Population of the UAE in 2020

THREE RESOURCES

Total Water Supply = 3,454 Mm³/Year

WATER DEMAND IN ABU DHABI EMIRATE

Source: SCAD (2014) Abu Dhabi Statistical yearbook; EAA& RTI (2009): International, Demand-Side Management for Electricity and Water Use in Abu Dhabi; RSB (2013): Supporting ADEV2030, Note: Groundwater is estimated based on 2011 data. The data about groundwater for the year 2012 is under methodological review by EAD due to concerns about the accuracy of data resulting from the lack of a reliable metering system in the wells. For the time being, it is assumed that groundwater production and consumption is maintained constant at the levels of 2011

CHALLENGES AND THREATS

Aridity and Scarcity

Institutional and
Legal
Fragmentations

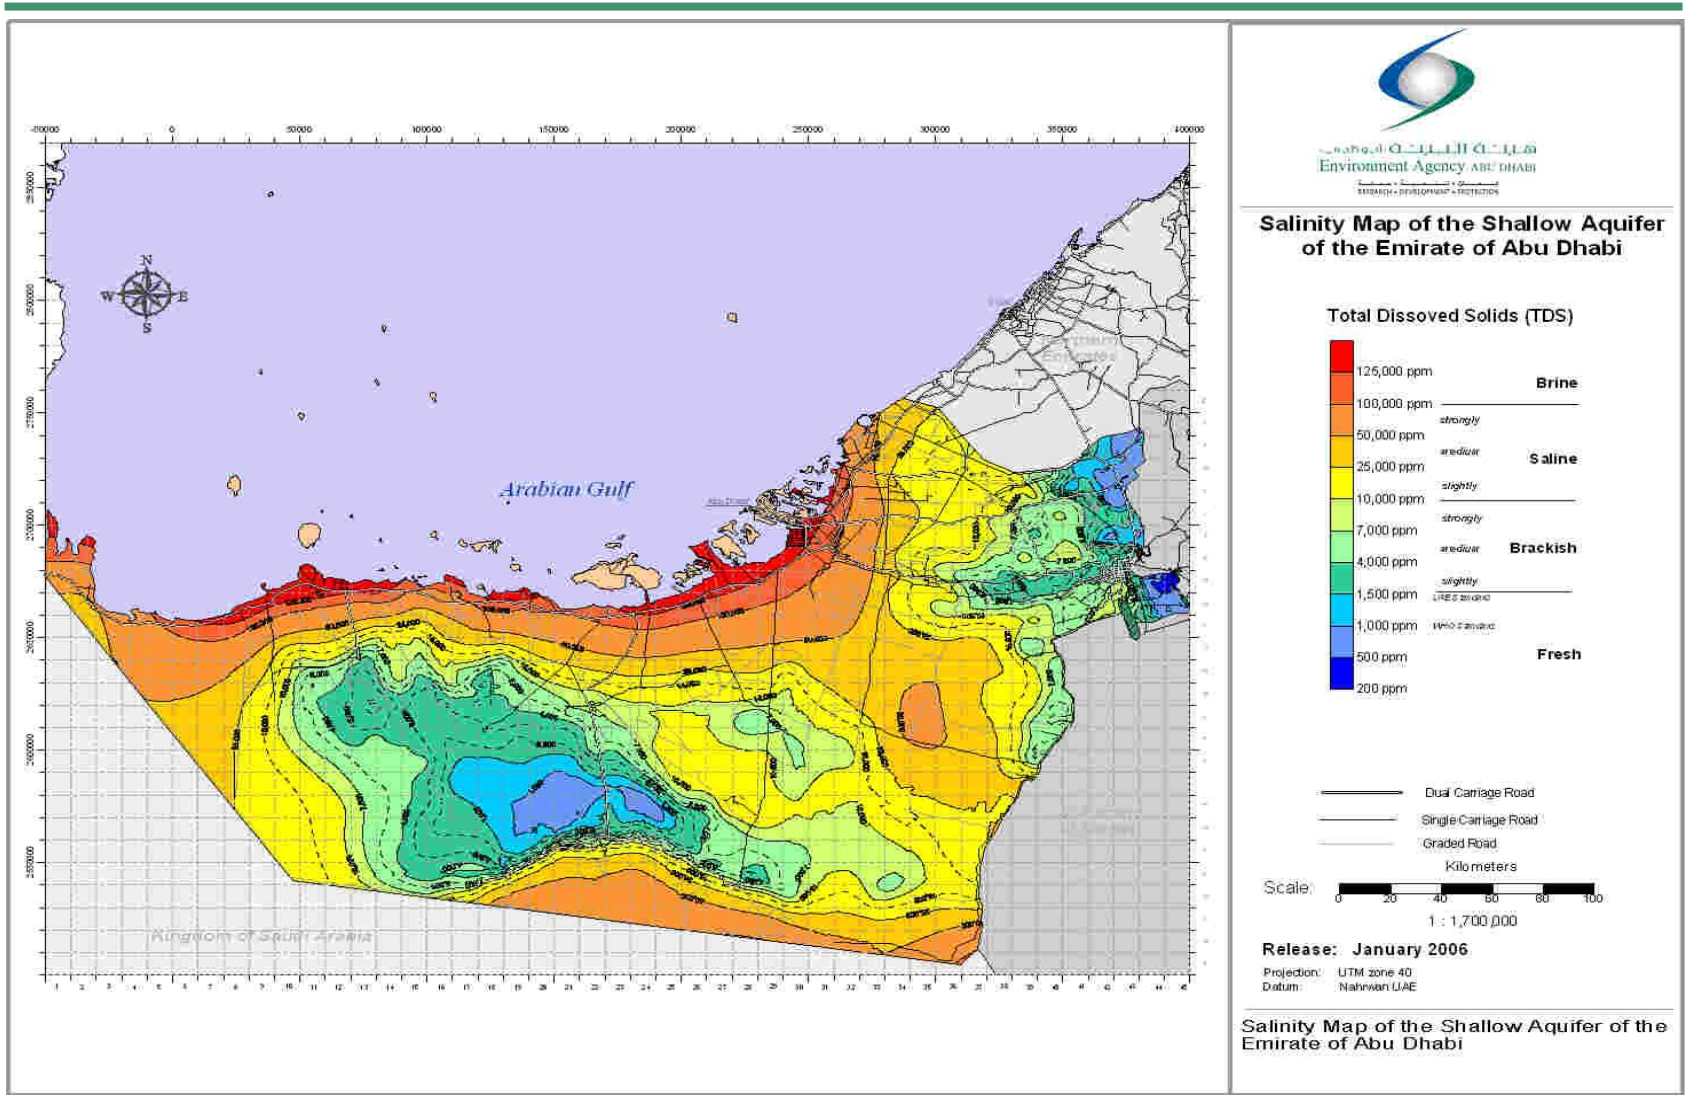

External Threats

ENVIRONMENT AGENCY – ABU DHABI PILOT PROJECT

ENVIRONMENT AGENCY – ABU DHABI PILOT PROJECT

MASDAR PILOT PROJECT AT GHANTOUT

- 1,500 – 2,500 m³/day water production
- 5 pilot plants
- A report published on the program found that solar-powered reverse osmosis is up to 75% more energy efficient than the thermal desalination technologies currently used in the UAE
