The proportion of fish stocks within biologically sustainable levels declined from 90% (1974) to 67% (2015).

Ocean acidity has increased by 26% since pre-industrial times.

It is expected to rapidly increase by 100–150% by 2100.

The increase in ocean acidity is a negative phenomenon. It impacts the ability of the ocean to absorb CO₂ and endangers marine life.
