accepted geographic criteria. They have been drawn up chiefly with a view to meeting the requirements of most users of regional population estimates. The differentiation between these regions has not been based initially on their population trends, and conditions among and within each of the several countries composing a region are not uniform." 4/ The concepts of "technically developed areas" and "technically underdeveloped areas" were introduced in the report, although no detailed aggregates except population totals were provided.

11. In the report World Population Prospects as Assessed in 1963, the world was reclassified into 8 major areas and 24 regions. The dichotomy of "more developed regions" and "less developed regions" was introduced on the basis of the fertility levels of various countries around 1960. The report stated that:

"At the present juncture, it is most pertinent to distinguish two major types only, namely, those of regions and countries regarded, by various criteria, as 'developed' and 'developing'. No other criterion, be it per capita income, urbanization, literacy, industrialization, etc., defines this dichotomy so sharply as the level of fertility. With exceedingly few exceptions, it can be said that where the gross reproduction rate is greater than 2.0, the country is a 'developing' one, and where it is less, the country is 'developed'. There are also differences in mortality between the two types of countries, but in this respect the association is now less strong than it used to be." 5/

12. This classification of two development regions, eight major areas and 24 regions has been used until the present. However, minor shifts of countries among regions have been made continuously in order to reflect the changing characteristics of these regions. For the 1988 revision, the classification was revised once again in a more visible way. Two hundred and six countries and areas in the world are now grouped into the more developed regions, the less developed regions, seven major areas and 22 regions. Table 1.1 presents a comparison of the present and the past classifications. The changes introduced for the current revision are:

(a) Tropical and Temperate South America are combined as South America;

(b) The major areas of East Asia and South Asia are deleted. The major area of Asia has four regions: Eastern Asia (which is equivalent to the old "East Asia"), South-eastern Asia, Southern Asia and Western Asia. China and Japan are no longer regions, they are countries within Eastern Asia;

(c) The categories of Arab countries and non-Arab countries in Western Asia are deleted;

(d) The region of Micronesia-Polynesia is deleted; Micronesia and Polynesia are separate regions of Oceania.

13. It should be noted that the composition of the more and the less developed regions has not changed. At this level of aggregation, the demographic characteristics of the more and the less developed regions are not expected to change greatly if slightly different criteria are introduced in the reclassification. At present, the less developed regions include all regions of Africa, Asia (excluding Japan), Latin America, and Oceania (excluding Australia and New Zealand). The more developed regions include all the other regions plus the three countries excluded from the developing regions. The full details of the classification are given in tables 2 through 5 in part two of this report.

Table 1.1. Classification of development regions, major areas and regions of the world, 1988 and 1984 classifications

1988 Classification	1984 Classification
World total	World total
More developed regions	More developed regions
Less developed regions	Less developed regions

14. In addition to the conventional groupings described above, aggregated values of demographic estimates and projections are shown at the end of table 17-A for seven special country groupings: least developed countries, Economic Commission for Africa (ECA) area, Economic Commission for Europe (ECE) area, Economic Commission for Latin America and the Caribbean (ECLAC) area, Economic and Social Commission for Asia and the Pacific (ESCAP) area, Economic and Social Commission for Western Asia (ESCWA) area and sub-Saharan Africa. Their composition is shown in table 1.2.

15. Least developed countries comprise 40 countries listed in The Least Developed Countries: 1987 Report (United Nations publication, Sales No. E.87.II.D.12) and Burma, whose inclusion in the group was approved by the General Assembly at its forty-second session (decision 42/428). The list of countries included in the calculation of aggregated demographic estimates and projections for each regional commission was either provided by the office in the regional commission that is in charge of population research or taken from its statistical publication. The list of countries is not necessarily identical to the list of members and associated members of the regional commission, mainly because the latter may include some countries the majority of whose population does not reside in the geographical region. The countries of sub-Saharan Africa comprise all countries in Eastern Africa, Middle Africa, Southern Africa and Western Africa, as well as the Sudan and Western Sahara in Northern Africa.

B. Methods of estimation

16. The first step of the estimation process is to establish the size of the total population and its age and sex structure for a date closest to the base year. In most cases, that information is derived from a national population census. Most countries have published their 1980 round of population census reports, some giving detailed tabulations. The data needed for estimating the size, age and sex distribution and other characteristics of population are ample. All data that were available to the United Nations have been evaluated and, when it was deemed necessary, adjustments were made. Estimates of total population and age and sex structures from 1950 to 1985 at five-year intervals (i.e., 1950, 1955, 1960, etc.), which were prepared in the previous revisions of population, were examined. The consistency of those age distributions with the base-year distributions - i.e., the 1985 distributions - was established; if necessary, further adjustments of either the base distribution or the distribution of an earlier date were made. In that process, any information from previous censuses, civil registrations and surveys, or on the age and sex structures of similar countries, including that derived from stable and quasi-stable population models, was taken into account.

17. Generally, for countries or areas where estimates of the size and structure of the population are readily available for 1950-1985, the estimates have been incorporated into previous United Nations revisions. However, if retrospective estimates of the total population and its age and sex structure are not available or are not acceptable for any of various reasons, estimates are prepared by the Population Division, utilizing available information on fertility, mortality and international migration.

18. In the process of preparing the retrospective estimates of the total population and its age and sex structure, past estimates of fertility, mortality and international migration must necessarily be inferred, because the components of demographic change, population size and age and sex structure are intrinsically interrelated. Estimates of some parameters limit the possible range of the estimates for the other parameters.

19. Estimates of international migration are usually the most problematic, owing to the lack of appropriate data. Therefore, they are sometimes derived from the differences between the reported age and sex structure and the expected distribution, based on estimates of past fertility and mortality, and from census data on place of birth, duration of residence or even statistics on arrivals and departures. The reliability of such estimates is generally not high. Because of this reliability problem, estimates of international migration in the past seven quinquennial periods, from 1950 to 1985, are not shown in table 17 in part two.

20. After the basic parameters, such as total size of population and its age and sex structure, mortality rate, age-specific fertility rate, and net migration by age and sex, are determined, the other demographic indicators presented in this report including, for example, median age, crude birth and death rates, age-dependency ratio, etc., are calculated. Population density at a given time was computed by dividing the total population size at that

time by the land area estimated for 1985, without making any adjustment for past changes of the land area. The estimates of land area in 1985 are based on table 1 of the Demographic Yearbook 1985 (United Nations publication, Sales No. E/F.86.XIII.1).

C. Methods of projection

21. The cohort component method was used in preparing the 1988 revision of population projections. That technique, which had been used in previous revisions, considers the levels and trends in each of the three major components of population change - that is, fertility, mortality and migration, together with the base-year population by age and sex. Although the method has been explained in detail in previous United Nations manuals, [6] the major steps involved are summarized below.

22. First, age and sex-specific survival rates are successively applied to the base-year population in order to determine the number of survivors in each age and sex category at the end of each five-year period. The survival rates are derived either from appropriate model life tables [7] selected in consideration of the age patterns of mortality in the national life tables, if available, or by extrapolating the latest national life table to an age pattern of mortality assumed for the future.

23. Secondly, the number of births expected to take place during each five-year period is estimated from the assumed total fertility rate, age patterns of fertility and the corresponding number of females in the reproductive age groups. The births are distributed by sex on the basis of an assumed sex ratio at birth. Finally, the number of survivors from those births at the end of each quinquennial period is calculated by applying the survival rates derived as described above.

24. Thirdly, the assumed number of net migrants during each quinquennial period of the projection period (i.e., immigrants minus emigrants), classified by age and sex, is added to or subtracted from the number of projected survivors to produce the projected population at the end of each five-year period.

25. Thus, at the end of each quinquennial period, there are at hand the projected population, by age and sex, and, for each such period, the assumed mortality, fertility and migration rates, also by age and sex. From that information, a set of demographic indicators is derived, and many of those indicators are presented in this report.

26. The approach described above was used for all countries with a population size of about 300,000 or more as of 1985. For most countries with populations of less than 300,000, the projections were made for the total population only by applying assumed rates of growth.

27. It may be observed that the extent and accuracy of the initial population data for the base year are of paramount importance in the production of the projections, especially for the short term. The benchmark data of a given

country for the base year have to be consistent with the data of its past years and compatible with the demographic trends and patterns of its neighbours with comparable socio-economic conditions.

D. Data

28. The data used in the 1988 revision were obtained mostly from official national sources, including population censuses, demographic surveys, civil registration records and other administrative records. The collection of the data is greatly facilitated by the work of the five regional commissions and the Statistical Office of the Department of International Economic and Social Affairs of the United Nations Secretariat. Given their close contact with individual countries, the secretariats of the regional commissions are able to monitor and to report on a country's demographic activities and publications. The work of the Statistical Office in the compilation of demographic data and in improving the methodology of data collection provides an invaluable source of up-to-date demographic statistics at both the national and the subnational level. Those statistics are stored in the United Nations Demographic Yearbook Data Base and selected data are published every quarter in the Population and Vital Statistics Report and each year in the Demographic Yearbook. Other reports on population changes prepared by various governmental and non-governmental organizations, research institutes and scholars have also been utilized in the 1988 revision.

29. In the preparation of most of the population estimates and projections, the basic data considered relate to the following five categories:

(a) Total population size;

(b) Age and sex structure;

(c) Fertility rate (e.g., total fertility rate and age-specific fertility rate);

(d) Mortality rate (e.g., life expectancy at birth and survival ratio);

(e) Net volume of international migration and its age and sex distribution.

The sources of the data for the five categories are discussed below.

