Handbook Acknowledgments.....	40

I am very pleased to present this Handbook, which will be useful to you as you and your family transition into New York.

Access to health care can be one of the most daunting parts of moving to a new duty station. Even when the quality of care available is high, navigating the health system, dealing with insurance and working out which practitioners to see about what problem can all be quite overwhelming, particularly if your first encounter with the system is as a result of an emergency.

This Handbook aims to simplify some of that, and gives you the information you need to make informed choices. I encourage you to read it prior to taking up your post, so that you are equipped to make decisions about health care for you and your family.

The UN invests heavily in supporting the health and wellbeing of its staff through the health insurance products we offer, and the Medical Services Division. We want you to feel confident and at ease as you learn to use the health care system of New York.

You are going to have a very busy first few weeks as you settle into your new duty station. Don't forget, during this time, to make some space to start taking control of your health care. In fact, I recommend you attend to three key tasks:

1. If your new role is going to involve travel, make an appointment at the Medical Services Division to have your travel health needs met (especially vaccinations), well in advance of your first planned travel.
2. Make a routine appointment with a Primary Care Practitioner (*this Handbook includes information on how to choose one*) within the first couple of months, so that you can start familiarising yourself with the health care system here, without the pressure of a medical emergency.
3. Identify your nearest emergency departments, and in that first discussion with your Primary Care Practitioner, develop a plan about who you would call, and where you would go to, in the event of an injury or sudden illness.

In an ideal world, you would have limited need for the information in this Handbook. However, if you do become unwell or suffer an injury, I know that the information provided here will help you to navigate the health care system with ease.

I wish you health and success in New York.

Thank you.

Catherine Pollard
Assistant Secretary-General
Office for Human Resources Management

The health care system in the United States (US) can be a confusing patchwork of insurance plans, payment systems, coverage options and forms of medical practice. It is hoped that this Handbook will give you a general overview of the system, and help you navigate the often-convoluted pathways to obtaining health care in the US.

What one receives in the way of health care benefits in the US is determined by the insurance package that one signs up for. Health insurance in the US resides primarily in the private sector, where employee groups negotiate with private health insurance companies to manage a package of health care benefits for their employees. In any large employee group there might be one, two or three health care packages offered, each with different benefits and, to some extent, different costs for the employee. The United Nations (UN) is unique in that it provides its own insurance package and contracts to process in- and out-of-network insurance claims in the US with three different insurance companies: Aetna and Empire Blue Cross (EBC) for medical, and Cigna for dental. This booklet will primarily refer to protocols and benefits associated with the two medical insurance packages, Aetna and Empire Blue Cross (EBC), offered to UN employees (the major concepts outlined here are applicable to the dental insurance plan as well).

It is important to note that the UN insurance plans are self-insured plans. This means that the risk of providing insurance rests with the UN and the covered members under the plan, but not with the insurance carriers. Premiums are set based on the projected claims experience of all active and retired staff members covered under the plans, and do not take into account the claims experience of non-UN populations. Premiums collected are held by the UN, and the insurance carriers are reimbursed only for the claims that they actually pay out to providers and plan members, in addition to a fixed monthly administrative fee per subscriber (i.e., an active or retired staff member, regardless of the number of family members covered).

While health insurance provides assistance to staff in covering a variety of medical costs, it does not cover all medical-related services, nor at full costs. All staff members and their covered family members should familiarize themselves with the rules and benefits of their selected health insurance plans, which are contained in the latest information circular and plan descriptions available on the UN Health and Life Insurance Section's website (<http://www.un.org/insurance>).

Terminology

Out-of-Pocket Costs is a generic term for any medical expenses that you, the consumer, are required to pay on your own. These are expenses above and beyond what your insurance plan will pay for.

In-Network refers to doctors, hospitals, clinics, laboratories, pharmacies and other health care providers that insurance companies have negotiated with to provide health care services at an agreed upon rate of payment.

For example, a routine visit might be negotiated at \$50/visit, which means the doctor agrees to accept this rate of payment, with the patient paying his/her co-pay (explained below) and the insurance plan covering the balance.

Factors to Consider:

- ◆ With the exception of co-pays, the insurance plan pays for the services.
- ◆ You should not incur additional out-of-pocket expenses for covered services or prescription drugs that are provided in-network.

Out-of-Network refers to medical service providers who are covered by your plan but are not signed on as in-network.

How it works: Your insurance company agrees to pay 80% of what they have determined to be the “usual and customary” fee for the service. You will pay out-of-pocket for the remaining portion.

