Peri-Urban Growth in Latin America

UN Expert Group Meeting on Population Distribution, Urbanization, Internal Migration and Development

Haroldo da Gama Torres

Cebrap – Brazil

Contents

- 1. Conceptual issues
- 2. Why are peri-urban areas important?
- 3. Why are peri-urban areas growing?
- 4. Implication for policies
 - Land use
 - Transportation
 - Housing
- 5. Peri-urban information deficit

Slum definition (Habitat, 2006) based on indicators of:

- Durable housing
- Sufficient floor space
- Access to treated water
- Access to sanitation
- Secured tenure

Can be estimated through household surveys

Problems

- Does not differentiate shantytowns from illegal settlements
- Does not provide information on poverty spatial distribution

Conceptual issues

Shantytown

Invaded land (Lim 1995):

- Private
- Public

Government action on invaded land is more difficult

Illegal settlement

Private development not fully recognized by city government

Problems

- Requires local register databases for population estimates
- Does not provide information on poverty spatial distribution

Likely to be a shantytown - Southwest Caracas

Likely to be an illegal settlement - Eastern Lima

Mosaic of houses

Geometrically designed streets

1

Peri-urban, also known as:

- Periphery
- Suburb

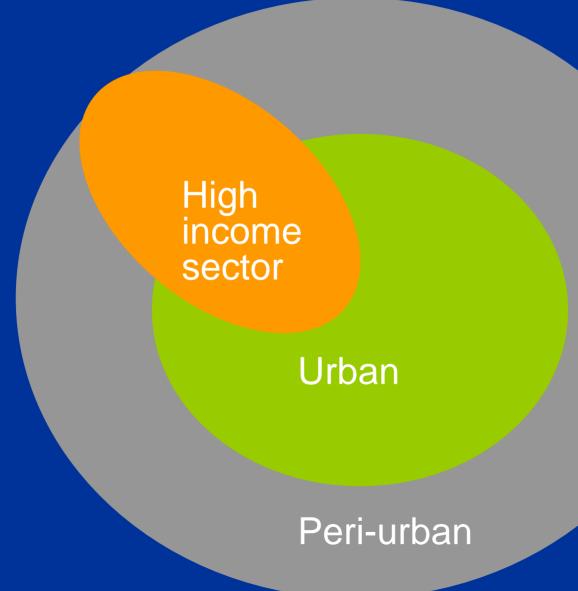

Allows for the spatial definition of "problem area"

Preliminary definition:

- Located in-between consolidated urban regions and rural ones
- Typically have lower demographic density, poorer urban infrastructure and mixed land use

Problems

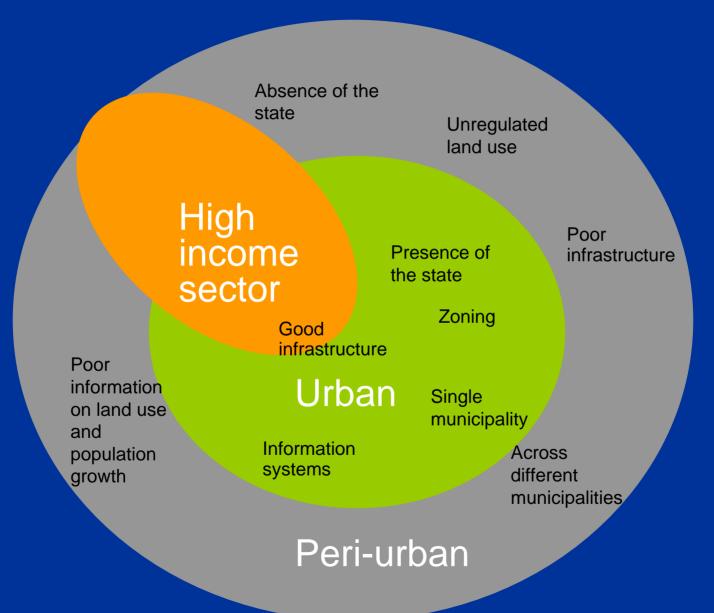

- The existence of high income areas in some parts (Sabatini, 2004)
- The existence of poor areas and shantytowns close to central areas