30. During the period 1975-1984, which the United Nations designated as the 1980 census decade, 191 countries or areas took at least one population census, and over 95 per cent of the world's population was enumerated. 8/ Twenty countries or areas took two censuses, most of which were regular quinquennial censuses. As a result, the number of censuses conducted in the 1980 decade totaled 211. Twenty-two countries did not conduct a census. Although census preparation had been made for many of them, for various reasons the enumeration was cancelled or postponed to a date after 1984. There were also some countries that relied on existing administrative

recording systems to collect population data and considered census-taking unnecessary. 9/ For a few other countries, no census was planned or no information was available about census plans.

31. From the completion of the 1984 report in late 1986 until the completion of the revision in early 1988, only a few countries have conducted population censuses and national demographic surveys. This new information has been incorporated in the 1988 revision if it was available. For the majority of countries, the basic data sources are the same as those used in the 1984 assessment, although more detailed data have now become available from the same sources. The reader should therefore refer to the 1984 assessment report for details of the data sources. 10/

E. Assumptions

32. The preparation of the assumptions on future trends of fertility, mortality and international migration for each country followed three general principles. First, it is common practice to assume that orderly progress will be made and that, during the projection period, catastrophes such as wars, famines and epidemics will not occur. Secondly, generally for countries or areas with populations of less than 300,000 in 1985, the cohort-component method is not used; projections are made only for the total population by the application of assumed rates of growth. Thirdly, the three variants of the projections - high, medium and low - are established by combining the assumed levels of fertility, mortality (currently only one level, medium) and international migration, and selecting those combinations that generally yield the maximum range for the projection of population size. Therefore, the high variant is based on the high assumptions of fertility and migration and the medium assumption of mortality. The medium variant is based on the medium assumptions of fertility, migration and mortality. The low variant is based on the low assumptions of fertility and migration and the medium assumption of mortality. In addition, the constant-variant projection is prepared for analytical purposes. The variant is based on the assumed constant fertility at levels for 1985 and the medium-variant assumptions of mortality and migration.

1. Mortality assumptions

33. The mortality assumptions in the United Nations projections are given in the form of life expectancies at birth and age and sex patterns of probabilities of surviving, corresponding to different levels of life expectancy at birth. The assumed schedule of age and sex-specific survival rates is obtained from model life tables or, when reliable data are available, from national life tables. In addition, where the observed age patterns of mortality differ from those given in the model life tables, that information is used to complement the model tables in the derivation of required survival ratios. 11/

34. For population projection purposes, working models for mortality improvement have been developed for the preparation of projection assumptions. The model postulates that the extent of mortality improvement

gradually decreases as mortality improves further and assumes that the expectation of life at birth improves by an average of 2.5 years for each quinquennial period when the level of mortality in terms of life expectation at birth is under 55 years, but by only 2.2 years for the male population and by 2.4 years for the female population when the expectation of life at birth is between 55 and 57.5 years. The improvement is reduced further to only 0.2 years when the level of mortality reaches 72.5-75.0 years for the male population and 77.5-80.0 years for the female population. This model was developed in the mid-1970s on the basis of mortality data available at that time 12/ and used in the 1982 and 1984 assessments of estimates and projections. However, more recent information from countries with lower mortality suggests that the lowest level of mortality given in the working model has been reached or already surpassed. A revision of the working model was then made.

35. Using data available since 1955 from many countries, both low-mortality and moderate-mortality countries, it can be calculated that the average quinquennial gain in life expectancy at birth was about 2 years for the male population when its life expectancy was between 60.0 and 62.5 years. Such gains were reduced to 0.8 years when its life expectancy level reached 70.0-72.5 years. For the female population, the corresponding gains were, respectively, 2.8 and 1.3 years. When life expectancy at birth reaches 77.5 years, the average quinquennial gain reduces to about one year (see table 1.3).

Table 1.3. Average quinquennial increment in life expectancy at birth according to the level of mortality from selected low-mortality populations*

Mortality level ($^{o}e_{o}$ in years)	Male	Female
60.0-62.5	2.02	2.80
62.5-65.0	1.61	2.80
65.0-67.5	0.82	2.13
67.5-70.0	0.85	2.01
70.0-72.5	0.80	1.31
72.5-75.0	-	0.86
75.0-77.5	-	1.15
77.5-80.0	-	1.01

* Includes most countries in Europe, Japan, Israel, Singapore, Canada, the United States of America, Argentina, Chile, Uruguay, Australia and New Zealand. Averages are calculated using data for 1955-1985 taken from World Population Prospects: Estimates and Projections as Assessed in 1984 (United Nations publication, Sales No.: E.86.XIII.3), table A-15.

36. The revised working model for mortality improvement was developed taking the above averages into consideration. Because the highest life expectancy at birth ever recorded is now 81.0 years for females in Iceland (1985) and Japan (1986) and 76 years for males in Iceland (1985) and Japan (1986), it was decided to extend the highest life expectancy at birth in the working model to 87.5 years for females and 82.5 years for males.

37. The working model (table 1.4) assumes that a population would achieve a quinquennial gain in life expectancy at birth of 2.5 years for males before it reaches the mortality level having a life expectancy at birth of 60 years. After that level, the quinquennial gain reduces gradually to 0.5 years when the life expectancy reaches 77.5 years or above. For the female population, the quinquennial gain would also be 2.5 years until life expectancy reaches 65 years, and it reduces gradually to 0.4 years when life expectancy reaches 82.5 years or above. Considering that the path of mortality improvement varies among populations, the working model introduces three variations in the speed of improvement and labels them fast, middle and slow models. In the actual projection, a model is selected for a population on the basis of the initial level of mortality and its reported speed of mortality improvement. The model described above is the middle model. The fast model gives slightly higher gains, assuming the 2.5-year quinquennial increments would be continued until the level reaches 62.5 years in the case of the male population and 67.5 years in the case of the female population.

Table 1.4. Working model for mortality improvement, quinquennial gains (in years) in life expectancy at birth ($^{o}e_{o}$) according to initial level of mortality

Initial mortality level ($^{o}e_{o}$ in years)	Fast		Middle		Slow	
	Male	Female	Male	Female	Male	Female
55.0-57.5	2.5	2.5	2.5	2.5	2.0	2.0
57.5-60.0	2.5	2.5	2.5	2.5	2.0	2.0
60.0-62.5	2.5	2.5	2.3	2.5	2.0	2.0
62.5-65.0	2.3	2.5	2.0	2.5	2.0	2.0
65.0-67.5	2.0	2.5	1.5	2.3	1.5	2.0
67.5-70.0	1.5	2.3	1.2	2.0	1.0	1.5
70.0-72.5	1.2	2.0	1.0	1.5	0.8	1.2
72.5-75.0	1.0	1.5	0.8	1.2	0.5	1.0
75.0-77.5	0.8	1.2	0.5	1.0	0.3	0.8
77.5-80.0	0.5	1.0	0.4	0.8	0.3	0.5
80.0-82.5	0.5	0.8	0.4	0.5	0.3	0.3
82.5-85.0	-	0.5	-	0.4	-	0.3
8.50-87.5	-	0.5	-	0.4	-	0.3

38. The slow model assumes the quinquennial gain would be only 2.0 years when the initial mortality level is between 55 and 65 years in the case of the male population and between 55 and 67.5 years in the case of the female population. The fast and slow models are derived in such a way that the middle model is about in the middle of the fast and the slow models once the mortality is at the level of 62.5 years or above in terms of life expectancy at birth (table 1.4).

39. With the extension of life expectancy at birth to higher levels, model life tables survival ratios are also in need of extension for the purpose of population projection. Survival ratios from the regional model life tables and the United Nations model life tables for developing countries are used for preparing population projections. The highest survival ratios provided by those models in published form correspond to a female life expectancy at birth of 80 years in the regional models and of 75 years in the United Nations models, and these mortality levels have already been surpassed by many countries.

40. An attempt was made trying to extrapolate the model life table survival ratios to a higher survival level using methods that generate the model life tables. The results of such extrapolation were, however, not satisfactory since these methods were apparently not designed to generate life tables corresponding to a life expectancy at birth above 80 years. Another attempt was made to extrapolate the age-specific probability of dying (q_x) of the life tables of a few populations that have the highest life expectancy at birth at present to still higher levels. It was intended to learn whether some low limits for the q_x could be determined and used as a guide in the extrapolation of model life table survival ratios. Nevertheless, such limits could not be defined unless certain arbitrary decisions were introduced. Rather than introducing an arbitrary lower limit for mortality declines, it was decided to construct a working life table corresponding to an expectation of life at birth of 87.5 years for the female population and to 82.5 years for the male population, and to make all model life tables, regional and United Nations, converge to this life table, by age groups, in an exponential manner.

41. The construction of this working life table utilizes the q_x values that are available from countries that now have the lowest mortality rates (table 1.5). If these mortality rates were derived from a single population, they imply a life expectation of life at birth of 75.5 years for the male population and 81.2 years for the female population. By reducing these q_x by one half, the expectation of life at birth calculated for the female population becomes 89.5 years and for the male population, 84.4 years. This exercise suggests that a working life table with a life expectancy at birth of 87.5 years for females and 82.5 years for males can be derived by selecting a set of composite age-specific probabilities of dying that are close to one half above q_x values. The desired working life table was constructed by using q_x for most middle age groups and by adjusting upward the q_x of the very young and very old age groups. The lowest infant mortality rates were assigned the values of .0047 and .0040 for male and female populations, respectively. The working age-specific probabilities of dying by sex thus derived are given in table 1.5. The highest levels of survival of each of the nine model life tables (West, North, South and East model of the regional

model life tables and General, Latin American, Chilean, Far Eastern and South Asian of the United Nations model life tables) were linked individually with the age-specific survival ratios derived from the working life table so that survival ratios of other mortality levels in between could be obtained through interpolation. These survival ratios have been used in the 1988 revision of population projections.

