

## **In Pursuit of Global Peace: Coordination, Transformation, Education, and Empowerment for a Sustainable Future**

In this moment of our history, we are faced with the common challenge of consolidating peace. This New Agenda urges us to take coordinated actions to prevent conflicts and promote sustainable development, with special consideration for individuals with various vulnerabilities.

As we approach the Future Summit and the 2025 Review of the Peacebuilding Architecture, we must contemplate concrete measures that member states, through the multilateral system, can implement to address shared challenges. This includes promoting inclusion and diversity in an increasingly interconnected world.

It is essential to acknowledge individuals with disabilities and other vulnerabilities in our quest for peace. A truly peaceful society is one that embraces diversity in all its forms and strives to eliminate any form of discrimination. This entails creating inclusive educational and social environments that foster mutual understanding, empathy, and collaboration. Inclusive education is not only a powerful tool for hate prevention but also a fundamental pillar for building fairer and more harmonious societies. By investing in education and fostering empathy, we ensure that all communities and vulnerable groups have equal opportunities to face crisis situations. This commission and member states should be urged to form a comprehensive and monitored program to achieve the aforementioned, while not losing sight of each region's essence.

The Peacebuilding Commission, in its endeavors, must ensure that the voices of those with different perspectives and abilities are heard and taken into account. This necessitates active collaboration and inclusive dialogue with representative organizations of persons with disabilities and other vulnerable groups.

Looking towards the Future Summit in 2024 and the 2025 review, it is vital to address priorities that strengthen the work of the United Nations in peacebuilding and maintenance. As mentioned earlier, innovation is also a key factor. Swift adaptation to emerging technologies, digital solutions, can help overcome geographical barriers and provide access to services and education in remote and disadvantaged areas, ensuring equal opportunities for all. Innovative technologies are emerging, such as the General Learning Assessment System developed by Dr. Glasbauer, which is proving to be a valuable tool. These technologies can facilitate training, monitoring, and response, empowering our societies to effectively and equitably build peace.

In conclusion, peace is an aspiration to which we must dedicate collective efforts. Only through collaboration among member states, international organizations, and civil society can we achieve sustainable and lasting peace. Let us continue working together to build a world where peace is an everyday and universal reality, where each individual is valued and contributes fully.