Factors to Consider:

- ◆ Whilst going out-of-network may mean that you have a wider range of providers to choose from, the downside is that you can incur much higher (and sometimes, very significant) out-of-pocket costs. The out-of-network provider often charges a much higher fee than an in-network provider.
- ◆ Out-of-network expenses can be considerable if the services are for surgery, hospitalization, and other costly procedures.
- ◆ It is perfectly acceptable to ask for the standard charges for a visit, a medical procedure or a diagnostic procedure in advance when you are going out-of-network. It is strongly advised that you find out which costs you will be responsible for in advance i.e., the facility costs, anaesthesiology, medications, etc.
- ◆ An additional drawback of out-of-network services is that you have to assume much more responsibilities for the administration of your medical care. Referrals, billing, prior approvals and cost management for out-of-network services require attention and input from the patient.
- ◆ Given the high cost of health care in the US, it is important for individuals to understand that they put themselves at financial risk when utilizing out-of-network providers since the insurance plans’ reimbursements are based on maximum allowable amounts and not the actual amounts charged by providers.

Co-Pay is a fixed fee established by the insurance companies in advance, which you make each time you use a service. It is paid at the time of each visit or may sometimes be billed to you at a later date. It is customary for the co-pay for a visit to a primary care physician to be lower than that for a specialist. The amount is often listed on your insurance card.

Deductible refers to medical expenses that you will be asked to pay before your insurance kicks in to pay for a service.

For example, some plans require consumers to pay for anywhere from \$20 to \$1,000 worth of services before the insurance coverage will start paying any benefits.

Factors to Consider:

- ◆ Deductibles are mostly applied to out-of-network services.
- ◆ A deductible can also be applicable for certain kinds of services, such as hospitalizations and mental health services.
- ◆ It is important to know what payments count toward your deductible.
- ◆ It is best to keep a file of receipts for the out-of-pocket expenses you incur, as well as statements showing what your insurance company has paid. This will help you to keep track of expenses and allow you to more easily keep track of where you and your family are in paying down your deductible.
- ◆ Even if you do not expect to receive a reimbursement, it is still important to file a claim with your insurance company in order for these expenses to be tracked and credited towards your deductible.

Prior Authorization is an attempt to rationalize and contain the high cost of medical care in the US. There are a number of medical procedures, medications, diagnostic tests and specialty consultations and hospitalizations that require authorization from the insurance company before the insurer will cover them. Except in emergencies, these procedures require authorization prior to the event. Your health care plan explains which health care activities needs prior authorization or approval.

Who is responsible for obtaining a prior authorization?

- ◆ If you are going to an in-network provider, they are responsible.
- ◆ If you are using an out-of-network provider, you or the physician who orders the test or performs the procedure will be responsible for obtaining approval from your insurer.

Factors to Consider:

- ◆ As the consumer, you will want to make sure that prior authorization has been obtained as you will be responsible for the entire bill if the approval is not in place.
- ◆ In some plans, failure to seek prior authorization for scheduled hospitalization, even for an in-network provider, will result in a penalty to be deducted from what the insurance plan will reimburse. You will then be

responsible for paying your provider the amount of the penalty that was not reimbursed by your plan.

- ◆ Prior approvals for services of out-of-network providers mean that the services will be reimbursed based on the maximum allowable amounts applicable for the plan; it is **not** a guarantee that the plan will reimburse at the prices charged by the provider.

How to choose an insurance plan

The UNHQ in New York offers the choice of two plans: Aetna and Empire Blue Cross. Other members of your family who work in the US may receive health insurance through their employers. There are different rules and protocols regarding health benefits so please read this section in your Handbook carefully, since there may be a cost savings if you are able to access benefits from both your plan and one in which your spouse is enrolled.

Here are some of the factors to consider in choosing a medical insurance plan:*

- ◆ **Your health needs and those of members of your family:** Young families without significant chronic health issues may do well with a plan that pays primarily for in-network coverage, i.e. a health maintenance organisation or Exclusive Provider Organization (EPO). The assumption here is that your health needs are simple and can be taken care of through the plan. If it is anticipated that you or a family member will require medical care from a number of specialists, expensive medications, and/or complicated medical procedures, then a plan with more flexibility and health care options might be best for you, i.e. a Preferred Provider Organization (PPO) or one with good out-of-network benefits.
- ◆ **Cost of deductibles, co-pays, and monthly rates, and scope of coverage:** For example, does the plan cover eye glasses, hearing aids, psychotherapy, dietary counselling and alternative medicine providers? These benefits are usually listed under a section called “Schedule of Benefits” and it is a good idea to review the Schedule of Benefits section to see which plan best fits you and your family’s health needs.
- ◆ **The possibility of accidents or sudden diagnosis of serious illness:** Accidents should be considered in selecting your plan, even if you and your family are generally healthy and may not need regular care. Like those of other employers, UN insurance plans have strict rules about enrolling in a plan or switching to another plan at any given time. If you are suddenly diagnosed with a serious illness or in an accident, you will not be entitled to join a plan or switch to a plan with better benefits at your convenience. Therefore, you should not only consider the monthly costs but also carefully review the plan’s benefits and coverage.

* Some of these considerations will only be relevant to plans other than Aetna or EBC, while others apply to both.