Table 1.5. Probability of dying by age and sex selected from countries with lowest mortality and constructed for the working life table

Age	Low mortality countries Males $^{o}e_{o}$=75.5		Females $^{o}e_{o}$=81.2		Model working life table Males $^{o}e_{o}$=82.5	Females $^{o}e_{o}$=87.5

2. Fertility assumptions

42. Assumptions regarding the levels and age patterns of fertility in the future were prepared for each quinquennial period from 1985 to 2025. Future fertility levels were specified in terms of the total fertility rate or gross reproduction rate and then decomposed into age-specific fertility rates. Assumptions on age patterns of future fertility were formulated in consideration of past and current age patterns of the country and the United Nations model age patterns. 13/

43. A key concept in the preparation of fertility assumptions is the replacement-level fertility, which is usually defined as the fertility level that produces the net reproduction rate of one when it is combined with the mortality schedule prevailing in the period. For projection purposes, however, it is not very convenient to compare the net reproduction rate among countries, because it is a combination of fertility and mortality. In this particular projection exercise, therefore, the replacement-level fertility indicates the fertility level that produces the net reproduction rate of one when it is combined with the lowest mortality pattern assumed possible in the projection period, which is shown in table 1.4. The replacement-level fertility defined in this manner implies a gross reproduction rate of about 1.01 and a total fertility rate in the range of 2.00 to 2.10, depending on the sex ratio at birth.

44. A basic fertility assumption in the previous United Nations projections was that fertility in most countries would stabilize at the replacement level some time in the future. Fertility of countries above the replacement level would decline, reach the replacement level and stabilize there. Fertility of countries below the replacement level would recover to the replacement level relatively soon. Medium-, high- and low-variant projections had the same level of fertility stabilization for the future, but were different with respect to the timing of stabilization at the replacement-level fertility.

45. The validity of such conventional assumptions has, however, become questionable as a continuation of below-replacement fertility or even further significant fertility decline was observed in a number of countries in more developed regions. Furthermore, continuous fertility decline into the below-replacement zone, passing the replacement-level without any slow-down, was seen in some low-fertility countries in less developed regions. It was assumed, therefore, in the present round of projections that fertility would stabilize at different levels in medium, high, low and constant variants.

46. Two different approaches to formulation of fertility assumptions were adopted for two different types of countries, namely, countries where fertility was above the replacement level and countries where fertility was about or below the replacement level. In the majority of countries in the less developed regions, fertility is above the replacement level. On the other hand, fertility is at about, or below, the replacement level in most countries in the more developed regions as well as in some countries in the less developed regions. Those low-fertility countries and areas in the less developed regions include Mauritius in Africa; Barbados, Cuba, Guadeloupe and Martinique in Latin America; and Hong Kong, the Republic of Korea and Singapore in Asia.

Table 2.10. Crude birth rate and total fertility rate for world and major areas, medium variant, 1950-2025

Period	World	More developed regions	Less developed regions	Africa	Latin America	Northern America	Asia	Europe	Oceania	USSR
				Crude birth rate (per 1,000 persons)						
1950-1955	37.4	22.6	44.6	48.9	42.5	24.6	42.9	19.8	27.6	26.3

Chapter II

SUMMARY OF MAJOR FINDINGS

A. Population size and growth

63. According to the 1988 revision of the United Nations population estimates and projections, the total population of the world in mid-1988 is estimated to be 5,112 million, with an annual rate of growth of about 1.73 per cent.

64. The world population, which grew from 2,515 million in 1950 to 4,854 million in 1985, will reach 6,251 million in 2000 and 8,467 million in 2025, according to the medium variant of the projections (table 2.1). The annual addition to the population total in absolute number, was 47 million in 1950-1955; it increased to 88 million in 1985-1990 and is expected to increase until about 1995-2000, when it will be 97 million. After 2000, the annual increase is expected to decrease and reach an average of 81 million by 2020-2025.

65. The revision indicates that the declining growth rate of population in the 1970s, followed by the highest annual growth rate of 2.06 per cent in 1965-1970, apparently reached a plateau in the first half of the 1980s at a rate of 1.74 per cent, which is the same as the growth rate between 1975 and 1980. It is expected that between 1985 and 1990 the average annual growth rate will remain almost unchanged at 1.73 per cent, before starting to decrease again after 1990.

66. The increase in growth rate from 1.80 per cent in 1950-1955 to 2.06 per cent in 1965-1970 was caused essentially by a sharp decline in mortality, with the crude death rate decreasing from 20 per 1,000 in 1950-1955 to 13 per 1,000 in 1965-1970, while the crude birth rate decreased only slightly from 37 to 34 per 1,000 in the same period. The sharp decline in fertility that took place in the 1970s brought the crude birth rate down to 28 per 1,000 for 1980-1985, while the decline in mortality slowed down a little, resulting in a crude death rate of 10 per 1,000 in 1980-1985 (table 2.2). Clearly, such a sharp fertility drop could not be sustained for a long period of time. Moreover, there have been relatively more females entering the reproductive ages since the late 1970s and they have kept the number of births high. The fluctuation of the growth rate in 1975-1995 within a small range around 1.74 reflects a temporary slow-down of the decline of the birth rate despite a continuous decline of fertility. A fluctuation of the growth rate of the population, resulting from the fluctuation of the birth rate and the death rate, has been a common phenomenon in the past, particularly when the rate is calculated on an annual basis. It is expected that the crude birth rate will decline faster after 1990 to reach 17 per 1,000 by 2020-2025.

67. The above are the results of the population projections of the medium variant. If the future fertility does not decline as fast as suggested in the medium variant, the world population, according to the high variant, is expected to reach 9,423 million by the year 2025 and the annual growth rate would increase to a peak of 1.9 per cent in 1990-1995 and afterward decrease

(a) When a nation is predominantly a net immigration country, the age-specific gross immigration schedules are younger than the emigration flows; and when the nation is predominantly a net emigration country, the age-sex gross emigration profiles are younger than the immigration schedules;

(b) When gross emigration, gross immigration or both occur in the form of family migration, the sex ratio among adults and children is close to 1 and the mean age of male adults is slightly higher than that of female adults (an amount that is similar to the mean age difference at the age of marriage); in general the mean age of children in these circumstances is the same;

(c) When gross emigration, gross immigration or both occur in the form of male (female) labour force migration only, the sex ratio among adults is higher (lower) than 1. The sex ratio among children remains close to 1 because children migrate with their mothers.

61. In order to use the model to derive an age-sex migration profile, four input parameters are needed:

(a) The total number of net migrants.

(b) Migration ratio. It is defined as the number of immigrants per emigrants of both sexes, if the nation is a predominantly emigration country; or as the number of emigrants per immigrants if it is a predominantly immigration country.

(c) Sex ratio of adult emigrants (men per women emigrants). This parameter may represent three different options: a male labour force emigration option if the ratio is greater than 1; a female labour force emigration option if the ratio is less than 1; and a family emigration option if the adult emigration sex ratio is equal to 1.

(d) Sex ratio of adult immigrants (men per women immigrants). Similarly, three options may be selected with this sex ratio: a male labour force immigration option if the ratio is greater than 1; a female labour force immigration option if it is less than 1; and, a family immigration option if the adult immigration ratio is equal to 1.

62. A summary of the migration model method is given in the annex to chapter II of this report.

47. Basic assumptions concerning future fertility of the above-replacement-level countries were that (a) those countries would experience some fertility decline in the future and (b) the timing and speed of the decline were related to socio-economic development and population policies of those countries. The validity of these basic assumptions has been supported by results of a recent comprehensive study of the World Fertility Survey data. 14/

48. In medium-variant projections for those countries with fertility above the replacement level, it was assumed that fertility would decline and stabilize at the replacement level some time in the future. The assumed date for a country to reach the replacement level is estimated by taking into account the population policies and programmes, adult literacy rates, school enrolment ratios, and gross national product per capita and gross domestic product per capita of the country. Historical, cultural and political factors and current levels of fertility and infant mortality were taken into consideration as well.

49. No mathematical equation, however, was set up for determining the date to reach the replacement level from current values of those indicators. This was partly because some important factors such as population policy were qualitative indicators difficult to quantify, and partly because many developing countries lacked reliable recent data on some quantitative socio-ecoonomic indicators.

50. The periods in which fertility is assumed to reach the replacement level in medium-variant projections for countries in Africa and Asia are shown in tables 1.6 and 1.7, respectively. A different methodology was adopted for countries in Latin America, and a detailed description of the methodology has been given elsewhere. 15/

51. Turning to the other three variants, it was generally assumed that fertility would stabilize at the total fertility rate of about 2.5 to 2.6 and 1.5 to 1.6 in high and low variants, respectively. In the constant-fertility variant projections, fertility levels as estimated for 1985 were assumed to remain unchanged in the future.

52. The approach described above was adopted only for countries where fertility was above the replacement level. The approach, however, could not be applied to countries where fertility was at about, or below, the replacement level, because fertility differentials among those countries were not closely related to their differences in the indicators of socio-economic development. It was considered that future trajectories of fertility in those countries would be strongly affected by changes in values and life-styles concerning marriage and family formation. 16/ It was, therefore, important to take into consideration idiosyncratic characteristics of socio-cultural changes of respective countries. Heavy emphasis was thus placed on fertility assumptions in population projections prepared by national authorities. For the majority of those countries, the fertility assumptions of their medium-variant projections or equivalent versions were incorporated into the United Nations projections in either one of the following two ways. For some countries, those assumptions were adopted as one of the variants of the United

in 1980-1985. The small decline is mostly attributable to the downward fertility trends in the Northern African region. In the rest of Africa, with only a few exceptions (Cape Verde, Ethiopia, Mauritius, Réunion, South Africa and Zimbabwe), most countries show no sign of notable fertility decline.

