

MODEL-BASED ESTIMATES AND PROJECTIONS OF FAMILY PLANNING INDICATORS 2014

COUNTRIES

A systematic and comprehensive set of annual, model-based estimates and projections is provided for a range of family planning indicators for a 60-year time period. Indicators include contraceptive prevalence, unmet need for family planning, total demand for family planning and the percentage of demand for family planning that is satisfied among married or in-union women for the period from 1970 to 2030. Median estimates with 80 per cent uncertainty intervals (represented by lines) and 95 per cent uncertainty intervals (represented by shaded areas) are provided for 194 countries or areas. Model results are as of April 2014.

A Bayesian hierarchical model combined with country-specific time trends was used to generate the estimates, projections and uncertainty assessments. The model advances prior work and accounts for differences by data source, sample population, and contraceptive methods included in measures of prevalence. **Details on the methodology are described in:**

Alkema L., V. Kantorova, C. Menozzi and A. Biddlecom. 2013. National, regional and global rates and trends in contraceptive prevalence and unmet need for family planning between 1990 and 2015: a systematic and comprehensive analysis. *The Lancet*. Vol. 381, Issue 9878, pp. 1642–1652.

The estimates and projections are based on the country-specific data compiled in:

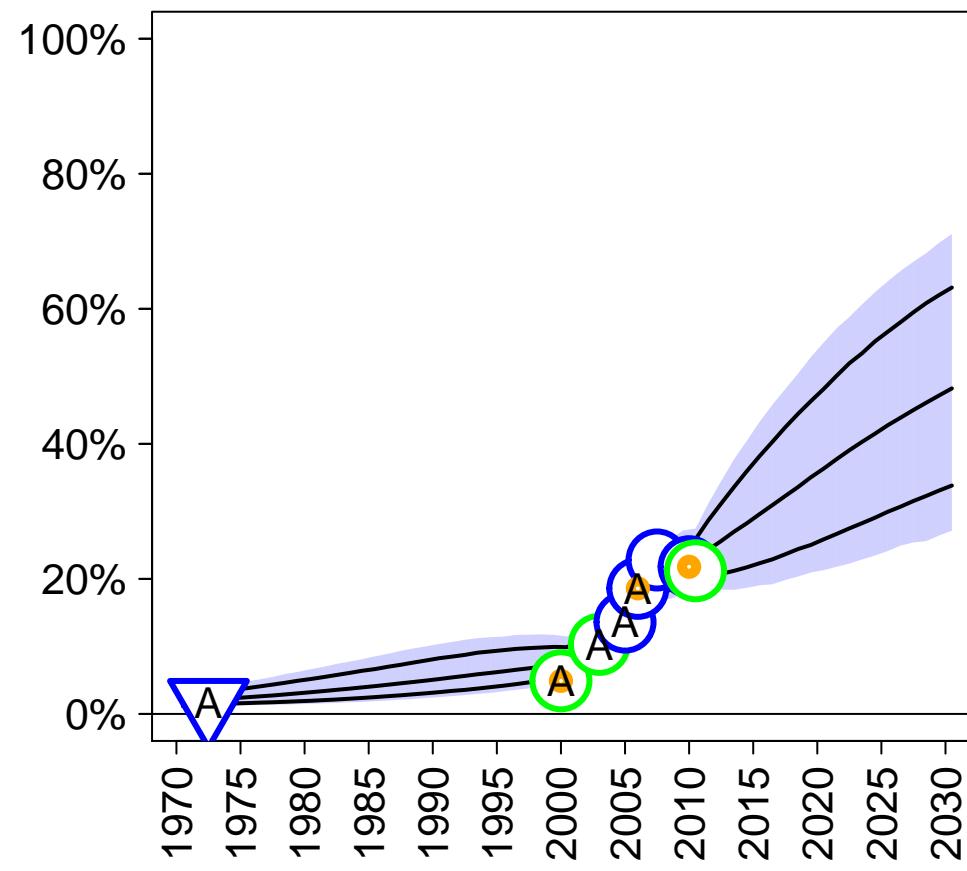

United Nations, Department of Economic and Social Affairs, Population Division. 2014. *World Contraceptive Use 2014*. New York: United Nations.