What to expect when you visit a physician's office

Making the first appointment: When you call to set up an initial visit, you might want to ask a few questions before going forward with the conversation:

- ◆ Are they taking new patients?
- ◆ When is the first available appointment?
- ◆ Do they accept your insurance plan?
- ◆ Are they part of the network of your insurance plan? (Practices change their insurance panels without much notice, so it is always good to check.)

In most offices, staff are told to inquire as to the nature of your medical problem. Are you calling for a wellness examination i.e., a routine check-up, or is the problem acute and requiring an immediate appointment? If you have special needs, e.g., requiring an appointment within a specific time frame, let the staff know that as well. Some offices will also ask for your insurance information while making the initial appointment.

Your medical appointment: It is highly recommended that you arrive 10 to 15 minutes before your first appointment since you will be asked to complete paperwork that includes providing your and your family's medical history, any medications you are currently taking, any allergies, etc. You should therefore be ready with that information. You will also be asked to sign forms regarding medical confidentiality as well as your agreement to be personally responsible for any costs that the insurance plan will not or will only partially reimburse. Some offices may also have their registration forms online, which

you can complete at home and bring with you to your first appointment. This would also cut down on waiting time.

Offices have different routines: In some doctor's offices you will be seen initially by a medical assistant who prepares you for the visit. The medical assistant will ask you to disrobe and put on an examination gown, take your height, weight and blood pressure, and collect information about your presenting problem. In other offices, the physician may speak with you first and obtain your medical history and then ask you to go into a separate area to disrobe and put on an examination gown.¹ After the examination you will be asked to dress and the physician will speak with you about their findings and make recommendations as to what needs to be done.

It is important that you have time to ask questions: Make sure that you prepare a list of questions before your visit. You would likely have time to ask these questions during your post-examination session with the doctor. When you leave the office, you should have a clear picture of what the doctor thinks about your health picture and what is recommended as the next steps in your ongoing medical care. Are instructions for testing or follow-up plans clear and have all your questions been answered? If you are not being asked to return to the office for a follow-up visit, make sure you know how you can obtain the results of any investigations that are being ordered.

¹ Respect for patient privacy is a well-articulated value in the US health care system. There should be a private place for disrobing and dressing and instructions given about how much disrobing is required, e.g., outer garments, all of your garments, etc. The examination gown or garments should provide adequate covering to preserve your modesty. There should be some discussion about the extent of the examination before you are asked to undress. When a male physician is examining a disrobed female patient there is usually a female chaperone present and/or you may request one to be present.

Primary Care

The **primary care physician (prime or “PCP”)** is the cornerstone of medical care in the US. The primary care physician offers continuous and comprehensive care, helps to organize referrals to specialists, administers preventive care, and is first in the line of contact for most medical problems. Primary care physicians are general internal medicine physicians, pediatricians and family physicians who see both children and adults. Many women, particularly those of child-bearing age, receive their basic care from a specialist in women’s health called an obstetrician gynaecologist (Ob-Gyn), who also provides many of the recommended preventive care services. However, the Ob-Gyn is not considered a primary care physician in most systems.

Most insurance plans require you to sign up with a primary care doctor who manages your medical care. While both UN plans do not generally require referrals from your primary care physician to seek care from specialists, there are specific situations where a written referral would be useful; these are described in your plan’s document. No matter what your plan requires, select a primary care physician who can advise you about health matters and help you navigate the complexities of the US health care system.

Primary care practices are organized in many different forms and you, the consumer, have a choice of which one you want to sign up for. Before deciding, however, you should determine in advance whether they accept your insurance **and** if they are in-network or out-of-network. For example, some practices do not take insurance and require the consumer to pay out-of-pocket. If you choose this option, you are responsible for negotiating reimbursement with the insurance company.

Here are a few of the practice models:

Private practice offices: There are hundreds of private offices throughout the New York metropolitan area out of which a single physician or group of physicians provide medical services. Medical practitioners can decide to sign up with a wide array of medical plans and insurance providers, go with only a few, or accept none at all.

Multispecialty groups: These are private practice groups that, in addition to having primary care physicians on staff, offer a broad array of specialty services.

Community clinics: These offer another way for physicians and other medical providers to work together in comprehensive care groups. Many community clinics are subsidized by the government, which means they have to accept a broader range of insurance plans, and meet certain standards for hours of service, range of services provided, and after-hours coverage.

Hospital-based practices: Most hospitals in the New York metropolitan area are associated with an ambulatory (outpatient) clinic that has primary care physicians as well as specialty clinics. Most also have teaching programs that include post-graduate medical trainees as providers.

Hospital affiliated medical practices: Many of the larger hospitals in the New York metropolitan area have created networks of affiliated medical practices that extend to different boroughs and even to different states. In addition to providing primary and specialty care services, these practices refer to the parent hospital for diagnostic studies, hospitalizations, additional specialty care and/or emergency care.