85. The future course of fertility decline in Africa is uncertain, and the uncertainty is reflected in the substantial differences in the variants. According to the medium variant, the total fertility rate will fall below 6 children per woman some time in the mid-1990s and decrease to approximately 3 children by 2025. In comparison, the high and low variants project total fertility rates of approximately 4 and a little over 2 per woman, respectively, for 2025.

86. In Latin America, a noticeable fertility decline appears to have begun in the mid-1960s. The total fertility rate in Latin America remained at about 5.9 between 1950 and 1965, fell to 5.5 for 1965-1970, and fell further, to 4.0, for 1980-1985. The past trend in the most populous Latin American country, Brazil, fits the pattern: the total fertility rate remained at approximately 6.2 during the period 1950-1965, then declined to 3.8 in 1980-1985. The fertility decline in Mexico, the second most populous country in the region, started slightly later: the total fertility rate remained at about 6.7 in the 1950s and 1960s, then fell during the 1970s, to reach 4.2 in 1980-1985.

87. A marked fertility decline in the 1970s characterized fertility trends in Eastern Asia. In China, the total fertility rate in the 1950s and 1960s is estimated to have been approximately 6, except for a few years of severe natural calamities around 1960. The fertility decline in the 1970s was almost spectacular: it is believed to have fallen below 4 in the mid-1970s and below 3 in the late 1970s, and is estimated to have been about 2.4 for 1980-1985. For the future, according to the medium variant, it is projected to fall under 2 after the year 2000 and to stabilize at 1.8 until 2025.

88. Fertility decline in South-eastern Asia was also remarkable but somewhat slower than that in Eastern Asia. The total fertility rate before 1970 was approximately 6, and then began to fall, reaching 4.3 for 1980-1985. The gradual decline is projected to continue to below 3 around the year 2000 and to nearly 2 by 2025. In Southern Asia and Western Asia the decline was much slower, with a total fertility rate of about 5.2 in 1980-1985. The decline is projected to accelerate in Southern Asia, the total fertility rate reaching 4 in 1995-2000 and falling to slightly above 2 in 2020-2025. The decline is projected to be slower in Western Asia, the total fertility rate reaching slightly below 3 in 2020-2025.

89. Another common measure of fertility is the crude birth rate, which is usually computed as the number of births per 1,000 population during a given period, divided by the size of the average population during the same period. The rate is usually stated per 1,000 population. The recent decline in the crude birth rate for the total world population, from 37 for 1950-1955 to 28 for 1980-1985, is expected to continue in the future, and the projected rate for 2020-2025 is 17 (table 2.10). The estimated crude birth rate for the more developed regions follows a downward trend, from 23 in 1950-1955 through 15 in

1980-1985 to 12 in 2020-2025. The corresponding rates for the less developed regions follow a steeper curve, from 45 in 1950-1955 through 32 in 1980-1985 to 19 in 2020-2025. In the 1950s and 1960s, noticeable declines in the crude birth rate were observed in a number of areas and countries in the less developed regions where the total fertility rate remained almost unchanged for the same period. Those apparent disparities between the two measures are attributable to the fact that the crude birth rate is affected not only by the level of fertility but also by the changing structure of population by age and sex. The female population of childbearing age in those areas and countries during the 1950s and 1960s grew at a slower pace than the total population. The reverse is happening in the 1980s, as the changing age structure is slowing down the decline in the birth rate.

90. On the contrary, in the more developed regions, it is projected that it is the changing age structure that will cause the crude birth rate to decline, despite a nearly constant fertility in the next 40 years.

C. Mortality

91. The life expectancy at birth for the world was 59.6 years in 1980-1985. For the less developed regions, it was 57.6 years, which was still significantly lower than the 72.3 years for the more developed regions. However, the difference between the more and the less developed regions has been reduced since 1950. The corresponding figures for 1950-1955 were 41.0 for the less developed regions and 65.7 for the more developed regions, so that the difference was 24.7 years. That difference was reduced to 14.7 years in 1980-1985 because of the rapid increases in life expectancy in most of the less developed countries and also because of the tendency for the annual increments in life expectancy to decrease at the higher levels prevailing in the more developed regions. Further convergence between the less and the more developed regions is anticipated: life expectancies in the less and the more developed regions are projected to be 63.1 and 75.4 for 1995-2000 and 70.4 and 78.7 for 2020-2025, respectively (table 2.11).

92. The average length of life is usually greater for females than for males: globally, 58.2 years for males versus 61.1 for females in 1980-1985, with a difference of 2.9 years. The female advantage is greater in the more developed regions, where females are expected to live longer than males by 7.8 years, than in the less developed regions, where the difference is 2.1 years.

93. Variation in mortality conditions among major areas and among countries within the same area is considerable. The major area with the highest mortality level is Africa, with a life expectancy at birth of 49.9 years for both sexes combined in 1980-1985. The life expectancy for Africa is estimated to have been 38.0 in 1950-1955, implying an average annual increment of 0.40 years for the three decades, which is relatively small compared to those for other high-mortality regions. Within Africa, Eastern, Middle and Western Africa are estimated to have had life expectancies below 50 for 1980-1985, whereas the figures for Northern and Southern Africa are 56.7 and 57.3 years, respectively.

Table 2.11. Crude death rate, life expectancy and infant mortality rate for world and major areas, medium variant, 1950-2025

Period	World	More developed regions	Less developed regions	Africa	Latin America	Northern America	Asia	Europe	Oceania	USSR
				Crude death rate (per 1,000 population)						
1950-1955	19.7	10.1	24.3	27.0	15.3	9.4	24.1	11.0	12.4	9.2

Source: See table 2.1.

94. In Latin America, the expectation of life at birth increased from an estimated 51.2 years in 1950-1955 to 64.5 years in 1980-1985. There are significant differentials within Latin America, ranging from life expectancies of 50.7 in Bolivia and 52.7 in Haiti to those of about 70 years or above in Argentina, Chile, Costa Rica, Panama, Uruguay and several Caribbean countries.

95. Another area with a relatively high mortality level is Southern Asia, where life expectancy progressed from 38.8 in 1950-1955 to 54.4 in 1980-1985. South-eastern Asia, Eastern Asia and Western Asia had similar levels of life expectancy in 1950-1955, respectively, 41.2, 42.7 and 43.5 years, but very different trends since then. The largest gain in Asia and also the largest among the less developed regions is in East Asia, with a marked increase to 68.4 in 1980-1985. It mirrors extremely rapid progress for China and also reflects the trends in such countries as Japan, the Republic of Korea and Hong Kong, where increases in life expectancy have been rapid relative to their levels. Life expectancy in 1980-1985 was 61.0 in Western Asia and 57.2 in South-eastern Asia, the result of a more moderate progression.

96. In spite of the relatively small population size of Oceania, the area is very heterogeneous with respect to mortality. The estimated life expectancy of 68.0 for 1980-1985 is a weighted average of 74.9 for Australia and New Zealand, 69.6 for Polynesia, 68.0 for Micronesia and 55.9 for Melanesia.

97. Increases occurred in the expectation of life at birth during the past three decades in countries that already had high life expectancies in the early 1950s. For example, life expectancies increased from 69.0 in 1950-1955 to 75.5 in 1980-1985 for Northern America, from 65.3 to 74.2 for Europe and from 64.1 to 69.5 for the Union of Soviet Socialist Republics.

98. It is projected that regional differences in mortality will diminish as an increasing number of countries reach very high levels, at which further gains are difficult to achieve. All of the major areas except Africa are projected to have life expectancies above 60 by 2000 and above 70 by 2025; Africa is expected, if the present trends continue, to reach a life expectancy of 55.7 for 1995-2000 and 65.2 for 2020-2025.

99. Another important indicator of the level of mortality is the infant mortality rate, which is the number of children under one year of age who die in a given period divided by the total number of live births in the same period. It is usually stated per 1,000 live births. In table 2.11 the infant mortality rates for the world and the major regions are shown. In 1980-1985, for the world as a whole, infant mortality is estimated to have been about 79 per 1,000 live births. For that period, the lowest rates among the major regions were for Northern America and Europe, 11 and 15 per 1,000, respectively. While those rates are comparatively low on an interregional basis, it is worth noting that they are about twice the lowest national infant mortality rate, 6 per 1,000, estimated for Iceland and Finland for 1980-1985. In contrast, the highest infant mortality rates for 1980-1985 among the major areas were 116 for Africa and 83 for Asia, with 113 in Southern Asia. Stated in somewhat more graphic terms, the rates mean that, on the average, slightly more than one out of every 10 children born in Africa or Southern Asia dies before reaching the first birthday. Again, those rates are regional averages,

and considerable variation exists within each area. For example, the infant mortality rate in Southern Asia for 1980-1985 ranged from a low of about 10 per 1,000 live births for Singapore to around 183 per 1,000 for Afghanistan.