- Demonstration stage: April 2014 – July 2016

MASDAR PILOT PROJECT AT GHANTOUT

Technology Provider	Desalination Technology	Capacity of Pilot Plant [m ³ /d]
Abengoa	Reverse Osmosis and Membrane Distillation	1,000
Suez	Reverse Osmosis and Liquid Ionic Membrane	100
Trevi Systems	Forward Osmosis	50
Veolia	Reverse Osmosis	300
Mascara	PV Powered Reverse Osmosis	30

MASDAR PILOT PROJECT AT GHANTOUT

NEW 200MIGD RO PROJECT AT Taweelah

- 200 MGD Reverse Osmosis (RO) at Taweelah with 41MW of Solar (PV on rooftops and land surrounding the plant)
- Independent Water Project (IWP); the world's largest RO plant.
- Enable :
 - Decoupling water from power generation
 - Reduce consumption of marginal gas cost (especially during winter)
 - Enhancing security of supply (especially in winter),
 - contribution to CO2 reduction
- Construction by Abengoa (Spain) and SEPCO III (China)

ADVANTAGES OF SOLAR DESALINATION

Sources of Direct GHG Emissions in Abu Dhabi Emirate, 2018
Total 120,405 Gg CO₂-equivalent

Contributions of Energy Subsectors Towards Direct GHGs in Abu Dhabi Emirate, 2018

FROM THERMAL DESALINATION TO MEMBRANE DESALINATION

Why is it Better?