Concierge medical practices: A new development in primary health care delivery is the growth of what are called concierge medical practices. Usually made up of one or more physicians, these practices charge a yearly membership fee, in exchange for which you the consumer would receive more convenient and personalized services. Your insurance plan is used to cover most medical expenses; the yearly membership fee – which can range from \$150 to \$5,000 (this is not reimbursed by the insurance plan) – pays for “amenities” such as email and phone access to physicians, same day appointments, no (or short) waiting times, and on-line appointment scheduling. Some concierge offices take a wide range of medical insurances, others are very limited. Most, if not all, of these concierge practices are considered out-of-network providers and claims will be reimbursed by the plan accordingly. Information about concierge practices in New York City is available online.

How to find a primary care physician: A good place to start is the on-line site provided by your insurance company that lists all physicians who have contracted with them to be in-network providers. This listing is organized by specialty and location (borough). Primary care physicians are listed under general internal medicine, paediatricians, and/or family practice. Friends and colleagues are also a good source of referral, or you may find it convenient to locate a medical practice that is close to where you live or work. If you or family members have a complex set of medical needs, attending a hospital or hospital-affiliated practice might be the most convenient, as medical information is most easily shared within these systems. Once you have located a primary care physician, you can go online and find consumer ratings of individual physicians and other information that can help you choose a primary care physician. Although changing your health insurance plan can only be done once a year during the UN official enrolment period, changing your primary care physician can be done at any time. You should not feel locked into any choice since it is very important to find a physician that you trust and with whom you feel comfortable.

Specialist Care

The medical care system considers a specialist to be any provider other than your primary care physician; specialists can be in- or out-of network. While both UN plans do not generally require referrals from your primary care physician to seek care from specialists, it is still a good idea to get a written referral anytime you are planning a visit to any kind of specialist. This will insure that your primary care physician receives a written report from the specialist and that your medical care (and documentation of your medical history) is coordinated from one place. An exception to the referral rule is women's health, where referrals are generally not required for visits to obstetrician gynaecologists (Ob-Gyn).

While some specialty care – e.g. dermatology or ophthalmology – can be relatively straightforward procedures, you are advised to prepare in advance for specialty visits that address more complex medical issues. Make sure to ask your primary care physician for copies of relevant laboratory and radiological studies, a referral note, and copies of letters from all other specialists you have seen for the problem.

Finding a specialist: The best source for finding a specialist is your primary care physician, who would generally work within a network of specialists. A second source is your insurance plan, which can give you names of in-network specialists in your area. For complicated and or more serious health concerns, you may request a referral to a specialist who practices at one of the specialty hospitals – cancer, joint disease, eye and ear problems or one of the larger academic medical centres in the city – such as New York University Medical Center, Columbia Presbyterian, Mount Sinai and New York Cornell.

Second opinions: Most insurance plans allow for a second opinion when a surgical procedure is advised. If you have any questions or doubts about the need for a surgical procedure, it is your right to ask for a second opinion from another specialist in the same field. Your primary care physician can arrange for a second opinion referral. The UN's insurance plans will cover the cost of doctor's visit for a second opinion in accordance with the plan rules for in- and out-of-network visits.

Preventive Care

Preventive care is widely accepted as an essential ingredient of the US health care system. The newly passed Affordable Care Act (“Obamacare”) mandates that all insurance plans offer preventive care and offers payment incentives for physicians whose patients receive a high standard of preventive care (There is a section in your health insurance policy that outlines preventive care benefits). Preventive care and preventive care guidelines are highly protocolized and are based on an understanding that some medical conditions can be almost completely prevented with immunizations, a healthier diet and exercise, smoking cessation, and/or other conditions can be vastly mitigated through early detection with screenings such as mammograms, PAP smears, colonoscopies, and early interventions such a removal of premalignant polyps from the colon. Preventive care guidelines have been established by a number of expert organizations and there are some differences of opinion among them as to what constitutes necessary preventive care. When you visit your primary care physician and/or Ob-Gyn, they will advise you on preventive care procedures and recommended health screenings.

Basic preventive care recommendations include:

Children: Starting in the first few months of life, there is a regular schedule of immunizations and examinations recommended for infants and children in the US. Children entering school are required by law to be immunized against common preventable diseases such as mumps, measles, chicken pox and many others. Parents should ensure to keep all documentation of their child’s immunization history as they will likely be needed for school entry.

Women and men between the ages of 50 and 75: are advised to have a screening procedure for early detection of cancer of the colon. The most common recommendation is a colonoscopy every 10 years.

Women between the ages of 50 and 74: are advised to have a mammogram screening every two years for early detection of breast cancer.

Women between the ages of 21 and 65: are advised to have a PAP smear no more than every three years to screen for cancer of the cervix.

Adult immunizations: Diphtheria/Tetanus immunization is recommended every 10 years. Immunizations to prevent influenza (flu) and pneumonia are recommended for people over 65 years of age, and those at higher risk for medical complications due to influenza.

Smoking cessation: There have been active campaigns throughout the US over the past 10 years in support of smoking cessation, with life and health insurance companies offering lower rates to non-smokers. If you are a smoker, your primary care physician can advise you on smoking cessation methods.