100. Another demographic indicator related to mortality is the crude death rate, which is the number of annual deaths per 1,000 population. The crude death rate represents effects of mortality on population growth, rather than the level of mortality. Although the expectation of life at birth is computed independently of the age and sex structure of a population, the crude death rate is affected by the age and sex distribution. Globally, the crude death rate declined by 6.4 points, from 19.7 per 1,000 in 1950-1955 to 13.3 in 1965-1970, then decreased by 3.0 more points to reach 10.4 in 1980-1985 (table 2.11). Future decline in the crude death rate is expected to be small: the projected rate is 8.7 for 1995-2000, which implies a reduction of only 1.7 per 1,000 in 15 years. Such a slow-down, and even slight increases for some countries, is mainly due to expected changes in age structure: as a result of population aging, an increasing proportion of population is expected to consist of older persons, for whom mortality is higher. The varying levels and speeds of population aging among regions are projected to produce a significant change in comparative levels of crude death rates. For example, the crude death rates for the more and the less developed regions, respectively, were 10.1 and 24.3 in 1950-1955, and 9.6 and 10.7 in 1980-1985, but they are projected to reverse in the future, reaching 10.6 and 7.1 in 2020-2025, in spite of the anticipated continuation of higher life expectancy in the more developed regions than in the less developed regions.

D. Population structure

101. The size and growth rate of a population are only one aspect of the characteristics of a population. The structure of a population in terms of the age and sex of its members is another very important aspect which needs to be looked at in order fully to understand population changes. In this section the levels and trends of the age and sex composition of the world population will be examined, with special attention to the child, the youth and the elderly population, and to regional variations.

1. Sex ratios

102. The sex ratio of a population is determined as the result of the complex interaction of sex ratio at birth, past history of differentials in mortality, changes in fertility and mortality levels, and age and sex structure of migration. For the world as a whole, the sex ratio, which was estimated at 101.2 males per 100 females in 1985, had been increasing slowly since 1950, when it was 99.7 males per 100 females. It is anticipated that the sex ratio will increase slightly until a high of 101.6 is reached around the year 2000, before decreasing to 101.0 in 2025 (table 2.12). The more developed regions had a sharp increase from a low sex ratio of 91.0 males per 100 females in 1950, to 93.7 in 1985 and an expected ratio of 95.2 in 2000. The low sex ratio in 1950 was due mainly to the excess male mortality during the Second World War. In the post-war period, the low sex ratio generations have gradually been replaced by younger generations with a higher sex ratio.

Table 2.12. Sex ratio for the world and by major areas, medium variant, 1950-2025

Year	World	More developed regions	Less developed regions	Africa	Latin America	Northern America	Asia	Europe	Oceania	USSR
1950	99.7	91.0	104.2	97.4	101.0	99.6	105.3	92.5	103.7	78.3
1970	100.4	93.0	104.2	98.1	100.3	96.3	104.5	94.7	102.1	85.6
1985	101.2	93.7	103.7	98.7	99.9	95.4	104.9	95.0	101.2	88.4
2000	101.6	95.2	103.2	99.3	99.5	95.7	104.5	96.0	100.9	92.3
2025	101.0	96.3	101.9	99.5	98.6	96.0	103.0	96.6	100.2	95.7

Source: See table 2.1.

Between 2000 and 2025 the sex ratio will increase only slightly to 96.3 in 2025. This slow increase will be caused by the fact that the expected further decline in mortality that will push up the sex ratio for nearly all age groups, will be counterbalanced by the increase in the proportion of the older age groups, which have low sex ratios (table 2.13).

103. In the less developed regions, the sex ratio changed very little during 1950-1985, fluctuating between 104.2 and 103.7. The sex ratio is expected to decrease slightly to 103.2 in 2000, and more significantly to 101.9 by 2025. This small change of the sex ratio until 2000 is primarily due to the fact that mortality differentials between males and females are small, so that changes in mortality level and in age structure produce only small changes in the overall sex ratio. In the future beyond 2000, it is expected that the female mortality would drop faster than the male mortality, producing lower sex ratios at higher ages and a lower overall sex ratio.

104. Among the major areas of the world, the USSR had the lowest sex ratio in 1985, 88.4 males per 100 females, resulting from, among other factors, a large sex differential in mortality. Europe and Northern America both had sex ratios of 95. The low sex ratio of Africa, 99, resulted mainly from a lesser sex ratio at birth, estimated at about 103, compared to 105-106 in other parts of the world. The high level of African mortality tends to generate a low sex ratio even though the sex differentials in mortality are relatively small. In 1985, Latin America had a sex ratio of 100, Oceania had a sex ratio of 101 and Asia had a sex ratio of 105. In the future, it is expected that regional differences in sex ratio will decrease markedly by 2025, with a convergence towards 100. Africa, Latin America and Oceania will have a sex ratio between 99 and 100, Asia will have the highest ratio of 103 and Europe, Northern America and the USSR will have the lowest ratio of 96.

2. Median age

105. In 1985 half of the world population was older than 23.4 years, and half was below this age. This median age is the same as the world had in 1950. However, the median age dropped to a low of 21.6 years in 1970 and then recovered to the present level (table 2.14). It is expected that the median age will increase continuously in the future, to 26.0 years in 2000 and 31.1 years in 2025.

106. In 1950 the median age was 28.2 years in the more developed regions, and 21.2 years in the less developed regions, reflecting the fact that the more developed regions had a much older population than the less developed regions. From 1950 to 1970 the population of the more developed regions became older, and its median age rose to 30.1 years. But the population of the less developed regions became younger, its median age decreasing to 19.0 years in the same period. The aging of the more developed regions was caused by the combined action of a decrease of fertility and a decrease of mortality. The juvenation of population in the less developed regions came from the large reduction of mortality from a high initial level in the absence of a significant reduction in fertility. The dynamics of population growth has been operating in such a way that the large reduction in infant and child mortality had the same effect as an increase in fertility and resulted in a

Table 2.13. Estimated and projected sex ratio by age groups, more developed regions and less developed regions, medium variant, 1950-2025

Source: See table 2.1.

larger population of young people. However, since 1970 the population of the less developed regions started becoming older because fertility began to decline and, significantly, as mortality had already fallen to moderate levels by 1970, its further decrease was less concentrated in infant and child mortality. The median age increased to 21.0 in 1985. The population of the more developed regions continued its aging process, the median age reaching 32.5 in 1985. The age pyramids are shown in figure V.

107. In the future it is expected that the populations of both the more developed and the less developed regions will continue growing older. In the more developed regions the pace will become faster, as fertility is expected to remain nearly constant at very low levels and mortality decline will become the major cause of aging. The median age may increase to 40.7 years in 2025. In the less developed regions the pace of aging will also accelerate with a rise of the median age to 29.7 years by 2025. In the process the declines in fertility and in mortality will be exercising their effects together in contributing to the aging of the population.

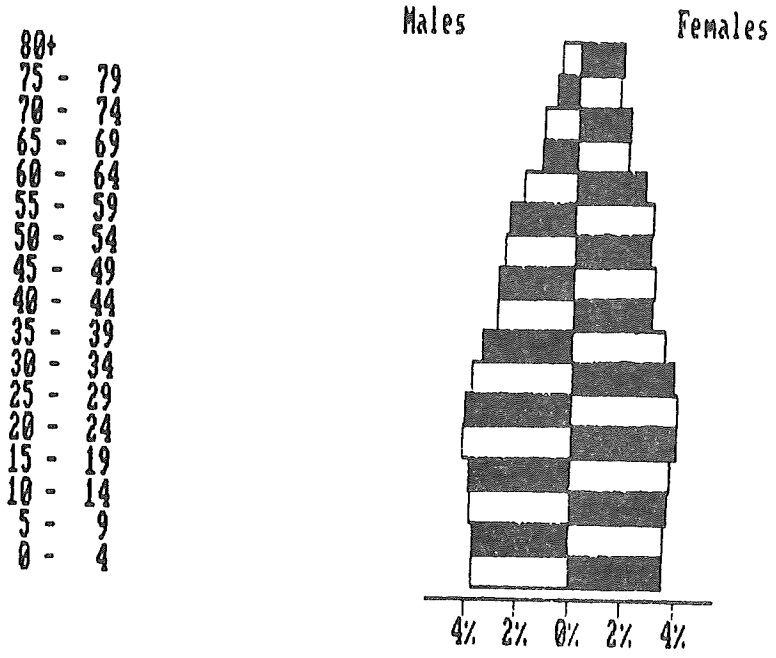

108. There are large differences in the age structures within the more developed and the less developed regions. For decades Europe has been the oldest region with a median age of 33.9 years in 1985. Europe is expected to remain the oldest region, reaching a median age of 42.9 years in 2025. The median ages for the USSR and Northern America in 1985 were, respectively, 30.0 and 31.5 years, and they are expected to increase to 36.4 and 40.8 years, respectively, by 2025 (table 2.14).

109. Between 1950 and 1970, all the regions within the less developed regions became younger. By 1970 Africa became the youngest, with a median age of 17.6 years, followed by Latin America with 18.6 years, and Asia was slightly older with a median age of 19.7 years. After 1970, Africa became even younger because of its persistent high fertility and declining mortality, which generated a larger young age population. The median age dropped to 17.3 years by 1985. All other less developed regions, however, reversed their trend and started growing older as fertility started to decline while mortality had already reached moderate levels. By 1985, Asia had a median age of 22.2 years and Latin America, 20.9 years. Very small change is expected in Africa until after 1995 when its population is expected to start growing older, reaching a median age of 22.6 years in 2025. Asia will age quickly and reach a median age of 32.5 years by 2025, and Latin America may reach a median age of 30.2 years by that time.