Flexible

Unlike thermal desalination, RO does not have to be integrated with a power plant which supports and underpins De-Coupling Strategy

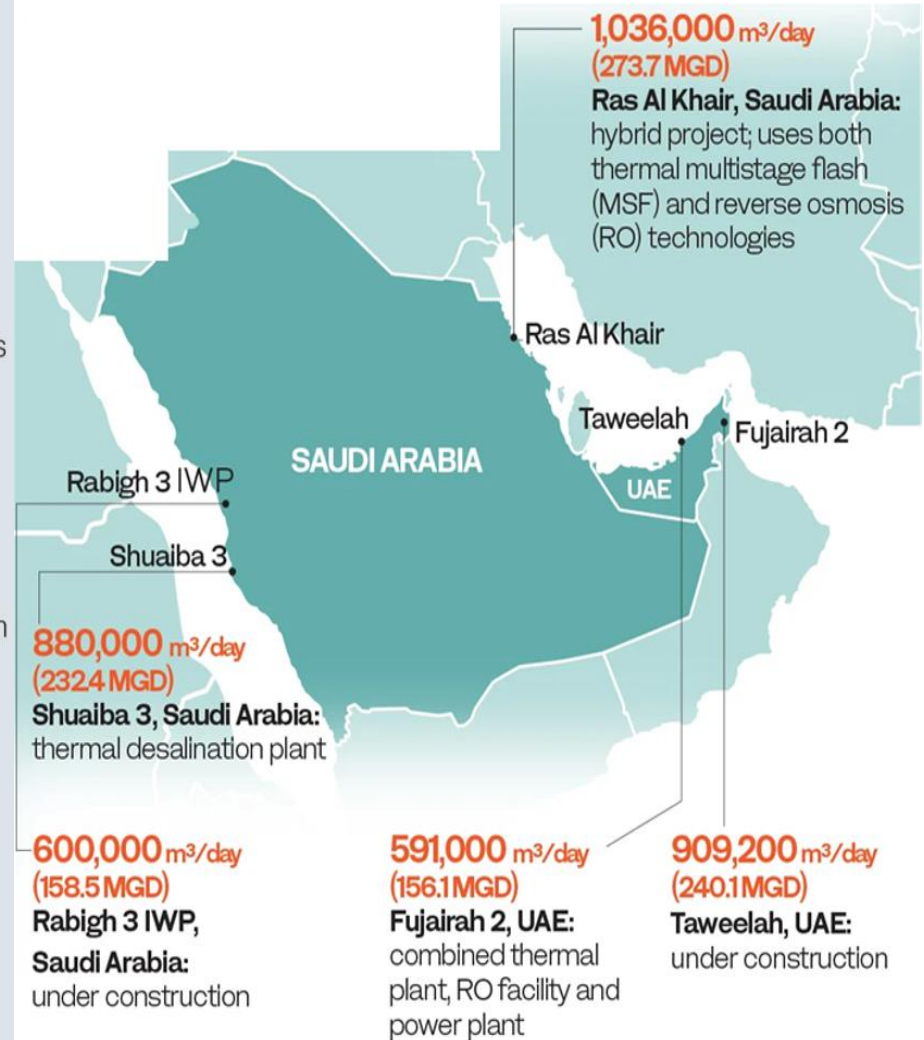

Environment Friendly

RO Produces the lowest airborne emissions per m³ of water produced with no waste heat generated and no impact on ambient seawater temperature

Cost Efficient

RO is a more efficient process, reducing costs due to improved technology and Energy Recovery Systems