Emergency and Urgent Care

In **planning for your medical care**, it is a good idea to know in advance what to do in the case of urgent or emergency medical problems. There are a number of options for dealing with health problems requiring immediate attention that arise outside of your primary care physician's regular office hours.

Many primary care offices have after-hours phone coverage. During your first visit to the office, ask what kind of after-hours coverage they provide. It is always preferable to call your primary care physician's office for a consultation before you seek outside care. They may suggest you come into the office, refer you to an urgent care centre, and/or emergency room or send you directly to the hospital for admission.

Urgent care centres or walk-in centres. A new phenomenon in the New York City medical scene, Urgent care centres offer a good alternative to emergency room care. These centres are scattered throughout the New York metropolitan area and do not require appointments. They take a range of insurance plans, and usually have on-site x-ray and laboratory facilities. Urgent care centres can provide diagnosis and treatment for many acute medical problems without the lengthy waiting time that one often encounters in the emergency room. You may want to locate an urgent care centre in your neighbourhood, and ask in advance if they accept your insurance plan.

There are no rules for determining a true medical emergency. A sudden loss of one's capacity to speak, reason, move and/or perform ordinary life activities may be considered an emergency, as might severe pain, high fevers, large blood loss, etc. The city's emergency care system can be accessed by dialling 911. An ambulance with a trained crew of emergency medical technicians will be dispatched to your home and bring you to the nearest hospital. Most large hospitals in the New York metropolitan area have emergency rooms that serve as the entry point for people who are in need of acute hospitalization. It is also possible to walk into a hospital emergency system on your own.

Emergency rooms are run on a triage system, i.e. the sickest patients take priority. At the entry station you will be seen by trained medical personnel who assess the urgency of your medical needs, and who track your care based on the severity of their assessment. When going to an emergency room with a non-emergent problem, it is not uncommon to wait four or five hours to access service and, depending on the time of day and/or month, experience a great deal of crowding.

Most plans penalize members for using emergency rooms for non-emergency conditions. By only covering a portion of the service cost, which can leave you with a sizeable out-of-pocket expense, consulting with your primary care physicians' office prior to going to an emergency room is advised. If it is decided that emergency care is required, your primary care physician can inform the Emergency Room in advance that you will be arriving, which often makes for a much more efficient visit.

Women's Health Care

Women's health care can be organized through a number of different systems.

Some primary care physicians, particularly those from family practice, offer routine women's health care: PAP smears, contraceptive counselling and pregnancy counselling. Some women prefer to go to a woman's health specialist, an Ob-Gyn, for all of their women's health care – and your insurance plan will cover those visits. There are also a number of clinics – family planning, Planned Parenthood, and others – that specialize in women's health care during the reproductive years. These clinics offer women's health services, contraceptive counselling and, in some cases, termination of pregnancy. There is a listing of these clinics in the Appendix.

Pregnancy Care: Although some family practitioners provide obstetrical care, most of the obstetrical care in the US is provided by woman health specialists – an Ob-Gyn and/or a midwife specializing in Obstetrics. Deliveries are performed mainly in the hospital and patients have a choice of birthing procedures: natural, with anaesthesia, or in a birthing suite. These possibilities are generally discussed in advance with the patient. There is a small movement towards home birthing in the US and these deliveries are done by midwives. As in much of US medicine, safety is a major concern. Pregnancies during the final stages are monitored closely, and if there is any sign that the birthing process is not going well, or that the unborn baby is in distress, a caesarean section or "c-section" is advised. Because of the rate of caesarean sections in the US, the risk is relatively high. Expectant mothers are also advised to contact their insurance company to discuss any related benefits that may be covered by the plan.

Communication

There is an increasing interest in US medicine on improving communication between the doctor and the patient. Doctor-patient communication is now a regular part of the medical school curriculum and most post-graduate primary physician programs offer additional training. An informed and active patient is considered the ideal – and a lot of attention is being devoted to achieving this ideal. The expectation is that the patient and family will ask questions and can expect answers from health care providers, and patients will be active partners in making health care decisions.

However, as with many areas of life, real life experience does not always live up to the ideal. Below are some of the things you can do to increase the likelihood of having a satisfying experience with your doctor. These recommendations are particularly applicable for consultations with specialists:

- ♦ **Come to the visit prepared with questions.** Think about what you want to accomplish with the visit. Many people do web research prior to a planned visit, and most physicians expect to be asked questions based on this research.
- ♦ **If you are being referred to a specialist,** ask your primary care physician why you are being referred and what questions do you want to ask the specialist. Bring all relevant laboratory and consultation reports with you to a specialist visit.
- ♦ **Bring a family member or friend with you to your medical visit.** To help process what you're learning, you may want to bring someone else with you as you may feel overwhelmed by the amount of information provided by physicians or other medical personnel. You can request to have them with you during the initial interview and post-exam discussion.
- ♦ **Ask questions.** If there is terminology you do not understand, ask for clarification. If a test is being ordered that you do not understand about, ask about it. Why is it being ordered? What does it involve?
- ♦ **Treatment recommendations.** Whether they be medications, medical procedures, surgery or something else, ask about what you can expect while undergoing treatment, about possible side effects, the anticipated recovery period, and anything else that might concern you.