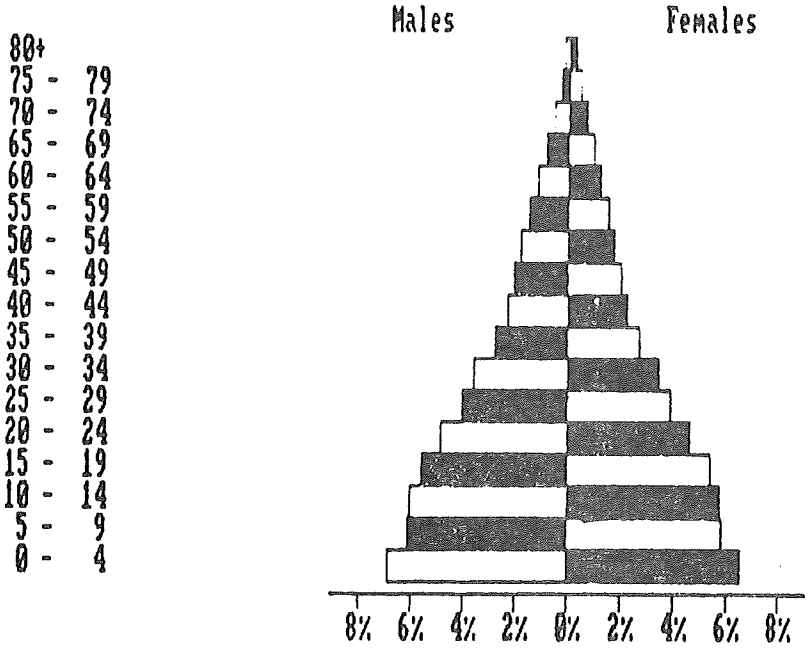

3. Child population

110. In 1985, the world had 1,627 million children under 15 years of age, which comprises 34 per cent of the total world population. There were 260 million children in the more developed regions, which accounted for 22 per cent of the total population of those regions and for 16 per cent of the total number of children in the world. The less developed regions had 1,367 million children, representing 37 per cent of the total population in less developed regions and 84 per cent of the world population of children (table 2.15).

Source: See table 2.1.
Note: Growth rate refers to the average annual rate of increase from the previous year as indicated.

111. As a result of continuing low fertility in the more developed regions, there has been a continuous decline of the child population and of its proportion to the total population since around 1965. In 1970, 279 million of the population in those regions, or 27 per cent of the total, were children. The number is expected to decline to 254 million in 2000 and further to 242 million in 2025, when children will represent 18 per cent of the total population.

112. In the less developed regions, the number of children has been increasing steadily, although the proportion to the total population has been declining since 1970, following closely the change in fertility. In 1970, there were 1,107 million children in the less developed regions, comprising 42 per cent of the total. As fertility decline accentuates, the proportion is expected to go down to 34 per cent in 2000 and to 26 per cent in 2025. The rate of growth of the child population, which was 1.4 per cent per year between 1970 and 1985, will increase to 1.6 per cent between 1985 and 2000 and decline to reach 0.3 per cent between 2000 and 2025.

4. Youth population

113. The youth population in the world, defined as those aged 15-24, numbered 941 million in 1985. It comprised 19 per cent of the total population. Between 1980 and 1990, it is growing at a rate of 1.8 per cent per year, slightly faster than the growth of the total population (1.7 per cent), and more than double the rate of growth of the child population (0.8 per cent). The current rapid growth is a direct consequence of the rapid growth of children in the 1960s and 1970s. As the growth of children is slowing down, the growth of youth is also slowing down considerably and this trend will continue into the 1990s. The average annual rate of growth dropped from 2.2 per cent in 1980-1985 to 1.4 per cent in 1985-1990. It is projected that it will drop further to 0.4 per cent in 1990-1995. However, the growth of youth will increase again, reaching an average rate of growth of 1.0 per cent between 2000 and 2025. By 2025, 16 per cent of the world population, or 1,358 million, will be youths aged 15-24 (table 2.16).

114. In 1985, Asia had relatively more youth in its population, 21 per cent, than any other major area of the world. Africa and Latin America had 19 and 20 per cent, respectively, and Europe, the USSR and Northern America had 16 to 17 per cent. Except in Africa, where the proportion of youth will go on increasing slowly to 21 per cent by 2025, all other major areas will have relatively less youth in the population because of the decline of fertility. In 2025, the proportion of youth is projected to be around 12 per cent in Europe and Northern America, 14 per cent in the USSR and Oceania and 16 per cent in Latin America and Asia. The absolute size of the youth population is also expected to decline in Europe, Northern America and the USSR. However, the size of the youth population in Africa, Latin America, Asia and Oceania is expected to continue its increase from 1985 to 2025.

5. Elderly population

115. The elderly population, aged 60 and over, in the world reached 432 million in 1985, comprising 9 per cent of the total population. The continuing improvement of mortality and reduction of fertility have made the

Source: See table 2.1.
Note: Growth rate refers to the average annual rate of increase between the given dates.

population age structure much older than before and, by 2000, the elderly are expected to reach 10 per cent of the total world population and number 612 million and by 2025, 15 per cent and 1,201 million (table 2.17).

116. The age structure of the more developed regions and that of the less developed regions differ mainly with regard to the elderly population. In 1985 there were 189 million elderly in the more developed regions or 16 per cent of the total population, and 243 million elderly in the less developed regions or 7 per cent of the total. However, the aging of population in the less developed regions is progressing rapidly. The average rate of increase of the elderly population in these regions will be 2.9 per cent in 1985-2000 and 3.3 per cent in 2000-2025. These rates are much higher than 1.5 per cent in the more developed regions in each of the respective periods. The elderly are expected to comprise 19 per cent of the total population in 2000 and 25 per cent in 2025 in the more developed regions and 8 and 12 per cent on the respective dates in the less developed regions.

117. The patterns and trends of growth of the elderly differ more sharply at the regional level. In 1985, Europe and Northern America had the largest proportion of elderly in their population, being respectively 18 and 16 per cent. The USSR had 14 per cent and Oceania, 12 per cent. The other major areas, namely, Africa, Latin America and Asia, had 7 per cent or less. Regional differentials are expected to become larger as population is expected to age more rapidly. By 2025, Europe and Northern America are projected to have about 27 per cent of elderly, Oceania and the USSR are projected to have 19 to 21 per cent, Latin America and Asia, 13 to 14 per cent and Africa would have only 6 per cent. Moreover, the picture is inverted if one looks at the future rate of growth of the elderly in each major area. Because of the relatively low proportion of elderly in 1985 and the fast growth of their total population, Africa, Asia and Latin America are anticipated to have the fastest growth of the elderly population, which would nearly quadruple between 1985 and 2025, with between 3.1 and 3.4 per cent of annual growth on average. The lowest growth rates are expected to occur in Europe and Northern America, 1.1 per cent and 1.8 per cent, respectively, while the USSR and Oceania are projected to grow at a rate of 1.7 per cent and 2.2 per cent, respectively. In all major areas the growth rate of the elderly population will be much higher than that of the total population.

6. Dependency

118. A major consequence of changes in the population's age distribution is a corresponding alteration of the balance between the number of persons of working age, 15-64 years, and the population in dependent ages, children under age 15 and persons aged 65 and over. (Although the elderly population was defined in the previous subsection as persons aged 60 and over, the old-age population used in the computation of the dependency ratio is defined as those aged 65 and over in conformity with common usage.) The dependency ratios are presented in table 2.18.

119. In 1985, the total dependency ratio in the world was 65 dependants per 100 persons of working age, consisting of 55 children aged 0-14 and 10 persons aged 65 and over. This was about the same level of dependency as in 1950.

Table 2.17. Elderly population (aged 60 years or more): size, growth rate and percentage of the total population, for major regions of the world, 1950-2025, medium variant

Source: See table 2.1.

During 1950-1965 the total dependency ratio increased gradually from 66 to 75, the highest level ever recorded for the world, and it has been declining since 1965. The decline in the total dependency ratio is expected to continue in the future, slowly reaching 62 in the year 2000, and faster after that, down to 52 in 2025. However, this process of change will be the result of very divergent trends for the young (aged 0-14) and the old (aged 65 and over) dependency ratios. The young dependency ratio is expected to decline continuously to 37 in 2025 and the old dependency ratio is expected to increase continuously to 15 in 2025, at which date the persons aged 65 and over will amount to 28 per cent of the dependants.

120. In 1985 the total dependency ratios were 71 in the less developed regions and 51 in the more developed regions; both decreased from their peak in 1965, when the total dependency ratio was 58 in the more developed regions and 84 in the less developed regions. In the future, the total dependency ratio in the more developed regions is expected to remain around 50 to 51 until the year 2010, and to increase to 58 in 2025. The young dependency ratio is expected to decrease gradually in those regions from 33 in 1985 to 30 in 2000 and to 28 in 2025, while the old dependency ratio increases from 17 to 22 and to 30 in the corresponding years. An opposite trend is expected in the less developed regions, where the total dependency ratio will decrease continuously, from 71 in 1985 to 64 in 2000, and to 51 in 2025. At some point between 2015 and 2020 the total dependency ratio of the less developed regions will become lower than that of the more developed regions. At that time, the young dependants will still be four times more numerous than the old dependants in the less developed regions, while their numbers will be nearly the same in the more developed regions.

121. At the level of the major regions, in 1985 Africa had by far the highest dependency ratio, 94, followed by Latin America, 73, and by Asia, 65. Northern America and Europe had the lowest ratios with 50. In the future it is expected that the dependency ratios will continue to decrease in the former group and increase in the latter group, and by 2025 the differences between regions will be small. Asia is expected to have the lowest ratio at that time, 47, followed by Latin America, 52. Africa will have the highest ratio, 62, followed closely by Northern America, 61. Europe, 58, and the USSR, 55, will be in between. The major differences will be in the composition of the dependency ratios, with the old dependency prominent in North America and Europe, and the young dependency prominent in Africa, Latin America, Asia, Oceania and the USSR.