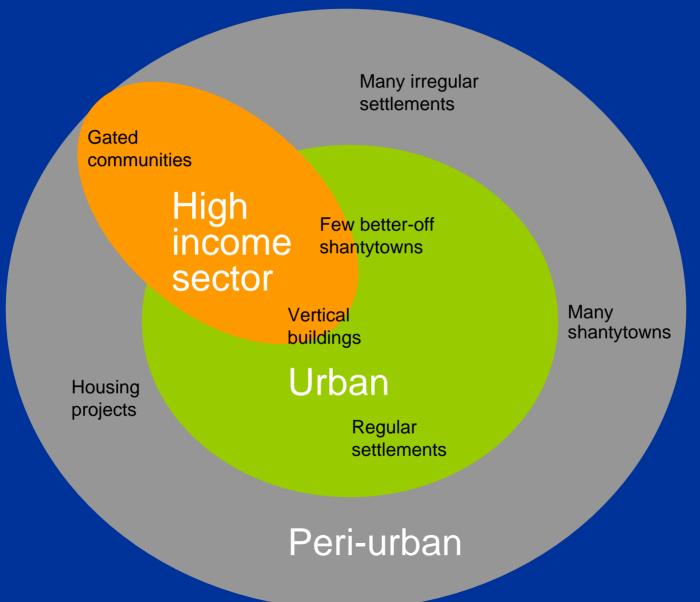

A variation of the centralperiphery model

Based on Sabatini (2004)