Language Comprehension

New York City is a polyglot culture and, to some extent, this is recognized in the medical care system. Public hospitals and clinics are required to have a panel of interpreters, or phone interpreters, available to serve non-English speaking clients. Private medical offices offer a variety of language skills. When researching a physician on the web you will find information about the languages in which a physician and/or his/her office staff is fluent. It is also permissible to bring a family member with you to help with translation.

Confidentiality

There is a great deal of emphasis on patient confidentiality in the US health care system. You, the patient, have the right to decide who has access to your medical information. Your written permission is required for your medical information to be sent to another doctor, medical faculty, insurance company or lawyer. Your verbal permission is required for family members, including your spouse, to be given details about your medical condition. Adolescents 18 years and older are considered emancipated and enjoy the same right to confidentiality as other adults in the family. There are specific situations such as family planning and treatment for Sexually Transmitted Diseases (STDs) where adolescents under the age of 18 can request confidentiality for their medical treatment.

Advance Directives and Living Wills

All patients have the right to make decisions regarding end-of-life care. These decisions are codified under the term, "advance directives." Elements of advance directives include:

- ◆ **Living will:** This legal written document spells out the types of medical treatments and life-sustaining measures, such as mechanical breathing (respiration and ventilation), tube feeding or resuscitation; you want or do not want. In some states, living wills may be called Health Care Declarations or Health Care Directives.
- ◆ **Medical or health care Power of Attorney (POA):** The medical POA is a legal document that designates an individual – referred to as your health care agent or proxy – who can make medical decisions for you in the event that you are incapacitated. However, a medical POA is different than a Power of Attorney that authorizes someone to make financial transactions for you.
- ◆ **Do not Resuscitate (DNR) order:** This is a request to not have cardiopulmonary resuscitation (CPR) if your heart stops or if you stop breathing.

Some people feel that it is helpful for everyone, regardless of health status, to have advance directives. Others consider them relevant only when a medical situation arises during which they might be required. On admission to the hospital, most people are asked to name a health care proxy or POA, and sign for other directives. Elderly patients are all encouraged to have advance directives and your doctor's office may ask you if you have them.

Hospitalization

For most people, hospitalization is a significant life event. Hospital rules and protocols disturb our life rhythms and daily habits. The food is generally not to our taste and sleep is interrupted. If you are in the hospital, however, chances are you really need to be there. There has been a trend in US health care to limit hospitalizations, and the time one spends in the hospital. Many surgical procedures are now performed in an ambulatory outpatient setting, which means you check in on the day of surgery, have the surgery, and return home

the same day.

Hospitalization stays have also become quite abbreviated. For example, the standard hospitalization for a normal childbirth is 24 to 48 hours and 96 hours post-cesarean section. Limiting these stays has proven to be a health benefit as recovery and rehabilitation are most effectively carried out away from the disruptive rhythms of the hospital. If it is not feasible to have what you need for recovery in your home, there are rehabilitation units at most hospitals where people can stay for a limited period of time. Your plan provides coverage for a rehabilitation unit stay and/or some level of post-hospital discharge home care if it is medically necessary.

Hospital admissions are arranged by a physician, and which hospital you enter is determined by your admitting physician. For example, a surgical procedure will be scheduled at a hospital chosen by the surgeon. In the case of an emergency, you will be taken to the nearest hospital and, if hospitalization is required, you will be admitted to that hospital and assigned a physician if your primary care physician is not on their staff. Most hospitals in the New York metropolitan area are teaching or training hospitals, so you will be visited by many different levels of physician providers. Expect to be asked frequently to give your name and birthdate by every provider you come in contact with. This preoccupation with patient identification is part of an entire system developed to prevent medical errors. If it is not clear to you or your family which physician is in charge of your care, it is important to ask for their name and contact number, so that you can request copies of your hospital record to be sent to your primary care physician. Upon discharge, you will be given a discharge summary that lists prescribed medications and follow-up recommendations.

Hospitals here generally have their own visitation rules and guidelines, including specific visitation hours and limits on the number of visitors a patient can receive at any one time. Most hospitals here do not permit visitors to sleep or stay overnight in the patient's room, unless specifically authorized.

Your plans reimburse 100% of hospitalization costs when your care is provided in-network, and coverage is for a semi-private room. If you are taken to an out-of-network hospital due to an emergency, most plans will reimburse for the full cost of care. Make sure to check your medical insurance plan.

Prescription Drug Coverage

Medications or prescription drugs

Medications can be a major contributor to your medical expenses. Although both UN insurance plans offer prescription drug benefits, there are a few things to know about medications, and prescribing in the US, that may help reduce out-of-pocket costs.

