

# The Global Sustainable Water and Energy Solutions Network launches New Website and Knowledge Platform

14 October, 2020

The Global Sustainable Water and Energy Solutions Network has launched its new and improved website at: <https://www.un.org/en/waterenergynetwork>

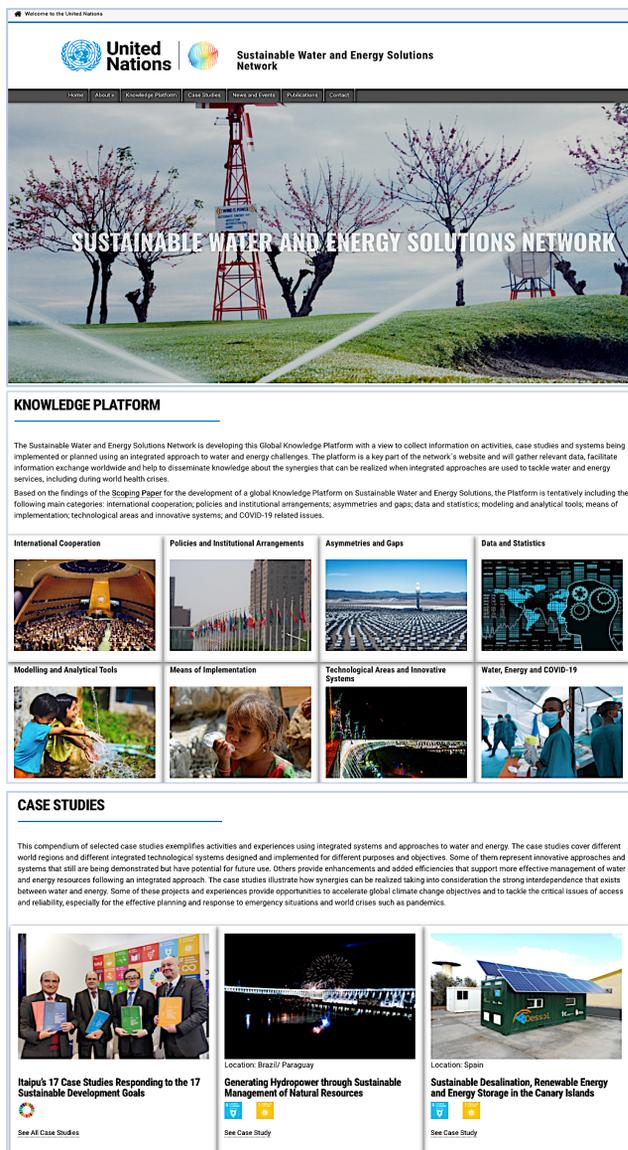

The new website collects information on activities, case studies and systems that use an integrated approach to water and energy challenges in support of the 2030 Agenda for Sustainable Development and the Paris Agreement on Climate Change. The knowledge platform is a key part of the network's website and will gather relevant data, facilitate information exchange worldwide and help to disseminate knowledge about the synergies that can be realized when integrated approaches are used to tackle water and energy services, including during world health crises.

Based on the findings of the [Scoping Paper](#) for the development of a global Knowledge Platform on Sustainable Water and Energy Solutions, the Platform includes the following main categories:

- international cooperation;
- policies and institutional arrangements;
- asymmetries and gaps;
- data and statistics;
- modeling and analytical tools;
- means of implementation;
- technological areas and innovative systems;
- COVID-19 related issues

A **new account** has also been activated [on Twitter](#), featuring real-time updates about the Network and key information about integrated water and energy solutions in support of sustainable development and climate action.

For more information on our work check out our new website and twitter account today!

## The Sustainable Water and Energy Solutions Network

Recognizing the need to address the interlinkages between water and energy and their contributions to the advancement of other SDGs, the UN Department of Economic and Social Affairs (UN DESA) and ITAIPU Binacional joined efforts in 2018 in partnership entitled "Sustainable Water and Energy Solutions" to promote water and energy sustainability and other SDGs. The initiative resulted in the creation of the global **Sustainable Water and Energy Solutions Network** on SDG 6 and SDG 7 interlinkages, with a large number of multi-stakeholders from all regions and constituencies. The aim is to bring together all stakeholders to promote an integrated approach to SDG 6 and SDG 7 in support of the 2030 Agenda for Sustainable Development.