Annex

METHOD OF MIGRATION MODEL CONSTRUCTION

1. In the present round of revision of the United Nations demographic estimates and projections, model age-sex patterns of net migration were adopted. Those model patterns are constructed by combining age profiles of gross immigration and emigration, which are based on model schedules of gross migration developed by Castro and Rogers (1983a and 1983b). Castro and Rogers analysed data on migrants by age in a number of countries, found similarities in those age profiles and developed model schedules that fit those observed profiles. In this annex, the procedure of combining Castro and Rogers model schedules of gross migration into model schedules of net migration is briefly described.

2. Definitions of a few special terms used in this annex need to be clarified first. A net immigration country means a country that has more immigrants than emigrants, and a net emigration country means a country that has more emigrants than immigrants. The migration ratio is defined as the ratio of emigrants to immigrants in a net immigration country, or the ratio of immigrants to emigrants in a net emigration country. Four subscripts will be used in the equations given in this annex. They are i, e, m and f, denoting immigration, emigration, male and female, respectively.

3. The proportion of all immigrants who are aged x is given by:

$$i(x) = W_i\ c_i(x) + (1 - W_i)\ a_i(x) \qquad (1)$$

where $a_i(x)$ is the proportion of adult immigrants aged x, $c_i(x)$ is the proportion of child immigrants aged x, and W_i is the proportion of all immigrants who are children. Similarly, the proportion of all emigrants who are aged x is given by:

$$e(x) = W_e\ c_e(x) + (1-W_e)\ a_e(x) \qquad (2)$$

where $c_e(x)$, $a_e(x)$ and W_e are defined for emigrants.

4. It may appear puzzling in equations (1) and (2) that the same age x is used both as an age of adults and as an age of children. In the present exercise of model construction, however, adults and children are not considered to be mutually exclusive groups divided by a particular age but are treated as two mathematical distributions that have overlapping tails.

5. The same set of gross migration schedules, a(x) and c(x), developed by Castro and Rogers is used for both immigration schedules $a_i(x)$ and $c_i(x)$, and emigration schedules $a_e(x)$ and $c_e(x)$:

$$a(x) = [\ 1/(ma - 23)]\ \exp -[(x - 23)/(ma - 23)] - \exp[-0.2\ (x - 23)]$$
$$c(x) = (\ 1/\ mc)\ \exp(\ x/\ mc)$$

where ma is the mean age of adult migrants and mc is the mean age of child migrants. Typical values of those mean ages are given below for each sex and each type of migration:

	NET EMIGRATION COUNTRY				NET IMMIGRATION COUNTRY			
	Emigration		Immigration		Emigration		Immigration	
	Males	Females	Males	Females	Males	Females	Males	Females
ma	32	30	35	31	35	31	32	30
mc	6	6	7	7	7	7	6	6

6. Those values were determined on the basis of recently observed five-year flows of immigration and emigration in 22 selected countries and Swedish time series data since 1920, and they were used for the present exercise of model schedule construction.

7. Although equations (1) and (2) are used separately for each sex, subscripts for sex are omitted to avoid unnecessary complexities. The difference between males and females, however, needs to be introduced here and the two sexes will be treated separately hereafter. The proportion of female migrants who are children, W_f, is fixed to be 0.1 for all migration flows, and the proportion of male migrants who are children is given by:

$$W_m = D / (1 + D) \qquad (3)$$

where D is the ratio of male child migrants to male adult migrants, which in turn is calculated as:

$$D = (W_f \, SRC) / [SRA (1 - W_f)] \qquad (4)$$

where SRC is the sex ratio of child migrants and SRA is the sex ratio of adult migrants. It is assumed that the sex ratio of child migrants is 1 and that all children migrate with their mothers.

8. Further calculation needs to be described separately for net emigration countries and net immigration countries.

Net emigration country

9. The number of emigrants can be expressed as:

$$ET = NT / (K_e - 1), \qquad (5)$$

where NT is the size of net migration and K_e is the migration ratio, which has previously been defined as the ratio of immigrants to emigrants if the country is a net emigration country. The number of immigrants is:

$$IT = NT + ET. \qquad (6)$$

10. In order to compute the number of migrants by sex, sex ratios need to be calculated. The sex ratio of emigrants and that of immigrants are given by:

$$SR_e = [(1 - W_{ef}) / (1 - W_{em})] \, SRA_e \qquad (7)$$
$$SR_i = [(1 - W_{if}) / (1 - W_{im})] \, SRA_i \qquad (8)$$

where W is the proportion of migrants who are children, SRA is the sex ratio of adult migrants and the subscripts are as previously defined. The number of female emigrants (E_f), of male emigrants (E_m), of female immigrants (I_f) and of male immigrants (I_m) can now be obtained as:

$$E_f = ET / (SR_e + 1) \quad (9)$$
$$E_m = ET - E_f \quad (10)$$
$$I_f = IT / (SR_i + 1) \quad (11)$$
$$I_m = IT - I_f \quad (12)$$

11. Using these values, we have the migration ratios and the size of net migration by sex as follows:

$$K_{em} = I_m / E_m$$
$$K_{ef} = I_f / E_f$$
$$N_m = I_m - E_m$$
$$N_f = I_f - E_f$$

12. Finally, the size of net emigration (emigrants minus immigrants) at age x is obtained for each set by substituting the N's and K's into the following equations:

$$N_{em}(x) = N_m [K_{em}\, i_m(x) - e_m(x)] / (K_{em} - 1) \quad (13)$$

$$N_{ef}(x) = N_f [K_{ef}\, i_f(x) - e_f(x)] / (K_{ef} - 1) \quad (14)$$

Net immigration country

13. The distribution of net migration by age and sex for net immigration countries is constructed in a way similar to the procedure for net emigration countries. Among equations (5) to (14) for net emigration countries, equations (7) through (12) can be used for net immigration countries. Equations (5) and (6) need to be replaced by

$$IT = NT (1 - K_i) \quad (15)$$

$$ET = IT - NT \quad (16)$$

where K_i is the ratio of emigrants to immigrants. The migration ratio and size of net migration are computed for each sex by:

$$K_{im} = E_m / I_m$$

$$K_{if} = E_f / I_f$$

$$N_m = I_m - E_m$$

$$N_f = I_f - E_f$$

Substituting the above values into the following equations, the size of net immigration (immigration minus emigration) at age x is obtained for each sex:

$$N_{im}(x) = N_m [\, i_m(x) - K_{im}\, e_m(x) \,] / (\, 1 - K_{im} \,) \qquad (17)$$

$$N_{if}(x) = N_f [\, i_f(x) - K_{if}\, e_f(x) \,] / (\, 1 - K_{if} \,) \qquad (18)$$

14. In summary, the distribution of net migration by age and sex is derived from the following four input parameters:

(a) The total size of net migration (NT). The sign NT determines whether the country is predominantly a net emigration (negative) or net immigration (positive) country.

(b) The sex ratio of adult emigrants and the sex ratio of adult immigrants (SRA_e and SRA_i). These two parameters are used in expressions (1) through (4) to generate the distribution of emigrants and immigrants by age and sex. These sex ratios determine the types of migration: male labour force emigration (immigration) if the ratio is significantly greater than 1; female labour force emigration (immigration) if the ratio is significantly less than 1; and family emigration (immigration) if the sex ratio is close to 1.

(c) The migration ratio (K_e or K_i). This ratio is used in equations (5) or (13).

15. The figure in this annex presents an example of gross and net migration schedules produced using this method. The profiles were produced using the following input parameter values:

Total number of net migrants (NT).....100,000

Migration ratio. Number of emigrants per immigrant (K_i).....0.6

Sex ratio of adult emigrants (SRA_e).....2.0
(male labour force)