Over-the-counter versus prescription medications: Your prescription drug benefit applies only to those medications that are prescribed by a licensed provider. You can buy many medications for pain, colds, stomach problems, etc., as well as vitamins and supplements, without a prescription (often referred to as “over-the-counter”). However, these costs will not be reimbursed under your pharmacy benefit plan.

Generic drugs: Many of the commonly used medications, antibiotics, hypertension, and heart disease medicines are available in generic form. Generic medications are highly regulated in the US and most are equivalent in strength and quality to brand name medications. Your prescription drug benefit offers the best coverage (the least out-of-pocket costs) when generic medications are used. Most US doctors will prescribe generic drugs if available. If you choose a branded drug instead, you will be responsible for the price difference.

In-network and out-of-network: Pharmacies are also in-network and out-of-network. Your drug benefit gives the best coverage when an in-network pharmacy is used.

Mail order: The insurance plans also have contracts with mail order pharmacies that will issue a 90 day supply of medications to you, the patient, at considerable cost savings. Mail order prescriptions are most effective for chronic or long term medications. Remember to ask your physician to write a prescription for a 90 day supply of medication when you plan to use an in-network mail-order pharmacy.

Prior approvals: Certain medications like for cancer treatment, transplantations, or rare blood diseases, are highly specialized and have no generic alternatives. “No generic alternatives” mean they are expensive and generate high out-of-pocket costs. The cost of these medications can be substantially reduced if your physician requests a “prior approval” from your insurer and makes the case for a lower cost since there is no substitute available for the medication.

Mental Health Problems

Mental health care in the US, also referred to as behavioural health, is organized quite separately from your other healthcare systems and may be difficult to access without some guidelines. Within the mental health system there is a strong bias toward psychopharmacology, and many psychiatrists in the US limit their practices to diagnosing and prescribing psychiatric medication. They are called psychopharmacologists. Therapy, counselling or medication for emotional problems is very common in the US and seems to carry fewer stigmas than in other cultures.

Below are some guidelines for using the mental health care system:

- ♦ **If you are faced with a mental health emergency:** such as marked changes in behaviour and/or thought processes not related to an acute physical illness or medications, there are a number of hospital-based psychiatric emergency rooms throughout the metropolitan area where you or family members can be seen for evaluation and, if needed, be admitted to a psychiatric facility for in-patient treatment. There is a list of hospitals that have psychiatric emergency facilities in the index. If you or a family member is experiencing a marked change in emotional behaviour or has an existing mental health problem, it is advisable to access this type of psychiatric emergency facility rather than a regular emergency room where personnel are trained to respond to psychiatric emergencies and can make appropriate decisions about follow-up care).
- ♦ **Ongoing psychiatric or psychotherapy care:** can be given by a psychiatrist, a therapist or a mental health clinic that provides both services. It is not uncommon for an individual with emotional problems to see both a psychiatrist for medications and a therapist – who is usually a clinical psychologist or clinical social worker. Note that many therapists have early morning or late afternoon/evening appointments to accommodate working people.
- ♦ **Preventive care:** There is a fair amount of public discussion about the need for more preventive mental health services but little agreement as to what those services should be. Your insurance plans offer fairly comprehensive coverage for mental health counselling and people are encouraged to seek counselling for persistent feelings of depression, anxiety, or uncontrollable anger. Schools will often inform parents if they feel a child is in need of behavioural evaluation and/or counselling based on how he/she is functioning in the classroom.

How to find an in-network mental health professional or treatment facility:

Your network provider directory, which can be accessed online, has listings with contact numbers for “behavioural health providers.” This is a good place to start as there is a benefit, as in other aspects of your care, to seeing an in-network provider. Your primary care physician may have suggestions for both talk therapy and psychopharmacologists, and some primary care physicians feel comfortable prescribing psychiatric medications themselves.

- ◆ **In-patient, residential and out-patient treatment for substance and/or alcohol abuse:** Most cases will be covered by your plan. There are many specialized facilities that treat drug and alcohol problems, a list of which is in the index as well as your provider network directory. Your primary care physician can generally help with a referral to a network facility.

Alternative Medical Practices

Coverage of alternative or naturopathic medical practices is limited to acupuncture, chiropractic services and nutritional counselling when you go to an in-net-work provider. Other practices such as homeopathy, massage therapy, nutritional supplements, and movement therapy are not covered services and generally will not be reimbursed.

The Staff Counsellor's Office at UN Headquarters

The Staff Counsellor's Office (SCO) is a primary point of contact for UN staff members to receive support and professional counselling when facing crisis or personal concerns including stress, anxiety, depression, grief, burnout, substance abuse, relationship issues, or reaction to a traumatic event. The SCO offers short-term individual counselling sessions that are confidential and free of charge. If longer-term assistance is needed, the SCO can refer you to an external provider. The SCO has a plan to provide Psychological First Aid to staff and families requiring immediate psychological or emotional support. Also, the SCO offers a variety of workshops, with a strong focus placed on providing staff with the knowledge and skills to manage daily stress, crisis, and difficult situations for themselves, family members, and their colleagues. We encourage staff members and managers to utilize the wealth of resources available through our office.