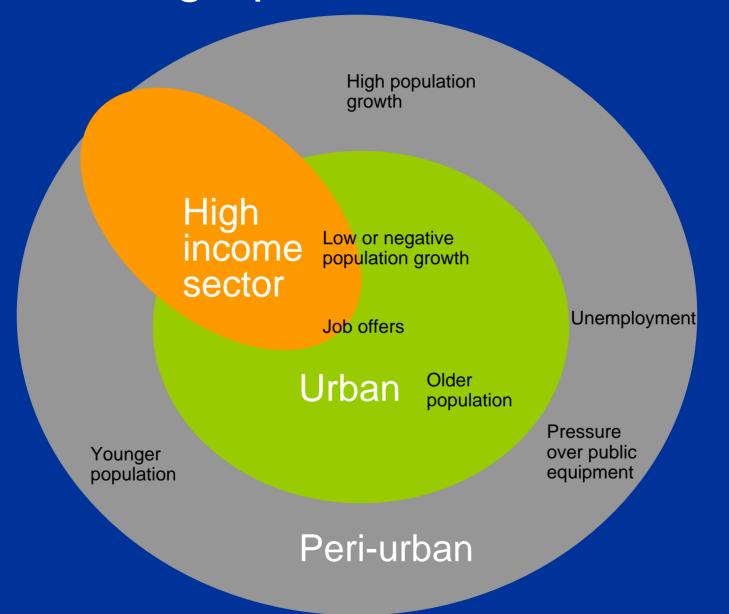

Institutional environment

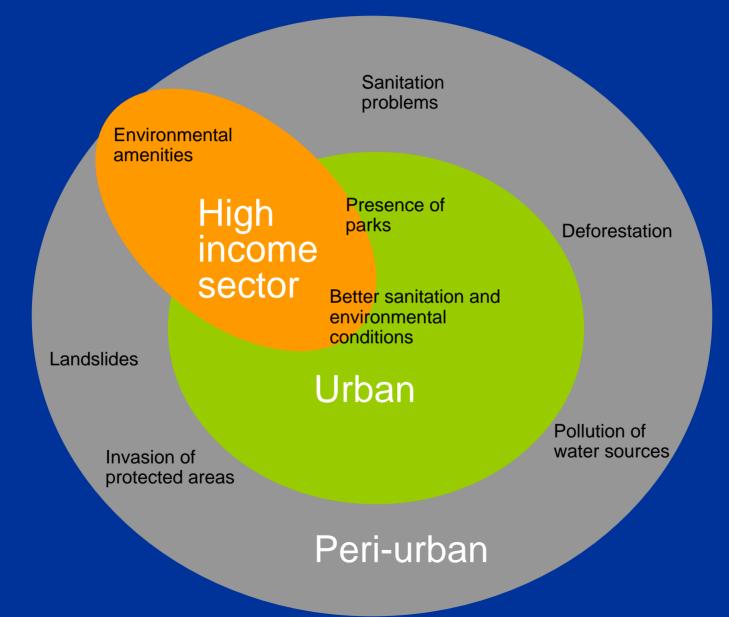

Land use

Demographics

Environment

Mexico City Example

Centro del Valle

Organized land use

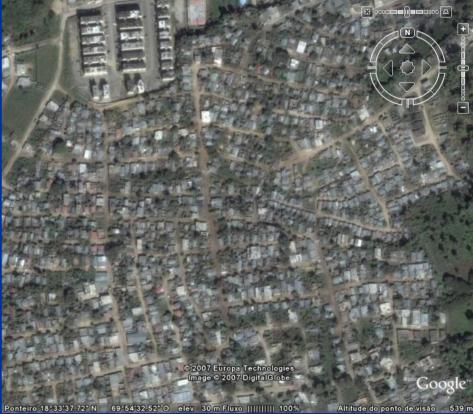

East: Border of La Caldeira volcano

Central area

North

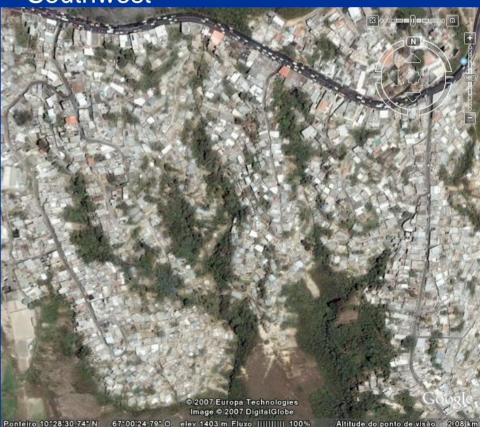

Caracas Example

Central/North

Southwest

Bogota Example

Central

Usaquén (North)

Risk areas

Lima Example

Miraflores

Environmental amenities

Vilarte (Northeast)

Buenos Aires Example

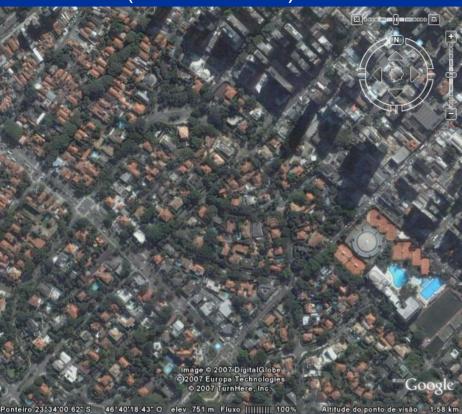

Vertical building and parks

Rafael del Castillo (Southwest)

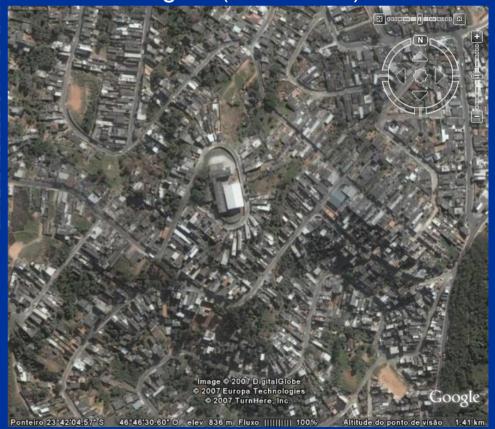

Sao Paulo Example

Jardins (Central/West)

Active zoning

Jardim Angela (Southwest)

Why are peri-urban areas important?

Peri-urban areas:

- •Will concentrate almost all population growth
- Already represent a significant share of the urban population

Latin America's urban population 2007: 450 million*

Latin America's urban population 2030 (E): 609 million*

Limitations

- Except for some case studies (Mexico, Sao Paulo, Santiago), we do not have hard data to fully support this argument
- Peri-urban population estimates depend on spatial data for two censuses (before 2000, most censuses had few GIS features)

- 1. Expensive housing markets in central areas
 - Poor families and/or recent migrants unable to settle in central areas
- 2. Restrictive urban zoning (for central areas only)
 - Zoning rationale mostly anti-growth
 - Artificially increased land price
- 3. Inadequate housing policies
 - Limited and not well funded
- 4. Different demographic dynamics in urban and peri-urban areas
 - Peri-urban population typically younger and less educated

Policy issues

Zoning, parks and building norms

- Difficulties for the state to enforce urban regulation and property rights
- Invasion of parks and protected areas
- Policy unintended consequences:
 - Very restrictive urban regulations ---> More irregular occupation

Policy issues

Transportation

- Longer journeys for peri-urban dwellers
- Crowded public transport systems
- Difficulties in accessing job centers

Different types of transport system may induce or restrict urban sprawl

Policy issues

Housing

- Housing policies reduce environmental degradation
- Traditional housing policies do not avoid segregation
- Land regularization is more cost effective

Limited housing policies (except Chile)

Peri-urban information deficit

Invisibility of peri-urban areas

- Policy makers' residence located elsewhere
- Lack of media coverage and focus
- Inadequate registration by urban information systems

Censuses are the only sources of information on peri-urban expansion, but they are conducted only at 10-year intervals

Peri-urban information deficit

The lack of information on peri-urban trends leads to:

- Poorly located schools and health care facilities
- Crowded public facilities
- Incapacity of the state to regulate land use

Peri-urban information deficit

The need for "early warning systems"*

- On-the-spot indication of unexpected urban expansion
- Use of satellite images and administrative data
- Easy access for local public managers

Google Earth, although helpful, is unable to indicate urban trends