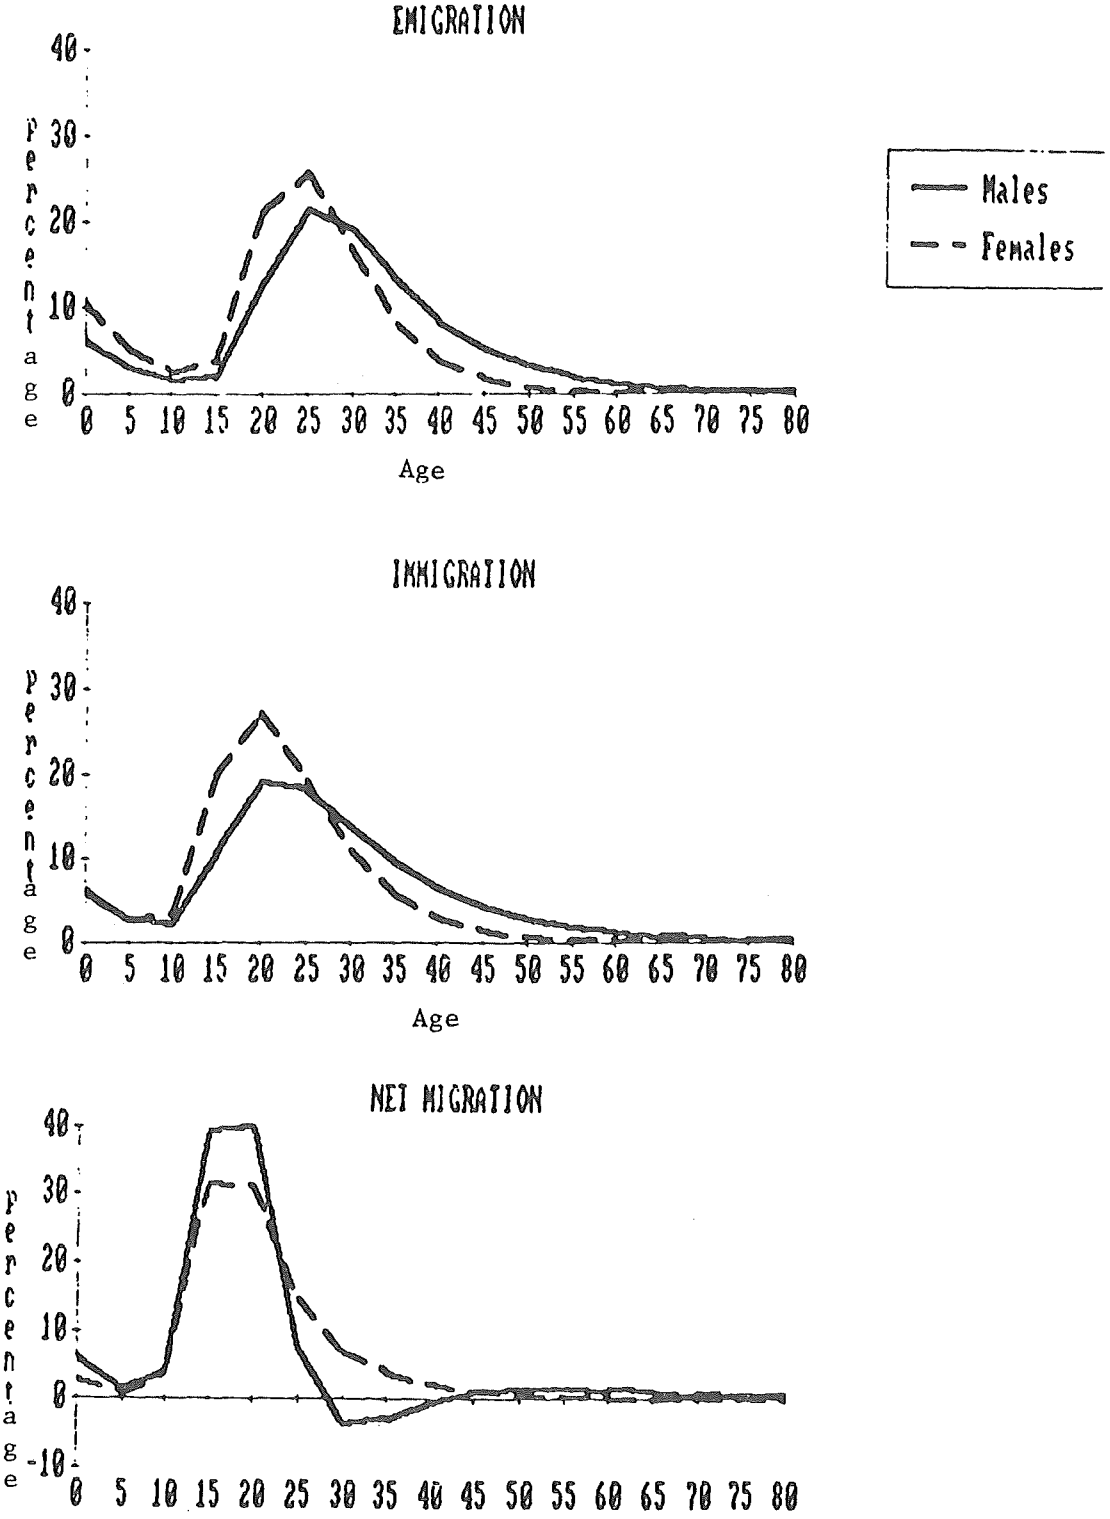

Sex ratio of adult immigrants (SRA_i).....1.0
(family migration)

Annex figure. Gross and net model migration schedules: Male labour force emigration and family immigration options

Part Two

TABLES OF POPULATION ESTIMATES AND PROJECTIONS

NOTE I : (FOR TABLES 2 TO 5)

(*) MORE DEVELOPED REGIONS COMPRISE NORTHERN AMERICA, JAPAN, ALL REGIONS OF EUROPE, AUSTRALIA-NEW ZEALAND AND UNION OF SOVIET SOCIALIST REPUBLICS.
(+) LESS DEVELOPED REGIONS COMPRISE ALL REGIONS OF AFRICA, ALL REGIONS OF LATIN AMERICA, ALL REGIONS OF ASIA EXCLUDING JAPAN, MELANESIA, MICRONESIA AND POLYNESIA.
(1) INCLUDING AGALESA, RODRIGUES AND ST. BRANDON.
(2) INCLUDING ASCENSION AND TRISTAN DA CUNHA.
(3) THE DATA WHICH RELATE TO THE FEDERAL REPUBLIC OF GERMANY AND THE GERMAN DEMOCRATIC REPUBLIC INCLUDE THE RELEVANT DATA RELATING TO BERLIN FOR WHICH SEPARATE DATA HAVE NOT BEEN SUPPLIED. THIS IS WITHOUT PREJUDICE TO ANY QUESTION OF STATUS WHICH MAY BE INVOLVED.
(4) INCLUDING COCOS (KEELING) ISLANDS, CHRISTMAS ISLAND, AND NORFOLK ISLAND.
(5) INCLUDING JOHNSTON ISLAND, MIDWAY ISLANDS AND WAKE ISLANDS.
(6) INCLUDING CANTON AND ENDERBURY ISLANDS.
(7) COMPRISING FEDERATED STATES OF MICRONESIA, MARSHALL ISLANDS, NORTHERN MARIANA AND PALAU.
(8) INCLUDING PITCAIRN AND TOKELAU.

NOTE II: (FOR TABLES 6 TO 16)

DATA FOR SMALL COUNTRIES OR AREAS, GENERALLY THOSE WITH POPULATION OF 300,000 OR LESS IN 1985, ARE NOT GIVEN IN THIS TABLE SEPARATELY. THEY HAVE BEEN INCLUDED IN THEIR REGIONAL POPULATION FIGURES.

(*) MORE DEVELOPED REGIONS COMPRISE NORTHERN AMERICA, JAPAN, ALL REGIONS OF EUROPE, AUSTRALIA-NEW ZEALAND AND UNION OF SOVIET SOCIALIST REPUBLICS.
(+) LESS DEVELOPED REGIONS COMPRISE ALL REGIONS OF AFRICA, ALL REGIONS OF LATIN AMERICA, ALL REGIONS OF ASIA EXCLUDING JAPAN, MELANESIA, MICRONESIA AND POLYNESIA.
(1) INCLUDING BRITISH INDIAN OCEAN TERRITORY AND SEYCHELLES.
(2) INCLUDING AGALESA, RODRIGUES AND ST. BRANDON.
(3) INCLUDING SAO TOME AND PRINCIPE.
(4) INCLUDING WESTERN SAHARA.
(5) INCLUDING ST. HELENA.
(6) INCLUDING ANGUILLA, ANTIGUA, BAHAMAS, BRITISH VIRGIN ISLANDS, CAYMAN ISLANDS, DOMINICA, GRENADA, MONTSERRAT, NETHERLANDS ANTILLES, SAINT CHRISTOPHER AND NEVIS, SAINT LUCIA, SAINT VINCENT AND THE GRENADINES, TURKS AND CAICOS ISLANDS AND UNITED STATES VIRGIN ISLANDS.
(7) INCLUDING BELIZE.
(8) INCLUDING FALKLAND ISLANDS (MALVINAS) AND FRENCH GUIANA.
(9) INCLUDING BERMUDA, GREENLAND AND ST. PIERRE AND MIQUELON.
(10) INCLUDING MACAU.
(11) INCLUDING BRUNEI DARUSSALAM.
(12) INCLUDING MALDIVES.
(13) INCLUDING GAZA STRIP (PALESTINE).
(14) THE DATA WHICH RELATE TO THE FEDERAL REPUBLIC OF GERMANY AND THE GERMAN DEMOCRATIC REPUBLIC INCLUDE THE RELEVANT DATA RELATING TO BERLIN FOR WHICH SEPARATE DATA HAVE NOT BEEN SUPPLIED. THIS IS WITHOUT PREJUDICE TO ANY QUESTION OF STATUS WHICH MAY BE INVOLVED.
(15) INCLUDING CHANNEL ISLANDS, FAEROE ISLANDS AND ISLE OF MAN.
(16) INCLUDING ANDORRA, GIBRALTAR, HOLY SEE AND SAN MARINO.
(17) INCLUDING LIECHTENSTEIN AND MONACO.
(18) INCLUDING COCOS (KEELING) ISLANDS, CHRISTMAS ISLAND, AND NORFOLK ISLAND.
(19) INCLUDING NEW CALEDONIA, SOLOMON ISLANDS AND VANUATU.
(20) COMPRISING GUAM, KIRIBATI (WHICH ALSO INCLUDES CANTON AND ENDERBURY ISLANDS), NAURU, PACIFIC ISLANDS (COMPRISING FEDERATED STATES OF MICRONESIA, MARSHALL ISLANDS, NORTHERN MARIANA AND PALAU), JOHNSTON ISLAND, MIDWAY ISLANDS AND WAKE ISLANDS.
(21) COMPRISING AMERICAN SAMOA, COOK ISLANDS, FRENCH POLYNESIA, NIUE, PITCAIRN, SAMOA, TUVALU, TOKELAU, TONGA, AND WALLIS AND FUTUNA ISLANDS.

TABLE 1. TOTAL POPULATION AND ANNUAL RATE OF CHANGE BY REGION AND AREA, 1950-2025, MEDIUM, HIGH AND LOW VARIANTS