Additional Benefits of Your UN Insurance Plan

Your Aetna and Empire Blue Cross coverage includes additional benefits for you whose costs are part of your monthly contributions.

ActiveHealth

This program was implemented as a health management service that provides confidential disease management and wellness programs to Aetna and Empire Blue Cross plan participants. This program works to reduce preventable conditions, which are often precursors to more serious and chronic conditions. It provides important care considerations to participants and their doctors and assists in managing the health concerns of participants including through voluntary one-on-one nurse coaching for members with chronic conditions.

Additional details can be found in the latest information circular on the UN health insurance program available at the UN Health and Life Insurance Section website (<http://www.un.org/insurance>).

FrontierMedex

This program provides emergency medical assistance when you or your covered family members are 100 or more miles away from your residence. Such assistance includes arranging for emergency evacuation and repatriation especially when you are on personal travel. Additional details of this program can be found in the latest information circular on the UN health insurance program available at the UN Health and Life Insurance section (<http://www.un.org/insurance>).

Please note that while evacuation and repatriation can be arranged, the related cost will not be covered by FrontierMedex, your health insurance plan, or the UN when it involves personal travel. Staff members may purchase travel insurance at their own cost that provides such coverage.

Patient Bill of Rights

As a patient in a hospital in New York State, you have the right, consistent with law, to:

- (1) Understand and use these rights. If for any reason you do not understand or you need help, the hospital MUST provide assistance, including an interpreter.
- (2) Receive treatment without discrimination as to race, color, religion, sex, national origin, disability, sexual orientation, source of payment, or age.
- (3) Receive considerate and respectful care in a clean and safe environment free of unnecessary restraints.
- (4) Receive emergency care if you need it.
- (5) Be informed of the name and position of the doctor who will be in charge of your care in the hospital.
- (6) Know the names, positions and functions of any hospital staff involved in your care and refuse their treatment, examination or observation.
- (7) A no smoking room.
- (8) Receive complete information about your diagnosis, treatment and prognosis.
- (9) Receive all the information that you need to give informed consent for any proposed procedure or treatment. This information shall include the possible risks and benefits of the procedure or treatment.
- (10) Receive all the information you need to give informed consent for an order not to resuscitate. You also have the right to designate an individual to give this consent for you if you are too ill to do so. If you would like additional information, please ask for a copy of the pamphlet "Deciding About Health Care — A Guide for Patients and Families."
- (11) Refuse treatment and be told what effect this may have on your health.
- (12) Refuse to take part in research. In deciding whether or not to participate, you have the right to a full explanation.
- (13) Privacy while in the hospital and confidentiality of all information and records regarding your care.
- (14) Participate in all decisions about your treatment and discharge from the hospital. The hospital must provide you with a written discharge plan and written description of how you can appeal your discharge.
- (15) Review your medical record without charge. Obtain a copy of your medical record for which the hospital can charge a reasonable fee. You cannot be denied a copy solely because you cannot afford to pay.
- (16) Receive an itemized bill and explanation of all charges.
- (17) Complain without fear of reprisals about the care and services you are receiving and to have the hospital respond to you and if you request it, a written response. If you are not satisfied with the hospital's response, you can complain to the New York State Health Department. The hospital must provide you with the State Health Department telephone number.
- (18) Authorize those family members and other adults who will be given priority to visit consistent with your ability to receive visitors.
- (19) Make known your wishes in regard to anatomical gifts. You may document your wishes in your health care proxy or on a donor card, available from the hospital.

Public Health Law(PHL)2803 (1)(g)Patient's Rights, 10NYCRR, 405.7,405.7(a)(1),405.7(c)

Handbook Acknowledgments

I want to express my deepest gratitude to all involved in the development of the Handbook. This was a collective work of numerous UN and non-UN colleagues, all of whom were committed to making it user-friendly and responsive to the needs of UN personnel and their family.

The initial draft of this Handbook was prepared for the UN Medical Services Division (MSD) by Dr. Susan Massad, a general medicine doctor based in New York with over 40 years of medical experience.

Contributors from the Medical Services Division include Dr. Michael Rowell, who first suggested the idea of this Handbook; James Gibson and Dr. Abdalla Mansour Amer who provided valuable feedback to the document; and Dr. Esther Tan, who coordinated the overall review of the draft by relevant parties.

Special thanks and appreciation are given to staff from the UN Health and Life Insurance Division for their important contributions to the Handbook on insurance-related matters; the OHRM Communications team on the design and dissemination of the Handbook; and the New York Local Expatriate Spouse Association (NYLESA) for their review of the document.

Finally, MSD gratefully acknowledges all staff of the UN for their valuable feedback to this document. We truly hope that this tool will be useful and provide you and your family with the necessary guidance and resources needed to navigate the US health care system.

Sincerely,

Dr. Jillann Farmer
Medical Director
UN Medical Services Division
